$$S \approx \sum_{k=0}^3 \frac{(-1)^k}{(2k)!} = 1 - \frac{1}{2!} + \frac{1}{4!} - \frac{1}{6!} = 1 - \frac{1}{2} + \frac{1}{24} - \frac{1}{720} = \frac{389}{720} \approx 0.5403$$

is correct to within 0.0001. ■

### NOW WORK Problem 19.

## Absolute and Conditional Convergence

The ideas of *absolute convergence* and *conditional convergence* are used to describe the convergence or divergence of a series  $\sum_{k=1}^{\infty} a_k$  in which the terms  $a_k$  are sometimes positive and sometimes negative (not necessarily alternating).

### DEFINITION Absolute Convergence

A series  $\sum_{k=1}^{\infty} a_k$  is **absolutely convergent** if the series

$$\sum_{k=1}^{\infty} |a_k| = |a_1| + |a_2| + \cdots + |a_n| + \cdots$$

is convergent.

**THEOREM Absolute Convergence Test**

If a series  $\sum_{k=1}^{\infty} a_k$  is absolutely convergent, then it is convergent.

**Proof** For any  $n$ ,

$$-|a_n| \leq a_n \leq |a_n|$$

Adding  $|a_n|$  yields

$$0 \leq a_n + |a_n| \leq 2|a_n|$$

Since  $\sum_{k=1}^{\infty} |a_k|$  converges, then  $\sum_{k=1}^{\infty} (2|a_k|) = 2 \sum_{k=1}^{\infty} |a_k|$  also converges. By the

Comparison Test for Convergence,  $\sum_{k=1}^{\infty} (a_k + |a_k|)$  converges. But  $a_n = (a_n + |a_n|) - |a_n|$ .

Since  $\sum_{k=1}^{\infty} a_k$  is the difference of two convergent series, it also converges. ■

**3 Determine Whether a Series Converges****EXAMPLE 4** Determining Whether a Series Converges

Determine whether the series  $1 - \frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} - \frac{1}{32} + \frac{1}{64} - \dots$  converges.

**Solution** The series  $1 - \frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} - \frac{1}{32} + \frac{1}{64} - \dots$  converges absolutely, since

$$1 + \frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^{n-1}} + \dots = \sum_{k=1}^{\infty} \left(\frac{1}{2}\right)^{k-1}, \text{ a geometric series with } r = \frac{1}{2}, \text{ converges.}$$

So by the Absolute Convergence Test, the series  $1 - \frac{1}{2} - \frac{1}{4} + \frac{1}{8} - \frac{1}{16} - \frac{1}{32} + \frac{1}{64} - \dots$  converges. ■

**NOW WORK** Problem 31.

**EXAMPLE 5** Determining Whether a Series Converges

Determine whether the series  $\sum_{k=1}^{\infty} \frac{\sin k}{k^2} = \frac{\sin 1}{1^2} + \frac{\sin 2}{2^2} + \frac{\sin 3}{3^2} + \dots$  converges.

**Solution** This series has both positive and negative terms, but it is not an alternating series. Use the Absolute Convergence Test to investigate the series  $\sum_{k=1}^{\infty} \left| \frac{\sin k}{k^2} \right|$ . Since

$$\left| \frac{\sin n}{n^2} \right| \leq \frac{1}{n^2}$$

for all  $n$ , and since  $\sum_{k=1}^{\infty} \frac{1}{k^2}$  is a convergent  $p$ -series, then by the Comparison Test for

Convergence, the series  $\sum_{k=1}^{\infty} \left| \frac{\sin k}{k^2} \right|$  converges. Since  $\sum_{k=1}^{\infty} \frac{\sin k}{k^2}$  is absolutely convergent,

it follows that  $\sum_{k=1}^{\infty} \frac{\sin k}{k^2}$  is convergent. ■

**NOW WORK** Problem 29.

The converse of the Absolute Convergence Test is not true. That is, if a series is convergent, the series may or may not be absolutely convergent. There are convergent series that are not absolutely convergent. For instance, we have shown that the alternating harmonic series

$$\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \cdots$$

**IN WORDS** If a series is absolutely convergent, then it is convergent. But just because a series converges does not mean it is absolutely convergent.

converges. The series of absolute values is the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$ , which is divergent.

### DEFINITION Conditional Convergence

A series that is convergent without being absolutely convergent is called **conditionally convergent**.

### EXAMPLE 6 Determining Whether a Series Is Absolutely or Conditionally Convergent or Divergent

Determine the numbers  $p$  for which the series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^p}$  is absolutely convergent, conditionally convergent, or divergent.

**Solution** We begin by testing the series for absolute convergence. The series of absolute values is  $\sum_{k=1}^{\infty} \left| \frac{(-1)^{k+1}}{k^p} \right| = \sum_{k=1}^{\infty} \frac{1}{k^p}$ . This is a  $p$ -series, which converges if  $p > 1$  and diverges if  $p \leq 1$ . So,  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^p}$  is absolutely convergent if  $p > 1$ .

It remains to determine what happens when  $p \leq 1$ . We use the Alternating Series Test, and begin by investigating  $\lim_{n \rightarrow \infty} a_n$ :

$$\bullet \lim_{n \rightarrow \infty} \frac{1}{n^p} = 0 \quad 0 < p \leq 1 \quad \bullet \lim_{n \rightarrow \infty} \frac{1}{n^p} = 1 \quad p = 0 \quad \bullet \lim_{n \rightarrow \infty} \frac{1}{n^p} = \infty \quad p < 0$$

Consequently,  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^p}$  diverges if  $p \leq 0$ .

Continuing, we check the second condition of the Alternating Series Test when  $0 < p \leq 1$ . Using the related function  $f(x) = \frac{1}{x^p}$ , for  $x > 0$ , we have  $f'(x) = -\frac{p}{x^{p+1}}$ . Since  $f'(x) < 0$  for  $0 < p \leq 1$ , the second condition of the Alternating Series Test is satisfied. We conclude that  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^p}$  is conditionally convergent if  $0 < p \leq 1$ .

To summarize, the alternating  $p$ -series,  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^p}$  is absolutely convergent if  $p > 1$ , conditionally convergent if  $0 < p \leq 1$ , and divergent if  $p \leq 0$ . ■

### NOW WORK Problem 33.

As illustrated in Figure 24 on p. 588, a series  $\sum_{k=1}^{\infty} a_k$  is either convergent or divergent.

If it is convergent, it is either absolutely convergent or conditionally convergent. The flowchart in Figure 25 can be used to determine whether a series is absolutely convergent, conditionally convergent, or divergent.

Figure 24

Figure 25

Absolute convergence of a series is stronger than conditional convergence, and absolutely convergent series and conditionally convergent series have different properties. We state, but do not prove, some of these properties now.

### Properties of Absolutely Convergent and Conditionally Convergent Series

- If a series  $\sum_{k=1}^{\infty} a_k$  is absolutely convergent, any rearrangement of its terms results in a series that is also absolutely convergent. Both series will have the same sum. See Problem 66.
- If two series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are absolutely convergent, the series  $\sum_{k=1}^{\infty} (a_k + b_k)$  is also absolutely convergent. Moreover,

$$\sum_{k=1}^{\infty} (a_k + b_k) = \sum_{k=1}^{\infty} a_k + \sum_{k=1}^{\infty} b_k$$

See Problem 62.

- If two series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are absolutely convergent, then the series

$$\sum_{k=1}^{\infty} c_k = \sum_{k=1}^{\infty} (a_1 b_k + a_2 b_{k-1} + \cdots + a_k b_1)$$

is also absolutely convergent.

The sum of the series  $\sum_{k=1}^{\infty} c_k$  equals the product of the sums of the two original series.

- If a series converges absolutely, then the series consisting of just the positive terms converges, as does the series consisting of just the negative terms. See Problem 63.
- If a series converges conditionally, then the series consisting of just the positive terms diverges, as does the series consisting of just the negative terms. See Problems 51, 52, and 64.
- If a series  $\sum_{k=1}^{\infty} a_k$  is conditionally convergent, its terms may be rearranged to form a new series that converges to *any* sum we like. In fact, they may be rearranged to form a *divergent series*. See Problems 53–55.

## 8.5 Assess Your Understanding

### Concepts and Vocabulary

1. **True or False** The series  $\sum_{k=1}^{\infty} (-1)^k \cos(k\pi)$  is an alternating series.
2. **True or False**  $\sum_{k=1}^{\infty} [1 + (-1)^k]$  is an alternating series.

3. **True or False** In an alternating series,  $\sum_{k=1}^{\infty} (-1)^k a_k$ , if  $\lim_{n \rightarrow \infty} a_n = 0$ , then the series is convergent.

4. **True or False** If the alternating series  $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$  satisfies the two conditions of the Alternating Series Test, then the error  $E_n$  in using the sum  $S_n$  of the first  $n$  terms as an approximation of the sum  $S$  of the series is  $|E_n| \leq a_n$ .
5. **True or False** A series that is not absolutely convergent is divergent.
6. **True or False** If a series is absolutely convergent, then the series converges.

### Skill Building

In Problems 7–18, use the Alternating Series Test to determine whether each alternating series converges or diverges.

7.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k^2}$
8.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{2\sqrt{k}}$
9.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k}{2k+1}$
10.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+1}{k}$
11.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^2}{5k^2+2}$
12.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+1}{k^2}$
13.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{(k+1)2^k}$
14.  $\sum_{k=2}^{\infty} (-1)^k \frac{1}{k \ln k}$
15.  $\sum_{k=2}^{\infty} (-1)^k \frac{1}{1+2^{-k}}$
16.  $\sum_{k=0}^{\infty} (-1)^k \frac{1}{k!}$
17.  $\sum_{k=1}^{\infty} (-1)^{k+1} \left( \frac{k}{k+1} \right)^k$
18.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^2}{(k+1)^3}$

In Problems 19–26, approximate the sum of each series using the first three terms and find an upper estimate to the error in using this approximation.

19.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k^2}$
20.  $\sum_{k=0}^{\infty} (-1)^k \frac{1}{k!}$
21.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k^4}$
22.  $\sum_{k=1}^{\infty} (-1)^{k+1} \left( \frac{1}{\sqrt{k}} \right)^k$
23.  $\sum_{k=0}^{\infty} (-1)^k \frac{1}{k!} \left( \frac{1}{3} \right)^k$
24.  $\sum_{k=0}^{\infty} (-1)^k \frac{1}{k!} \left( \frac{1}{2} \right)^k$
25.  $\sum_{k=0}^{\infty} (-1)^k \frac{1}{2k+1} \left( \frac{1}{3} \right)^{2k+1}$
26.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k^k}$

In Problems 27–42, determine whether each series is absolutely convergent, conditionally convergent, or divergent.

27.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{2k}$
28.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{3k-4}$
29.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{\sin k}{k^2+1}$
30.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{\cos k}{k^2}$
31.  $\sum_{k=1}^{\infty} (-1)^{k+1} \left( \frac{1}{5} \right)^k$
32.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{5^k}{k!}$
33.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{e^k}{k}$
34.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} 2^k}{k^2}$

35.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k(k+1)}$
37.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} \sqrt{k}}{k^2+1}$
39.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{\ln k}{k}$
41.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{1}{k e^k}$

36.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k\sqrt{k+3}}$
38.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} \sqrt{k}}{k+1}$
40.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} \ln k}{k^3}$
42.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{e^k}$

### Applications and Extensions

In Problems 43–50, determine whether each series is absolutely convergent, conditionally convergent, or divergent.

43.  $\sum_{k=2}^{\infty} \frac{(-1)^k}{k \ln k}$
44.  $\sum_{k=2}^{\infty} \frac{(-1)^k}{k (\ln k)^2}$
45.  $\sum_{k=1}^{\infty} \frac{\sin k}{k^2}$
46.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1} \tan^{-1} k}{k}$
47.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k^{1/k}}$
48.  $\sum_{k=1}^{\infty} (-1)^{k+1} \left( \frac{k}{k+1} \right)^k$
49.  $1 - \frac{1}{2!} + \frac{1}{3!} - \frac{1}{4!} + \frac{1}{5!} - \dots$
50.  $1 - \frac{1}{3^2} + \frac{1}{5^2} - \frac{1}{7^2} + \dots$

51. Show that the positive terms of  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  diverge.
52. Show that the negative terms of  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  diverge.

53. Show that the terms of the series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  can be rearranged so the resulting series converges to 0.

54. Show that the terms of the series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  can be rearranged so the resulting series converges to 2.

55. Show that the terms of the series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  can be rearranged so the resulting series diverges.

56. Show that the series

$$e^{-x} \cos x + e^{-2x} \cos(2x) + e^{-3x} \cos(3x) + \dots$$

is absolutely convergent for all positive values of  $x$ .  
(Hint: Use the fact that  $|\cos \theta| \leq 1$ .)

57. Determine whether the series below converges (absolutely or conditionally) or diverges.

$$1 + r \cos \theta + r^2 \cos(2\theta) + r^3 \cos(3\theta) + \dots$$

58. What is wrong with the following argument?

$$A = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \dots$$

$$\left( \frac{1}{2} \right) A = \frac{1}{2} - \frac{1}{4} + \frac{1}{6} - \frac{1}{8} + \dots$$

So,

$$A + \left( \frac{1}{2} \right) A = 1 + \frac{1}{3} - \frac{1}{2} + \frac{1}{5} + \frac{1}{7} - \frac{1}{4} + \dots$$

The series on the right is a rearrangement of the terms of the series  $A$ . So its sum is  $A$ , meaning

$$A + \left(\frac{1}{2}\right)A = A$$

$$A = 0$$

But,

$$A = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \left(\frac{1}{5} - \frac{1}{6}\right) + \cdots > 0$$

**Bernoulli's Error** In Problems 59–61, consider an incorrect argument given by Jakob Bernoulli to prove that

$$\sum_{k=1}^{\infty} \frac{1}{k(k+1)} = \frac{1}{2} + \frac{1}{6} + \frac{1}{12} + \cdots = 1$$

Bernoulli's argument went as follows:

Let  $N = 1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \cdots$ . Then

$$N - 1 = \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \cdots$$

Now, subtract term-by-term to get

$$N - (N - 1) = \left(1 - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \cdots \quad (4)$$

$$1 = \frac{1}{2} + \frac{1}{6} + \frac{1}{12} + \cdots$$

59. What is wrong with Bernoulli's argument?
60. In general, what can be said about the convergence or divergence of a series formed by taking the term-by-term difference (or sum) of two divergent series? Support your answer with examples.
61. Although the method is wrong, Bernoulli's conclusion is correct; that is, it is true that  $\sum_{k=1}^{\infty} \frac{1}{k(k+1)} = 1$ . Prove it! [Hint: Look at the partial sums using the form of the series in (4).]
62. Show that if two series  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are absolutely convergent, the series  $\sum_{k=1}^{\infty} (a_k + b_k)$  is also absolutely convergent. Moreover,  $\sum_{k=1}^{\infty} (a_k + b_k) = \sum_{k=1}^{\infty} a_k + \sum_{k=1}^{\infty} b_k$ .
63. Show that if a series converges absolutely, then the series consisting of just the positive terms converges, as does the series consisting of just the negative terms.
64. Show that if a series converges conditionally, then the series consisting of just the positive terms diverges, as does the series consisting of just the negative terms.
65. Determine whether the series  $\sum_{k=1}^{\infty} c_k$ , where

$$c_k = \begin{cases} \frac{1}{a^k} & \text{if } k \text{ is even} \\ -\frac{1}{b^k} & \text{if } k \text{ is odd} \end{cases} \quad a > 1, b > 1,$$

converges absolutely, converges conditionally, or diverges.

66. Prove that if a series  $\sum_{k=1}^{\infty} a_k$  is absolutely convergent, any rearrangement of its terms results in a series that is also absolutely convergent. (Hint: Use the triangle inequality:  $|a + b| \leq |a| + |b|$ .)

67. Suppose that the terms of the series  $\sum_{k=1}^{\infty} a_k$  are alternating,  $|a_{k+1}| \leq |a_k|$  for all integers  $k$ , and  $\lim_{n \rightarrow \infty} a_n = 0$ . Show that the series converges.

### Challenge Problems

In Problems 68–71, determine whether each series is absolutely convergent, conditionally convergent, or divergent.

68.  $\sum_{k=1}^{\infty} \sin \frac{(-1)^k}{k}$
69.  $\sum_{k=2}^{\infty} \frac{(-1)^k}{\sqrt[p]{k^3 + 1}}, p > 2$
70.  $\sum_{k=2}^{\infty} (-1)^k k^{(1-k)/k}$
71.  $\sum_{k=2}^{\infty} \frac{(-1)^k}{(\ln k)^{\ln k}}$

In Problems 72–74, use the result of Problem 67 to determine whether each series converges or diverges.

72.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{\sqrt{k}}{(k+1)}$
73.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k}{(k+1)^2}$
74.  $\sum_{k=2}^{\infty} (-1)^k \ln \frac{k+1}{k}$
75. Let  $\{a_n\}$  be a sequence that is decreasing and is bounded from below by 0. Define

$$R_n = \sum_{k=n+1}^{\infty} (-1)^{k+1} a_k \quad \text{and} \quad \Delta a_k = a_k - a_{k+1}$$

Suppose that the sequence  $\{\Delta a_k\}$  decreases.

- (a) Show that the series  $\sum_{k=1}^{\infty} (-1)^{k+1} \Delta a_k$  is a convergent alternating series.

- (b) Show that

$$|R_n| = \frac{a_n}{2} + \frac{1}{2} \sum_{k=1}^{\infty} (-1)^k \Delta a_{k+n-1}$$

$$\text{and } \sum_{k=1}^{\infty} (-1)^k \Delta a_{k+n-1} < 0. \text{ Deduce } |R_n| < \frac{1}{2} a_n.$$

- (c) Show that

$$|R_n| = \frac{a_{n+1}}{2} + \frac{1}{2} \sum_{k=1}^{\infty} (-1)^{k+1} \Delta a_{k+n}$$

- (d) Conclude that  $\frac{a_{n+1}}{2} < |R_n|$ .

## 8.6 Ratio Test; Root Test

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Use the Ratio Test (p. 591)
- 2 Use the Root Test (p. 593)

One of the most practical tests for convergence of a series makes use of the ratio of two consecutive terms.

### THEOREM Ratio Test

Let  $\sum_{k=1}^{\infty} a_k$  be a series of nonzero terms.

1. Let  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L$ , a number.
  - If  $L < 1$ , then the series  $\sum_{k=1}^{\infty} a_k$  converges absolutely and so  $\sum_{k=1}^{\infty} a_k$  is convergent.
  - If  $L = 1$ , the test fails to indicate whether the series converges or diverges.
  - If  $L > 1$ , then the series  $\sum_{k=1}^{\infty} a_k$  diverges.
2. If  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \infty$ , then the series  $\sum_{k=1}^{\infty} a_k$  diverges.

A proof of the Ratio Test is given at the end of the section.

### 1 Use the Ratio Test

#### EXAMPLE 1 Using the Ratio Test

Use the Ratio Test to determine whether each series converges or diverges.

(a)  $\sum_{k=1}^{\infty} \frac{k}{4^k}$       (b)  $\sum_{k=1}^{\infty} \frac{2^k}{k}$       (c)  $\sum_{k=1}^{\infty} \frac{3k+1}{k^2}$       (d)  $\sum_{k=1}^{\infty} \frac{1}{k!}$

**Solution** (a)  $\sum_{k=1}^{\infty} \frac{k}{4^k}$  is a series of nonzero terms;  $a_{n+1} = \frac{n+1}{4^{n+1}}$  and  $a_n = \frac{n}{4^n}$ . The absolute value of their ratio is

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{\frac{n+1}{4^{n+1}}}{\frac{n}{4^n}} = \frac{n+1}{4^{n+1}} \cdot \frac{4^n}{n} = \frac{n+1}{4n}$$

Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{n+1}{4n} = \frac{1}{4} < 1$$

Since the limit is less than 1, the series converges.

(b)  $\sum_{k=1}^{\infty} \frac{2^k}{k}$  is a series of nonzero terms;  $a_{n+1} = \frac{2^{n+1}}{n+1}$  and  $a_n = \frac{2^n}{n}$ . The absolute value of their ratio is

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{2^{n+1}}{n+1} \cdot \frac{n}{2^n} = \frac{2n}{n+1}$$

Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{2n}{n+1} = 2 > 1$$

Since the limit is greater than 1, the series diverges.

(c)  $\sum_{k=1}^{\infty} \frac{3k+1}{k^2}$  is a series of nonzero terms;  $a_{n+1} = \frac{3(n+1)+1}{(n+1)^2} = \frac{3n+4}{(n+1)^2}$  and  $a_n = \frac{3n+1}{n^2}$ . The absolute value of their ratio is

$$\left| \frac{a_{n+1}}{a_n} \right| = \left[ \frac{3n+4}{(n+1)^2} \right] \left( \frac{n^2}{3n+1} \right) = \left( \frac{3n+4}{3n+1} \right) \left( \frac{n^2}{n^2+2n+1} \right) = \frac{3n^3+4n^2}{3n^3+7n^2+5n+1}$$

Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{3n^3+4n^2}{3n^3+7n^2+5n+1} = 1$$

The Ratio Test gives no information about this series. Another test must be used.

(You can show that the series diverges by comparing it to the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$ .)

(d)  $\sum_{k=1}^{\infty} \frac{1}{k!}$  is a series of nonzero terms;  $a_{n+1} = \frac{1}{(n+1)!}$  and  $a_n = \frac{1}{n!}$ . The absolute value of their ratio is

$$\left| \frac{a_{n+1}}{a_n} \right| = \frac{n!}{(n+1)!} = \frac{1}{n+1}$$

Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$$

Since the limit is less than 1, the series  $\sum_{k=1}^{\infty} \frac{1}{k!}$  converges. ■

**NOTE** In Section 8.9, we show that  $\sum_{k=1}^{\infty} \frac{1}{k!} = e$ .

### NOW WORK Problem 7.

As Example 1 illustrates, the Ratio Test is useful in determining whether a series containing factorials and/or powers converges or diverges.

### EXAMPLE 2 Using the Ratio Test

Use the Ratio Test to determine whether the series  $\sum_{k=1}^{\infty} \frac{k!}{k^k}$  converges or diverges.

**Solution**  $\sum_{k=1}^{\infty} \frac{k!}{k^k}$  is a series of nonzero terms. Since  $a_{n+1} = \frac{(n+1)!}{(n+1)^{n+1}}$  and  $a_n = \frac{n!}{n^n}$ , the absolute value of their ratio is

$$\begin{aligned} \left| \frac{a_{n+1}}{a_n} \right| &= \frac{\frac{(n+1)!}{(n+1)^{n+1}}}{\frac{n!}{n^n}} = \frac{(n+1)!}{(n+1)^{n+1}} \cdot \frac{n^n}{n!} = \frac{n^n}{(n+1)^n} \\ &= \left( \frac{n}{n+1} \right)^n = \left( \frac{1}{1+\frac{1}{n}} \right)^n = \frac{1}{\left( 1+\frac{1}{n} \right)^n} \end{aligned}$$

So,

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{1}{\left( 1+\frac{1}{n} \right)^n} = \frac{\lim_{n \rightarrow \infty} 1}{\lim_{n \rightarrow \infty} \left( 1+\frac{1}{n} \right)^n} = \frac{1}{e}$$

Since  $\frac{1}{e} < 1$ , the series converges. ■

**NEED TO REVIEW?** The number  $e$  expressed as a limit is discussed in Section 3.3, pp. 227–228.

### NOW WORK Problem 15.

**CAUTION** In Example 2, the ratio

$\left| \frac{a_{n+1}}{a_n} \right|$  converges to  $\frac{1}{e}$ . This does not

mean that  $\sum_{k=1}^{\infty} \frac{k!}{k^k}$  converges to  $\frac{1}{e}$ . In

fact, the sum of the series  $\sum_{k=1}^{\infty} \frac{k!}{k^k}$  is not

known; all that is known is that the series converges.

We conclude the discussion of the Ratio Test with these observations:

- To test  $\sum_{k=1}^{\infty} a_k$  for convergence, it is important to check whether the *limit of the ratio*  $\left| \frac{a_{n+1}}{a_n} \right|$ , not the ratio itself, is less than 1.

For example, for the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$ , which diverges,

the ratio  $\left| \frac{a_{n+1}}{a_n} \right| = \left| \frac{n}{n+1} \right| < 1$ , but  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{n}{n+1} = 1$ .

- For divergence, it is sufficient to show that the ratio  $\left| \frac{a_{n+1}}{a_n} \right| > 1$  for all  $n$ .
- The Ratio Test is not conclusive when  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$ . It is also not conclusive when  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \neq \infty$  does not exist.
- If the general term  $a_n$  of an infinite series involves  $n$ , either exponentially or factorially, the Ratio Test often answers the question of convergence or divergence.

The *Root Test* works well for series of nonzero terms whose  $n$ th term involves an  $n$ th power.

### THEOREM Root Test

Let  $\sum_{k=1}^{\infty} a_k$  be a series of nonzero terms. Suppose  $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = L$ , a number.

- If  $L < 1$ , then  $\sum_{k=1}^{\infty} a_k$  is absolutely convergent, so the series  $\sum_{k=1}^{\infty} a_k$  converges.
- If  $L > 1$ , then  $\sum_{k=1}^{\infty} a_k$  diverges.
- If  $L = 1$ , the test is inconclusive.

The proof of the Root Test is similar to the proof of the Ratio Test. It is left as an exercise (Problem 55).

## 2 Use the Root Test

### EXAMPLE 3 Using the Root Test

Use the Root Test to determine whether the series  $\sum_{k=1}^{\infty} \frac{e^k}{k^k}$  converges or diverges.

**Solution**  $\sum_{k=1}^{\infty} \frac{e^k}{k^k}$  is a series of nonzero terms. The  $n$ th term is  $a_n = \frac{e^n}{n^n} = \left(\frac{e}{n}\right)^n$ . Since  $a_n$  involves an  $n$ th power, we use the Root Test.

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left(\frac{e}{n}\right)^n} = \lim_{n \rightarrow \infty} \frac{e}{n} = 0 < 1$$

The series  $\sum_{k=1}^{\infty} \frac{e^k}{k^k}$  converges. ■

### NOW WORK Problem 27.

**EXAMPLE 4** Using the Root Test

Use the Root Test to determine whether the series  $\sum_{k=1}^{\infty} \left( \frac{8k+3}{5k-2} \right)^k$  converges or diverges.

**Solution**  $\sum_{k=1}^{\infty} \left( \frac{8k+3}{5k-2} \right)^k$  is a series of nonzero terms. The  $n$ th term is  $a_n = \left( \frac{8n+3}{5n-2} \right)^n$ .

Since  $a_n$  involves an  $n$ th power, we use the Root Test.

$$\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = \lim_{n \rightarrow \infty} \sqrt[n]{\left( \frac{8n+3}{5n-2} \right)^n} = \lim_{n \rightarrow \infty} \frac{8n+3}{5n-2} = \frac{8}{5} > 1$$

The series diverges. ■

**NOW WORK** Problem 23.

**Proof of the Ratio Test** Let  $\sum_{k=1}^{\infty} a_k$  be a series of nonzero terms.

*Case 1:*  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L$ , a number.

- $0 \leq L < 1$  Let  $r$  be any number for which  $L < r < 1$ . Since  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L$  and  $L < r$ , then by the definition of the limit of a sequence, we can find a number  $N$  so that for any number  $n > N$ , the ratio  $\left| \frac{a_{n+1}}{a_n} \right|$  can be made as close as we please to  $L$  and be less than  $r$ . Then

$$\left| \frac{a_{N+1}}{a_N} \right| < r \quad \text{or} \quad |a_{N+1}| < r \cdot |a_N|$$

$$\left| \frac{a_{N+2}}{a_{N+1}} \right| < r \quad \text{or} \quad |a_{N+2}| < r \cdot |a_{N+1}| < r^2 \cdot |a_N|$$

$$\left| \frac{a_{N+3}}{a_{N+2}} \right| < r \quad \text{or} \quad |a_{N+3}| < r \cdot |a_{N+2}| < r^3 \cdot |a_N|$$

Each term of the series  $|a_{N+1}| + |a_{N+2}| + \cdots$  is less than the corresponding term of the geometric series  $|a_N|r + |a_N|r^2 + |a_N|r^3 + \cdots$ . Since  $|r| < 1$ , the geometric series converges. By the Comparison Test for Convergence, the series  $|a_{N+1}| + |a_{N+2}| + \cdots$  also converges. So, the series  $\sum_{k=1}^{\infty} |a_k|$  converges. By the

Absolute Convergence Test, the series  $\sum_{k=1}^{\infty} a_k$  converges.

- $L = 1$  To show that the test fails for  $L = 1$ , we exhibit two series, one that diverges and another that converges, to show that no conclusion can be drawn. Consider  $\sum_{k=1}^{\infty} \frac{1}{k}$  and  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ . The first is the harmonic series, which diverges. The second is a  $p$ -series with  $p > 1$ , which converges. It is left to you to show that

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1 \text{ in each case. (See Problems 45 and 46.)}$$

- $L > 1$  Let  $r$  be any number for which  $1 < r < L$ . Since  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L$ , there is a number  $N$  so that for any number  $n > N$ , the ratio  $\left| \frac{a_{n+1}}{a_n} \right|$  can be made

as close as we please to  $L$  and will be greater than  $r$ . That is, for all numbers  $n > N$ , the ratio  $\left| \frac{a_{n+1}}{a_n} \right| > r > 1$  so that  $|a_{n+1}| > |a_n|$ . After the  $N$ th term, the absolute value of the terms are positive and increasing. So,  $\lim_{n \rightarrow \infty} |a_n| \neq 0$  and, therefore,  $\lim_{n \rightarrow \infty} a_n \neq 0$ . By the Test for Divergence, the series diverges.

Case 2:  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \infty$  The proof that this series diverges is left as an exercise (Problem 54). ■

## 8.6 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The Ratio Test can be used to show that the series  $\sum_{k=1}^{\infty} \cos(k\pi)$  diverges.
- True or False** In using the Ratio Test, if  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = L$ , then the sum of the series  $\sum_{k=1}^{\infty} a_k$  equals  $L$ .
- True or False** In using the Ratio Test, if  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$ , then the Ratio Test indicates that the series  $\sum_{k=1}^{\infty} a_k$  converges.
- True or False** The Root Test works well if the  $n$ th term of a series of nonzero terms involves an  $n$ th root.

In Problems 23–34, use the Root Test to determine whether each series converges or diverges.

- $\sum_{k=1}^{\infty} \left( \frac{2k+1}{5k+1} \right)^k$
- $\sum_{k=1}^{\infty} \left( \frac{3k-1}{2k+1} \right)^k$
- $\sum_{k=1}^{\infty} \left( \frac{k}{5} \right)^k$
- $\sum_{k=1}^{\infty} \frac{\pi^{2k}}{k^k}$
- $\sum_{k=2}^{\infty} \left( \frac{\ln k}{k} \right)^k$
- $\sum_{k=2}^{\infty} \left( \frac{1}{\ln k} \right)^k$
- $\sum_{k=1}^{\infty} \left( \frac{\sqrt{k^2+1}}{3k} \right)^k$
- $\sum_{k=1}^{\infty} \left( \frac{\sqrt{4k^2+1}}{k} \right)^k$
- $\sum_{k=1}^{\infty} \frac{k^2}{2^k}$
- $\sum_{k=1}^{\infty} \frac{k^3}{3^k}$
- $\sum_{k=1}^{\infty} \frac{k^4}{5^k}$
- $\sum_{k=1}^{\infty} \frac{k}{3^k}$

In Problems 35–44, determine whether each series converges or diverges.

- $\sum_{k=1}^{\infty} \frac{10}{(3k+1)^k}$
- $\sum_{k=1}^{\infty} \left( 1 + \frac{1}{k} \right)^{k^2}$
- $\sum_{k=1}^{\infty} \frac{(k+1)(k+2)}{k!}$
- $\sum_{k=1}^{\infty} \frac{k!}{(3k+1)!}$
- $\sum_{k=1}^{\infty} \frac{k \ln k}{2^k}$
- $\sum_{k=1}^{\infty} \left[ \ln \left( e^3 + \frac{1}{k} \right) \right]^k$
- $\sum_{k=1}^{\infty} \sin^k \left( \frac{1}{k} \right)$
- $\sum_{k=1}^{\infty} \frac{k^k}{2^{k^2}}$
- $\sum_{k=1}^{\infty} \frac{\left( 1 + \frac{1}{k} \right)^{2k}}{e^k}$
- $\sum_{k=2}^{\infty} \frac{2^k(k+1)}{k^2(k+2)}$

### Skill Building

In Problems 5–22, use the Ratio Test to determine whether each series converges or diverges.

- $\sum_{k=1}^{\infty} \frac{4k^2-1}{2^k}$
- $\sum_{k=1}^{\infty} \frac{1}{(2k+1)2^k}$
- $\sum_{k=1}^{\infty} k \left( \frac{2}{3} \right)^k$
- $\sum_{k=1}^{\infty} \frac{5^k}{k^2}$
- $\sum_{k=1}^{\infty} \frac{10^k}{(2k)!}$
- $\sum_{k=1}^{\infty} \frac{(2k)!}{5^k 3^{k-1}}$
- $\sum_{k=1}^{\infty} \frac{k}{(2k-2)!}$
- $\sum_{k=1}^{\infty} \frac{(k+1)!}{3^k}$
- $\sum_{k=1}^{\infty} \frac{2^k}{k(k+1)}$
- $\sum_{k=1}^{\infty} \frac{k!}{k^{k+1}}$
- $\sum_{k=1}^{\infty} \frac{k^3}{k!}$
- $\sum_{k=1}^{\infty} \frac{k!}{k^{k+1}}$
- $\sum_{k=1}^{\infty} \frac{k}{k^2(k+1)^2}$
- $\sum_{k=1}^{\infty} \frac{k^3}{k!}$
- $\sum_{k=1}^{\infty} \frac{k!}{k^{k+1}}$
- $\sum_{k=1}^{\infty} \frac{3^{k-1}}{k \cdot 2^k}$
- $\sum_{k=1}^{\infty} \frac{k(k+2)}{3^k}$
- $\sum_{k=1}^{\infty} \frac{k}{e^k}$
- $\sum_{k=1}^{\infty} \frac{e^k}{k^3}$
- $\sum_{k=1}^{\infty} k \cdot 2^k$
- $\sum_{k=1}^{\infty} \frac{4^k}{k}$

### Applications and Extensions

- For the divergent series  $\sum_{k=1}^{\infty} \frac{1}{k}$ , show that  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$ .

46. For the convergent series  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ , show that  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = 1$ .

47. Give an example of a convergent series  $\sum_{k=1}^{\infty} a_k$  for which  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \neq \infty$  does not exist.

48. Give an example of a divergent series  $\sum_{k=1}^{\infty} a_k$  for which  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| \neq \infty$  does not exist.

49. (a) Show that the series  $\sum_{k=1}^{\infty} \frac{(-1)^k 3^k}{k!}$  converges.

**CAS** (b) Use technology to find the sum of the series.

50. Determine whether the following series is convergent or divergent:

$$\frac{1}{3} - \frac{2^3}{3^2} + \frac{3^3}{3^3} - \frac{4^3}{3^4} + \cdots + \frac{(-1)^{n-1} n^3}{3^n} + \cdots$$

51. Show that  $\lim_{n \rightarrow \infty} \frac{n!}{n^n} = 0$ , where  $n$  denotes a positive integer.

52. Show that the Root Test is inconclusive for  $\sum_{k=1}^{\infty} \frac{1}{k}$  and  $\sum_{k=1}^{\infty} \frac{1}{k^2}$ .

53. Use the Ratio Test to find the real numbers  $x$  for which the series  $\sum_{k=1}^{\infty} \frac{x^k}{k^2}$  converges or diverges.

54. Prove that  $\sum_{k=1}^{\infty} a_k$  diverges if  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \infty$ .

55. Prove the Root Test.

56. The terms of the series

$$\frac{1}{4} + \frac{1}{2} + \frac{1}{8} + \frac{1}{4} + \frac{1}{16} + \frac{1}{8} + \frac{1}{32} + \cdots$$

$$\text{are } a_{2k} = \frac{1}{2^k} \text{ and } a_{2k-1} = \frac{1}{2^{k+1}}.$$

(a) Show that using the Ratio Test to determine whether the series converges is inconclusive.

(b) Show that using the Root Test to determine whether the series converges is conclusive.

(c) Does the series converge?

### Challenge Problems

57. Show that the following series converges:

$$1 + \frac{2}{2^2} + \frac{3}{3^3} + \frac{1}{4^4} + \frac{2}{5^5} + \frac{3}{6^6} + \cdots$$

58. Show that  $\sum_{k=1}^{\infty} \frac{(k+1)^2}{(k+2)!}$  converges. (Hint: Use the Limit Comparison Test and the convergent series  $\sum_{k=1}^{\infty} \frac{1}{k!}$ .)

59. Suppose  $0 < a < b < 1$ . Use the Root Test to show that the series

$$a + b + a^2 + b^2 + a^3 + b^3 + \cdots$$

converges.

60. Show that if the Ratio Test indicates a series converges, then so will the Root Test. The converse is not true. Refer to Problem 56.

## 8.7 Summary of Tests

**OBJECTIVES** When you finish this section, you should be able to:

**1** Choose an appropriate test to determine whether a series converges (p. 596)

In the previous sections, we have discussed a variety of tests that can be used to determine if a series converges or diverges. In the exercises following each section, the instructions indicate which test to use. Unfortunately, in practice, series do not come with instructions. This section summarizes the tests that we have discussed and gives some clues as to what test has the best chance of answering the fundamental question, ‘Does the series converge or diverge?’

### 1 Choose an Appropriate Test to Determine Whether a Series Converges

The following outline is a guide to help you choose a test to use when determining the convergence or divergence of a series. Table 5 lists the tests we have discussed. Table 6 describes important series we have analyzed.

## Guide to Choosing a Test to Determine Whether a Series Is Convergent

1. Check to see if the series is a geometric series or a  $p$ -series. If yes, then use the conclusion given for these series in Table 6.
2. Find  $\lim_{n \rightarrow \infty} a_n$  of the series  $\sum_{k=1}^{\infty} a_k$ . If  $\lim_{n \rightarrow \infty} a_n \neq 0$ , then by the Test for Divergence, the series diverges.
3. If the series  $\sum_{k=1}^{\infty} a_k$  has only positive terms and meets the conditions of the Integral Test, find the related function  $f$ . Use the integral test if  $\int_1^{\infty} f(x) dx$  is easy to find.
4. If the series  $\sum_{k=1}^{\infty} a_k$  has only positive terms and the  $n$ th term is a quotient of sums or differences of powers of  $n$ , the Limit Comparison Test with an appropriate  $p$ -series will usually work.
5. If the series  $\sum_{k=1}^{\infty} a_k$  has only positive terms and the preceding attempts fail, then try the Comparison Test for Convergence or the Comparison Test for Divergence.
6. *Series with some negative terms.*
  - For an alternating series, use the Alternating Series Test. It is sometimes better to use the Absolute Convergence Test first.
  - For other series containing negative terms, always use the Absolute Convergence Test first.
7. If the series  $\sum_{k=1}^{\infty} a_k$  has nonzero terms that involve products, factorials, or powers, the Ratio Test is a good choice.
8. If the series  $\sum_{k=1}^{\infty} a_k$  has nonzero terms and the  $n$ th term involves an  $n$ th power, try the Root Test.

TABLE 5 Tests for Convergence and Divergence of Series

| Test Name                                                                    | Description                                                                                                                                                                                         | Comment                                                                                 |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <i>Test for Divergence</i> for all series (p. 566)                           | $\sum_{k=1}^{\infty} a_k$ diverges if $\lim_{n \rightarrow \infty} a_n \neq 0$ .                                                                                                                    | No information is obtained about convergence if $\lim_{n \rightarrow \infty} a_n = 0$ . |
| <i>Integral Test</i> (p. 569) for series of positive terms                   | $\sum_{k=1}^{\infty} a_k$ converges (diverges) if $\int_1^{\infty} f(x) dx$ converges (diverges), where $f$ is continuous, positive, and decreasing for $x \geq 1$ ; and $f(k) = a_k$ for all $k$ . | Good to use if $f$ is easy to integrate.                                                |
| <i>Comparison Test for Convergence</i> for series of positive terms (p. 576) | $\sum_{k=1}^{\infty} a_k$ converges if $0 < a_k \leq b_k$ and the series $\sum_{k=1}^{\infty} b_k$ converges.                                                                                       | $\sum_{k=1}^{\infty} b_k$ must have positive terms and be convergent.                   |
| <i>Comparison Test for Divergence</i> for series of positive terms (p. 576)  | $\sum_{k=1}^{\infty} a_k$ diverges if $a_k \geq c_k > 0$ and the series $\sum_{k=1}^{\infty} c_k$ diverges.                                                                                         | $\sum_{k=1}^{\infty} c_k$ must have positive terms and be divergent.                    |

Continued

TABLE 5 (Continued)

| Test Name                                                          | Description                                                                                                                                                                                                                                                                                                      | Comment                                                                                                                                                     |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Limit Comparison Test</i> (p. 577) for series of positive terms | $\sum_{k=1}^{\infty} a_k$ converges (diverges) if $\sum_{k=1}^{\infty} b_k$ converges (diverges), and $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L$ , a positive real number.                                                                                                                                | $\sum_{k=1}^{\infty} b_k$ must have positive terms, whose convergence (divergence) can be determined.                                                       |
| <i>Alternating Series Test</i> (p. 582)                            | $\sum_{k=1}^{\infty} (-1)^{k+1} a_k$ , $a_k > 0$ , converges if <ul style="list-style-type: none"> <li><math>\lim_{n \rightarrow \infty} a_n = 0</math> and</li> <li>the <math>a_k</math> are nonincreasing.</li> </ul>                                                                                          | The error made by using the $n$ th partial sum as an approximation to the sum $S$ of the series is less than the $(n + 1)$ st term of the series.           |
| <i>Absolute Convergence Test</i> (p. 586)                          | If $\sum_{k=1}^{\infty}  a_k $ converges, then $\sum_{k=1}^{\infty} a_k$ converges.                                                                                                                                                                                                                              | The converse is not true. That is, if $\sum_{k=1}^{\infty}  a_k $ diverges, $\sum_{k=1}^{\infty} a_k$ may converge.                                         |
| <i>Ratio Test</i> (p. 591) for series with nonzero terms           | $\sum_{k=1}^{\infty} a_k$ converges if $\lim_{n \rightarrow \infty} \left  \frac{a_{n+1}}{a_n} \right  < 1$ .<br>$\sum_{k=1}^{\infty} a_k$ diverges if $\lim_{n \rightarrow \infty} \left  \frac{a_{n+1}}{a_n} \right  > 1$ or<br>if $\lim_{n \rightarrow \infty} \left  \frac{a_{n+1}}{a_n} \right  = \infty$ . | Good to use if $a_n$ includes factorials or powers.<br>It provides no information if $\lim_{n \rightarrow \infty} \left  \frac{a_{n+1}}{a_n} \right  = 1$ . |
| <i>Root Test</i> (p. 593) for series with nonzero terms            | $\sum_{k=1}^{\infty} a_k$ converges if $\lim_{n \rightarrow \infty} \sqrt[n]{ a_n } < 1$ .<br>$\sum_{k=1}^{\infty} a_k$ diverges if $\lim_{n \rightarrow \infty} \sqrt[n]{ a_n } > 1$ or<br>if $\lim_{n \rightarrow \infty} \sqrt[n]{ a_n } = \infty$ .                                                          | Good to use if $a_n$ involves $n$ th powers.<br>It provides no information if $\lim_{n \rightarrow \infty} \sqrt[n]{ a_n } = 1$ .                           |

## 8.7 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The series  $\sum_{k=1}^{\infty} \frac{1}{k^p}$  converges if  $p \geq 1$ .
- True or False** According to the Test for Divergence, an infinite series  $\sum_{k=1}^{\infty} a_k$  converges if  $\lim_{n \rightarrow \infty} a_n = 0$ .
- True or False** If a series is absolutely convergent, then it is convergent.
- True or False** If a series is not absolutely convergent, then it is divergent.
- True or False** According to the Ratio Test, a series  $\sum_{k=1}^{\infty} a_k$  of nonzero terms converges if  $\left| \frac{a_{n+1}}{a_n} \right| < 1$ .
- To use the Comparison Test for Convergence to show that a series  $\sum_{k=1}^{\infty} a_k$  of positive terms converges, find a series  $\sum_{k=1}^{\infty} b_k$  that is known to converge and show that  $0 < \text{---} \leq \text{---}$ .

### Skill Building

In Problems 7–39, determine whether each series converges (absolutely or conditionally) or diverges. Use any applicable test.

- $\sum_{k=1}^{\infty} \frac{9k^3 + 5k^2}{k^{5/2} + 4}$
- $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{\sqrt{2k+1}}$
- $6 + 2 + \frac{2}{3} + \frac{2}{9} + \frac{2}{27} + \cdots$
- $\sum_{k=1}^{\infty} \frac{1}{k^2} \sin \frac{\pi}{k}$
- $\sum_{k=1}^{\infty} \frac{3k+2}{k^3+1}$
- $1 + \frac{2^2+1}{2^3+1} + \frac{3^2+1}{3^3+1} + \frac{4^2+1}{4^3+1} + \cdots$
- $\sum_{k=1}^{\infty} \frac{k+4}{k\sqrt{3k-2}}$
- $\sum_{k=1}^{\infty} \frac{\sin k}{k^3}$
- $\sum_{k=1}^{\infty} \frac{3^{2k-1}}{k^2+2k}$
- $\sum_{k=1}^{\infty} \frac{5^k}{k!}$
- $\sum_{k=1}^{\infty} \left(1 + \frac{2}{k}\right)^k$
- $\sum_{k=1}^{\infty} \frac{k^2+4}{e^k}$
- $\frac{2}{3} - \frac{3}{4} \cdot \frac{1}{2} + \frac{4}{5} \cdot \frac{1}{3} - \frac{5}{6} \cdot \frac{1}{4} + \cdots$
- $2 + \frac{3}{2} \cdot \frac{1}{4} + \frac{4}{3} \cdot \frac{1}{4^2} + \frac{5}{4} \cdot \frac{1}{4^3} + \cdots$
- $1 + \frac{1 \cdot 3}{2!} + \frac{1 \cdot 3 \cdot 5}{3!} + \frac{1 \cdot 3 \cdot 5 \cdot 7}{4!} + \cdots$
- $\frac{1}{\sqrt{1 \cdot 2 \cdot 3}} + \frac{1}{\sqrt{2 \cdot 3 \cdot 4}} + \frac{1}{\sqrt{3 \cdot 4 \cdot 5}} + \cdots$
- $\sum_{k=1}^{\infty} \frac{k!}{(2k)!}$
- $\sum_{k=1}^{\infty} k^3 e^{-k^4}$
- $\sum_{k=1}^{\infty} \frac{1}{\sqrt{k} + 100}$

- $\sum_{k=1}^{\infty} \frac{k^2+5k}{3+5k^2}$
- $\sum_{k=1}^{\infty} \frac{1}{\sqrt[3]{k^4+4}}$
- $\sum_{k=1}^{\infty} \frac{1}{11} \left(\frac{-3}{2}\right)^k$
- $\frac{1}{3} - \frac{2}{4} + \frac{3}{5} - \frac{4}{6} + \cdots$
- $\sum_{k=1}^{\infty} \left(-\frac{1}{k}\right)^k$
- $\sum_{k=1}^{\infty} \frac{5}{2^k+1}$
- $\sum_{k=1}^{\infty} e^{-k^2}$
- $\sum_{k=2}^{\infty} \frac{(-1)^{k-1}}{k(\ln k)^3}$
- $\sum_{k=1}^{\infty} \frac{1}{(2k)^k}$
- $\sum_{k=2}^{\infty} \left(\frac{\ln k}{1000}\right)^k$
- $\sum_{k=1}^{\infty} \frac{1}{\cosh^2 k}$
- $\sum_{k=1}^{\infty} \frac{\tan^{-1} k}{k^2}$

In Problems 40–42, determine whether each series converges or diverges. If it converges, find its sum.

- $\sum_{k=1}^{\infty} (\sqrt{k+1} - \sqrt{k})$
- $\sum_{k=2}^{\infty} \ln \frac{k}{k+1}$
- Determine whether  $1 + \frac{1 \cdot 2}{1 \cdot 3} + \frac{1 \cdot 2 \cdot 3}{1 \cdot 3 \cdot 5} + \frac{1 \cdot 2 \cdot 3 \cdot 4}{1 \cdot 3 \cdot 5 \cdot 7} + \cdots$  converges or diverges.
- (a) Show that the series  $\sum_{k=1}^{\infty} \left[ \left(\frac{2}{3}\right)^k - \frac{2}{k^2+2k} \right]$  converges.  
(b) Find the sum of the series.
- (a) Show that the series  $\sum_{k=1}^{\infty} \left[ \left(-\frac{1}{4}\right)^k + \frac{3}{k(k+1)} \right]$  converges.  
(b) Find the sum of the series.

### Challenge Problems

- (a) Determine whether the series  $1 - 1 - \frac{1}{2} + \frac{1}{3} + \frac{1}{3} - \frac{1}{9} - \frac{1}{4} + \frac{1}{27} + \frac{1}{5} - \frac{1}{81} - \cdots$  converges or diverges.  
(b) Find the sum of the series if it converges.

In Problems 47 and 48, determine whether each series converges or diverges.

- $\sum_{k=1}^{\infty} \frac{\ln k}{2k^3-1}$
- $\sum_{k=1}^{\infty} \sin^3\left(\frac{1}{k}\right)$

## 8.8 Power Series

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Determine whether a power series converges (p. 600)
- 2 Find the interval of convergence of a power series (p. 603)
- 3 Define a function using a power series (p. 604)
- 4 Use properties of power series (p. 606)

In this section, we study series with variable terms, called *power series*. Just as a polynomial is the sum of a **finite** number of monomials, a power series is the sum of an **infinite** number of monomials.

### DEFINITION Power Series

If  $x$  is a variable, then a series of the form

$$\sum_{k=0}^{\infty} a_k x^k = a_0 + \sum_{k=1}^{\infty} a_k x^k = a_0 + a_1 x + a_2 x^2 + \cdots$$

where the coefficients  $a_0, a_1, a_2, \dots$  are constants, is called a **power series in  $x$**  or a **power series centered at 0**.

A series of the form

$$\sum_{k=0}^{\infty} a_k (x - c)^k = a_0 + \sum_{k=1}^{\infty} a_k (x - c)^k = a_0 + a_1 (x - c) + a_2 (x - c)^2 + \cdots$$

where  $c$  is a constant, is called a **power series in  $(x - c)$**  or a **power series centered at  $c$** .

**IN WORDS** A power series  $\sum_{k=0}^{\infty} a_k x^k$  is a sum of an infinite number of monomials.

If  $x = 0$  in a power series  $\sum_{k=0}^{\infty} a_k x^k$ , then the power series equals  $a_0$ . Also notice that the index  $k$  of a power series starts at 0.

### 1 Determine Whether a Power Series Converges

For a particular value of  $x$ , a power series in  $x$  reduces to a series of real numbers like the series studied so far. For example,  $\sum_{k=1}^{\infty} \frac{x^k}{k}$  is a power series in  $x$ . The series converges (to 0) if  $x = 0$ . If  $x = 1$ , it becomes the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$ , which is divergent. If  $x = -1$ , it becomes the alternating harmonic series  $\sum_{k=1}^{\infty} (-1)^k \frac{1}{k}$ , which is convergent. To find all numbers  $x$  for which a power series in  $x$  is convergent, the Ratio Test (p. 591) or the Root Test (p. 593) are usually used since, in a power series,  $x$  is raised to a power.

### EXAMPLE 1 Determining Whether a Power Series Converges

Find all numbers  $x$  for which each power series in  $x$  converges.

- (a)  $\sum_{k=0}^{\infty} \frac{x^k}{k!} = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots$
- (b)  $\sum_{k=0}^{\infty} \frac{kx^k}{4^k} = \frac{x}{4} + \frac{2x^2}{4^2} + \frac{3x^3}{4^3} + \cdots$
- (c)  $\sum_{k=0}^{\infty} k!x^k = 1 + x + 2!x^2 + 3!x^3 + \cdots$

**Solution (a)** For the series  $\sum_{k=0}^{\infty} \frac{x^k}{k!}$ , we use the Ratio Test with

$$a_n = \frac{x^n}{n!} \quad \text{and} \quad a_{n+1} = \frac{x^{n+1}}{(n+1)!}$$

Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{n+1}}{(n+1)!}}{\frac{x^n}{n!}} \right| = \lim_{n \rightarrow \infty} \frac{|x|^{n+1} n!}{(n+1)! |x|^n} = |x| \lim_{n \rightarrow \infty} \frac{1}{n+1} = 0$$

Since the limit is less than 1 for every number  $x$ , it follows from the Ratio Test that the power series  $\sum_{k=0}^{\infty} \frac{x^k}{k!}$  is absolutely convergent for all real numbers.

**NOTE** Since  $\sum_{k=0}^{\infty} \frac{x^k}{k!}$  converges

absolutely for every number  $x$ , the limit of the  $n$ th term equals 0. That is,

$$\lim_{n \rightarrow \infty} \frac{x^n}{n!} = 0 \text{ for every number } x.$$

**(b)** For  $\sum_{k=0}^{\infty} \frac{kx^k}{4^k}$ , we use the Ratio Test with  $a_n = \frac{nx^n}{4^n}$  and  $a_{n+1} = \frac{(n+1)x^{n+1}}{4^{n+1}}$ . Then

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \frac{\frac{(n+1)|x|^{n+1}}{4^{n+1}}}{\frac{n|x|^n}{4^n}} = \lim_{n \rightarrow \infty} \frac{(n+1)|x|^{n+1}(4^n)}{4^{n+1} \cdot n|x|^n} \\ &= |x| \lim_{n \rightarrow \infty} \frac{n+1}{4n} = \frac{|x|}{4} \end{aligned}$$

By the Ratio Test, the series converges absolutely if  $\frac{|x|}{4} < 1$ , or equivalently if  $|x| < 4$ .

It diverges if  $\frac{|x|}{4} > 1$  or equivalently if  $|x| > 4$ . The Ratio Test gives no information when  $\frac{|x|}{4} = 1$ , that is, when  $x = -4$  or  $x = 4$ . However, we can check these values directly by replacing  $x$  by 4 and  $-4$ .

For  $x = 4$ , the series becomes

$$\sum_{k=0}^{\infty} \frac{k4^k}{4^k} = \sum_{k=1}^{\infty} k = 1 + 2 + \cdots$$

which diverges. For  $x = -4$ , the series becomes

$$\sum_{k=0}^{\infty} \frac{k(-4)^k}{4^k} = \sum_{k=0}^{\infty} \frac{(-1)^k k (4^k)}{4^k} = \sum_{k=0}^{\infty} (-1)^k k = -1 + 2 - 3 + \cdots$$

which also diverges. (Look at the sequence of partial sums.)

The series  $\sum_{k=0}^{\infty} \frac{kx^k}{4^k}$  converges absolutely for  $-4 < x < 4$  and diverges for  $|x| \geq 4$ .

**(c)** For  $\sum_{k=0}^{\infty} k!x^k$ , we use the Ratio Test with  $a_n = n!x^n$  and  $a_{n+1} = (n+1)!x^{n+1}$ . Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \frac{(n+1)! |x|^{n+1}}{n! |x|^n} = |x| \lim_{n \rightarrow \infty} (n+1) = \begin{cases} 0 & \text{if } x = 0 \\ \infty & \text{if } x \neq 0 \end{cases}$$

We conclude that the power series  $\sum_{k=0}^{\infty} k!x^k$  converges only when  $x = 0$ . For any other number  $x$ , the power series diverges. ■

### NOW WORK Problem 15.

The next theorem gives more information about the numbers for which a power series converges or diverges.

**THEOREM** Convergence/Divergence of a Power Series

- (a) If the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges for a number  $x_0 \neq 0$ , then it converges absolutely for all numbers  $x$  for which  $|x| < |x_0|$ .
- (b) If the power series  $\sum_{k=0}^{\infty} a_k x^k$  diverges for a number  $x_1$ , then it diverges for all numbers  $x$  for which  $|x| > |x_1|$ .

**RECALL** If a series  $\sum_{k=0}^{\infty} a_k$  converges, then  $\lim_{n \rightarrow \infty} a_n = 0$ .

**Proof** **Part (a)** Assume that  $\sum_{k=0}^{\infty} a_k x_0^k$  converges. Then

$$\lim_{n \rightarrow \infty} (a_n x_0^n) = 0$$

Using the definition of the limit of a sequence and choosing  $\varepsilon = 1$ , there is a positive integer  $N$  for which  $|a_n x_0^n| < 1$  for all  $n > N$ . Now for any number  $x$  for which  $|x| < |x_0|$ , we have

$$|a_n x^n| = \left| \frac{a_n x^n x_0^n}{x_0^n} \right| = |a_n x_0^n| \left| \frac{x}{x_0} \right|^n < \left| \frac{x}{x_0} \right|^n \quad \text{for } n > N$$

$\uparrow$   
 $|a_n x_0^n| < 1$

The series  $\sum_{k=0}^{\infty} \left| \frac{x}{x_0} \right|^k$  is a convergent geometric series since  $r = \left| \frac{x}{x_0} \right| < 1$  ( $|x| < |x_0|$ ).

Therefore, by the Comparison Test for Convergence, the series  $\sum_{k=0}^{\infty} |a_k x^k|$  converges, and so the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges absolutely for all numbers  $x$  such that  $|x| < |x_0|$ .

**Part (b)** Suppose the series converges for some number  $x$ ,  $|x| > |x_1|$ . Then it must converge for  $x_1$  [by Part (a)], which contradicts the hypothesis of the theorem. Therefore, the series diverges for all  $x$  such that  $|x| > |x_1|$ . ■

The next result is a consequence of the previous theorem. It states that every power series belongs to one of three categories.

**THEOREM**

For a power series  $\sum_{k=0}^{\infty} a_k (x - c)^k$ , exactly one of the following is true:

- The series converges only if  $x = c$ .
- The series converges absolutely for all  $x$ .
- There is a positive number  $R$  for which the series converges absolutely for all  $x$ ,  $|x - c| < R$ , and diverges for all  $x$ ,  $|x - c| > R$ . The behavior of the series at  $|x - c| = R$  must be determined separately.

In the theorem, the number  $R$  is called the **radius of convergence**. If the series converges only for  $x = c$ , then  $R = 0$ ; if the series converges absolutely for all  $x$ , then  $R = \infty$ . If the series converges absolutely for  $|x - c| < R$ ,  $0 < R < \infty$ , we call the set of all numbers  $x$  for which the power series converges the **interval of convergence** of the power series. Once the radius  $R$  of convergence is determined, we test the endpoints  $x = c - R$  and  $x = c + R$  to find the interval of convergence.

As Example 1 illustrates, the Ratio Test is a useful method for determining the radius of convergence of a power series. However, the test gives no information about convergence or divergence at the endpoints of the interval of convergence. At an endpoint, a power series may be absolutely convergent, conditionally convergent, or divergent.

For example, the series  $\sum_{k=0}^{\infty} \frac{kx^k}{4^k}$  in Example 1(b) converges absolutely for  $|x| < 4$  and diverges for  $|x| \geq 4$ . So, the radius of convergence is  $R = 4$ , and the interval of convergence is the open interval  $(-4, 4)$ , as shown in Figure 26.

Figure 26

## 2 Find the Interval of Convergence of a Power Series

### EXAMPLE 2 Finding the Interval of Convergence of a Power Series

Find the radius of convergence and the interval of convergence of the power series

$$\sum_{k=1}^{\infty} \frac{x^{2k}}{k}$$

**Solution** We use the Ratio Test with  $a_n = \frac{x^{2n}}{n}$  and  $a_{n+1} = \frac{x^{2(n+1)}}{n+1}$ . Then

$$\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \lim_{n \rightarrow \infty} \left| \frac{\frac{x^{2(n+1)}}{n+1}}{\frac{x^{2n}}{n}} \right| = \lim_{n \rightarrow \infty} \left| \frac{x^{2n+2}}{n+1} \cdot \frac{n}{x^{2n}} \right| = x^2 \lim_{n \rightarrow \infty} \frac{n}{n+1} = x^2$$

The series converges absolutely if  $x^2 < 1$ , or equivalently, if  $-1 < x < 1$ .

To determine the behavior at the endpoints, we investigate  $x = -1$  and  $x = 1$ .

When  $x = 1$  or  $x = -1$ ,  $\frac{x^{2k}}{k} = \frac{(x^2)^k}{k} = \frac{1^k}{k} = \frac{1}{k}$ , so the series reduces to the harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k}$ , which diverges. Consequently, the radius of convergence is  $R = 1$ , and the interval of convergence is  $-1 < x < 1$ , as shown in Figure 27. ■

Figure 27

**NOW WORK** Problem 19(a).

### EXAMPLE 3 Finding the Interval of Convergence of a Power Series

Find the radius of convergence  $R$  and the interval of convergence of the power series

$$\sum_{k=0}^{\infty} \frac{x^k}{(k+2)^{2k}}$$

**Solution** We use the Root Test. Then

$$\lim_{n \rightarrow \infty} \sqrt[n]{\left| \frac{x^n}{(n+2)^{2n}} \right|} = \lim_{n \rightarrow \infty} \frac{|x|}{(n+2)^2} = |x| \lim_{n \rightarrow \infty} \frac{1}{(n+2)^2} = 0$$

The series converges absolutely for all  $x$ . The radius of convergence is  $R = \infty$ , and the interval of convergence is  $(-\infty, \infty)$ . ■

**NOW WORK** Problems 19(b) and 21.

### EXAMPLE 4 Finding the Interval of Convergence of a Power Series

Find the radius of convergence  $R$  and the interval of convergence of the power series

$$\sum_{k=0}^{\infty} (-1)^k \frac{(x-2)^k}{k+1}$$

**Solution**  $\sum_{k=0}^{\infty} (-1)^k \frac{(x-2)^k}{k+1}$  is a power series centered at 2. We use the Ratio Test with

$$a_n = (-1)^n \frac{(x-2)^n}{n+1} \text{ and } a_{n+1} = (-1)^{n+1} \frac{(x-2)^{n+1}}{n+2}. \text{ Then}$$

$$\begin{aligned} \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| &= \lim_{n \rightarrow \infty} \left| \frac{\frac{(-1)^{n+1}(x-2)^{n+1}}{n+2}}{\frac{(-1)^n(x-2)^n}{n+1}} \right| = \lim_{n \rightarrow \infty} \left| \frac{(n+1)(x-2)}{n+2} \right| \\ &= |x-2| \lim_{n \rightarrow \infty} \frac{n+1}{n+2} = |x-2| \end{aligned}$$

The series converges absolutely if  $|x - 2| < 1$ , or equivalently if  $1 < x < 3$ . The radius of convergence is  $R = 1$ . We check the endpoints  $x = 1$  and  $x = 3$  separately.

If  $x = 1$ ,

$$\begin{aligned}\sum_{k=0}^{\infty} (-1)^k \frac{(x-2)^k}{k+1} &= \sum_{k=0}^{\infty} (-1)^k \frac{(-1)^k}{k+1} = \sum_{k=0}^{\infty} \frac{(-1)^{2k}}{k+1} = \sum_{k=0}^{\infty} \frac{1}{k+1} \\ &= 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n+1} + \cdots\end{aligned}$$

which is the divergent harmonic series.

If  $x = 3$ ,

$$\sum_{k=0}^{\infty} (-1)^k \frac{(x-2)^k}{k+1} = \sum_{k=0}^{\infty} (-1)^k \frac{1}{k+1} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots + \frac{(-1)^n}{n+1} + \cdots$$

which is the convergent alternating harmonic series.

The series  $\sum_{k=0}^{\infty} (-1)^k \frac{(x-2)^k}{k+1}$  converges for  $1 < x \leq 3$ , as shown in Figure 28. ■

Figure 28

### NOW WORK Problem 31.

## 3 Define a Function Using a Power Series

A power series  $\sum_{k=0}^{\infty} a_k x^k$  defines a function  $f$  whose domain is the interval of convergence of the power series. If  $I$  is the interval of convergence of  $\sum_{k=0}^{\infty} a_k x^k$ , the function  $f$  defined by the power series  $\sum_{k=0}^{\infty} a_k x^k$  is

$$f(x) = a_0 + a_1 x + a_2 x^2 + \cdots + a_n x^n + \cdots$$

The domain of  $f$  is the interval of convergence  $I$ .

If  $f$  is defined by the power series  $\sum_{k=0}^{\infty} a_k x^k$ , whose interval of convergence is  $I$ , and if  $x_0$  is a number in  $I$ , then  $f$  can be evaluated at  $x_0$  by finding the sum of the series

$$f(x_0) = \sum_{k=0}^{\infty} a_k x_0^k = a_0 + a_1 x_0 + a_2 x_0^2 + \cdots + a_n x_0^n + \cdots$$

### EXAMPLE 5 Analyzing a Function Defined by a Power Series

A function  $f$  is defined by the power series  $f(x) = \sum_{k=0}^{\infty} x^k$ .

- Find the domain of  $f$ .
- Evaluate  $f\left(\frac{1}{2}\right)$  and  $f\left(-\frac{1}{3}\right)$ .
- Find  $f$ .

**Solution** (a)  $\sum_{k=0}^{\infty} x^k$  is a power series centered at 0 with  $a_k = 1$ . Then

$$f(x) = 1 + x + x^2 + x^3 + x^4 + \cdots$$

The domain of  $f$  equals the interval of convergence of the power series. Since the series  $\sum_{k=0}^{\infty} x^k$  is a geometric series, it converges for  $|x| < 1$ . The radius of convergence is 1, and the interval of convergence is  $(-1, 1)$ . The domain of  $f$  is the open interval  $(-1, 1)$ .

(b) The numbers  $\frac{1}{2}$  and  $-\frac{1}{3}$  are in the interval  $(-1, 1)$ , so they are in the domain of  $f$ .

Then  $f\left(\frac{1}{2}\right)$  is a geometric series with  $r = \frac{1}{2}$ ,  $a = 1$ , and

$$f\left(\frac{1}{2}\right) = 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \left(\frac{1}{2}\right)^3 + \cdots = \frac{a}{1-r} = \frac{1}{1-\frac{1}{2}} = 2$$

Similarly,

$$f\left(-\frac{1}{3}\right) = 1 - \frac{1}{3} + \left(-\frac{1}{3}\right)^2 + \left(-\frac{1}{3}\right)^3 + \cdots = \frac{1}{1+\frac{1}{3}} = \frac{3}{4}$$

(c) Since  $f$  is defined by a geometric series, we can find  $f$  by summing the series.

$$f(x) = \sum_{k=0}^{\infty} x^k = 1 + x + x^2 + \cdots + x^n + \cdots = \frac{1}{1-x} \quad -1 < x < 1$$

$\uparrow$   
 $a = 1; r = x$

In Example 5, the function  $f$  defined by the power series  $\sum_{k=0}^{\infty} x^k$  was found to be  $f(x) = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k$ ,  $-1 < x < 1$ . In this case, we say that the function  $f$  is **represented** by the power series.

#### NOW WORK Problem 45.

#### EXAMPLE 6 Representing a Function by a Power Series Centered at 0

Represent each of the following functions by a power series centered at 0:

(a)  $h(x) = \frac{1}{1-2x^2}$       (b)  $g(x) = \frac{1}{3+x}$       (c)  $F(x) = \frac{x^2}{1-x}$

**Solution** We use the function  $f(x) = \frac{1}{1-x}$ ,  $-1 < x < 1$ , represented by the geometric series  $\sum_{k=0}^{\infty} x^k$ .

(a) In the geometric series for  $f(x) = \frac{1}{1-x}$ , we replace  $x$  by  $2x^2$ . This series converges if  $|2x^2| < 1$ , or equivalently if  $-\frac{\sqrt{2}}{2} < x < \frac{\sqrt{2}}{2}$ . Then on the open interval  $\left(-\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}\right)$ , the function  $h(x) = \frac{1}{1-2x^2}$  is represented by the power series

$$\begin{aligned} h(x) &= \frac{1}{1-2x^2} = 1 + (2x^2) + (2x^2)^2 + (2x^2)^3 + \cdots \\ &= 1 + 2x^2 + 4x^4 + 8x^6 + \cdots + 2^n x^{2n} + \cdots = \sum_{k=0}^{\infty} (2x^2)^k = \sum_{k=0}^{\infty} 2^k x^{2k} \end{aligned}$$

(b) We begin by writing

$$g(x) = \frac{1}{3+x} = \frac{1}{3} \left( \frac{1}{1+\frac{x}{3}} \right) = \frac{1}{3} \left[ \frac{1}{1-\left(-\frac{x}{3}\right)} \right]$$

Now in the geometric series for  $f(x) = \frac{1}{1-x}$ , replace  $x$  by  $-\frac{x}{3}$ . This series converges if  $\left|-\frac{x}{3}\right| < 1$ , or equivalently if  $-3 < x < 3$ . Then in the open interval  $(-3, 3)$ ,

$g(x) = \frac{1}{3+x}$  is represented by the power series

$$\begin{aligned} g(x) &= \frac{1}{3+x} = \frac{1}{3} \left[ 1 + \left(-\frac{x}{3}\right) + \left(-\frac{x}{3}\right)^2 + \left(-\frac{x}{3}\right)^3 + \cdots \right] = \frac{1}{3} \sum_{k=0}^{\infty} (-1)^k \left(\frac{x}{3}\right)^k \\ &= \sum_{k=0}^{\infty} \frac{(-1)^k x^k}{3^{k+1}} \end{aligned}$$

(c)  $F(x) = \frac{x^2}{1-x} = x^2 \left( \frac{1}{1-x} \right)$ . Now for all numbers in the interval  $(-1, 1)$ ,

$$\frac{1}{1-x} = 1 + x + x^2 + \cdots + x^n + \cdots$$

So for any number  $x$  in the interval of convergence,  $-1 < x < 1$ , we have

$$F(x) = x^2 (1 + x + x^2 + \cdots + x^n + \cdots) = x^2 + x^3 + x^4 + \cdots + x^{n+2} + \cdots = \sum_{k=2}^{\infty} x^k$$

**NOTE** Notice that the power series for  $F$  begins at  $k = 2$ .

#### **NOW WORK** Problem 55.

## 4 Use Properties of Power Series

The function  $f$  represented by a power series has properties similar to those of a polynomial. We state three of these properties without proof.

### **THEOREM** Properties of Power Series

Let  $\sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  having a nonzero radius of convergence  $R$ . Define the function  $f$  as

$$f(x) = \sum_{k=0}^{\infty} a_k x^k = a_0 + a_1 x + a_2 x^2 + \cdots + a_n x^n + \cdots \quad -R < x < R$$

- *Continuity property:*

$$\lim_{x \rightarrow x_0} \left( \sum_{k=0}^{\infty} a_k x^k \right) = \sum_{k=0}^{\infty} \left( \lim_{x \rightarrow x_0} a_k x^k \right) = \sum_{k=0}^{\infty} a_k x_0^k \quad -R < x_0 < R$$

- *Differentiation property:*

$$\frac{d}{dx} \left( \sum_{k=0}^{\infty} a_k x^k \right) = \sum_{k=0}^{\infty} \left( \frac{d}{dx} a_k x^k \right) = \sum_{k=1}^{\infty} k a_k x^{k-1}$$

- *Integration property:*

$$\int_0^x \left( \sum_{k=0}^{\infty} a_k t^k \right) dt = \sum_{k=0}^{\infty} \left( \int_0^x a_k t^k dt \right) = \sum_{k=0}^{\infty} \frac{a_k x^{k+1}}{k+1}$$

The differentiation and integration properties of power series state that a power series can be differentiated and integrated term-by-term and that the resulting series represent the derivative and integral, respectively, of the function represented by the original power series. Moreover, it can be shown that the power series obtained by differentiating (or

**CAUTION** The theorem states that the radii of convergence of the three

series  $\sum_{k=0}^{\infty} a_k x^k$ ,  $\sum_{k=1}^{\infty} k a_k x^{k-1}$ , and

$\sum_{k=0}^{\infty} \frac{a_k x^{k+1}}{k+1}$  are the same. This does not

imply that the intervals of convergence are the same; the endpoints of the interval must be checked separately for each series. For example, the interval of

convergence of  $\sum_{k=0}^{\infty} \frac{x^k}{k}$  is  $[-1, 1)$ , but

the interval of convergence of its

derivative  $\sum_{k=1}^{\infty} x^{k-1}$  is  $(-1, 1)$ .

integrating) a power series whose radius of convergence is  $R$ , converges and has the same radius of convergence  $R$  as the original power series. (See Problem 86.)

The differentiation and integration properties can be used to obtain new functions defined by a power series.

### EXAMPLE 7 Using the Differentiation Property of Power Series

Use the differentiation property of power series to find the derivative of

$$f(x) = \frac{1}{1-x} = \sum_{k=0}^{\infty} x^k$$

**Solution** The function  $f(x) = \frac{1}{1-x}$ , defined on the open interval  $(-1, 1)$ , is represented by the power series

$$f(x) = \frac{1}{1-x} = 1 + x + x^2 + \cdots + x^n + \cdots = \sum_{k=0}^{\infty} x^k$$

Using the differentiation property, we find that

$$f'(x) = \frac{1}{(1-x)^2} = 1 + 2x + 3x^2 + \cdots + nx^{n-1} + \cdots = \sum_{k=1}^{\infty} kx^{k-1}$$

whose radius of convergence is 1. ■

**NOW WORK** Problem 59(a).

### EXAMPLE 8 Finding the Power Series Representation for $\ln \frac{1}{1-x}$

(a) Find the power series representation for  $\ln \frac{1}{1-x}$ .

(b) Find  $\ln 2$ .

**Solution** (a) If  $y = \ln \frac{1}{1-x}$ , then  $y' = \frac{1}{1-x}$ . That is,  $y'$  is represented by the geometric series  $\sum_{k=0}^{\infty} x^k$ , which converges on the interval  $(-1, 1)$ . So, if we use the integration property of power series for  $y' = \frac{1}{1-x}$ , we obtain a series for  $y = \ln \frac{1}{1-x}$ .

$$y' = \frac{1}{1-x} = 1 + x + x^2 + \cdots + x^n + \cdots = \sum_{k=0}^{\infty} x^k$$

$$\int_0^x \frac{1}{1-t} dt = \int_0^x (1 + t + t^2 + \cdots + t^n + \cdots) dt$$

$$\ln \frac{1}{1-x} = x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots + \frac{x^{n+1}}{n+1} + \cdots = \sum_{k=0}^{\infty} \frac{x^{k+1}}{k+1}$$

The radius of convergence of this series is 1.

To find the interval of convergence, we investigate the endpoints. When  $x = 1$ ,

$$x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots + \frac{x^{n+1}}{n+1} + \cdots = 1 + \frac{1}{2} + \frac{1}{3} + \cdots$$

the harmonic series, which diverges. When  $x = -1$ ,

$$x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots + \frac{x^{n+1}}{n+1} + \cdots = -1 + \frac{1}{2} - \frac{1}{3} + \cdots + (-1)^{n+1} \frac{1}{n+1} + \cdots$$

an alternating harmonic series, which converges. The interval of convergence of the power series  $\sum_{k=1}^{\infty} \frac{x^k}{k}$  is  $[-1, 1)$ . So,

$$\ln \frac{1}{1-x} = x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots = \sum_{k=0}^{\infty} \frac{x^{k+1}}{k+1} \quad -1 \leq x < 1 \quad (1)$$

(b) To find  $\ln 2$ , notice that when  $x = -1$ , we have  $\ln \frac{1}{1-x} = \ln \frac{1}{2} = -\ln 2$ . In (1) let  $x = -1$ . Then

$$\begin{aligned} -\ln 2 &= -1 + \frac{1}{2} - \frac{1}{3} + \cdots \\ \ln 2 &= 1 - \frac{1}{2} + \frac{1}{3} - \cdots \end{aligned}$$

The sum of the alternating harmonic series is  $\ln 2$ .

**NOW WORK** Problems 59(b) and 65.

### EXAMPLE 9 Finding the Power Series Representation for $\tan^{-1} x$

Show that the power series representation for  $\tan^{-1} x$  is

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{2k+1}$$

Find the radius of convergence and the interval of convergence.

**Solution** If  $y = \tan^{-1} x$ , then  $y' = \frac{1}{1+x^2}$ , which is the sum of the geometric series  $\sum_{k=0}^{\infty} (-1)^k x^{2k}$ . That is,

$$\frac{1}{1+x^2} = \sum_{k=0}^{\infty} (-1)^k x^{2k} = 1 - x^2 + x^4 - x^6 + \cdots$$

This series converges when  $|x^2| < 1$ , or equivalently for  $-1 < x < 1$ . We use the integration property of power series to integrate  $y' = \frac{1}{1+x^2}$  and obtain a series for  $y = \tan^{-1} x$ .

$$\begin{aligned} \int_0^x \frac{dt}{1+t^2} &= \int_0^x (1 - t^2 + t^4 - \cdots) dt \\ \tan^{-1} x &= x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{2k+1} \end{aligned}$$

The radius of convergence is 1. To find the interval of convergence, we check  $x = -1$  and  $x = 1$ . For  $x = -1$ ,

$$-1 + \frac{1}{3} - \frac{1}{5} + \frac{1}{7} - \cdots$$

For  $x = 1$ , we get

$$1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \cdots$$

Both of these series satisfy the two conditions of the Alternating Series Test, and so each one converges. The interval of convergence is the closed interval  $[-1, 1]$ . ■

**ORIGINS** The power series representation for  $\tan^{-1} x$  is called **Gregory's series** (or Gregory–Leibniz series or Madhava–Gregory series). James Gregory (1638–1675) was a Scottish mathematician. His mother, Janet Anderson, was his teacher and taught him geometry. Gregory, like many other mathematicians of his time, was searching for a good way to approximate  $\pi$ , a result of which was Gregory's series. Gregory was also a major contributor to the theory of optics, and he is credited with inventing the reflective telescope.

Since  $\tan^{-1} 1 = \frac{\pi}{4}$ , we can use Gregory's series to approximate  $\pi$ . Then

$$\frac{\pi}{4} = \sum_{k=0}^{\infty} (-1)^k \frac{1^{2k+1}}{2k+1} = \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} = 1 - \frac{1}{3} + \frac{1}{5} - \cdots$$

While we now have an approximation for  $\pi$ , unfortunately the series converges very slowly, requiring many terms to get close to  $\pi$ . See Problem 82.

**NOW WORK** Problem 69.

## 8.8 Assess Your Understanding

### Concepts and Vocabulary

- True or False** Every power series  $\sum_{k=0}^{\infty} a_k(x-c)^k$  converges for at least one number.
- True or False** Let  $b_n$  denote the  $n$ th term of the power series  $\sum_{k=0}^{\infty} a_k x^k$ . If  $\lim_{n \rightarrow \infty} \left| \frac{b_{n+1}}{b_n} \right| < 1$  for every number  $x$ , then  $\sum_{k=0}^{\infty} a_k x^k$  is absolutely convergent on the interval  $(-\infty, \infty)$ .
- True or False** If the radius of convergence of a power series  $\sum_{k=0}^{\infty} a_k x^k$  is 0, then the power series converges only for  $x = 0$ .
- True or False** If a power series converges at one endpoint of its interval of convergence, then it must converge at its other endpoint.
- True or False** The power series  $\sum_{k=0}^{\infty} a_k x^k$  and  $\sum_{k=0}^{\infty} a_k (x-3)^k$  have the same radius of convergence.
- True or False** The power series  $\sum_{k=0}^{\infty} a_k x^k$  and  $\sum_{k=0}^{\infty} a_k (x-3)^k$  have the same interval of convergence.
- True or False** If the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $x = 8$ , then it converges for  $x = -8$ .
- True or False** If the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $x = 3$ , then it converges for  $x = 1$ .
- True or False** If the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $x = -4$ , then it converges for  $x = 3$ .
- True or False** If the power series  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $x = 3$ , then it diverges for  $x = 5$ .
- True or False** A possible interval of convergence for the power series  $\sum_{k=0}^{\infty} a_k x^k$  is  $[-2, 4]$ .
- True or False** If the power series  $\sum_{k=0}^{\infty} a_k x^k$  diverges for a number  $x_1$ , then it converges for all numbers  $x$  for which  $|x| < |x_1|$ .

### Skill Building

In Problems 13–16, find all numbers  $x$  for which each power series converges.

13.  $\sum_{k=0}^{\infty} kx^k$

14.  $\sum_{k=0}^{\infty} \frac{kx^k}{3^k}$

15.  $\sum_{k=0}^{\infty} \frac{(x+1)^k}{3^k}$

16.  $\sum_{k=1}^{\infty} \frac{(x-2)^k}{k^2}$

In Problems 17–26:

- Use the Ratio Test to find the radius of convergence and the interval of convergence of each power series.
- Use the Root Test to find the radius of convergence and the interval of convergence of each power series.
- Which test, the Ratio Test or the Root Test, did you find easier to use? Give the reasons why.

17.  $\sum_{k=0}^{\infty} \frac{x^k}{2^k(k+1)}$

18.  $\sum_{k=0}^{\infty} (-1)^k \frac{x^k}{2^k(k+1)}$

19.  $\sum_{k=0}^{\infty} \frac{x^k}{k+5}$

20.  $\sum_{k=0}^{\infty} \frac{x^k}{1+k^2}$

21.  $\sum_{k=0}^{\infty} \frac{k^2 x^k}{3^k}$

22.  $\sum_{k=0}^{\infty} \frac{2^k x^k}{3^k}$

23.  $\sum_{k=2}^{\infty} \frac{kx^k}{2k+1}$

24.  $\sum_{k=0}^{\infty} (6x)^k$

25.  $\sum_{k=0}^{\infty} (x-3)^k$

26.  $\sum_{k=0}^{\infty} \frac{k(2x)^k}{3^k}$

In Problems 27–44, find the radius of convergence and the interval of convergence of each power series.

27.  $\sum_{k=1}^{\infty} \frac{x^k}{k^3}$

28.  $\sum_{k=2}^{\infty} \frac{x^k}{\ln k}$

29.  $\sum_{k=1}^{\infty} \frac{(x-2)^k}{k^3}$

30.  $\sum_{k=0}^{\infty} \frac{k(x-2)^k}{3^k}$

31.  $\sum_{k=0}^{\infty} \frac{(-1)^k}{(2k+1)!} x^{2k+1}$

32.  $\sum_{k=1}^{\infty} (kx)^k$

33.  $\sum_{k=1}^{\infty} \frac{kx^k}{\ln(k+1)}$

34.  $\sum_{k=1}^{\infty} \frac{x^k}{\ln(k+1)}$

35.  $\sum_{k=0}^{\infty} \frac{k(k+1)x^k}{4^k}$

$$36. \sum_{k=1}^{\infty} \frac{(-1)^k (x-5)^k}{k(k+1)}$$

$$38. \sum_{k=0}^{\infty} \frac{x^k}{e^k}$$

$$40. \sum_{k=0}^{\infty} \frac{(x+1)^k}{k!}$$

$$42. \sum_{k=1}^{\infty} \frac{(x+1)^k}{k(k+1)(k+2)}$$

$$44. \sum_{k=0}^{\infty} \frac{3^k (x-2)^k}{k!}$$

45. A function  $f$  is defined by the power series

$$f(x) = \sum_{k=0}^{\infty} \frac{x^k}{3^k}.$$

- (a) Find the domain of  $f$ .  
 (b) Evaluate  $f(2)$  and  $f(-1)$ .  
 (c) Find  $f$ .

46. A function  $f$  is defined by the power series

$$f(x) = \sum_{k=0}^{\infty} (-1)^k \left(\frac{x}{2}\right)^k.$$

- (a) Find the domain of  $f$ .  
 (b) Evaluate  $f(0)$  and  $f(1)$ .  
 (c) Find  $f$ .

47. A function  $f$  is defined by the power series

$$f(x) = \sum_{k=0}^{\infty} \frac{(x-2)^k}{2^k}.$$

- (a) Find the domain of  $f$ .  
 (b) Evaluate  $f(1)$  and  $f(2)$ .  
 (c) Find  $f$ .

48. A function  $f$  is defined by the power series

$$f(x) = \sum_{k=0}^{\infty} (-1)^k (x+3)^k.$$

- (a) Find the domain of  $f$ .  
 (b) Evaluate  $f(-3)$  and  $f(-2.5)$ .  
 (c) Find  $f$ .

49. If  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $x = 3$ , what, if anything, can be said about the convergence at  $x = 2$ ? Can anything be said about the convergence at  $x = 5$ ?

50. If  $\sum_{k=0}^{\infty} a_k (x-2)^k$  converges for  $x = 6$ , at what other numbers  $x$  must the series necessarily converge?

51. If the series  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $x = 6$  and diverges for  $x = -8$ , what, if anything, can be said about the truth of the

$$37. \sum_{k=0}^{\infty} (-1)^k \frac{(x-3)^{2k}}{9^k}$$

$$39. \sum_{k=0}^{\infty} (-1)^k \frac{(2x)^k}{k!}$$

$$41. \sum_{k=0}^{\infty} (-1)^k \frac{(x-1)^{4k}}{k!}$$

$$43. \sum_{k=1}^{\infty} \frac{k^k x^k}{k!}$$

following statements?

- (a) The series converges for  $x = 2$ .  
 (b) The series diverges for  $x = 7$ .  
 (c) The series is absolutely convergent for  $x = 6$ .  
 (d) The series converges for  $x = -6$ .  
 (e) The series diverges for  $x = 10$ .  
 (f) The series is absolutely convergent for  $x = 4$ .

52. If the radius of convergence of the power series  $\sum_{k=0}^{\infty} a_k (x-3)^k$

is  $R = 5$ , what, if anything, can be said about the truth of the following statements?

- (a) The series converges for  $x = 2$ .  
 (b) The series diverges for  $x = 7$ .  
 (c) The series diverges for  $x = 8$ .  
 (d) The series converges for  $x = -6$ .  
 (e) The series converges for  $x = -2$ .

In Problems 53–58:

- (a) Use a geometric series to represent each function as a power series centered at 0.  
 (b) Determine the radius of convergence and the interval of convergence of each series.

$$53. f(x) = \frac{1}{1+x^3}$$

$$54. f(x) = \frac{1}{1-x^2}$$

$$55. f(x) = \frac{1}{6-2x}$$

$$56. f(x) = \frac{4}{x+2}$$

$$57. f(x) = \frac{x}{1+x^3}$$

$$58. f(x) = \frac{4x^2}{x+2}$$

In Problems 59–62:

- (a) Use the differentiation property of power series to find  $f'(x)$  for each series.  
 (b) Use the integration property of power series to find the indefinite integral of each series.

$$59. f(x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!}$$

$$60. f(x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}$$

$$61. f(x) = \sum_{k=0}^{\infty} \frac{x^k}{k!}$$

$$62. f(x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^k}{k!}$$

In Problems 63–70, find a power series representation of  $f$ . Use a geometric series and properties of a power series.

$$63. f(x) = \frac{1}{(1+x)^2}$$

$$64. f(x) = \frac{1}{(1-x)^3}$$

$$65. f(x) = \frac{2}{3(1-x)^2}$$

$$66. f(x) = \frac{1}{(1-x)^4}$$

$$67. f(x) = \ln\left(\frac{1}{1+x}\right)$$

$$68. f(x) = \ln(1-2x)$$

$$69. f(x) = \ln(1-x^2)$$

$$70. f(x) = \ln(1+x^2)$$

## Applications and Extensions

In Problems 71–78, find all  $x$  for which each power series converges.

71.  $\sum_{k=1}^{\infty} \frac{x^k}{k}$

72.  $\sum_{k=1}^{\infty} \frac{(x-4)^k}{k}$

73.  $\sum_{k=1}^{\infty} \frac{x^k}{2k+1}$

74.  $\sum_{k=1}^{\infty} \frac{x^k}{k^2}$

75.  $\sum_{k=0}^{\infty} x^{k^2}$

76.  $\sum_{k=1}^{\infty} \frac{k^a}{a^k} (x-a)^k, \quad a \neq 0$

77.  $\sum_{k=0}^{\infty} \frac{(k!)^2}{(2k)!} (x-1)^k$

78.  $\sum_{k=0}^{\infty} \frac{\sqrt{k!}}{(2k)!} x^k$

79. (a) In the geometric series  $\frac{1}{1-x} = \sum_{k=0}^{\infty} x^k, -1 < x < 1$ , replace  $x$  by  $x^2$  to obtain the power series representation for  $\frac{1}{1-x^2}$ .

(b) What is its interval of convergence?

80. (a) Integrate the power series found in Problem 79 for  $\frac{1}{1-x^2}$  to obtain the power series  $\frac{1}{2} \ln \frac{1+x}{1-x}$ .

(b) What is its interval of convergence?

81. Use the power series found in Problem 80 to get an approximation for  $\ln 2$  correct to three decimal places.

**CAS** 82. Use the first 1000 terms of Gregory's series to approximate  $\frac{\pi}{4}$ . What is the approximation for  $\pi$ ?

83. If  $R > 0$  is the radius of convergence of  $\sum_{k=1}^{\infty} a_k x^k$ , show

$$\text{that } \lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \frac{1}{R}, \text{ provided this limit exists.}$$

84. If  $R$  is the radius of convergence of  $\sum_{k=1}^{\infty} a_k x^k$ , show that the radius of convergence of  $\sum_{k=1}^{\infty} a_k x^{2k}$  is  $\sqrt{R}$ .

85. Prove that if a power series is absolutely convergent at one endpoint of its interval of convergence, then the power series is absolutely convergent at the other endpoint.

86. Suppose  $\sum_{k=0}^{\infty} a_k x^k$  converges for  $|x| < R$  and that  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right|$  exists. Show that  $\sum_{k=1}^{\infty} k a_k x^{k-1}$  and  $\sum_{k=0}^{\infty} \frac{a_k}{k+1} x^{k+1}$  also converge for  $|x| < R$ .

## Challenge Problems

87. Consider the differential equation

$$(1+x^2)y'' - 4xy' + 6y = 0$$

Assuming there is a solution  $y(x) = \sum_{k=0}^{\infty} a_k x^k$ , substitute and obtain a formula for  $a_k$ . Your answer should have the form

$$y(x) = a_0(1-3x^2) + a_1\left(x - \frac{1}{3}x^3\right) \quad a_0, a_1 \text{ real numbers}$$

88. If the series  $\sum_{k=0}^{\infty} a_k 3^k$  converges, show that the series  $\sum_{k=1}^{\infty} k a_k 2^k$  also converges.

89. Find the interval of convergence of the series  $\sum_{k=1}^{\infty} \frac{(x-2)^k}{k(3^k)}$ .

90. Let a power series  $S(x)$  be convergent for  $|x| < R$ . Assume that  $S(x) = \sum_{k=0}^{\infty} a_k x^k$  with partial sums  $S_n(x) = \sum_{k=0}^n a_k x^k$ .

Suppose for any number  $\varepsilon > 0$ , there is a number  $N$  so that when  $n > N$ ,  $|S(x) - S_n(x)| < \frac{\varepsilon}{3}$  for all  $|x| < R$ .

Show that  $S(x)$  is continuous for all  $|x| < R$ .

91. Find the power series in  $x$ , denoted by  $f(x)$ , for which  $f''(x) + f(x) = 0$  and  $f(0) = 0, f'(0) = 1$ . What is the radius of convergence of the series?

92. The **Bessel function of order  $m$**  of the first kind, where  $m$  is a nonnegative integer, is defined as

$$J_m(x) = \sum_{k=0}^{\infty} (-1)^k \frac{1}{(k+m)!k!} \left(\frac{x}{2}\right)^{2k+m}$$

Show that:

$$(a) \quad J_0(x) = x^{-1} \frac{d}{dx} (x J_1(x))$$

$$(b) \quad J_1(x) = x^{-2} \frac{d}{dx} (x^2 J_2(x))$$

## 8.9 Taylor Series; Maclaurin Series

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Express a function as a Taylor series or a Maclaurin series (p. 613)
- 2 Determine the convergence of a Taylor/Maclaurin series (p. 614)
- 3 Find Taylor/Maclaurin expansions (p. 616)
- 4 Work with a binomial series (p. 619)

We saw in Section 8.8 that it is often possible to obtain a power series representation for a function by starting with a known series and differentiating, integrating, or substituting.

But what if you have no initial series? In other words, so far we have seen that functions can be represented by power series, and if we know the sum of the power series, then we know the function. In this section, we investigate what the power series representation of a function must look like *if it has a power series representation*.

Consider the power series in  $(x - c)$ :

$$\sum_{k=0}^{\infty} a_k (x - c)^k = a_0 + a_1(x - c) + a_2(x - c)^2 + \cdots + a_n(x - c)^n + \cdots$$

and suppose its interval of convergence is the open interval  $(c - R, c + R)$ ,  $R > 0$ . We define the function  $f$  as the series

$$f(x) = \sum_{k=0}^{\infty} a_k (x - c)^k = a_0 + a_1(x - c) + a_2(x - c)^2 + \cdots + a_n(x - c)^n + \cdots \quad (1)$$

The coefficients  $a_0, a_1, \dots$  can be expressed in terms of  $f$  and its derivatives in the following way. Repeatedly differentiate the function using the differentiation property of a power series,

$$f'(x) = \sum_{k=1}^{\infty} k a_k (x - c)^{k-1} = a_1 + 2a_2(x - c) + 3a_3(x - c)^2 + 4a_4(x - c)^3 + \cdots$$

$$\begin{aligned} f''(x) &= \sum_{k=2}^{\infty} [k(k-1)] a_k (x - c)^{k-2} \\ &= (2 \cdot 1) a_2 + (3 \cdot 2) a_3(x - c) + (4 \cdot 3) a_4(x - c)^2 + \cdots \end{aligned}$$

$$\begin{aligned} f'''(x) &= \sum_{k=3}^{\infty} [k(k-1)(k-2)] a_k (x - c)^{k-3} \\ &= (3 \cdot 2 \cdot 1) a_3 + (4 \cdot 3 \cdot 2) a_4(x - c) + \cdots \end{aligned}$$

and for any positive integer  $n$ ,

$$\begin{aligned} f^{(n)}(x) &= \sum_{k=n}^{\infty} k(k-1)(k-2) \cdots (k-n+1) a_k (x - c)^{k-n} \\ &= [n \cdot (n-1) \cdot \cdots \cdot 1] a_n + [(n+1) \cdot n \cdot (n-1) \cdot \cdots \cdot 2] a_{n+1}(x - c) + \cdots \\ &= n! a_n + (n+1)! a_{n+1}(x - c) + \cdots \end{aligned}$$

Now we let  $x = c$  in each derivative and solve for  $a_k$ .

$$\begin{array}{ll} f(c) = a_0 & a_0 = f(c) \\ f'(c) = a_1 & a_1 = f'(c) \\ f''(c) = 2a_2 & a_2 = \frac{f''(c)}{2!} \\ f'''(c) = 3! a_3 & a_3 = \frac{f'''(c)}{3!} \\ \vdots & \vdots \\ f^{(n)}(c) = n! a_n & a_n = \frac{f^{(n)}(c)}{n!} \end{array}$$

If we substitute for  $a_k$  in (1), we obtain

$$f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \cdots$$

and have proved the following result.

**THEOREM Taylor Series; Maclaurin Series**

Suppose  $f$  is a function that has derivatives of all orders on the open interval  $(c - R, c + R)$ ,  $R > 0$ . If  $f$  can be represented by the power series  $\sum_{k=0}^{\infty} a_k (x - c)^k$ , whose radius of convergence is  $R$ , then

$$\begin{aligned} f(x) &= f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \cdots \\ &= \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!}(x - c)^k \end{aligned} \quad (2)$$

for all numbers  $x$  in the open interval  $(c - R, c + R)$ . A power series that has the form of equation (2) is called a **Taylor series** of the function  $f$ .

When  $c = 0$ , the Taylor series representation of a function  $f$

$$f(x) = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!}x^k$$

is called a **Maclaurin series**.

**ORIGINS** Colin Maclaurin (1698–1746) was a Scottish mathematician. An orphan, he and his brother were raised by an uncle. Maclaurin was 11 years old when he entered the University of Glasgow, and within a year he had taught himself Euclid's elements (geometry). Maclaurin was 19 when he was appointed professor of Mathematics at the University of Aberdeen, Scotland. Maclaurin was an avid supporter of Newton's mathematics. In response to a claim that Newton's calculus lacked rigor, Maclaurin wrote the first systematic treatise on Newton's methods. In it he used Taylor series centered about 0, which are now known as Maclaurin series.

The Taylor series in  $(x - c)$  of a function  $f$  is referred to as the **Taylor expansion of  $f$  about  $c$** ; the Maclaurin series of a function  $f$  is called the **Maclaurin expansion of  $f$  about 0**.

In a Taylor series, all the derivatives are evaluated at  $c$ , and the interval of convergence has its center at  $c$ . In a Maclaurin series, all the derivatives are evaluated at 0, and the interval of convergence has its center at 0.

**1 Express a Function as a Taylor Series or a Maclaurin Series**

The next example shows what a Maclaurin expansion of  $f(x) = e^x$  must look like (if there is one).

**EXAMPLE 1 Expressing a Function as a Maclaurin Series**

Assuming that  $f(x) = e^x$  can be represented by a power series in  $x$ , find its Maclaurin series.

**Solution** To express a function  $f$  as a Maclaurin series, we begin by evaluating  $f$  and its derivatives at 0.

$$\begin{aligned} f(x) &= e^x & f(0) &= 1 \\ f'(x) &= e^x & f'(0) &= 1 \\ f''(x) &= e^x & f''(0) &= 1 \\ &\vdots & &\vdots \end{aligned}$$

Then we use the definition of a Maclaurin series.

$$f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{x^k}{k!} \quad (3)$$

$\uparrow$   
 $f^{(k)}(0)=1$

**NOW WORK Problem 3.**

But how can we be sure  $f(x) = e^x$  can be represented by a power series? We know [Example 1(a), p. 600] that the power series  $\sum_{k=0}^{\infty} \frac{x^k}{k!}$  converges absolutely for all numbers  $x$ . But does the series  $\sum_{k=0}^{\infty} \frac{x^k}{k!}$  converge to  $e^x$ ? To answer these questions, we need to investigate the convergence of a Taylor series.

## 2 Determine the Convergence of a Taylor/Maclaurin Series

The conditions on the function  $f$  that guarantee that its power series representation actually converges to  $f$  are based on the Taylor polynomial  $P_n(x)$  of  $f$  discussed in Section 3.5 (pp. 240–241). There, we found that the Taylor polynomial  $P_n(x)$  of a function  $f$  whose first  $n$  derivatives are continuous on an open interval containing the number  $c$  is given by

$$P_n(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n$$

To use  $P_n(x)$  to approximate the function  $f$  for  $x$  close to  $c$ , we investigate the difference between  $f(x)$  and  $P_n(x)$ , called the **remainder**  $R_n$ .

### THEOREM Taylor's Formula with Remainder

Let  $f$  be a function whose first  $n + 1$  derivatives are continuous on an open interval  $I$  containing the number  $c$ . Then for every  $x$  in  $I$ , there is a number  $u$  between  $x$  and  $c$  for which

$$f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + R_n(x)$$

where

$$R_n(x) = \frac{f^{(n+1)}(u)}{(n+1)!}(x - c)^{n+1}$$

is the remainder after  $n$  terms.

The proof of this result appears in Appendix B.

The Taylor series in  $x - c$  of a function  $f$  is  $\sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!}(x - c)^k$ . Notice that the  $n$ th partial sum of the Taylor series in  $x - c$  of  $f$  is precisely the Taylor polynomial  $P_n(x)$  of  $f$  at  $c$ . If the Taylor series  $\sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!}(x - c)^k$  converges to  $f(x)$ , it follows that

$$f(x) = \lim_{n \rightarrow \infty} P_n(x)$$

But Taylor's Formula with Remainder states that

$$f(x) = P_n(x) + R_n(x)$$

So, if the Taylor series converges, we must have

$$f(x) = \lim_{n \rightarrow \infty} [P_n(x) + R_n(x)] = \lim_{n \rightarrow \infty} P_n(x) + \lim_{n \rightarrow \infty} R_n(x) = f(x) + \lim_{n \rightarrow \infty} R_n(x)$$

That is,  $\lim_{n \rightarrow \infty} R_n(x) = 0$ .

**THEOREM** Convergence of a Taylor Series

If a function  $f$  has derivatives of all orders in an open interval  $I = (c - R, c + R)$ ,  $R > 0$ , centered at  $c$ , and if

$$\lim_{n \rightarrow \infty} R_n(x) = 0$$

for all numbers  $x$  in  $I$ , then

$$f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!} (x-c)^k = f(c) + f'(c)(x-c) + \frac{f''(c)}{2!}(x-c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x-c)^n + \cdots$$

for all numbers  $x$  in  $I$ .

At first glance, the convergence theorem appears simple, but in practice it is not always easy to show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$ . One reason is that the term  $f^{(n+1)}(u)$ , which appears in  $R_n(x)$ , depends on  $n$ , making the limit difficult to find.

**EXAMPLE 2** Determining the Convergence of a Maclaurin Series

Show that  $1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots$  converges to  $e^x$  for every number  $x$ . That is, prove that

$$e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{x^k}{k!}$$

for all real numbers.

**Solution** To prove that  $1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots = e^x$  for every number  $x$ , we need to show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$ . Since  $f^{(n+1)}(x) = e^x$ , we have

$$R_n(x) = \frac{f^{(n+1)}(u)x^{n+1}}{(n+1)!} = \frac{e^u x^{n+1}}{(n+1)!}$$

where  $u$  is between 0 and  $x$ . To show that  $\lim_{n \rightarrow \infty} R_n(x) = 0$ , we consider two cases:  $x > 0$  and  $x < 0$ .

*Case 1:* When  $x > 0$ , then  $0 < u < x$ , so that  $1 < e^u < e^x$  and, for every positive integer  $n$ ,

$$0 < R_n(x) = \frac{e^u x^{n+1}}{(n+1)!} < \frac{e^x x^{n+1}}{(n+1)!}$$

By the Ratio Test, the series  $\sum_{k=0}^{\infty} \frac{x^{k+1}}{(k+1)!}$  converges for all  $x$ . It follows that

$$\lim_{n \rightarrow \infty} \frac{x^{n+1}}{(n+1)!} = 0, \text{ and, therefore,}$$

$$\lim_{n \rightarrow \infty} \frac{e^x x^{n+1}}{(n+1)!} = e^x \lim_{n \rightarrow \infty} \frac{x^{n+1}}{(n+1)!} = 0$$

By the Squeeze Theorem,  $\lim_{n \rightarrow \infty} R_n(x) = 0$ .

*Case 2:* When  $x < 0$ , then  $x < u < 0$  and  $e^x < e^u < 1$ , so that

$$0 \leq |R_n(x)| = \frac{e^u \cdot |x|^{n+1}}{(n+1)!} < \frac{|x|^{n+1}}{(n+1)!}$$

**NEED TO REVIEW?** The Squeeze Theorem is discussed in Section 1.4, pp. 106–107.

Since  $\lim_{n \rightarrow \infty} \frac{|x|^{n+1}}{(n+1)!} = 0$ , by the Squeeze Theorem,  $\lim_{n \rightarrow \infty} R_n(x) = 0$ .

So for all  $x$ ,  $\lim_{n \rightarrow \infty} R_n(x) = 0$ . As a result,

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{x^k}{k!}$$

for all numbers  $x$ . ■

### 3 Find Taylor/Maclaurin Expansions

#### EXAMPLE 3 Finding the Maclaurin Expansion for $f(x) = \sin x$

- (a) Find the Maclaurin expansion for  $f(x) = \sin x$ .  
 (b) Show that it converges to  $\sin x$  for all numbers  $x$ .

**Solution** (a) The value of  $f$  and its derivatives at 0 are

$$\begin{aligned} f(x) &= \sin x & f(0) &= 0 \\ f'(x) &= \cos x & f'(0) &= 1 \\ f''(x) &= -\sin x & f''(0) &= 0 \\ f'''(x) &= -\cos x & f'''(0) &= -1 \end{aligned}$$

Higher-order derivatives follow this same pattern, so if  $f(x) = \sin x$  can be represented by a power series in  $x$ , then

$$\begin{aligned} \sin x &= f(0) + \frac{f'(0)}{1!}x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \cdots = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \\ &= \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!} \end{aligned}$$

(b) To prove that the series actually converges to  $\sin x$  for all  $x$ , we need to show that the remainders  $R_{2n+1}(x)$  and  $R_{2n}(x)$  approach zero. For  $R_{2n+1}(x)$  we have

$$R_{2n+1}(x) = (-1)^{n+1} \frac{f^{(2n+2)}(u) x^{2n+2}}{(2n+2)!}$$

where  $u$  is between 0 and  $x$ . Since  $|f^{(2n+2)}(u)| = |\sin u| \leq 1$  for every number  $u$ , then

$$0 \leq |R_{2n+1}(x)| = \frac{|f^{(2n+2)}(u)|}{(2n+2)!} |x|^{2n+2} \leq \frac{|x|^{2n+2}}{(2n+2)!}$$

By the Ratio Test, the series  $\sum_{k=0}^{\infty} \frac{|x|^{2k+1}}{(2k+1)!}$  converges for all  $x$ , so

$$\lim_{n \rightarrow \infty} \frac{|x|^{2n+2}}{(2n+2)!} = 0$$

By the Squeeze Theorem,  $\lim_{n \rightarrow \infty} |R_{2n+1}(x)| = 0$  and therefore  $\lim_{n \rightarrow \infty} R_{2n+1}(x) = 0$  for all  $x$ .

A similar argument holds for the remainder  $|R_{2n}(x)| = \frac{|\cos u| x^{2n+1}}{(2n+1)!}$ .

We conclude that the series  $\sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!}$  converges to  $\sin x$  for all  $x$ . That is,

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!}$$
■

The task of finding the Taylor expansion for a function  $f$  by taking successive derivatives and then showing that  $\lim_{n \rightarrow \infty} R_n(x) = 0$  can be challenging. Consequently, it is usually easier to use a known series and properties of power series to find the Taylor series of a function  $f$ .

For example, we can find the Maclaurin expansion for  $f(x) = \cos x$  by differentiating the Maclaurin series for  $f(x) = \sin x$ .

#### EXAMPLE 4 Finding the Maclaurin Expansion for $f(x) = \cos x$

Find the Maclaurin expansion for  $f(x) = \cos x$ .

**Solution** We apply the differentiation property of power series to the Maclaurin expansion for  $\sin x$ .

$$\begin{aligned}\frac{d}{dx} \sin x &= \frac{d}{dx} \left( x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots \right) \\ &= \frac{d}{dx} \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!}\end{aligned}$$

Then

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{(2k)!}$$

for all numbers  $x$ . ■

**NOTE** The Maclaurin expansion for  $f(x) = \cos x$  could also have been found by integrating the Maclaurin expansion for  $f(x) = \sin x$ .

We can use known Taylor expansions to obtain the power series representations of other functions. For example, if in the Maclaurin expansion for  $e^x$ , the variable  $x$  is replaced by  $-x$ , then

$$f(x) = e^{-x} = 1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots$$

for all numbers  $x$ . We use this in the next example to find the Maclaurin expansion for the hyperbolic cosine function.

#### EXAMPLE 5 Finding the Maclaurin Expansion for $f(x) = \cosh x$

Find the Maclaurin expansion for  $f(x) = \cosh x$ .

**Solution** Since

$$\cosh x = \frac{e^x + e^{-x}}{2}$$

its Maclaurin expansion can be found by adding corresponding terms of the Maclaurin expansions for  $e^x$  and  $e^{-x}$  and then dividing by 2. The result is

$$\begin{aligned}\cosh x &= \frac{e^x + e^{-x}}{2} = \frac{\left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots\right) + \left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \cdots + (-1)^n \frac{x^n}{n!} + \cdots\right)}{2} \\ &= \frac{1+1}{2} + \frac{x-x}{2} + \frac{x^2+x^2}{2 \cdot 2!} + \frac{x^3-x^3}{2 \cdot 3!} + \cdots + \frac{x^n + (-1)^n x^n}{2 \cdot n!} + \cdots\end{aligned}$$

$$\cosh x = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \frac{x^6}{6!} + \cdots + \frac{x^{2n}}{(2n)!} + \cdots = \sum_{k=0}^{\infty} \frac{x^{2k}}{(2k)!}$$

for all  $x$ . ■

**NOW WORK** Problem 27.

**EXAMPLE 6** Finding the Maclaurin Expansion for  $f(x) = e^x \cos x$ 

Find the first five terms of the Maclaurin expansion for  $f(x) = e^x \cos x$ .

**Solution** The Maclaurin expansion for  $f(x) = e^x \cos x$  is obtained by multiplying the Maclaurin expansion for  $e^x$  by the Maclaurin expansion for  $\cos x$ . That is,

$$e^x \cos x = \left(1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \cdots\right) \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right)$$

Then

$$\begin{aligned} e^x \cos x &= 1 \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) + x \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) \\ &\quad + \frac{x^2}{2!} \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) + \frac{x^3}{3!} \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) \\ &\quad + \frac{x^4}{4!} \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) + \frac{x^5}{5!} \left(1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots\right) + \cdots \\ &= \left(1 - \frac{x^2}{2} + \frac{x^4}{24}\right) + \left(x - \frac{x^3}{2} + \frac{x^5}{24}\right) + \left(\frac{x^2}{2} - \frac{x^4}{4}\right) + \left(\frac{x^3}{6} - \frac{x^5}{12}\right) \\ &\quad + \frac{x^4}{24} + \frac{x^5}{120} + \cdots \\ &= 1 + x + \left(-\frac{1}{2} + \frac{1}{2}\right)x^2 + \left(-\frac{1}{2} + \frac{1}{6}\right)x^3 + \left(\frac{1}{24} - \frac{1}{4} + \frac{1}{24}\right)x^4 \\ &\quad + \left(\frac{1}{24} - \frac{1}{12} + \frac{1}{120}\right)x^5 + \cdots \\ &= 1 + x - \frac{1}{3}x^3 - \frac{1}{6}x^4 - \frac{1}{30}x^5 + \cdots \end{aligned}$$

**NOW WORK** Problem 29.**EXAMPLE 7** Finding the Taylor Expansion for  $f(x) = \cos x$  about  $\frac{\pi}{2}$ 

Find the Taylor expansion for  $f(x) = \cos x$  about  $\frac{\pi}{2}$ .

**Solution** To express  $f(x) = \cos x$  as a Taylor expansion about  $\frac{\pi}{2}$ , we evaluate  $f$  and its derivatives at  $\frac{\pi}{2}$ .

$$\begin{aligned} f(x) &= \cos x & f\left(\frac{\pi}{2}\right) &= 0 \\ f'(x) &= -\sin x & f'\left(\frac{\pi}{2}\right) &= -1 \\ f''(x) &= -\cos x & f''\left(\frac{\pi}{2}\right) &= 0 \\ f'''(x) &= \sin x & f'''\left(\frac{\pi}{2}\right) &= 1 \end{aligned}$$

For derivatives of odd order,  $f^{(2n+1)}\left(\frac{\pi}{2}\right) = (-1)^{n+1}$ . For derivatives of even order,  $f^{(2n)}\left(\frac{\pi}{2}\right) = 0$ . The Taylor expansion for  $f(x) = \cos x$  about  $\frac{\pi}{2}$  is

$$\begin{aligned}
 f(x) = \cos x &= f\left(\frac{\pi}{2}\right) + f'\left(\frac{\pi}{2}\right)\left(x - \frac{\pi}{2}\right) + \frac{f''\left(\frac{\pi}{2}\right)}{2!}\left(x - \frac{\pi}{2}\right)^2 \\
 &\quad + \frac{f'''\left(\frac{\pi}{2}\right)}{3!}\left(x - \frac{\pi}{2}\right)^3 + \cdots \\
 &= -\left(x - \frac{\pi}{2}\right) + \frac{1}{3!}\left(x - \frac{\pi}{2}\right)^3 - \frac{1}{5!}\left(x - \frac{\pi}{2}\right)^5 + \cdots \\
 &= \sum_{k=0}^{\infty} \frac{(-1)^{k+1}}{(2k+1)!} \left(x - \frac{\pi}{2}\right)^{2k+1}
 \end{aligned}$$

The radius of convergence is  $\infty$ ; the interval of convergence is  $(-\infty, \infty)$ . ■

### NOW WORK Problem 15.

## 4 Work with a Binomial Series

In algebra, the Binomial Theorem states that if  $m$  is a positive integer and  $a$  and  $b$  are real numbers, then

$$\begin{aligned}
 (a+b)^m &= a^m + \binom{m}{1}a^{m-1}b + \binom{m}{2}a^{m-2}b^2 + \cdots + \binom{m}{m-2}a^2b^{m-2} \\
 &\quad + \binom{m}{m-1}ab^{m-1} + b^m = \sum_{k=0}^m \binom{m}{k}a^{m-k}b^k
 \end{aligned}$$

where

$$\binom{m}{k} = \frac{m!}{k!(m-k)!} = \frac{m(m-1)\cdots(m-k+1)}{k!}$$

**NEED TO REVIEW?** The Binomial Theorem is discussed in Appendix A.5, p. A-43.

In the Binomial Theorem,  $m$  is a positive integer. To generalize the result, we find a Maclaurin series for the function  $f(x) = (1+x)^m$ , where  $m$  is any real number.

### EXAMPLE 8 Finding the Maclaurin Expansion for $f(x) = (1+x)^m$

Find the Maclaurin series for  $f(x) = (1+x)^m$ , where  $m$  is any real number.

**Solution** We begin by finding the derivatives of  $f$  at 0:

$$\begin{array}{ll}
 f(x) = (1+x)^m & f(0) = 1 \\
 f'(x) = m(1+x)^{m-1} & f'(0) = m \\
 f''(x) = m(m-1)(1+x)^{m-2} & f''(0) = m(m-1) \\
 \vdots & \vdots \\
 f^{(n)}(x) = m(m-1)(m-2)\cdots(m-n+1)(1+x)^{m-n} & f^{(n)}(0) = m(m-1)(m-2)\cdots(m-n+1)
 \end{array}$$

The Maclaurin expansion for  $f$  is

$$\begin{aligned}
 (1+x)^m &= 1 + mx + \frac{m(m-1)}{2!}x^2 + \cdots \\
 &\quad + \frac{m(m-1)(m-2)\cdots(m-n+1)}{n!}x^n + \cdots \\
 &= \binom{m}{0} + \binom{m}{1}x + \binom{m}{2}x^2 + \cdots + \binom{m}{n}x^n + \cdots = \sum_{k=0}^{\infty} \binom{m}{k}x^k
 \end{aligned}$$

where

$$\binom{m}{0} = 1 \quad \text{and} \quad \binom{m}{k} = \frac{m(m-1)(m-2) \cdots (m-k+1)}{k!}$$

The series

$$\begin{aligned}(1+x)^m &= \sum_{k=0}^{\infty} \binom{m}{k} x^k \\ &= 1 + mx + \frac{m(m-1)}{2!}x^2 + \frac{m(m-1)(m-2)}{3!}x^3 + \cdots + \binom{m}{n}x^n + \cdots\end{aligned}$$

is called a **binomial series** because of its similarity in form to the Binomial Theorem, and  $\binom{m}{k}$  is called the **binomial coefficient of  $x^k$** .

The following result, which we state without proof, gives the conditions under which the binomial series  $(1+x)^m$  converges.

### THEOREM Convergence of a Binomial Series

The binomial series

$$(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$$

converges

- for all  $x$  if  $m$  is a nonnegative integer. (In this case, there are only  $m+1$  nonzero terms.)
- on the open interval  $(-1, 1)$  if  $m \leq -1$ .
- on the half-open interval  $(-1, 1]$  if  $-1 < m < 0$ .
- on the closed interval  $[-1, 1]$  if  $m > 0$ , but  $m$  is not an integer.

### EXAMPLE 9 Using a Binomial Series

Represent the function  $f(x) = \sqrt{x+1}$  as a Maclaurin series, and find its interval of convergence.

**Solution** Write  $\sqrt{x+1} = (1+x)^{1/2}$  and use the binomial series with  $m = \frac{1}{2}$ . The result is

$$\begin{aligned}(1+x)^{1/2} &= 1 + \frac{1}{2}x + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}x^2 + \frac{\frac{1}{2}\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{3!}x^3 + \cdots \\ &= 1 + \frac{1}{2}x - \frac{1}{8}x^2 + \frac{1}{16}x^3 - \cdots\end{aligned}$$

Since  $m = \frac{1}{2} > 0$  and  $m$  is not an integer, the series converges on the closed interval  $[-1, 1]$ . ■

**NOW WORK** Problem 37.

**EXAMPLE 10** Using a Binomial Series

Represent the function  $f(x) = \sin^{-1} x$  by a Maclaurin series.

**Solution** Recall that

$$\sin^{-1} x = \int_0^x \frac{dt}{\sqrt{1-t^2}} = \int_0^x (1-t^2)^{-1/2} dt$$

We write the integrand as a binomial series, with  $x = -t^2$  and  $m = -\frac{1}{2}$ .

$$\begin{aligned} (1-t^2)^{-1/2} &= 1 + \left(-\frac{1}{2}\right)(-t^2) + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{2!}(-t^2)^2 \\ &\quad + \frac{\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)}{3!}(-t^2)^3 + \cdots \\ &= 1 + \frac{1}{2}t^2 + \frac{3}{8}t^4 + \frac{5}{16}t^6 + \cdots \end{aligned}$$

Now we use the integration property of a power series to obtain

$$\begin{aligned} \int_0^x \frac{dt}{\sqrt{1-t^2}} &= \int_0^x \left(1 + \frac{1}{2}t^2 + \frac{3}{8}t^4 + \frac{5}{16}t^6 + \cdots\right) dt \\ \sin^{-1} x &= x + \left(\frac{1}{2}\right)\left(\frac{x^3}{3}\right) + \left(\frac{3}{8}\right)\left(\frac{x^5}{5}\right) + \left(\frac{5}{16}\right)\left(\frac{x^7}{7}\right) + \cdots \\ &= x + \frac{x^3}{6} + \frac{3}{40}x^5 + \frac{5}{112}x^7 + \cdots \end{aligned}$$

In Problem 57, you are asked to show that the interval of convergence is  $[-1, 1]$ .

## Summary

TABLE 7

| Series                                                                                                                         | Comment                                       |
|--------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| $\frac{1}{1-x} = \sum_{k=0}^{\infty} x^k = 1 + x + x^2 + x^3 + \cdots$                                                         | Converges for $ x  < 1$ .                     |

| $e^x = \sum_{k=0}^{\infty} \frac{x^k}{k!} = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots$                       | Converges for all real numbers $x$ .          |
| $\sin x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!} = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots$ | Converges for all real numbers $x$ .          |
| $\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!} = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots$     | Converges for all real numbers $x$ .          |
| $\ln(1+x) = \sum_{k=0}^{\infty} \frac{(-1)^k x^{k+1}}{k+1}$                                                                    | Converges on the interval $(-1, 1]$ .         |
| $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$                                                                               | For convergence, see the theorem on page 620. |

## 8.9 Assess Your Understanding

## Concepts and Vocabulary

- The series representation of a function  $f$  given by the power series  $f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)(x - c)^2}{2!} + \cdots + \frac{f^{(n)}(c)(x - c)^n}{n!} + \cdots$  is called a(n) \_\_\_\_\_ about  $c$ .
- If  $c = 0$  in the Taylor expansion of a function  $f$ , then the expansion is called a(n) \_\_\_\_\_ expansion.

## Skill Building

In Problems 3–14, assuming each function can be represented by a power series, find the Maclaurin expansion of each function.

- $f(x) = \ln(1 - x)$
- $f(x) = \ln(1 + x)$
- $f(x) = \frac{1}{1 - x}$
- $f(x) = \frac{1}{1 - 3x}$
- $f(x) = \frac{1}{(1 + x)^2}$
- $f(x) = (1 + x)^{-3}$
- $f(x) = \frac{1}{1 + x^2}$
- $f(x) = \frac{1}{1 + 2x^3}$
- $f(x) = e^{3x}$
- $f(x) = e^{x/2}$
- $f(x) = \sin(\pi x)$
- $f(x) = \cos(2x)$

In Problems 15–22, assuming each function can be represented by a power series, find the Taylor expansion of each function about the given number  $c$ .

- $f(x) = e^x$ ;  $c = 1$
- $f(x) = e^{2x}$ ;  $c = -1$
- $f(x) = \ln x$ ;  $c = 1$
- $f(x) = \sqrt{x}$ ;  $c = 1$
- $f(x) = \frac{1}{x}$ ;  $c = 1$
- $f(x) = \frac{1}{\sqrt{x}}$ ;  $c = 4$
- $f(x) = \sin x$ ;  $c = \frac{\pi}{6}$
- $f(x) = \cos x$ ;  $c = -\frac{\pi}{2}$

In Problems 23–26, assuming each function can be represented by a power series, find the Taylor expansion of each function about the given number  $c$ . Comment on the result.

- $f(x) = 3x^3 + 2x^2 + 5x - 6$ ;  $c = 0$
- $f(x) = 4x^4 - 2x^3 - x$ ;  $c = 0$
- $f(x) = 3x^3 + 2x^2 + 5x - 6$ ;  $c = 1$
- $f(x) = 4x^4 - 2x^3 + x$ ;  $c = 1$

In Problems 27 and 28, find the Maclaurin expansion for each function.

- $f(x) = \sinh x$
- $f(x) = e^{-x^2}$

In Problems 29–32, use properties of power series to find the first five nonzero terms of the Maclaurin expansion.

- $f(x) = xe^x$
- $f(x) = xe^{-x}$
- $f(x) = e^{-x} \sin x$
- $f(x) = e^{-x} \cos x$

In Problems 33 and 34, use a Maclaurin series for  $f$  to obtain the first four nonzero terms of the Maclaurin expansion for  $g$ .

- $f(x) = \frac{1}{\sqrt{1 - x^2}}$ ;  $g(x) = \sin^{-1} x$
- $f(x) = \tan x$ ;  $g(x) = \ln(\cos x)$

In Problems 35–42, use a binomial series to represent each function, and find the interval of convergence.

- $f(x) = \sqrt{1 + x^2}$
- $f(x) = \frac{1}{\sqrt{1 - x}}$
- $f(x) = (1 + x)^{1/5}$
- $f(x) = (1 - x)^{5/3}$
- $f(x) = \frac{1}{(1 + x^2)^{1/2}}$
- $f(x) = \frac{1}{(1 + x)^{3/4}}$
- $f(x) = \frac{2x}{\sqrt{1 - x}}$
- $f(x) = \frac{x}{1 + x^3}$

## Applications and Extensions

- Find the Maclaurin expansion for  $f(x) = \sin^2 x$ .
- Find the Maclaurin expansion for  $f(x) = \cos^2 x$ .
- Obtain the Maclaurin expansion of  $\cos x$  by integrating the Maclaurin series for  $\sin x$ .
- Find the Maclaurin expansion for  $f(x) = \ln \frac{1}{1 - x}$ . Compare the result to the power series representation of  $f(x) = \ln \frac{1}{1 - x}$  found in Section 8.8, Example 8, page 607.
- Find the first five nonzero terms of the Maclaurin expansion for  $f(x) = \sec x$ .
- Probability** The **standard normal distribution**  $p(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}$  is important in probability and statistics. If a random variable  $Z$  has a standard normal distribution, then the probability that an observation of  $Z$  is between  $Z = a$  and  $Z = b$  is given by

$$P(a \leq Z \leq b) = \frac{1}{\sqrt{2\pi}} \int_a^b e^{-x^2/2} dx$$

- Find the Maclaurin expansion for  $p(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}$ .
  - Use properties of power series to find a power series representation for  $P$ .
  - Use the first four terms of the series representation for  $P$  to approximate  $P(-0.5 \leq Z \leq 0.3)$ .
- CAS** (d) Use technology to approximate  $P(-0.5 \leq Z \leq 0.3)$ .

In Problems 49–52, use a Maclaurin expansion to find each integral.

- $\int \frac{1}{1 + x^2} dx$
- $\int \sec x dx$
- $\int e^{x^{1/3}} dx$
- $\int \ln(1 + x) dx$

**53. Even Functions** Show that if  $f$  is an even function, then the Maclaurin expansion for  $f$  has only even powers of  $x$ .

**54. Odd Functions** Show that if  $f$  is an odd function, then the Maclaurin expansion for  $f$  has only odd powers of  $x$ .

**55.** Show that  $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$ , when  $m$  is a nonnegative integer, by showing that  $R_n(x) \rightarrow 0$  as  $n \rightarrow \infty$ .

**56.** Show that the series  $\sum_{k=0}^{\infty} \binom{m}{k} x^k$  converges absolutely for  $|x| < 1$  and diverges for  $|x| > 1$  if  $m < 0$ . (Hint: Use the Ratio Test.)

**57.** Show that the interval of convergence of the Maclaurin expansion for  $f(x) = \sin^{-1} x$  is  $[-1, 1]$ .

**58. Euler's Error** Euler believed  $\frac{1}{2} = 1 - 1 + 1 - 1 + 1 - 1 + \cdots$ . He based his argument to support this equation on his belief in the identification of a series and the values of the function from which it was derived.

- Write the Maclaurin expansion for  $\frac{1}{1+x}$ . Do this without calculating any derivatives.
- Evaluate both sides of the equation you derived in (a) at  $x = 1$  to arrive at the formula above.
- Criticize the procedure used in (b).

**61.** Show that  $\sum_{k=1}^{\infty} \frac{k}{(k+1)!} = 1$

**62.** Let  $s_n = \frac{1}{1!} + \frac{1}{2!} + \cdots + \frac{1}{n!}$ ,  $n = 1, 2, 3, \dots$

(a) Show that  $n! \geq 2^{n-1}$ .

(b) Show that  $0 < s_n \leq 1 + \frac{1}{2} + \left(\frac{1}{2}\right)^2 + \cdots + \left(\frac{1}{2}\right)^{n-1}$ .

(c) Show that  $0 < s_n < s_{n+1} < 2$ . Then, conclude that  $S = \lim_{n \rightarrow \infty} s_n$  and  $S \leq 2$ .

(d) Let  $t_n = \left[1 + \frac{1}{n}\right]^n$ . Show that

$$t_n = 1 + 1 + \frac{1}{2!} \left[1 - \frac{1}{n}\right] + \frac{1}{3!} \left[1 - \frac{1}{n}\right] \left[1 - \frac{2}{n}\right] + \cdots + \frac{1}{n!} \left[1 - \frac{1}{n}\right] \left[1 - \frac{2}{n}\right] \cdots \left[1 - \frac{n-1}{n}\right] < s_n + 1$$

(e) Show that  $0 < t_n < t_{n+1} < 3$ . Then, conclude that  $e = \lim_{n \rightarrow \infty} t_n \leq 3$ .

**63.** Show that  $\left[1 + \frac{1}{n}\right]^n < e$  for all  $n > 0$ .

**64.** From the fact that  $\sin t \leq t$  for all  $t \geq 0$ , use integration repeatedly to prove

$$1 - \frac{x^2}{2!} \leq \cos x \leq 1 - \frac{x^2}{2!} + \frac{x^4}{4!} \quad \text{for all } x \geq 0$$

**65.** Find the first four nonzero terms of the Maclaurin expansion for  $f(x) = (1+x)^x$ .

**66.** Show that  $f(x) = \begin{cases} e^{-1/x^2} & x \neq 0 \\ 0 & x = 0 \end{cases}$  has a Maclaurin expansion at  $x = 0$ . Then show that the Maclaurin series does not converge to  $f$ .

### Challenge Problems

**59.** Find the exact sum of the infinite series:

$$\frac{x^3}{1(3)} - \frac{x^5}{3(5)} + \frac{x^7}{5(7)} - \frac{x^9}{7(9)} + \cdots \quad \text{for } x = 1$$

**60.** Find an elementary expression for  $\sum_{k=1}^{\infty} \frac{x^{k+1}}{k(k+1)}$ .

Hint: Integrate the series for  $\ln \frac{1}{1-x}$ .

## 8.10 Approximations Using Taylor/Maclaurin Expansions

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Approximate functions and their graphs (p. 623)
- 2 Approximate the number  $e$ ; approximate logarithms (p. 625)
- 3 Approximate definite integrals (p. 627)

### 1 Approximate Functions and Their Graphs

If we know the power series representation of a function or if we know the function to which a Taylor or Maclaurin series converges, we can use the first several terms of the series to approximate both the function and its graph.

**EXAMPLE 1** Approximating  $y = \sin x$ 

- (a) Approximate  $y = \sin x$  by using the first four nonzero terms of its Maclaurin expansion.
- (b) Graph  $y = \sin x$  along with the approximation found in (a).
- (c) Use (a) to approximate  $\sin 0.1$ .
- (d) What is the error in using this approximation?

**Solution** (a) The Maclaurin expansion for  $y = \sin x$  was found in Example 3 (p. 616) of Section 8.9.

$$y = \sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots = \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!}$$

Using the first four nonzero terms of the Maclaurin expansion, we can approximate  $\sin x$  as

$$\sin x \approx x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} \quad (1)$$

DF Figure 29

- (b) The graphs of  $y = \sin x$  and the approximation in (1) are given in Figure 29.
- (c) Using (1), we get

$$\sin 0.1 \approx 0.1 - \frac{0.1^3}{3!} + \frac{0.1^5}{5!} - \frac{0.1^7}{7!} \approx 0.0998$$

- (d) Since the Maclaurin expansion for  $y = \sin x$  at  $x = 0$  is an alternating series that satisfies the conditions of the Alternating Series Test, the error  $E$  in using the first four terms as an approximation is less than or equal to the absolute value of the 5th term at  $x = 0.1$ . That is,

$$E \leq \left| \frac{0.1^9}{9!} \right| = 2.756 \times 10^{-15}$$

**NOW WORK** Problem 1.**EXAMPLE 2** Approximating  $y = \sqrt{1+x}$ 

- (a) Write the Maclaurin expansion for  $y = \sqrt{1+x}$  using a binomial series.
- (b) Approximate  $\sqrt{1+x}$  using the first five terms of the Maclaurin series.
- (c) Graph  $y = \sqrt{1+x}$  together with the first five terms of the approximation found in (b).
- (d) Comment on the graphs in (c).
- (e) Use the first five terms of the approximation for  $\sqrt{1+x}$  to approximate  $\sqrt{1.2}$ . What is the error in using this approximation?

**Solution** (a) For  $-1 \leq x \leq 1$ , we have

$$\begin{aligned} \sqrt{1+x} &= (1+x)^{1/2} = \sum_{k=0}^{\infty} \binom{\frac{1}{2}}{k} x^k \\ &= 1 + \frac{1}{2}x + \frac{\frac{1}{2} \left(-\frac{1}{2}\right)}{2!} x^2 + \frac{\frac{1}{2} \left(-\frac{1}{2}\right) \left(-\frac{3}{2}\right)}{3!} x^3 + \cdots + \binom{\frac{1}{2}}{n} x^n + \cdots \end{aligned}$$

(b) From part (a), we have

$$\sqrt{1+x} \approx 1 + \frac{1}{2}x - \frac{1}{8}x^2 + \frac{1}{16}x^3 - \frac{5}{128}x^4 \quad (2)$$

(c) The graphs of  $y = \sqrt{1+x}$  and the first five terms of the approximation in (2) are given in Figure 30.

(d) On the interval of convergence  $[-1, 1]$ , the graphs are almost identical. Outside this interval, the graphs diverge.

(e) Using (2) and  $x = 0.2$ , we have

$$\sqrt{1.2} \approx 1 + \frac{1}{2}(0.2) - \frac{1}{8}(0.2)^2 + \frac{1}{16}(0.2)^3 - \frac{5}{128}(0.2)^4 = 1.0954375$$

Since the binomial series for  $y = \sqrt{1+x}$  at  $x = 0.2$  is an alternating series that satisfies the conditions of the Alternating Series Test, the error  $E$  in using the first five terms of the series as an approximation of  $\sqrt{1.2}$  is less than or equal to the absolute value of the 6th term at  $x = 0.2$ . That is,

$$E \leq \left| \frac{\frac{1}{2} \left(-\frac{1}{2}\right) \left(-\frac{3}{2}\right) \left(-\frac{5}{2}\right) \left(-\frac{7}{2}\right)}{5!} x^5 \right| = \frac{7}{256} (0.2)^5 = 8.75 \times 10^{-6}$$

$\uparrow$   
 $x = 0.2$

Figure 30

### NOW WORK Problem 3.

## 2 Approximate the Number $e$ ; Approximate Logarithms

The important number  $e$ , the base of the natural logarithm, is an irrational number, so its decimal expansion neither terminates nor repeats. Here, we explore one way that  $e$  can be approximated. Another important irrational number is  $\pi$ . We explore several ways to approximate  $\pi$  in Problems 18, 19, and 23.

### EXAMPLE 3 Approximating $e$

Approximate  $e$  correct to within 0.000001.

**Solution** In Example 2 (p. 615) of Section 8.9, we showed that the Maclaurin series

$\sum_{k=0}^{\infty} \frac{x^k}{k!}$  converges to  $e^x$  for every number  $x$ . If  $x = 1$ , we have

$$e = e^1 = 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \cdots + \frac{1}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{1}{k!}$$

But this series converges very slowly.

For faster convergence, we can use  $x = -1$ . Then

$$e^{-1} = 1 - 1 + \frac{1}{2!} - \frac{1}{3!} + \cdots + \frac{(-1)^n}{n!} + \cdots = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!}$$

Since this series is an alternating series that satisfies the conditions of the Alternating Series Test, we can use the error estimate for an alternating series. Since we want  $e$  correct to within 0.000001, we need the error  $E < 0.000001$ . That is, we need

$$\frac{1}{n!} < 0.000001, \text{ or equivalently, } n! > 10^6. \text{ Since } 10! = 3.6288 \times 10^6 > 10^6,$$

but  $9! = 362,880 < 10^6$ , using 10 terms of the Maclaurin series will approximate  $e^{-1}$  correct to within 0.000001.

$$\sum_{k=0}^9 \frac{(-1)^k}{k!} = 1 - 1 + \frac{1}{2} - \frac{1}{3!} + \frac{1}{4!} - \frac{1}{5!} + \frac{1}{6!} - \frac{1}{7!} + \frac{1}{8!} - \frac{1}{9!} = \frac{16,687}{45,360}$$

Then

$$e = \frac{1}{e^{-1}} = \left( \frac{16,687}{45,360} \right)^{-1} \approx 2.71828$$

correct to within 0.000001. ■

### NOW WORK Problem 19.

## Approximate Logarithms

In Example 8 (p. 607) of Section 8.8, we integrated the geometric series  $\frac{1}{1-x} = \sum_{k=0}^{\infty} x^k$ , and found that

$$\ln \frac{1}{1-x} = x + \frac{x^2}{2} + \frac{x^3}{3} + \cdots + \frac{x^n}{n} + \cdots \quad (3)$$

for  $-1 \leq x < 1$ . It might appear that this expansion can be used to compute the logarithms of numbers, but the series converges only for  $-1 \leq x < 1$ , and unless  $x$  is close to 0, the series converges so slowly that too many terms would be required for practical use.

A more useful formula for computing logarithms is obtained by multiplying (3) by  $(-1)$  and using the fact that  $-\ln \frac{1}{A} = \ln \left( \frac{1}{A} \right)^{-1} = \ln A$ . Then

$$\ln(1-x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \cdots \quad (4)$$

Now we replace  $x$  by  $-x$ . The result is

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \cdots \quad (5)$$

Subtracting (4) from (5), we obtain

$$\ln \frac{1+x}{1-x} = 2 \left( x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots \right) \quad (6)$$

This series converges for  $-1 < x < 1$ .

If  $N$  is a positive integer, let  $x = \frac{1}{2N+1}$ . Then  $0 < x < 1$ , and

$$\frac{1+x}{1-x} = \frac{1 + \frac{1}{2N+1}}{1 - \frac{1}{2N+1}} = \frac{2N+1+1}{2N+1-1} = \frac{N+1}{N}$$

Substituting into (6), we obtain

$$\ln \frac{N+1}{N} = 2 \left( x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots \right)$$

Since  $x = \frac{1}{2N+1}$ ,

$$\ln(N+1) = \ln N + 2 \left[ \frac{1}{2N+1} + \frac{1}{3} \left( \frac{1}{2N+1} \right)^3 + \frac{1}{5} \left( \frac{1}{2N+1} \right)^5 + \cdots \right] \quad (7)$$

This series converges for all positive integers  $N$ .

**EXAMPLE 4** Approximating a Logarithm

- (a) Approximate  $\ln 2$  using the first three terms of (7).  
 (b) Approximate  $\ln 3$  using the first three terms of (7).

**Solution** (a) In (7), we let  $N = 1$  and use the first three terms of the series; then

$$\ln 2 \approx 2 \left[ \frac{1}{3} + \frac{1}{3} \left( \frac{1}{3} \right)^3 + \frac{1}{5} \left( \frac{1}{3} \right)^5 \right] \approx 0.693004$$

(The first three terms of this series approximates  $\ln 2$  correct to within 0.001.)

- (b) To find  $\ln 3$ , let  $N = 2$  and use  $\ln 2 = 0.693004$  in (7).

$$\begin{aligned} \ln 3 &\approx \ln 2 + 2 \left[ \frac{1}{5} + \frac{1}{3} \left( \frac{1}{5} \right)^3 + \frac{1}{5} \left( \frac{1}{5} \right)^5 \right] \\ &\approx 0.693004 + 2 \left[ \frac{1}{5} + \frac{1}{3} \left( \frac{1}{5} \right)^3 + \frac{1}{5} \left( \frac{1}{5} \right)^5 \right] \approx 1.098465 \end{aligned}$$

Continuing in this way, a table of natural logarithms can be formed.

**NOW WORK** Problem 15.**3 Approximate Definite Integrals**

We have already discussed the approximation of definite integrals using Riemann sums, the trapezoidal rule, and Simpson's rule. Taylor/Maclaurin series can also be used to approximate definite integrals.

**EXAMPLE 5** Using a Maclaurin Expansion to Approximate an Integral

Use a Maclaurin expansion to approximate  $\int_0^{1/2} e^{-x^2} dx$  correct to within 0.001.

**Solution** Replace  $x$  by  $-x^2$  in the Maclaurin expansion for  $e^x$  to obtain the Maclaurin expansion for  $e^{-x^2}$ .

$$\begin{aligned} e^x &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \\ e^{-x^2} &= 1 - x^2 + \frac{x^4}{2!} - \frac{x^6}{3!} + \frac{x^8}{4!} - \dots \end{aligned}$$

Now use the integration property of power series.

$$\begin{aligned} \int_0^{1/2} e^{-x^2} dx &= \int_0^{1/2} \left( 1 - x^2 + \frac{x^4}{2!} - \frac{x^6}{3!} + \dots \right) dx \\ &= \left[ x - \frac{x^3}{3} + \frac{x^5}{2!5} - \frac{x^7}{3!7} + \dots \right]_0^{1/2} \\ &= \frac{1}{2} - \frac{1}{3(2)^3} + \frac{1}{2!5(2)^5} - \frac{1}{3!7(2)^7} + \dots \\ &\approx 0.5 - 0.041666 + 0.003125 - 0.000186 + \dots \end{aligned}$$

Since this series satisfies the two conditions of the Alternating Series Test, the error due to using the first three terms as an approximation is less than the 4th term,

$$\frac{1}{3!7(2)^7} = 1.860119048 \times 10^{-4}. \text{ So,}$$

$$\int_0^{1/2} e^{-x^2} dx \approx \frac{1}{2} - \frac{1}{3(2)^3} + \frac{1}{2!5(2)^5} \approx 0.461458$$

correct to within 0.001. ■

### NOW WORK Problem 9.

Notice that only three terms were needed to obtain the desired accuracy. To obtain this same accuracy using Simpson's rule or the trapezoidal rule would have required a very fine partition of  $\left[0, \frac{1}{2}\right]$ . In practice, efficiency of technique is an important consideration for solving numerical problems.

## 8.10 Assess Your Understanding

### Skill Building

- (a) Approximate  $y = \cos x$  by using the first four nonzero terms of its Maclaurin expansion.

(b) Graph  $y = \cos x$  along with the approximation found in (a).

(c) Use the approximation in (a) to approximate  $\cos \frac{\pi}{90}$ , ( $2^\circ$ ).

(d) What is the error in using this approximation?

(e) If the approximation in (a) is used, for what values of  $x$  is the error less than 0.0001?
- (a) Approximate  $y = e^x$  by using the first four nonzero terms of its Maclaurin expansion.

(b) Graph  $y = e^x$  along with the approximation found in (a).

(c) Use the approximation in (a) to approximate  $e^{1/2}$ .

(d) What is the error in using this approximation?

(e) If the approximation in (a) is used, for what values of  $x$  is the error less than 0.0001?
- (a) Represent the function  $f(x) = \sqrt[3]{1+x}$  as a Maclaurin series.

(b) What is the interval of convergence?

(c) Approximate  $y = \sqrt[3]{1+x}$  using the first five terms of its Maclaurin series.

- (d) Graph  $y = \sqrt[3]{1+x}$  along with the approximation found in (c).
- (e) Comment on the graphs in (d) and the result of the approximation.
- (f) Use the result from (c) to approximate  $\sqrt[3]{0.9}$ . What is the error in using this approximation?
- (a) Represent  $y = \frac{1}{\sqrt{4+x}}$  as a Maclaurin series.

(b) What is the interval of convergence?

(c) Approximate  $y = \frac{1}{\sqrt{4+x}}$  using the first four terms of its Maclaurin series.

- (d) Graph  $y = \frac{1}{\sqrt{4+x}}$  along with the approximation found in (c).

- (e) Comment on the graphs in (d) and the result of the approximation.
- (f) Use the result from (c) to approximate  $\frac{1}{\sqrt{4.2}}$ . What is the error in using this approximation?

- (a) Represent  $y = \tan^{-1} x$  as a Maclaurin series.

(b) What is the interval of convergence?

(c) Approximate  $y = \tan^{-1} x$  using the first five nonzero terms of its Maclaurin series.

- (d) Graph  $y = \tan^{-1} x$  along with the approximation found in (c).

- (e) Comment on the graphs in (d) and the result of the approximation.

- (a) Represent  $y = \frac{1}{1-x}$  as a Maclaurin series.

(b) What is the interval of convergence?

(c) Approximate  $y = \frac{1}{1-x}$  using the first four nonzero terms of its Maclaurin series.

- (d) Graph  $y = \frac{1}{1-x}$  along with the approximation found in (c).

- (e) Comment on the graphs in (d) and the result of the approximation.

In Problems 7–14, use properties of power series to approximate each integral using the first four terms of a Maclaurin series.

7.  $\int_0^1 \sin x^2 dx$

8.  $\int_0^1 \cos x^2 dx$

9.  $\int_0^1 \frac{x^2}{1 + \cos x} dx$

10.  $\int_0^{0.1} \frac{x}{\ln(2+x)} dx$

11.  $\int_0^{0.2} \sqrt[3]{1+x^4} dx$
12.  $\int_0^{1/2} \sqrt[3]{1+x} dx$
13.  $\int_0^{1/2} \frac{1}{\sqrt[3]{1+x^2}} dx$
14.  $\int_0^{0.2} \frac{1}{\sqrt{1+x^3}} dx$

### Applications and Extensions

15. Use the recursive formula (7) for  $\ln(N+1)$  to show  $\ln 4 \approx 1.38629$ .
16. (a) Write the first three nonzero terms and the general term of the Maclaurin series for  $f(x) = 3 \sin\left(\frac{x}{2}\right)$ .
- (b) What is the interval of convergence for the series found in (a)?
- (c) What is the minimum number of terms of the series in (a) that are necessary to approximate  $f$  on the interval  $(-2, 2)$  with an error less than or equal to 0.1?
17. **Calculators Are Perfect, Right?** They always get the right answer with what looks like little or no effort at all. This is very misleading because calculators use a lot of the ideas learned in this chapter to obtain these answers. One advantage we have over a calculator is that we can approximate answers up to any accuracy we choose. So let's prove you are smarter than any calculator by approximating each of the following correct to within 0.001 using a Maclaurin series.
- (a)  $F(x) = \sin x, \quad x = 4^\circ$
- (b)  $F(x) = \cos x, \quad x = 15^\circ$
- (c)  $F(x) = \tan^{-1} x, \quad x = 0.05$

**Source:** Contributed by the students at Lander University, Greenwood, SC.

18. **Leibniz Formula for  $\pi$**  Leibniz derived the following formula for  $\frac{\pi}{4}$ :  $\frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \cdots$ .
- (a) Find  $\int_0^1 \frac{1}{1+x^2} dx$ .
- (b) Expand the integrand in (a) into a power series and integrate it term-by-term to get Leibniz's formula.
- (c) Find the sum of the first 10 terms in the above series. Does it appear that Leibniz's formula is useful for approximating  $\pi$ ?
- (d) How many terms are required to approximate  $\pi$  correct to 10 decimal places?

19. **Approximating  $\pi$**  The series approximation of  $\pi$  using Gregory's series converges very slowly. (See Problem 82, Section 8.8, p. 611.) A more rapidly convergent series is obtained by using the identity

$$\tan^{-1} 1 = \tan^{-1}\left(\frac{1}{2}\right) + \tan^{-1}\left(\frac{1}{3}\right)$$

Use  $x = \frac{1}{2}$  and  $x = \frac{1}{3}$  in **Gregory's series**, together with this identity, to approximate  $\pi$  using the first four terms.

20. **Faster than light?** At low speeds, the kinetic energy  $K$ , that is, the energy due to the motion of an object of mass  $m$  and speed  $v$ , is given by the formula  $K = K(v) = \frac{1}{2}mv^2$ . But this formula is only an approximation to the general formula, and works only for speeds much less than the speed of light,  $c$ . The general formula, which holds for all speeds, is

$$K_{\text{gen}}(v) = mc^2 \left( \frac{1}{\sqrt{1 - \frac{v^2}{c^2}}} - 1 \right)$$

The formula for  $K$  was used very successfully for many years before Einstein arrived at the general formula, so  $K$  must be essentially correct for low speeds. Use a binomial expansion to show that  $\frac{1}{2}mv^2$  is a first approximation to  $K_{\text{gen}}$  for  $v$  close to 0.

### Challenge Problems

21. Let  $a_k = (-1)^{k+1} \int_0^{\pi/k} \sin(kx) dx$ .
- (a) Find  $a_k$ .
- (b) Show that the infinite series  $\sum_{k=1}^{\infty} a_k$  converges.
- (c) Show that  $1 \leq \sum_{k=1}^{\infty} a_k \leq \frac{3}{2}$ .
22. Find the Maclaurin expansion for  $f(x) = xe^{x^3}$ .
23. (a) Use the Maclaurin expansion for  $f(x) = \sin^{-1} x$  to find numerical series for  $\frac{\pi}{2}$  and for  $\frac{\pi}{6}$ .
- (b) Use the result of (a) to approximate  $\frac{\pi}{2}$  correct to within 0.001.
- (c) Use the result of (a) to approximate  $\frac{\pi}{6}$  correct to within 0.001.

# Chapter Review

## THINGS TO KNOW

### 8.1 Sequences

#### Definitions:

- A sequence is a function whose domain is the set of positive integers and whose range is a subset of real numbers. (p. 538)
- $n$ th term of a sequence (p. 538)
- Limit of a sequence (p. 541)
- Convergence; divergence of a sequence (p. 541)
- Related function of a sequence (p. 543)
- Divergence of a sequence to infinity (p. 545)
- Bounded sequence (p. 546)
- Monotonic sequence (p. 548)

#### Properties of a Convergent Sequence: (p. 542)

If  $\{s_n\}$  and  $\{t_n\}$  are convergent sequences and if  $c$  is a number, then

- Constant multiple property:  $\lim_{n \rightarrow \infty} (cs_n) = c \lim_{n \rightarrow \infty} s_n$
- Sum and difference properties:  

$$\lim_{n \rightarrow \infty} (s_n \pm t_n) = \lim_{n \rightarrow \infty} s_n \pm \lim_{n \rightarrow \infty} t_n$$
- Product property:  $\lim_{n \rightarrow \infty} (s_n \cdot t_n) = \left( \lim_{n \rightarrow \infty} s_n \right) \left( \lim_{n \rightarrow \infty} t_n \right)$
- Quotient property:  $\lim_{n \rightarrow \infty} \frac{s_n}{t_n} = \frac{\lim_{n \rightarrow \infty} s_n}{\lim_{n \rightarrow \infty} t_n}$   
 provided  $\lim_{n \rightarrow \infty} t_n \neq 0$
- Power property:  $\lim_{n \rightarrow \infty} s_n^p = \left[ \lim_{n \rightarrow \infty} s_n \right]^p$   
 where  $p \geq 2$  is an integer
- Root property:  $\lim_{n \rightarrow \infty} \sqrt[p]{s_n} = \sqrt[p]{\lim_{n \rightarrow \infty} s_n}$ ,  
 where  $p \geq 2$  and  $s_n \geq 0$  if  $p$  is even

#### Theorems:

- Let  $\{s_n\}$  be a sequence of real numbers. If  $\lim_{n \rightarrow \infty} s_n = L$  and if  $f$  is a function that is continuous at  $L$  and is defined for all numbers  $s_n$ , then  $\lim_{n \rightarrow \infty} f(s_n) = f(L)$ . (p. 543)
- The Squeeze Theorem for sequences (p. 545)
- A convergent sequence is bounded (p. 547)
- If a sequence is not bounded from above or if it is not bounded from below, then it diverges. (p. 547)
- An increasing (or nondecreasing) sequence  $\{s_n\}$  that is bounded from above converges. (p. 549)
- A decreasing (or nonincreasing) sequence  $\{s_n\}$  that is bounded from below converges. (p. 549)
- Let  $\{s_n\}$  be a sequence and let  $f$  be a related function of  $\{s_n\}$ . Suppose  $L$  is a real number.  
 If  $\lim_{x \rightarrow \infty} f(x) = L$ , then  $\lim_{n \rightarrow \infty} s_n = L$ . (p. 544)
- The sequence  $\{r^n\}$ , where  $r$  is a real number,
  - converges to 0, for  $-1 < r < 1$ .
  - converges to 1, for  $r = 1$ .
  - diverges for all other numbers (p. 546).

**Procedure:** Ways to show a sequence is monotonic (p. 548)

**Summary:** How to determine if a sequence converges (p. 550)

### 8.2 Infinite Series

- If  $a_1, a_2, \dots, a_n, \dots$  is an infinite collection of numbers, the expression  $\sum_{k=1}^{\infty} a_k = a_1 + a_2 + \dots + a_n + \dots$  is called an infinite series or, simply, a series. (p. 554)
- $n$ th term or general term of a series (p. 554)
- Partial sum  $S_n = \sum_{k=1}^n a_k$ , where  $S_n$  is the sum of the first  $n$  terms of the series  $\sum_{k=1}^{\infty} a_k$  (p. 554)
- Convergence, divergence of a series (p. 555)
- Geometric series  $\sum_{k=1}^{\infty} ar^{k-1} = a + ar + ar^2 + \dots, a \neq 0$  (p. 557)  
 $\sum_{k=1}^{\infty} ar^{k-1}$  converges if  $|r| < 1$ , and its sum is  $\frac{a}{1-r}$   
 $\sum_{k=1}^{\infty} ar^{k-1}$  diverges if  $|r| \geq 1$ . (p. 558)
- Harmonic series  $\sum_{k=1}^{\infty} \frac{1}{k} = 1 + \frac{1}{2} + \frac{1}{3} + \dots$  (p. 561)  
 The harmonic series diverges. (p. 561)

**Summary:** Series and convergence of series (p. 561)

### 8.3 Properties of Series; the Integral Test

- If the series  $\sum_{k=1}^{\infty} a_k$  converges, then  $\lim_{n \rightarrow \infty} a_n = 0$ . (p. 566)
- The Test for Divergence:  
 The infinite series  $\sum_{k=1}^{\infty} a_k$  diverges if  $\lim_{n \rightarrow \infty} a_n \neq 0$ . (p. 566)
- If two infinite series are identical after a certain term, then either both series converge or both series diverge. If both series converge, they do not necessarily have the same sum. (p. 567)
- The General Convergence Test (p. 569)
- The Integral Test (p. 569)
- A  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^p} = 1 + \frac{1}{2^p} + \frac{1}{3^p} + \dots + \frac{1}{n^p} + \dots$ , where  $p$  is a positive real number. (p. 570) The  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^p}$  converges if  $p > 1$  and diverges if  $0 < p \leq 1$ . (p. 571)
- Bounds on the sum of a  $p$ -series:  
 If  $p > 1$ , then  $\frac{1}{p-1} < \sum_{k=1}^{\infty} \frac{1}{k^p} < 1 + \frac{1}{p-1}$ . (p. 572)

**Properties of Convergent Series:** If  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are two convergent series and if  $c \neq 0$  is a number, then

- Sum and difference properties:

$$\sum_{k=1}^{\infty} (a_k \pm b_k) = \sum_{k=1}^{\infty} a_k \pm \sum_{k=1}^{\infty} b_k \quad (\text{p. 568})$$

- Constant multiple property:

$$\sum_{k=1}^{\infty} (ca_k) = c \sum_{k=1}^{\infty} a_k \quad (\text{p. 568})$$

- If  $\sum_{k=1}^{\infty} a_k$  diverges, then  $\sum_{k=1}^{\infty} (ca_k)$  also diverges. (p. 568)

## 8.4 Comparison Tests

### Theorems:

- Comparison Test for Convergence: If  $0 < a_k \leq b_k$ , for all  $k$ , and  $\sum_{k=1}^{\infty} b_k$  converges, then  $\sum_{k=1}^{\infty} a_k$  converges. (p. 576)
- Comparison Test for Divergence: If  $0 < c_k \leq a_k$ , for all  $k$ , and  $\sum_{k=1}^{\infty} c_k$  diverges, then  $\sum_{k=1}^{\infty} a_k$  diverges. (p. 576)
- Limit Comparison Test: Suppose  $\sum_{k=1}^{\infty} a_k$  and  $\sum_{k=1}^{\infty} b_k$  are both series of positive terms. If  $\lim_{n \rightarrow \infty} \frac{a_n}{b_n} = L$ ,  $0 < L < \infty$ , then both series converge or both diverge. (p. 577)

**Summary:** Table 3: Series often used for comparisons (p. 579)

## 8.5 Alternating Series; Absolute Convergence

### Definitions:

- Alternating series (p. 582)
- A series  $\sum_{k=1}^{\infty} a_k$  is absolutely convergent if the series  $\sum_{k=1}^{\infty} |a_k|$  is convergent. (p. 585)
- A series that is convergent without being absolutely convergent is conditionally convergent. (p. 587)

### Theorems:

- Alternating Series Test: (p. 582)
- Error estimate (p. 584)
- Absolute Convergence Test: If a series  $\sum_{k=1}^{\infty} a_k$  is absolutely convergent, then it is convergent. (p. 586)

**Properties of Absolutely Convergent and Conditionally Convergent series:** (p. 588)

- The alternating harmonic series  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k}$  converges. (p. 583).

## 8.6 Ratio Test, Root Test

- Ratio Test (p. 591)
- Root Test (p. 593)

## 8.7 Summary of Tests

- Guide for choosing a test (p. 597)
- Tests for convergence and divergence (Table 5; pp. 597–598)

## 8.8 Power Series

### Definitions:

- Power series:  $\sum_{k=0}^{\infty} a_k x^k$  or  $\sum_{k=0}^{\infty} a_k (x - c)^k$ , where  $c$  is a constant. (p. 600)
- Radius of convergence (p. 602)
- Interval of convergence (p. 602)

### Theorems:

- If a power series centered at 0 converges for a number  $x_0 \neq 0$ , then it converges absolutely for all numbers  $x$  for which  $|x| < |x_0|$ . (p. 602)
- If a power series centered at 0 diverges for a number  $x_1$ , then it diverges for all numbers  $x$  for which  $|x| > |x_1|$ . (p. 602)
- For a power series centered at  $c$ , exactly one of the following is true (p. 602):
  - The series converges for only  $x = c$ .
  - The series converges absolutely for all  $x$ .
  - There is a positive number  $R$  for which the series converges absolutely for all  $x$ ,  $|x - c| < R$ , and diverges for all  $x$ ,  $|x - c| > R$ .

**Properties of Power Series:** (p. 606)

Let  $f(x) = \sum_{k=0}^{\infty} a_k x^k$  be a power series in  $x$  having a nonzero radius of convergence  $R$ .

- Continuity property:

$$\lim_{x \rightarrow x_0} \left( \sum_{k=0}^{\infty} a_k x^k \right) = \sum_{k=0}^{\infty} \left( \lim_{x \rightarrow x_0} a_k x^k \right) = \sum_{k=0}^{\infty} a_k x_0^k$$

- Differentiation property:

$$\frac{d}{dx} \left( \sum_{k=0}^{\infty} a_k x^k \right) = \sum_{k=0}^{\infty} \left( \frac{d}{dx} a_k x^k \right) = \sum_{k=1}^{\infty} k a_k x^{k-1}$$

- Integration property:

$$\int_0^x \left( \sum_{k=0}^{\infty} a_k t^k \right) dt = \sum_{k=0}^{\infty} \left( \int_0^x a_k t^k dt \right) = \sum_{k=0}^{\infty} \frac{a_k x^{k+1}}{k+1}$$

## 8.9 Taylor Series; Maclaurin Series

### Theorems:

- Taylor series: (p. 613)

$$\begin{aligned} f(x) &= f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 \\ &\quad + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \cdots = \sum_{k=0}^{\infty} \frac{f^{(k)}(c)}{k!}(x - c)^k \end{aligned}$$

- Maclaurin series (p. 613)

$$\begin{aligned} f(x) &= f(0) + f'(0)x + \frac{f''(0)x^2}{2!} + \cdots + \frac{f^{(n)}(0)x^n}{n!} + \cdots \\ &= \sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!} x^k \end{aligned}$$

- Taylor's formula with remainder (p. 614)
- Convergence of a Taylor series (p. 615)
- Binomial series (p. 620)
- Convergence of a binomial series (p. 620)

## 8.10 Approximations Using Taylor/Maclaurin Expansions (pp. 623–628)

## OBJECTIVES

| Section | You should be able to ...                                                             | Example | Review Exercises |
|---------|---------------------------------------------------------------------------------------|---------|------------------|
| 8.1     | 1 Write the terms of a sequence (p. 539)                                              | 1, 2    | 1, 2             |
|         | 2 Find the $n$ th term of a sequence (p. 539)                                         | 3, 4    | 3                |
|         | 3 Use properties of convergent sequences (p. 542)                                     | 5, 6    | 4, 5             |
|         | 4 Use a related function or the Squeeze Theorem to show a sequence converges (p. 543) | 7–10    | 6, 7             |
|         | 5 Determine whether a sequence converges or diverges (p. 545)                         | 11–15   | 8–13             |
| 8.2     | 1 Determine whether a series has a sum (p. 554)                                       | 1–3     | 14, 15           |
|         | 2 Analyze a geometric series (p. 557)                                                 | 4–6     | 17–20            |
|         | 3 Analyze the harmonic series (p. 561)                                                |         | 16               |
| 8.3     | 1 Use the Test for Divergence (p. 567)                                                | 1       | 21               |
|         | 2 Work with properties of series (p. 567)                                             | 2       | 25–27            |
|         | 3 Use the Integral Test (p. 569)                                                      | 3–5     | 22, 23           |
|         | 4 Analyze a $p$ -series (p. 570)                                                      | 6       | 24               |
| 8.4     | 1 Use Comparison Tests for Convergence and Divergence (p. 576)                        | 1, 2    | 28               |
|         | 2 Use the Limit Comparison Test (p. 577)                                              | 3, 4    | 28–30            |
| 8.5     | 1 Determine whether an alternating series converges (p. 583)                          | 1, 2    | 31–33            |
|         | 2 Approximate the sum of a convergent alternating series (p. 584)                     | 3       | 31–33            |
|         | 3 Determine whether a series converges (p. 586)                                       | 4–6     | 34–37            |
| 8.6     | 1 Use the Ratio Test (p. 591)                                                         | 1, 2    | 38, 39           |
|         | 2 Use the Root Test (p. 593)                                                          | 3, 4    | 40, 41           |
| 8.7     | 1 Choose an appropriate test to determine whether a series converges (p. 596)         |         | 42–52            |
| 8.8     | 1 Determine whether a power series converges (p. 600)                                 | 1       | 53(a)–58(a)      |
|         | 2 Find the interval of convergence of a power series (p. 603)                         | 2–4     | 53(b)–58(b)      |
|         | 3 Define a function using a power series (p. 604)                                     | 5, 6    | 59, 60           |
|         | 4 Use properties of power series (p. 606)                                             | 7–9     | 61               |
| 8.9     | 1 Express a function as a Taylor series or a Maclaurin series (p. 613)                | 1       | 64               |
|         | 2 Determine the convergence of a Taylor/Maclaurin series (p. 614)                     | 2       |                  |
|         | 3 Find Taylor/Maclaurin expansions (p. 616)                                           | 3–7     | 62, 63, 65, 66   |
|         | 4 Work with a binomial series (p. 619)                                                | 8–10    | 67–69            |
| 8.10    | 1 Approximate functions and their graphs (p. 623)                                     | 1, 2    | 70               |
|         | 2 Approximate the number $e$ ; approximate logarithms (p. 625)                        | 3, 4    | 71               |
|         | 3 Approximate definite integrals (p. 627)                                             | 5       | 72, 73           |

## REVIEW EXERCISES

In Problems 1 and 2, the  $n$ th term of a sequence  $\{s_n\}$  is given. Write the first five terms of each sequence.

1.  $s_n = \frac{(-1)^{n+1}}{n^4}$       2.  $s_n = \frac{2^n}{3^n}$

3. Find an expression for the  $n$ th term of the sequence,  $2, -\frac{3}{2}, \frac{9}{8}, -\frac{27}{32}, \frac{81}{128}, \dots$ , assuming the indicated pattern continues for all  $n$ .

In Problems 4 and 5, use properties of convergent sequences to find the limit of each sequence.

4.  $\left\{1 + \frac{n}{n^2 + 1}\right\}$       5.  $\left\{\ln \frac{n+2}{n}\right\}$

In Problems 6 and 7, use a related function or the Squeeze Theorem for sequences to show each sequence converges. Find its limit.

6.  $\{\tan^{-1} n\}$       7.  $\left\{\frac{(-1)^n}{(n+1)^2}\right\}$

8. Determine if the sequence  $\left\{\frac{e^n}{(n+2)^2}\right\}$  is monotonic. If it is monotonic, is it increasing, nondecreasing, decreasing, or nonincreasing? Is it bounded from above and/or from below? Does it converge?

In Problems 9–12, determine whether each sequence converges or diverges. If it converges, find its limit.

9.  $\{n!\}$       10.  $\left\{\left(\frac{5}{8}\right)^n\right\}$

11.  $\left\{\left(-\frac{1}{2}\right)^n\right\}$       12.  $\{(-1)^n + e^{-n}\}$

13. Show that sequence  $\left\{1 + \frac{2}{n}\right\}$  converges by showing it is either bounded from above and increasing or is bounded from below and decreasing.

14. Find the fifth partial sum of  $\sum_{k=1}^{\infty} \frac{(-1)^k}{4^{k-1}}$ .
15. Find the sum of the telescoping series  $\sum_{k=1}^{\infty} \left( \frac{4}{k+4} - \frac{4}{k+5} \right)$ .

In Problems 16–19, determine whether each series converges or diverges. If it converges, find its sum.

16.  $\sum_{k=1}^{\infty} \frac{\cos^2(k\pi)}{k}$       17.  $\sum_{k=1}^{\infty} -(\ln 2)^k$

18.  $\sum_{k=0}^{\infty} \frac{e}{3^k}$       19.  $\sum_{k=1}^{\infty} (4^{1/3})^k$

20. Express 0.123123123... as a rational number using a geometric series.
21. Show that the series  $\sum_{k=1}^{\infty} \frac{3k-2}{k}$  diverges.

In Problems 22 and 23, use the Integral Test to determine whether each series converges or diverges.

22.  $\sum_{k=1}^{\infty} \frac{\ln k}{k^2}$       23.  $\sum_{k=1}^{\infty} \frac{1}{4k^2+9}$

24. Determine whether the  $p$ -series  $\sum_{k=1}^{\infty} \frac{1}{k^{5/2}}$  converges or diverges. If it converges, find bounds for the sum.

In Problems 25–27, determine whether each series converges or diverges.

25.  $\sum_{k=5}^{\infty} \left[ \frac{1}{k^5} \cdot \frac{1}{2^k} \right]$       26.  $\sum_{k=1}^{\infty} \left[ \frac{3}{5^k} - \left( \frac{2}{3} \right)^{k-1} \right]$       27.  $\sum_{k=1}^{\infty} \frac{3}{k^5}$

In Problems 28–30, use a Comparison Test to determine whether each series converges or diverges.

28.  $\sum_{k=1}^{\infty} \frac{1}{\sqrt{k+1}}$       29.  $\sum_{k=1}^{\infty} \frac{k+1}{k^{k+1}}$       30.  $\sum_{k=1}^{\infty} \frac{4}{k^3}$

In Problems 31–33, determine whether each alternating series converges or diverges. If the series converges, approximate the sum of each series correct to within 0.001.

31.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+2}{k(k+1)}$       32.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k^2}{e^k}$

33.  $\sum_{k=1}^{\infty} (-1)^k \frac{3}{\sqrt[3]{k}}$

In Problems 34–37, determine whether each series converges (absolutely or conditionally) or diverges.

34.  $\sum_{k=1}^{\infty} \sin\left(\frac{\pi}{2}k\right)$       35.  $\sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{\sqrt{k}}$       36.  $\sum_{k=1}^{\infty} \frac{\cos k}{k^3}$

37.  $\frac{1}{2} - \frac{4}{2^3+1} + \frac{9}{3^3+1} - \frac{16}{4^3+1} + \cdots$

In Problems 38 and 39, use the Ratio Test to determine whether each series converges or diverges.

38.  $\sum_{k=1}^{\infty} \frac{2^k}{k!}$       39.  $\sum_{k=1}^{\infty} \frac{k!}{e^{k^2}}$

In Problems 40 and 41, use the Root Test to determine whether each series converges or diverges.

40.  $\sum_{k=1}^{\infty} \frac{2^k}{(k+3)^{k+1}}$       41.  $\sum_{k=1}^{\infty} (-1)^k (e^{-k} - 1)^k$

In Problems 42–52, determine whether each series converges or diverges.

42.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{2^{k+1}}{3^k}$       43.  $\sum_{k=1}^{\infty} \ln\left(1 + \frac{1}{k}\right)$

44.  $\sum_{k=5}^{\infty} \frac{3}{k\sqrt{k-4}}$       45.  $\sum_{k=1}^{\infty} \frac{1}{\left(1 + \frac{k^2+1}{k^2}\right)^k}$

46.  $\sum_{k=1}^{\infty} \frac{2 \cdot 4 \cdot 6 \cdots (2k)}{1 \cdot 3 \cdot 5 \cdots (2k-1)}$       47.  $\sum_{k=1}^{\infty} \frac{k^2}{(1+k^3) \ln \sqrt[3]{1+k^3}}$

48.  $\sum_{k=1}^{\infty} \frac{k^{10}}{2^k}$       49.  $\sum_{k=1}^{\infty} \frac{\left(1 + \frac{1}{k^2}\right)^{k^2}}{2^k}$

50.  $\sum_{k=1}^{\infty} \left(\frac{k^2+1}{k}\right)^k$       51.  $\sum_{k=1}^{\infty} \frac{k!}{3k^k}$

52.  $\sum_{k=1}^{\infty} (-1)^{k+1} \frac{k+2}{3k-2}$

In Problems 53–58,

- (a) Find the radius of convergence of each power series.  
 (b) Find the interval of convergence of each power series.

53.  $\sum_{k=1}^{\infty} \frac{(x-3)^{3k-1}}{k^2}$       54.  $\sum_{k=1}^{\infty} \frac{x^k}{\sqrt[3]{k}}$

55.  $\sum_{k=0}^{\infty} (-1)^k \frac{1}{k!(k+1)} \left(\frac{x}{2}\right)^{2k+1}$       56.  $\sum_{k=1}^{\infty} \frac{k^k}{(k!)^2} x^k$

57.  $\sum_{k=1}^{\infty} \frac{(x-1)^k}{k}$       58.  $\sum_{k=0}^{\infty} \frac{3^k x^k}{5^k}$

In Problems 59 and 60, express each function as a power series centered at 0.

59.  $f(x) = \frac{2}{x+3}$       60.  $f(x) = \frac{1}{1-3x}$

61. (a) Use properties of a power series to find the power series representation for  $\int \frac{1}{1-3x^2} dx$ .

- (b) Use (a) to approximate  $\int_0^{1/2} \frac{1}{1-3x^2} dx$  correct to within 0.001.

62. Find the Taylor expansion of  $f(x) = \frac{1}{1-2x}$  about  $c = 1$ .
63. Find the Taylor expansion of  $f(x) = e^{x/2}$  about  $c = 1$ .
64. Find the Maclaurin expansion of  $f(x) = 2x^3 - 3x^2 + x + 5$ . Comment on the result.
65. Find the Taylor expansion of  $f(x) = \tan x$  about  $c = \frac{\pi}{4}$ .
66. Find the first five terms of the Maclaurin expansion for  $f(x) = e^{-x} \sin x$ .

In Problems 67–69, use a binomial series to represent each function. Then determine its interval of convergence.

67.  $f(x) = \frac{1}{(x+1)^4}$       68.  $f(x) = \sqrt[3]{x^2-1}$
69.  $f(x) = \frac{1}{\sqrt{1-x}}$

70. (a) Approximate  $y = \cos x$  by using the first four nonzero terms of the Taylor expansion for  $y = \cos x$  about  $\frac{\pi}{2}$ .  
 (b) Graph  $y = \cos x$  along with the Taylor expansion found in (a).  
 (c) Use (a) to approximate  $\cos 88^\circ$ .  
 (d) What is the error in using this approximation?  
 (e) If the approximation in (a) is used, for what values of  $x$  is the error less than 0.0001?
71. Use the Maclaurin expansion for  $f(x) = e^x$  to approximate  $e^{0.3}$  correct to three decimal points.

In Problems 72 and 73, use properties of power series to approximate each integral using the first four terms of a Maclaurin series.

72.  $\int_0^{1/2} \frac{dx}{\sqrt{1-x^3}}$       73.  $\int_0^{1/2} e^{x^2} dx$

## CHAPTER 8 PROJECT

### How Calculators Calculate

The sine function is used in many scientific applications, so a calculator/computer must be able to evaluate it with lightning-fast speed.

While we know how to find the exact value of the sine function for many numbers, such as  $0$ ,  $\frac{\pi}{6}$ ,  $\frac{\pi}{2}$ ,

and so on, we have no methodology for finding the exact value of  $\sin 3$  (which should be close to  $\sin \pi$ ) or  $\sin 1.5$  (which should be close to  $\sin \frac{\pi}{2}$ ). Since the sine function can be evaluated at any real number, we first use some of its properties to restrict its domain to something more manageable.

1. Explain why we can evaluate  $\sin x$  for any  $x$  using only the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ . (We could restrict that domain further, but this will work for now. See Problem 6 below.)
2. Use the Maclaurin expansion for  $\sin x$  to find an approximation for  $\sin \frac{1}{2}$  correct to within  $10^{-5}$ . Compare your approximation to the one your calculator/computer provides. How many terms of the series do you need to obtain this accuracy?
3. Find an approximation for  $\sin \frac{3}{2}$  correct to within  $10^{-5}$ . How many terms of the series do you need to obtain this accuracy?
4. Explain why the approximation in Problem 3 requires more terms than that of Problem 2.
5. Represent  $\sin x$  as a Taylor expansion about  $\frac{\pi}{4}$ .

6. Explain why we can evaluate  $\sin x$  for any  $x$  using only the interval  $\left[0, \frac{\pi}{2}\right]$ .
7. Use the result of Problem 5 to find an approximation for  $\sin \frac{1}{2}$  correct to within  $10^{-5}$ . Compare the result with the values your calculator/computer supplies for  $\sin \frac{1}{2}$ , as well as with the result from the Maclaurin approximation obtained in Problem 2. How many terms of the series do you need for the approximation?
8. Use the Taylor expansion to find an approximation for  $\sin \frac{3}{2}$  correct to within  $10^{-5}$ . Compare the result with the value your calculator/computer supplies for  $\sin \frac{3}{2}$ , as well as with the result from the Maclaurin approximation obtained in Problem 3. How many terms of the series do you need for the approximation?

The answers to Problems 3 and 8 reveal why Maclaurin series or Taylor series are not used to approximate the value of most functions. But often the methods used are similar. For example, a Chebyshev polynomial approximation to the sine function on the interval  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  still has the form of a Maclaurin series, but it was designed to converge more uniformly than the Maclaurin series, so that it can be expected to give answers near  $\frac{\pi}{2}$  that are roughly as accurate as those near zero.

Chebyshev polynomials are commonly found in mathematical libraries for calculators/computers. For example, the widely used

Gnu Compiler Collection\* uses Chebyshev polynomials to evaluate trigonometric functions. The Chebyshev polynomial approximation of degree 7 for the sine function is

$$S_7(x) = 0.9999966013x - 0.1666482357x^3 + 0.008306286146x^5 - 0.1836274858 \times 10^{-3}x^7 \quad (1)$$

The Chebyshev polynomials are designed to remain close to a function across an entire closed interval. They seek to keep the approximation within a specified distance of the function being approximated at every point of that interval. If  $S_n$  is a Chebyshev approximation of degree  $n$  to the sine function on  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ , then the error estimate in using  $S_n(x)$  is given by

$$\max_{-\pi/2 \leq x \leq \pi/2} |\sin x - S_n(x)| \leq \frac{\left(\frac{\pi}{2}\right)^{n+1}}{2^n(n+1)!} \quad (2)$$

Like most error estimates of this type, it gives an upper bound to the error.

9. Use the Chebyshev polynomial approximation in (1) for  $x = \frac{1}{2}$  and  $x = \frac{3}{2}$ . Compare the results with the values your calculator/computer supplies for  $\sin \frac{1}{2}$  and  $\sin \frac{3}{2}$ , as well as with the results from the Maclaurin approximations and the Taylor series approximations obtained in Problems 2, 3, 7, and 8.

10. Define  $E_7(x) = |\sin x - S_7(x)|$ . Use graphing technology to graph  $E_7$  on  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ .

11. Find the local maximum and local minimum values of  $E_7$  on  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$ . Compare these numbers with the error estimate in equation (2), and discuss the characteristics of the error.

12. Which approximation for the sine function would be preferable: the Maclaurin approximation, the Taylor approximation, or the Chebyshev approximation? Why?

### Polar Graphs and Microphones

If you've ever shown up early to a concert or performance and seen the staff setting up the sound system, you understand a bit about the work that goes into obtaining optimal sound quality. Different microphones are designed to pick up sound from different directions, and sound technicians know that the selection and placement of microphones and monitors (speakers that are aimed back at the musicians so that they can hear the other instruments) vary depending on the specific purpose and venue. The same choices factor into the construction of cellphones and Bluetooth devices, which need to amplify the sound coming out of your mouth and minimize the barking dogs, loud trucks, and random conversations that may be happening around you.

The choice of the right microphone and speaker and their placement to achieve a specific goal requires an understanding of the direction of the sound and the area where it is being picked up. We can use polar coordinates and polar equations to model these goals.

**CHAPTER 9 PROJECT** The Chapter Project on p. 692 examines the design of several different microphones and the directions from where the sounds they amplify originate.

Until now, we have worked primarily with explicitly defined functions  $y = f(x)$ , where  $x$  and  $y$  represent rectangular coordinates. Because the graphs of functions satisfy the Vertical-line Test, many graphs, such as circles, cannot be represented using functions. To address this issue, we introduce *parametric equations*, a way to represent graphs that are not necessarily those of functions. Additionally, parametric equations are particularly useful because they allow us to model motion along a curve, and to determine not only the location of an object (a point) but also the time it is there.

The chapter continues with a discussion of an alternate coordinate system, *polar coordinates*. Using polar coordinates, we can represent graphs that would be extremely complicated, or even impossible, to represent in rectangular coordinates.

## 9.1 Parametric Equations

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Graph parametric equations (p. 637)
- 2 Find a rectangular equation for a curve represented parametrically (p. 638)
- 3 Use time as the parameter in parametric equations (p. 640)
- 4 Convert a rectangular equation to parametric equations (p. 641)

The graph of an equation of the form  $y = f(x)$ , where  $f$  is a function, is intersected no more than once by any vertical line. There are many graphs, however, such as circles and some parabolas, that do not pass the Vertical-line Test. To study such graphs requires a different model. One such model uses a pair of equations and a third variable, called a *parameter*.

### DEFINITION

Suppose  $x = x(t)$  and  $y = y(t)$  are two functions of a third variable  $t$ , called the **parameter**, that are defined on the same interval  $I$ . Then the equations

$$x = x(t) \quad y = y(t)$$

where  $t$  is in  $I$  are called **parametric equations**, and the collection of points defined by

$$(x, y) = (x(t), y(t))$$

is called a **plane curve**.

**Figure 1**  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ .

**TABLE 1**

| $t$ | $x$ | $y$ | $(x, y)$ |
|-----|-----|-----|----------|
| -2  | 12  | -4  | (12, -4) |
| -1  | 3   | -2  | (3, -2)  |
| 0   | 0   | 0   | (0, 0)   |
| 1   | 3   | 2   | (3, 2)   |
| 2   | 12  | 4   | (12, 4)  |

**Figure 2**  $x(t) = 3t^2$ ,  $y(t) = 2t$ ,  $-2 \leq t \leq 2$

### 1 Graph Parametric Equations

Parametric equations are particularly useful for describing motion along a curve. Suppose an object moves along a curve represented by the parametric equations

$$x = x(t) \quad y = y(t)$$

where each function is defined over the interval  $a \leq t \leq b$ . For a given value of  $t$ , the values of  $x = x(t)$  and  $y = y(t)$  determine a point  $(x, y)$  on the curve. In fact, as  $t$  varies over the interval from  $t = a$  to  $t = b$ , successive values of  $t$  determine the direction of the motion of the object moving along the curve. See Figure 1. The arrows show the direction, or the **orientation**, of the object as it moves from  $A$  to  $B$ .

### EXAMPLE 1 Graphing a Plane Curve

Graph the plane curve represented by the parametric equations

$$x(t) = 3t^2 \quad y(t) = 2t \quad -2 \leq t \leq 2$$

Indicate the orientation of the curve.

**Solution** Corresponding to each number  $t$ ,  $-2 \leq t \leq 2$ , there are a number  $x$  and a number  $y$  that are the coordinates of a point  $(x, y)$  on the curve. We form a table listing various choices of the parameter  $t$  and the corresponding values for  $x$  and  $y$ , as shown in Table 1.

The motion begins when  $t = -2$  at the point  $(12, -4)$  and ends when  $t = 2$  at the point  $(12, 4)$ . Figure 2 illustrates the plane curve whose parametric equations are  $x(t) = 3t^2$  and  $y(t) = 2t$ . The arrows indicate the orientation of the plane curve for increasing values of the parameter  $t$ . ■

## 2 Find a Rectangular Equation for a Curve Represented Parametrically

The plane curve in Figure 2 should look familiar. To identify it, we find the corresponding rectangular equation by eliminating the parameter  $t$  from the parametric equations

$$x(t) = 3t^2 \quad y(t) = 2t \quad -2 \leq t \leq 2$$

We begin by solving for  $t$  in  $y = 2t$ , obtaining  $t = \frac{y}{2}$ . Then we substitute  $t = \frac{y}{2}$  in the other equation.

$$x = 3t^2 = 3\left(\frac{y}{2}\right)^2 = \frac{3y^2}{4}$$

The equation  $x = \frac{3y^2}{4}$  is a parabola with its vertex at the origin and its axis of symmetry along the  $x$ -axis. We refer to this equation as the **rectangular equation** of the curve to distinguish it from the parametric equations.

Notice that the plane curve represented by the parametric equations  $x(t) = 3t^2$ ,  $y(t) = 2t$ ,  $-2 \leq t \leq 2$ , is only part of the parabola  $x = \frac{3y^2}{4}$ . In general, the graph of the rectangular equation obtained by eliminating the parameter will contain more points than the plane curve defined using parametric equations. Therefore, when graphing a plane curve represented by a rectangular equation, we may have to restrict the graph to match the parametric equations.

### Finding a Rectangular Equation for a Plane Curve Represented Parametrically

#### EXAMPLE 2

Find a rectangular equation of the curve whose parametric equations are

$$x(t) = R \cos t \quad y(t) = R \sin t$$

where  $R > 0$  is a constant. Graph the plane curve and indicate its orientation.

**Solution** The presence of the sine and cosine functions in the parametric equations suggests using the Pythagorean Identity  $\cos^2 t + \sin^2 t = 1$ . Then

$$\begin{aligned} \left(\frac{x}{R}\right)^2 + \left(\frac{y}{R}\right)^2 &= 1 & \cos t &= \frac{x}{R} & \sin t &= \frac{y}{R} \\ x^2 + y^2 &= R^2 \end{aligned}$$

The graph of the rectangular equation is a circle with center at the origin and radius  $R$ . In the parametric equations, as the parameter  $t$  increases, the points  $(x, y)$  on the circle are traced out in the counterclockwise direction, as shown in Figure 3. ■

**Figure 3** The orientation is counterclockwise.

#### NOW WORK Problems 9 and 15.

When analyzing the parametric equations in Example 2, notice there are no restrictions on  $t$ , so  $t$  varies from  $-\infty$  to  $\infty$ . As a result, the circle is repeated each time  $t$  increases by  $2\pi$ .

If we wanted to describe a curve consisting of exactly one revolution in the counterclockwise direction, the domain must be restricted to an interval of length  $2\pi$ . For example, we could use

$$x(t) = R \cos t \quad y(t) = R \sin t \quad 0 \leq t \leq 2\pi$$

Now the plane curve starts when  $t = 0$  at  $(R, 0)$  and ends when  $t = 2\pi$  at  $(R, 0)$ .

If we wanted the curve to consist of exactly three revolutions in the counterclockwise direction, the domain must be restricted to an interval of length  $6\pi$ . For example, we could

use  $x(t) = R \cos t$ ,  $y(t) = R \sin t$ , with  $-2\pi \leq t \leq 4\pi$ , or  $0 \leq t \leq 6\pi$ , or  $2\pi \leq t \leq 8\pi$ , or any arbitrary interval of length  $6\pi$ .

### EXAMPLE 3 Finding a Rectangular Equation for a Plane Curve Represented Parametrically

Find rectangular equations for the plane curves represented by each of the parametric equations. Graph each curve and indicate its orientation.

(a)  $x(t) = R \cos t$     $y(t) = R \sin t$     $0 \leq t \leq \pi$  and  $R > 0$

(b)  $x(t) = R \sin t$     $y(t) = R \cos t$     $0 \leq t \leq \pi$  and  $R > 0$

**Solution** (a) We eliminate the parameter  $t$  using a Pythagorean Identity.

$$\cos^2 t + \sin^2 t = 1$$

$$\left(\frac{x}{R}\right)^2 + \left(\frac{y}{R}\right)^2 = 1 \quad \cos t = \frac{x}{R}, \quad \sin t = \frac{y}{R}$$

$$x^2 + y^2 = R^2 \quad (1)$$

Figure 4  $y = \sqrt{R^2 - x^2}$ ,  $-R \leq x \leq R$ .

Figure 5  $x = \sqrt{R^2 - y^2}$ ,  $-R \leq y \leq R$ .

The rectangular equation represents a circle with radius  $R$  and center at the origin. In the parametric equations,  $0 \leq t \leq \pi$ , so the curve begins when  $t = 0$  at the point  $(R, 0)$ , passes through the point  $(0, R)$  when  $t = \frac{\pi}{2}$ , and ends when  $t = \pi$  at the point  $(-R, 0)$ .

The curve is an upper semicircle of radius  $R$  with counterclockwise orientation, as shown in Figure 4. If we solve equation (1) for  $y$ , we obtain the rectangular equation of the semicircle

$$y = \sqrt{R^2 - x^2} \quad \text{where } -R \leq x \leq R$$

(b) We eliminate the parameter  $t$  as we did in (a), and again we obtain

$$x^2 + y^2 = R^2 \quad (2)$$

The rectangular equation represents a circle with radius  $R$  and center at  $(0, 0)$ . But in the parametric equations,  $0 \leq t \leq \pi$ , so now the curve begins when  $t = 0$  at the point  $(0, R)$ , passes through the point  $(R, 0)$  when  $t = \frac{\pi}{2}$ , and ends at the point  $(0, -R)$  when  $t = \pi$ . The curve is a right semicircle of radius  $R$  with a *clockwise* orientation, as shown in Figure 5. If we solve equation (2) for  $x$ , we obtain the rectangular equation of the semicircle

$$x = \sqrt{R^2 - y^2} \quad \text{where } -R \leq y \leq R$$

**NOTE** In Example 3 (a) we expressed the rectangular equation as a function  $y = f(x)$ , and in (b) we expressed the rectangular equation as a function  $x = g(y)$ .

Parametric equations are not unique; that is, different parametric equations can represent the same graph. Two examples of other parametric equations that represent the graph in Figure 5 are

- $x(t) = R \sin t$     $y(t) = -R \cos(\pi - t)$     $0 \leq t \leq \pi$

- $x(t) = R \sin(3t)$     $y(t) = R \cos(3t)$     $0 \leq t \leq \frac{\pi}{3}$

There are other examples.

### Finding a Rectangular Equation for a Plane Curve Represented Parametrically

#### EXAMPLE 4

(a) Find a rectangular equation of the plane curve whose parametric equations are

$$x(t) = \cos(2t) \quad y(t) = \sin t \quad -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$$

(b) Graph the rectangular equation.

(c) Determine the restrictions on  $x$  and  $y$  so the graph corresponding to the rectangular equation is identical to the plane curve described by

$$x = x(t) \quad y = y(t) \quad -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$$

(d) Graph the plane curve whose parametric equations are

$$x = \cos(2t) \quad y = \sin t \quad -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$$

**Solution** (a) To eliminate the parameter  $t$ , we use a trigonometric identity that involves  $\sin t$  and  $\cos(2t)$ , namely,  $\sin^2 t = \frac{1 - \cos(2t)}{2}$ . Then

$$y^2 = \sin^2 t = \frac{1 - \cos(2t)}{2} = \frac{1 - x}{2}$$

$\uparrow$   $y(t) = \sin t$                        $\uparrow$   $x(t) = \cos(2t)$

(b) The curve represented by the rectangular equation  $y^2 = \frac{1-x}{2}$  is the parabola shown in Figure 6(a).

(c) The plane curve represented by the parametric equations does not include all the points on the parabola. Since  $x(t) = \cos(2t)$  and  $-1 \leq \cos(2t) \leq 1$ , then  $-1 \leq x \leq 1$ . Also, since  $y(t) = \sin t$ , then  $-1 \leq y \leq 1$ . Finally, the curve is traced out exactly once in the counterclockwise direction from the point  $(-1, -1)$  (when  $t = -\frac{\pi}{2}$ ) to the point  $(-1, 1)$  (when  $t = \frac{\pi}{2}$ ).

(d) The plane curve represented by the given parametric equations is the part of the parabola shown in Figure 6(b). ■

#### NOW WORK Problem 21.

Figure 6

### 3 Use Time as the Parameter in Parametric Equations

If the parameter  $t$  represents time, then the parametric equations  $x = x(t)$  and  $y = y(t)$  specify how the  $x$ - and  $y$ -coordinates of a moving object vary with time. This motion is sometimes referred to as **curvilinear motion**. Describing curvilinear motion using parametric equations specifies not only *where* the object is, that is, its location  $(x, y)$ , but also *when* it is there, that is, the time  $t$ . A rectangular equation provides only the location of the object.

#### EXAMPLE 5 Using Time as the Parameter in Parametric Equations

Describe the motion of an object that moves along a curve so that at time  $t$  it has coordinates

$$x(t) = 3 \cos t \quad y(t) = 4 \sin t \quad 0 \leq t \leq 2\pi$$

**Solution** We eliminate the parameter  $t$  using the Pythagorean Identity  $\cos^2 t + \sin^2 t = 1$ .

$$\frac{x^2}{9} + \frac{y^2}{16} = 1 \quad \cos t = \frac{x}{3}, \sin t = \frac{y}{4}$$

The plane curve is the ellipse shown in Figure 7. When  $t = 0$ , the object is at the point  $(3, 0)$ . As  $t$  increases, the object moves around the ellipse in a counterclockwise

Figure 7  $\frac{x^2}{9} + \frac{y^2}{16} = 1$ .

direction, reaching the point  $(0, 4)$  when  $t = \frac{\pi}{2}$ , the point  $(-3, 0)$  when  $t = \pi$ , the point  $(0, -4)$  when  $t = \frac{3\pi}{2}$ , and returning to its starting point  $(3, 0)$  when  $t = 2\pi$ . ■

### NOW WORK Problem 41.

## 4 Convert a Rectangular Equation to Parametric Equations

Suppose the rectangular equation corresponding to a curve is known. Then the curve can be represented by a variety of parametric equations.

For example, if a curve is defined by the function  $y = f(x)$ , one way of obtaining parametric equations is to let  $x = t$ . Then  $y = f(t)$  and

$$x(t) = t \quad y(t) = f(t)$$

where  $t$  is in the domain of  $f$ , are parametric equations of the curve.

### EXAMPLE 6 Finding Parametric Equations for a Curve Represented by a Rectangular Equation

Find parametric equations corresponding to the equation  $y = x^2 - 4$ .

**Solution** We let  $x = t$ . Then parametric equations are

$$x(t) = t \quad y(t) = t^2 - 4 \quad -\infty < t < \infty$$

We can also find parametric equations for  $y = x^2 - 4$  by letting  $x = t^3$ . Then the parametric equations are

$$x(t) = t^3 \quad y(t) = t^6 - 4 \quad -\infty < t < \infty$$

Although the choice of  $x$  may appear arbitrary, we need to be careful when choosing the substitution for  $x$ . The substitution must be a function that allows  $x$  to take on all the values in the domain of  $f$ . For example, if we let  $x(t) = t^2$ , then  $y(t) = t^4 - 4$ . But  $x(t) = t^2$ ,  $y(t) = t^4 - 4$  are not parametric equations for all of  $y = x^2 - 4$ , since only points for which  $x \geq 0$  are obtained.

### NOW WORK Problem 47.

### EXAMPLE 7 Finding Parametric Equations for an Object in Motion

Find parametric equations that trace out the ellipse

$$\frac{x^2}{4} + y^2 = 1$$

where the parameter  $t$  is time (in seconds) and:

- (a) The motion around the ellipse is counterclockwise, begins at the point  $(2, 0)$ , and requires 1 second for a complete revolution.
- (b) The motion around the ellipse is clockwise, begins at the point  $(0, 1)$ , and requires 2 seconds for a complete revolution.

Figure 8  $\frac{x^2}{4} + y^2 = 1$

**Solution** (a) Figure 8 shows the graph of the ellipse  $\frac{x^2}{4} + y^2 = 1$ .

Since the motion begins at the point  $(2, 0)$ , we want  $x = 2$  and  $y = 0$  when  $t = 0$ . We let

$$x(t) = 2 \cos(\omega t) \quad \text{and} \quad y(t) = \sin(\omega t)$$

for some constant  $\omega$ . This choice for  $x = x(t)$  and  $y = y(t)$  satisfies the equation  $\frac{x^2}{4} + y^2 = 1$  and also satisfies the requirement that when  $t = 0$ , then  $x = 2$  and  $y = 0$ .

**NEED TO REVIEW?** The period of a sinusoidal graph is discussed in Section P. 6, p. 50.

Figure 9  $\frac{x^2}{4} + y^2 = 1$

For the motion to be counterclockwise, as  $t$  increases from 0, the value of  $x$  must decrease and the value of  $y$  must increase. This requires  $\omega > 0$ . [Do you see why? If  $\omega > 0$ , then  $x = 2 \cos(\omega t)$  is decreasing when  $t > 0$  is near zero, and  $y = \sin(\omega t)$  is increasing when  $t > 0$  is near zero.]

Finally, since 1 revolution takes 1 second, the period is  $\frac{2\pi}{\omega} = 1$ , so  $\omega = 2\pi$ . Parametric equations that satisfy the conditions given in (a) are

$$x(t) = 2 \cos(2\pi t) \quad y(t) = \sin(2\pi t) \quad 0 \leq t \leq 1$$

(b) Figure 9 shows the graph of the ellipse  $\frac{x^2}{4} + y^2 = 1$ .

Since the motion begins at the point  $(0, 1)$ , we want  $x = 0$  and  $y = 1$  when  $t = 0$ . We let

$$x(t) = 2 \sin(\omega t) \quad \text{and} \quad y(t) = \cos(\omega t)$$

for some constant  $\omega$ . This choice for  $x = x(t)$  and  $y = y(t)$  satisfies the equation  $\frac{x^2}{4} + y^2 = 1$  and also satisfies the requirement that when  $t = 0$ , then  $x = 2 \sin 0 = 0$  and  $y = \cos 0 = 1$ .

For the motion to be clockwise, as  $t$  increases from 0, the value of  $x$  must increase and the value of  $y$  must decrease. This requires that  $\omega > 0$ .

Finally, since 1 revolution takes 2 seconds, the period is  $\frac{2\pi}{\omega} = 2$ , or  $\omega = \pi$ . Parametric equations that satisfy the conditions given in (b) are

$$x(t) = 2 \sin(\pi t) \quad y(t) = \cos(\pi t) \quad 0 \leq t \leq 2$$

### NOW WORK Problem 55.

Figure 10

**RECALL** For a circle of radius  $r$ , a central angle of  $\theta$  radians subtends an arc whose length  $s$  is  $s = r\theta$ .

### The Cycloid

Suppose that a circle rolls along a horizontal line without slipping. As the circle rolls along the line, a point  $P$  on the circle traces out a curve called a **cycloid**, as shown in Figure 10. Deriving the equation of the cycloid in rectangular coordinates is complicated, but the derivation in terms of parametric equations is relatively easy.

We begin with a circle of radius  $a$ . Suppose the fixed line on which the circle rolls is the  $x$ -axis. Let the origin be one of the points at which the point  $P$  comes into contact with the  $x$ -axis. Figure 10 shows the position of this point  $P$  after the circle has rolled a bit. The angle  $t$  (in radians) measures the angle through which the circle has rolled. Since the circle does not slip, it follows that

$$\text{Arc } AP = d(O, A)$$

The length of the arc  $AP$  is

$$at = d(O, A) \quad s = r\theta, \quad r = a, \quad \theta = t$$

The  $x$ -coordinate of the point  $P = (x, y)$  is

$$x = d(O, X) = d(O, A) - d(X, A) = at - a \sin t = a(t - \sin t)$$

The  $y$ -coordinate of the point  $P$  is

$$y = d(O, Y) = d(A, C) - d(B, C) = a - a \cos t = a(1 - \cos t)$$

### THEOREM Parametric Equations of a Cycloid

Parametric equations of a cycloid are

$$x(t) = a(t - \sin t) \quad y(t) = a(1 - \cos t) \quad -\infty < t < \infty$$

**NOTE** In Greek, *brachistochrone* means “the shortest time,” and *tautochrone* “equal time.”

### Applications to Mechanics

If  $a < 0$  in the parametric equations of the cycloid, the result is an inverted cycloid, as shown in Figure 11(a). The inverted cycloid arises as a result of some remarkable applications in the field of mechanics. We discuss two of them: the *brachistochrone* and *tautochrone*.

Figure 11

The **brachistochrone** is the curve of quickest descent. If an object is constrained to follow some path from a point  $A$  to a lower point  $B$  (not on the same vertical line) and is acted on only by gravity, the time needed to make the descent is minimized if the path is an inverted cycloid. See Figure 11(b). For example, in sliding packages from a loading dock onto a ship, a ramp in the shape of an inverted cycloid might be used so the packages get to the ship in the least amount of time. This discovery, which is attributed to many famous mathematicians (including Johann Bernoulli and Blaise Pascal), was a significant step in creating the branch of mathematics known as the *calculus of variations*.

Suppose  $Q$  is the lowest point on an inverted cycloid. If several objects placed at various positions on an inverted cycloid simultaneously begin to slide down the cycloid, they will reach the point  $Q$  at the same time, as indicated in Figure 11(c). This is referred to as the **tautochrone property** of the cycloid. It was used by the Dutch mathematician, physicist, and astronomer Christian Huygens (1629–1695) to construct a pendulum clock with a bob that swings along an inverted cycloid, as shown in Figure 12. In Huygens' clock, the bob was made to swing along an inverted cycloid by suspending the bob on a thin wire constrained by two plates shaped like cycloids. In a clock of this design, the period of the pendulum is independent of its amplitude.

Figure 12

## 9.1 Assess Your Understanding

### Concepts and Vocabulary

- Let  $x = x(t)$  and  $y = y(t)$  be two functions whose common domain is some interval  $I$ . The collection of points defined by  $(x, y) = (x(t), y(t))$  is called a plane \_\_\_\_\_. The variable  $t$  is called a(n) \_\_\_\_\_.
- Multiple Choice** The parametric equations  $x(t) = 2 \sin t$ ,  $y(t) = 3 \cos t$  define a(n) [(a) line, (b) hyperbola, (c) ellipse, (d) parabola].
- Multiple Choice** The parametric equations  $x(t) = a \sin t$ ,  $y(t) = a \cos t$ ,  $a > 0$ , define a [(a) line, (b) hyperbola, (c) parabola, (d) circle].
- If a circle rolls along a horizontal line without slipping, a point  $P$  on the circle traces out a curve called a(n) \_\_\_\_\_.
- True or False** The parametric equations defining a curve are unique.
- True or False** Plane curves represented using parametric equations have an orientation.

### Skill Building

In Problems 7–20:

- Find the rectangular equation of each plane curve with the given parametric equations.
  - Graph the plane curve represented by the parametric equations and indicate its orientation.
- $x(t) = 2t + 1$ ,  $y(t) = t + 2$ ;  $-\infty < t < \infty$
  - $x(t) = t - 2$ ,  $y(t) = 3t + 1$ ;  $-\infty < t < \infty$
  - $x(t) = 2t + 1$ ,  $y(t) = t + 2$ ;  $0 \leq t \leq 2$
  - $x(t) = t - 2$ ,  $y(t) = 3t + 1$ ;  $0 \leq t \leq 2$
  - $x(t) = e^t$ ,  $y(t) = t$ ;  $-\infty < t < \infty$
  - $x(t) = t$ ,  $y(t) = \frac{1}{t}$ ;  $-\infty < t < \infty$ ,  $t \neq 0$
  - $x(t) = \sin t$ ,  $y(t) = \cos t$ ;  $0 \leq t \leq 2\pi$
  - $x(t) = \cos t$ ,  $y(t) = \sin t$ ;  $0 \leq t \leq \pi$

15.  $x(t) = 2 \sin t$ ,  $y(t) = 3 \cos t$ ;  $0 \leq t \leq 2\pi$   
 16.  $x(t) = 4 \cos t$ ,  $y(t) = 3 \sin t$ ;  $0 \leq t \leq 2\pi$   
 17.  $x(t) = 2 \sin t - 3$ ,  $y(t) = 2 \cos t + 1$ ;  $0 \leq t \leq \pi$   
 18.  $x(t) = 4 \cos t + 1$ ,  $y(t) = 4 \sin t - 3$ ;  $0 \leq t \leq \pi$   
 19.  $x(t) = 3$ ,  $y(t) = 2t$ ;  $-\infty < t < \infty$   
 20.  $x(t) = 4t + 1$ ,  $y(t) = 2t$ ;  $-\infty < t < \infty$

In Problems 21–36:

- (a) Find a rectangular equation of each plane curve with the given parametric equations.  
 (b) Graph the rectangular equation.  
 (c) Determine the restrictions on  $x$  and  $y$  so that the graph corresponding to the rectangular equation is identical to the plane curve.  
 (d) Graph the plane curve represented by the parametric equations.

21.  $x(t) = 2$ ,  $y(t) = t^2 + 4$ ;  $t > 0$   
 22.  $x(t) = t + 3$ ,  $y(t) = t^3$ ;  $-4 \leq t \leq 4$   
 23.  $x(t) = t + 5$ ,  $y(t) = \sqrt{t}$ ;  $t \geq 0$   
 24.  $x(t) = 2t^2$ ,  $y(t) = 2t^3$ ;  $0 \leq t \leq 3$   
 25.  $x(t) = t^{1/2} + 1$ ,  $y(t) = t^{3/2}$ ;  $t \geq 1$   
 26.  $x(t) = 2e^t$ ,  $y(t) = 1 - e^t$ ;  $t \geq 0$   
 27.  $x(t) = \sec t$ ,  $y(t) = \tan t$ ;  $-\frac{\pi}{2} < t < \frac{\pi}{2}$   
 28.  $x(t) = 3 \sinh t$ ,  $y(t) = 2 \cosh t$ ;  $-\infty < t < \infty$   
 29.  $x(t) = t^4$ ,  $y(t) = t^2$   
 30.  $x(t) = t^2$ ,  $y(t) = t^4$   
 31.  $x(t) = t^2$ ,  $y(t) = 2t - 1$   
 32.  $x(t) = e^{2t}$ ,  $y(t) = 2e^t - 1$   
 33.  $x(t) = \left(\frac{1}{t}\right)^2$ ,  $y(t) = \frac{2}{t} - 1$   
 34.  $x(t) = t^4$ ,  $y(t) = 2t^2 - 1$

 35.  $x(t) = 3 \sin^2 t - 2$ ,  $y(t) = 2 \cos t$ ;  $0 \leq t \leq \pi$

 36.  $x(t) = 1 + 2 \sin^2 t$ ,  $y(t) = 2 - \cos t$ ;  $0 \leq t \leq 2\pi$

**Using Time as the Parameter** In Problems 37–42, describe the motion of an object that moves along a curve so that at time  $t$  it has coordinates  $(x(t), y(t))$ .

37.  $x(t) = \frac{1}{t^2}$ ,  $y(t) = \frac{2}{t^2 + 1}$ ;  $t > 0$   
 38.  $x(t) = \frac{3t}{\sqrt{t^2 + 1}}$ ,  $y(t) = \frac{3}{\sqrt{t^2 + 1}}$   
 39.  $x(t) = \frac{4}{\sqrt{4 - t^2}}$ ,  $y(t) = \frac{4t}{\sqrt{4 - t^2}}$ ;  $0 \leq t < 2$   
 40.  $x(t) = \sqrt{t - 3}$ ,  $y(t) = \sqrt{t + 1}$ ;  $t \geq 3$   
 41.  $x(t) = \sin t - 2$ ,  $y(t) = 4 - 2 \cos t$ ;  $0 \leq t \leq 2\pi$   
 42.  $x(t) = 2 + \tan t$ ,  $y(t) = 3 - 2 \sec t$ ;  $-\pi/2 < t < \pi/2$

In Problems 43–50, find two different pairs of parametric equations corresponding to each rectangular equation.

43.  $y = 4x - 2$       44.  $y = -8x + 3$       45.  $y = -2x^2 + 1$   
 46.  $y = x^2 + 1$       47.  $y = 4x^3$       48.  $y = 2x^2$   
 49.  $x = \frac{1}{3}\sqrt{y} - 3$       50.  $x = y^{3/2}$

In Problems 51–54, find parametric equations that represent the curve shown. The graphs in Problems 53 and 54 are parts of ellipses.

51.

52.

53.

54.

**Motion of an Object** In Problems 55–58, find parametric equations for an object that moves along the ellipse  $\frac{x^2}{9} + \frac{y^2}{4} = 1$ , where the parameter is time (in seconds) if:

55. the motion begins at  $(3, 0)$ , is counterclockwise, and requires 3 seconds for 1 revolution.  
 56. the motion begins at  $(3, 0)$ , is clockwise, and requires 3 seconds for 1 revolution.  
 57. The motion begins at  $(0, 2)$ , is clockwise, and requires 2 seconds for 1 revolution.  
 58. the motion begins at  $(0, 2)$ , is counterclockwise, and requires 1 second for 1 revolution.

In Problems 59 and 60, the parametric equations of four plane curves are given. Graph each curve, indicate its orientation, and compare the graphs.

59. (a)  $x(t) = t$ ,  $y(t) = t^2$ ;  $-4 \leq t \leq 4$   
 (b)  $x(t) = \sqrt{t}$ ,  $y(t) = t$ ;  $0 \leq t \leq 16$   
 (c)  $x(t) = e^t$ ,  $y(t) = e^{2t}$ ;  $0 \leq t \leq \ln 4$   
 (d)  $x(t) = \cos t$ ,  $y(t) = 1 - \sin^2 t$ ;  $0 \leq t \leq \pi$   
 60. (a)  $x(t) = t$ ,  $y(t) = \sqrt{1 - t^2}$ ;  $-1 \leq t \leq 1$   
 (b)  $x(t) = \sin t$ ,  $y(t) = \cos t$ ;  $0 \leq t \leq 2\pi$   
 (c)  $x(t) = \cos t$ ,  $y(t) = \sin t$ ;  $0 \leq t \leq 2\pi$   
 (d)  $x(t) = \sqrt{1 - t^2}$ ,  $y(t) = t$ ;  $-1 \leq t \leq 1$

## Applications and Extensions

In Problems 61–64, the parametric equations of a plane curve and its graph are given. Match each graph in I–IV to the restricted domain given in a–d. Also indicate the orientation of each graph.

61.

- (a)  $\left[-\frac{\pi}{2}, \frac{\pi}{2}\right]$  (b)  $\left[-\pi, \frac{\pi}{2}\right]$  (c)  $[-\pi, 0]$  (d)  $[0, \pi]$

62.

- (a)  $\left[\frac{\pi}{2}, \pi\right]$  (b)  $\left[0, \frac{\pi}{3}\right]$  (c)  $\left[0, \frac{\pi}{2}\right]$  (d)  $\left[\frac{\pi}{3}, \pi\right]$

63.

- (a)  $\left[\frac{\pi}{2}, \frac{3\pi}{2}\right]$  (b)  $[\pi, 2\pi]$  (c)  $[0, \pi]$  (d)  $\left[\frac{5\pi}{4}, 2\pi\right]$

64.

- (a)  $\left[0, \frac{5\pi}{6}\right]$  (b)  $[\pi, 2\pi]$  (c)  $\left[0, \frac{\pi}{2}\right]$  (d)  $\left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$

65. (a) Graph the plane curve represented by the parametric equations  $x(t) = 7(t - \sin t)$ ,  $y(t) = 7(1 - \cos t)$ ,  $0 \leq t \leq 2\pi$ .  
(b) Find the coordinates of the point  $(x, y)$  on the curve when  $t = 2.1$ .
66. (a) Graph the plane curve represented by the parametric equations  $x(t) = t - e^t$ ,  $y(t) = 2e^{t/2}$ ,  $-8 \leq t \leq 2$ .  
(b) Find the coordinates of the point  $(x, y)$  on the curve when  $t = 1.5$ .
67. Find parametric equations for the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ .
68. Find parametric equations for the hyperbola  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ .

Problems 69–71 involve projectile motion. When an object is propelled upward at an inclination  $\theta$  to the horizontal with initial speed  $v_0$ , the resulting motion is called **projectile motion**. See the figure. Parametric equations that model the path of the projectile, ignoring air resistance, are given by

$$x(t) = (v_0 \cos \theta)t \quad y(t) = -\frac{1}{2}gt^2 + (v_0 \sin \theta)t + h$$

where  $t$  is time,  $g$  is the constant acceleration due to gravity (approximately  $32 \text{ ft/s}^2$  or  $9.8 \text{ m/s}^2$ ), and  $h$  is the height from which the projectile is released.

69. **Trajectory of a Baseball** A baseball is hit with an initial speed of 125 ft/s at an angle of  $40^\circ$  to the horizontal. The ball is hit at a height of 3 ft above the ground.
- Find parametric equations that model the position of the ball as a function of the time  $t$  in seconds.
  - What is the height of the baseball after 2 seconds?
  - What horizontal distance  $x$  has the ball traveled after 2 seconds?
  - How long does it take the baseball to travel  $x = 300$  ft?
  - What is the height of the baseball at the time found in (d)?
  - How long is the ball in the air before it hits the ground?
  - How far has the baseball traveled horizontally when it hits the ground?
70. **Trajectory of a Baseball** A pitcher throws a baseball with an initial speed of 145 ft/s at an angle of  $20^\circ$  to the horizontal. The ball leaves his hand at a height of 5 ft.
- Find parametric equations that model the position of the ball as a function of the time  $t$  in seconds.
  - What is the height of the baseball after  $\frac{1}{2}$  second?
  - What horizontal distance  $x$  has the ball traveled after  $\frac{1}{2}$  second?
  - How long does it take the baseball to travel  $x = 60$  ft?
  - What is the height of the baseball at the time found in (d)?
71. **Trajectory of a Football** A quarterback throws a football with an initial speed of 80 ft/s at an angle of  $35^\circ$  to the horizontal. The ball leaves the quarterback's hand at a height of 6 ft.
- Find parametric equations that model the position of the ball as a function of time  $t$  in seconds.
  - What is the height of the football after 1 second?
  - What horizontal distance  $x$  has the ball traveled after 1 second?
  - How long does it take the football to travel  $x = 120$  ft?
  - What is the height of the football at the time found in (d)?
72. The plane curve represented by the parametric equations  $x(t) = t$ ,  $y(t) = t^2$ , and the plane curve represented by the parametric equations  $x(t) = t^2$ ,  $y(t) = t^4$  (where, in each case, time  $t$  is the parameter) appear to be identical, but they differ in an important aspect. Identify the difference, and explain its meaning.
73. The circle  $x^2 + y^2 = 4$  can be represented by the parametric equations  $x(\theta) = 2 \cos \theta$ ,  $y(\theta) = 2 \sin \theta$ ,  $0 \leq \theta \leq 2\pi$ , or by the parametric equations  $x(\theta) = 2 \sin \theta$ ,  $y(\theta) = 2 \cos \theta$ ,  $0 \leq \theta \leq 2\pi$ . But the plane curves represented by each pair of parametric equations are different. Identify and explain the difference.
74. **Uniform Motion** A train leaves a station at 7:15 a.m. and accelerates at the rate of  $3 \text{ mi/h}^2$ . Mary, who can run  $6 \text{ mi/h}$ , arrives at the station 2 seconds after the train has left. Find parametric equations that model the motion of the train and of Mary as a function of time. (*Hint:* The position  $s$  at time  $t$  of an object having acceleration  $a$  is  $s = \frac{1}{2}at^2$ .)

### Challenge Problems

75. Find parametric equations for the circle  $x^2 + y^2 = R^2$ , using as the parameter the slope  $m$  of the line through the point  $(-R, 0)$  and a general point  $P = (x, y)$  on the circle.
76. Find parametric equations for the parabola  $y = x^2$ , using as the parameter the slope  $m$  of the line joining the point  $(1, 1)$  to a general point  $P = (x, y)$  on the parabola.
77. **Hypocycloid** Let a circle of radius  $b$  roll, without slipping, inside a fixed circle with radius  $a$ , where  $a > b$ . A fixed point  $P$  on the circle of radius  $b$  traces out a curve, called a **hypocycloid**, as shown in the figure. If  $A = (a, 0)$  is the initial position of the point  $P$  and if  $t$  denotes the angle from the

positive  $x$ -axis to the line segment from the origin to the center of the circle, show that the parametric equations of the hypocycloid are

$$x(t) = (a - b) \cos t + b \cos \left( \frac{a - b}{b} t \right)$$

$$y(t) = (a - b) \sin t - b \sin \left( \frac{a - b}{b} t \right) \quad 0 \leq t \leq 2\pi$$

78. **Hypocycloid** Show that the rectangular equation of a hypocycloid with  $a = 4b$  is  $x^{2/3} + y^{2/3} = a^{2/3}$ .

79. **Epicycloid** Suppose a circle of radius  $b$  rolls on the outside of a second circle, as shown in the figure. Find the parametric equations of the curve, called an **epicycloid**, traced out by the point  $P$ .

## 9.2 Tangent Lines; Arc Length

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find an equation of the tangent line at a point on a plane curve (p. 648)
- 2 Find the arc length of a plane curve (p. 651)

Recall that if a function  $f$  is differentiable, the derivative  $f'(x) = \frac{dy}{dx}$  is the slope of the tangent line to the graph of  $f$  at a point  $(x, y)$ . To obtain a formula for the slope of the tangent line to a curve when it is represented by parametric equations,  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , we require the curve to be *smooth*.

### DEFINITION Smooth Curve

Let  $C$  denote a plane curve represented by the parametric equations

$$x = x(t) \quad y = y(t) \quad a \leq t \leq b$$

Suppose each function  $x(t)$  and  $y(t)$  is continuous on the closed interval  $[a, b]$  and differentiable on the open interval  $(a, b)$ . If both  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$  are continuous and are never simultaneously 0 on  $(a, b)$ , then  $C$  is called a **smooth curve**.

A smooth curve  $x = x(t)$ ,  $y = y(t)$ , for which  $\frac{dx}{dt}$  is never 0, can be represented by the rectangular equation  $y = F(x)$ , where  $F$  is differentiable. (You are asked to prove this in Problem 64.) Suppose  $(x(t), y(t))$  is a point on the curve. Then

$$y = F(x)$$

$$y(t) = F(x(t))$$

Now, we use the Chain Rule to obtain

$$\frac{dy}{dt} = \frac{dy}{dx} \cdot \frac{dx}{dt}$$

Since  $\frac{dx}{dt} \neq 0$ , we have

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$$

Since  $\frac{dy}{dx}$  is the slope of the tangent line to the graph of  $y = F(x)$ , we have proved the following result.

### THEOREM Slope of the Tangent Line to a Smooth Curve

For a smooth curve  $C$  represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , the slope of the tangent line to  $C$  at the point  $(x, y)$  is given by

$$\boxed{\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}} \quad (1)$$

provided  $\frac{dx}{dt} \neq 0$ .

- At a number  $t$  where  $\frac{dx}{dt} = 0$ , but  $\frac{dy}{dt} \neq 0$ , a smooth curve  $C$  has a **vertical tangent line**.
- At a number  $t$  where  $\frac{dy}{dt} = 0$ , but  $\frac{dx}{dt} \neq 0$ , a smooth curve  $C$  has a **horizontal tangent line**.

## 1 Find an Equation of the Tangent Line at a Point on a Plane Curve

**NEED TO REVIEW?** Equations of tangent lines are discussed in Section 2.1, pp. 147–149.

Now that we have a way to find the slope of the tangent line to a smooth curve  $C$  at a point, we can use the point-slope form of a line to obtain an equation of the tangent line.

### EXAMPLE 1 Finding an Equation of the Tangent Line to a Smooth Curve

- (a) Find an equation of the tangent line to the plane curve with parametric equations  $x(t) = 3t^2$ ,  $y(t) = 2t$ , when  $t = 1$ .
- (b) Find all the points on the plane curve at which the tangent line is vertical.

**Solution** (a) The curve is smooth  $\left(\frac{dy}{dt} = 2\right.$  is never zero $\left.)\right)$ . Since  $\frac{dx}{dt} = 6t$  is not 0 at  $t = 1$ , the slope of the tangent line to the curve is

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\frac{d}{dt}(2t)}{\frac{d}{dt}(3t^2)} = \frac{2}{6t} = \frac{1}{3t}$$

When  $t = 1$ , the slope of the tangent line is  $\frac{1}{3}$ . Since  $x = 3$  and  $y = 2$  when  $t = 1$ , an equation of the tangent line is

$$\begin{aligned} y - 2 &= \frac{1}{3}(x - 3) & y - y_1 &= m(x - x_1); \quad x_1 = 3, y_1 = 2, m = \frac{1}{3} \\ y &= \frac{1}{3}x + 1 \end{aligned}$$

Figure 13  $x(t) = 3t^2$ ,  $y(t) = 2t$

- (b) A vertical tangent line occurs when  $\frac{dx}{dt} = 0$  and  $\frac{dy}{dt} \neq 0$ . Since  $\frac{dx}{dt} = 0$  and  $\frac{dy}{dt} = 2$  when  $t = 0$ , there is a vertical tangent line to the curve when  $t = 0$ , namely at the point  $(0, 0)$ . ■

Figure 13 illustrates the results of Example 1.

**NOW WORK** Problem 15.

**EXAMPLE 2** Finding the Slope of the Tangent Line to a Cycloid

Consider the cycloid defined by

$$x(t) = a(t - \sin t) \quad y(t) = a(1 - \cos t) \quad 0 < t < 2\pi \quad a > 0$$

- (a) Show that the slope of the tangent line to the cycloid is given by  $\frac{\sin t}{1 - \cos t}$ .  
 (b) Find any points where the tangent line to the cycloid is horizontal.

**Solution** (a)  $x(t) = at - a \sin t$   $y(t) = a - a \cos t$

$$\frac{dx}{dt} = a - a \cos t \quad \frac{dy}{dt} = a \sin t$$

For  $0 < t < 2\pi$ ,  $\frac{dx}{dt} = a(1 - \cos t) \neq 0$ . Then the slope of the tangent line is

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{a \sin t}{a(1 - \cos t)} = \frac{\sin t}{1 - \cos t}$$

- (b) The cycloid has a horizontal tangent line when  $\frac{dy}{dt} = a \sin t = 0$ , but  $\frac{dx}{dt} \neq 0$ . For  $0 < t < 2\pi$ , we have  $a \sin t = 0$  when  $t = \pi$ . Since  $\frac{dx}{dt} \neq 0$  for  $0 < t < 2\pi$ , the cycloid has a horizontal tangent line when  $t = \pi$ , at the point  $(\pi a, 2a)$ . The equation of the horizontal tangent line is  $y = 2a$ , as shown in Figure 14. ■

Figure 14  $x(t) = a(t - \sin t)$ ,  
 $y(t) = a(1 - \cos t)$ ,  $0 < t < 2\pi$

**NOW WORK** Problem 27.

**EXAMPLE 3** Finding an Equation of the Tangent Line to a Smooth Curve

The plane curve represented by the parametric equations  $x(t) = t^3 - 4t$ ,  $y(t) = t^2$ , crosses itself at the point  $(0, 4)$ , and so has two tangent lines there, as shown in Figure 15. Find equations for these tangent lines.

**Solution** We begin by finding the numbers  $t$  that correspond to the point  $(0, 4)$ .

$$\begin{aligned} x &= 0 & y &= 4 \\ t^3 - 4t &= 0 & t^2 &= 4 \\ t(t^2 - 4) &= 0 & t &= -2 \text{ or } 2 \\ t &= 0, -2, \text{ or } 2 \end{aligned}$$

We exclude  $t = 0$ , since if  $t = 0$ , then  $y \neq 4$ . So we investigate only  $t = -2$  and  $t = 2$ . Since  $\frac{dx}{dt} = 3t^2 - 4 \neq 0$  for  $t = -2$  and  $t = 2$ , the slope of the tangent

Figure 15  $x(t) = t^3 - 4t$ ,  $y(t) = t^2$

lines is given by

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\frac{d}{dt}(t^2)}{\frac{d}{dt}(t^3 - 4t)} = \frac{2t}{3t^2 - 4}$$

When  $t = -2$ , the slope of the tangent line is

$$\frac{dy}{dx} = \frac{2(-2)}{3(-2)^2 - 4} = \frac{-4}{8} = -\frac{1}{2}$$

and an equation of the tangent line at the point  $(0, 4)$  is

$$\begin{aligned} y - 4 &= -\frac{1}{2}(x - 0) \\ y &= -\frac{1}{2}x + 4 \end{aligned}$$

When  $t = 2$ , the slope of the tangent line at the point  $(0, 4)$  is

$$\frac{dy}{dx} = \frac{2(2)}{3(2)^2 - 4} = \frac{4}{8} = \frac{1}{2}$$

and an equation of the tangent line at  $(0, 4)$  is

$$\begin{aligned} y - 4 &= \frac{1}{2}(x - 0) \\ y &= \frac{1}{2}x + 4 \end{aligned}$$

#### NOW WORK Problem 45.

#### EXAMPLE 4 Projectile Motion

A projectile is fired at an angle  $\theta$ ,  $0 < \theta < \frac{\pi}{2}$ , to the horizontal with an initial speed of  $v_0$  m/s. Assuming no air resistance, the position of the projectile after  $t$  seconds is given by the parametric equations  $x(t) = (v_0 \cos \theta)t$ ,  $y(t) = (v_0 \sin \theta)t - \frac{1}{2}gt^2$ ,  $t \geq 0$ , where  $g$  is the acceleration due to gravity.

- (a) Find the slope of the tangent line to the motion of the projectile as a function of  $t$ .
- (b) At what time is the projectile at its maximum height?

**Solution** (a) The slope of the tangent line is given by  $\frac{dy}{dx}$ .

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\frac{d}{dt} \left[ (v_0 \sin \theta)t - \frac{1}{2}gt^2 \right]}{\frac{d}{dt} [(v_0 \cos \theta)t]} = \frac{v_0 \sin \theta - gt}{v_0 \cos \theta} = \tan \theta - \frac{gt}{v_0 \cos \theta}$$

(b) The projectile is at its maximum height when the slope of the tangent line equals 0. That is, when

$$\begin{aligned} \frac{dy}{dx} &= \frac{v_0 \sin \theta - gt}{v_0 \cos \theta} = 0 \\ v_0 \sin \theta - gt &= 0 \\ t &= \frac{v_0 \sin \theta}{g} \end{aligned}$$

**NEED TO REVIEW?** Arc length is discussed in Section 6.5, pp. 438–442.

## 2 Find the Arc Length of a Plane Curve

For a function  $y = f(x)$  that has a derivative that is continuous on some interval containing  $a$  and  $b$ , the arc length  $s$  of  $f$  from  $a$  to  $b$  is given by  $s = \int_a^b \sqrt{1 + [f'(x)]^2} dx$ . For a smooth curve represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ , we have the following formula for arc length.

### THEOREM Arc Length Formula for Parametric Equations

For a smooth curve  $C$  represented by the parametric equations

$$x = x(t) \quad y = y(t) \quad a \leq t \leq b$$

the arc length  $s$  of  $C$  from  $t = a$  to  $t = b$  is given by the formula

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

A partial proof of this theorem is given at the end of the section.

### EXAMPLE 5 Finding Arc Length for Parametric Equations

Find the length  $s$  of the curve represented by the parametric equations

$$x(t) = t^3 + 2 \quad y(t) = 2t^{9/2}$$

from the point where  $t = 1$  to the point where  $t = 3$ . Figure 16 shows the graph of the curve.

**Solution** We begin by finding the derivatives  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$ .

$$\frac{dx}{dt} = 3t^2 \quad \text{and} \quad \frac{dy}{dt} = 9t^{7/2}$$

The curve is smooth for  $1 \leq t \leq 3$ . Now using the arc length formula for parametric equations, we have

$$\begin{aligned} s &= \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \int_1^3 \sqrt{(3t^2)^2 + (9t^{7/2})^2} dt \\ &= \int_1^3 \sqrt{9t^4 + 81t^7} dt = \int_1^3 3t^2 \sqrt{1 + 9t^3} dt \end{aligned}$$

We use the substitution  $u = 1 + 9t^3$ . Then  $du = 27t^2 dt$ , or equivalently,  $3t^2 dt = \frac{du}{9}$ . Changing the limits of integration, we find that when  $t = 1$ , then  $u = 10$ ; and when  $t = 3$ , then  $u = 1 + 9 \cdot 3^3 = 244$ . The arc length  $s$  is

$$\begin{aligned} s &= \int_1^3 3t^2 \sqrt{1 + 9t^3} dt = \int_{10}^{244} \sqrt{u} \left(\frac{du}{9}\right) = \frac{1}{9} \int_{10}^{244} u^{1/2} du = \frac{1}{9} \left[ \frac{u^{3/2}}{\frac{3}{2}} \right]_{10}^{244} \\ &= \frac{2}{27} [244^{3/2} - 10^{3/2}] = \frac{4}{27} [244\sqrt{61} - 5\sqrt{10}] \end{aligned}$$

**Figure 16**  $x(t) = t^3 + 2$ ,  $y(t) = 2t^{9/2}$ ,  $1 \leq t \leq 3$

**NEED TO REVIEW?** The substitution method for definite integrals is discussed in Section 5.6, pp. 391–393.

**Figure 17**  $x(t) = a(t - \sin t)$ ,  
 $y(t) = a(1 - \cos t)$ ,  $a > 0$ .

### EXAMPLE 6 Finding the Arc Length of a Cycloid

Find the length  $s$  of one arch of the cycloid:

$$x(t) = a(t - \sin t) \quad y(t) = a(1 - \cos t) \quad a > 0$$

Figure 17 shows the graph of the cycloid.

**Solution** One arch of the cycloid is obtained when  $t$  varies from 0 to  $2\pi$ . Since

$$\frac{dx}{dt} = a - a \cos t = a(1 - \cos t) \quad \text{and} \quad \frac{dy}{dt} = a \sin t$$

are both continuous and are never simultaneously 0 on  $(0, 2\pi)$ , the cycloid is smooth on  $[0, 2\pi]$ . The arc length  $s$  is

$$\begin{aligned} s &= \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \int_0^{2\pi} \sqrt{a^2(1 - \cos t)^2 + a^2 \sin^2 t} dt \\ &= a \int_0^{2\pi} \sqrt{(1 - 2\cos t + \cos^2 t) + \sin^2 t} dt = a \int_0^{2\pi} \sqrt{1 - 2\cos t + 1} dt \\ &= \sqrt{2}a \int_0^{2\pi} \sqrt{1 - \cos t} dt \end{aligned}$$

To integrate  $\sqrt{1 - \cos t}$  we use a half-angle identity. Since  $\sin \frac{t}{2} \geq 0$  if  $0 \leq t \leq 2\pi$ ,

we have  $\sin \frac{t}{2} = \sqrt{\frac{1 - \cos t}{2}}$ . Then

$$\sqrt{1 - \cos t} = \sqrt{2} \sin \frac{t}{2}$$

Now the arc length  $s$  from  $t = 0$  to  $t = 2\pi$  is

$$s = \sqrt{2}a \int_0^{2\pi} \sqrt{1 - \cos t} dt = \sqrt{2}a \int_0^{2\pi} \sqrt{2} \sin \frac{t}{2} dt = 2a \left[ -2 \cos \frac{t}{2} \right]_0^{2\pi} = 8a \quad \blacksquare$$

### NOW WORK Problem 37.

**Partial Proof of the Arc Length Formula** The proof for parametric equations is similar to the one we used in Chapter 6 to prove the arc length formula for a function  $y = f(x)$ ,  $a \leq x \leq b$ .

First, we partition the closed interval  $[a, b]$  into  $n$  subintervals:

$$[a, t_1], [t_1, t_2], \dots, [t_{i-1}, t_i], \dots, [t_{n-1}, b]$$

each of length  $\Delta t = \frac{b-a}{n}$ . Corresponding to each number  $a, t_1, t_2, \dots, t_{n-1}, b$ , there is a point  $P_0, P_1, P_2, \dots, P_n$ , on the curve, as shown in Figure 18.

We join each point  $P_{i-1}$  to the next point  $P_i$  with a line segment. The sum of the lengths of the line segments is an approximation to the length of the curve from  $t = a$  to  $t = b$ . This sum can be written as

$$d(P_0, P_1) + d(P_1, P_2) + \dots + d(P_{n-1}, P_n) = \sum_{i=1}^n d(P_{i-1}, P_i)$$

where  $d(P_{i-1}, P_i)$  is the length of the line segment joining the points  $P_{i-1}$  and  $P_i$ . Using the distance formula, the length of each line segment is  $d(P_{i-1}, P_i) = \sqrt{[x(t_i) - x(t_{i-1})]^2 + [y(t_i) - y(t_{i-1})]^2}$ . Then the sum of the lengths of the line segments is

$$\sum_{i=1}^n d(P_{i-1}, P_i) = \sum_{i=1}^n \sqrt{[x(t_i) - x(t_{i-1})]^2 + [y(t_i) - y(t_{i-1})]^2}$$

**Figure 18**  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$

**NEED TO REVIEW?** The Mean Value Theorem is discussed in Section 4.3, pp. 277–278.

Since the curve is smooth, the functions  $x = x(t)$  and  $y = y(t)$  satisfy the conditions of the Mean Value Theorem on  $[a, b]$ , and so satisfy the same conditions on each subinterval  $[t_{i-1}, t_i]$ . This means that there are numbers  $u_i$  and  $v_i$  in each open interval  $(t_{i-1}, t_i)$  for which

$$x(t_i) - x(t_{i-1}) = \left[ \frac{dx}{dt}(u_i) \right] \Delta t \quad y(t_i) - y(t_{i-1}) = \left[ \frac{dy}{dt}(v_i) \right] \Delta t$$

The sum of the lengths of the segments can be written as

$$\sum_{i=1}^n d(P_{i-1}, P_i) = \sum_{i=1}^n \sqrt{\left[ \frac{dx}{dt}(u_i) \right]^2 + \left[ \frac{dy}{dt}(v_i) \right]^2} \Delta t$$

These sums are not Riemann sums, since the numbers  $u_i$  and  $v_i$  are not necessarily equal. However, there is a result (usually given in advanced calculus) that states the limit of the sums  $\sum_{i=1}^n \sqrt{\left[ \frac{dx}{dt}(u_i) \right]^2 + \left[ \frac{dy}{dt}(v_i) \right]^2} \Delta t$ , as  $\Delta t \rightarrow 0$ , is a definite integral.\* That is, the length  $s$  of the curve from  $t = a$  to  $t = b$  is

$$s = \int_a^b \sqrt{\left( \frac{dx}{dt} \right)^2 + \left( \frac{dy}{dt} \right)^2} dt$$

\*This is where the continuity of the derivatives is used, to guarantee the existence of the definite integral.

## 9.2 Assess Your Understanding

### Concepts and Vocabulary

1. **Multiple Choice** Let  $C$  denote a curve represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , where each function  $x(t)$  and  $y(t)$  is continuous on the closed interval  $[a, b]$

and differentiable on the open interval  $(a, b)$ . If both  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$  are continuous and never simultaneously 0 on  $(a, b)$ , then  $C$  is called a [(a) smooth, (b) differentiable, (c) parametric] curve.

2. **True or False** If  $C$  is a smooth curve, represented by the parametric equations  $x = x(t)$  and  $y = y(t)$ ,  $a \leq t \leq b$ , then the slope of the tangent line to  $C$  at the point  $(x, y)$  is given by the

formula  $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}$ , provided  $\frac{dx}{dt} \neq 0$ .

3. If in the formula for the slope of a tangent line,  $\frac{dy}{dx} = 0$  (but  $\frac{dx}{dt} \neq 0$ ), then the curve has a(n) \_\_\_\_\_ tangent line

at the point  $(x(t), y(t))$ . If  $\frac{dx}{dt} = 0$  (but  $\frac{dy}{dt} \neq 0$ ), then the curve has a(n) \_\_\_\_\_ tangent line at the point  $(x(t), y(t))$ .

4. **True or False** For a smooth curve  $C$  represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , the length  $s$

of  $C$  from  $t = a$  to  $t = b$  is given by the formula

$$s = \int_a^b \sqrt{\frac{d^2x}{dt^2} + \frac{d^2y}{dt^2}} dt.$$

### Skill Building

In Problems 5–12, find  $\frac{dy}{dx}$ . Assume  $\frac{dx}{dt} \neq 0$ .

5.  $x(t) = e^t \cos t$ ,  $y(t) = e^t \sin t$

6.  $x(t) = 1 + e^{-t}$ ,  $y(t) = e^{3t}$

7.  $x(t) = t + \frac{1}{t}$ ,  $y(t) = 4 + t$

8.  $x(t) = t + \frac{1}{t}$ ,  $y(t) = t - \frac{1}{t}$

9.  $x(t) = \cos t + t \sin t$ ,  $y(t) = \sin t - t \cos t$

10.  $x(t) = \cos^3 t$ ,  $y(t) = \sin^3 t$

11.  $x(t) = \cot^2 t$ ,  $y(t) = \cot t$

12.  $x(t) = \sin t$ ,  $y(t) = \sec^2 t$

In Problems 13–26, for each pair of parametric equations:

- (a) Find an equation of the tangent line to the curve at the given number.  
(b) Graph the curve and the tangent line.

13.  $x(t) = 2t^2$ ,  $y(t) = t$  at  $t = 2$   
 14.  $x(t) = t$ ,  $y(t) = 3t^2$  at  $t = -2$   
 15.  $x(t) = 3t$ ,  $y(t) = 2t^2 - 1$  at  $t = 1$   
 16.  $x(t) = 2t$ ,  $y(t) = t^2 - 2$  at  $t = 2$   
 17.  $x(t) = \sqrt{t}$ ,  $y(t) = \frac{1}{t}$  at  $t = 4$   
 18.  $x(t) = \frac{2}{t^2}$ ,  $y(t) = \frac{1}{t}$  at  $t = 1$   
 19.  $x(t) = \frac{t}{t+2}$ ,  $y(t) = \frac{4}{t+2}$  at  $t = 0$   
 20.  $x(t) = \frac{t^2}{1+t}$ ,  $y(t) = \frac{1}{1+t}$  at  $t = 0$   
 21.  $x(t) = e^t$ ,  $y(t) = e^{-t}$  at  $t = 0$   
 22.  $x(t) = e^{2t}$ ,  $y(t) = e^t$  at  $t = 0$   
 23.  $x(t) = \sin t$ ,  $y(t) = \cos t$  at  $t = \frac{\pi}{4}$   
 24.  $x(t) = \sin^2 t$ ,  $y(t) = \cos t$  at  $t = \frac{\pi}{4}$   
 25.  $x(t) = 4 \sin t$ ,  $y(t) = 3 \cos t$  at  $t = \frac{\pi}{3}$   
 26.  $x(t) = 2 \sin t - 1$ ,  $y(t) = \cos t + 2$  at  $t = \frac{\pi}{6}$

In Problems 27–30, for each smooth curve, find any points where the tangent line is either horizontal or vertical.

27.  $x(t) = t^2$ ,  $y(t) = t^3 - 4t$   
 28.  $x(t) = t^3 - 9t$ ,  $y(t) = t^2$   
 29.  $x(t) = 1 - \cos t$ ,  $y(t) = 1 - \sin t$ ,  $0 \leq t \leq 2\pi$   
 30.  $x(t) = -3 \cos t + \cos(3t)$ ,  $y(t) = \sin t$ ,  $0 \leq t \leq 2\pi$

In Problems 31–38, find the length of each curve over the given interval.

31.  $x(t) = t^3$ ,  $y(t) = t^2$ ;  $0 \leq t \leq 2$   
 32.  $x(t) = 3t^2 + 1$ ,  $y(t) = t^3 - 1$ ;  $0 \leq t \leq 2$   
 33.  $x(t) = t - 1$ ,  $y(t) = \frac{1}{2}t^2$ ;  $0 \leq t \leq 2$   
 34.  $x(t) = t^2$ ,  $y(t) = 2t$ ;  $1 \leq t \leq 3$   
 35.  $x(t) = 4 \sin t$ ,  $y(t) = 4 \cos t$ ;  $-\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$   
 36.  $x(t) = 6 \sin t$ ,  $y(t) = 6 \cos t$ ;  $-\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$   
 37.  $x(t) = 2 \sin t - 1$ ,  $y(t) = 2 \cos t + 1$ ;  $0 \leq t \leq 2\pi$   
 38.  $x(t) = e^t \sin t$ ,  $y(t) = e^t \cos t$ ;  $0 \leq t \leq \pi$

In Problems 39–44:

(a) Use the arc length formula for parametric equations to set up the integral for finding the length of each curve over the given interval.

 (b) Find the length  $s$  of each curve over the given interval.

 (c) Graph each curve over the given interval.

39.  $x(t) = 2 \cos(2t)$ ,  $y(t) = t^2$ ;  $0 \leq t \leq 2\pi$

40.  $x(t) = t^2$ ,  $y(t) = \sin t$ ;  $0 \leq t \leq 2\pi$   
 41.  $x(t) = t^2$ ,  $y(t) = \sqrt{t+2}$ ;  $-2 \leq t \leq 2$   
 42.  $x(t) = t - \cos t$ ,  $y(t) = 1 - \sin t$ ;  $0 \leq t \leq \pi$   
 43.  $x(t) = 3 \cos t + \cos(3t)$ ,  $y(t) = 3 \sin t - \sin(3t)$ ;  $0 \leq t \leq 2\pi$  (a hypocycloid)  
 44.  $x(t) = 5 \cos t - \cos(5t)$ ,  $y(t) = 5 \sin t - \sin(5t)$ ;  $0 \leq t \leq 2\pi$  (an epicycloid)

## Applications and Extensions

### 45. Tangent Lines

- (a) Find all the points on the plane curve  $C$  represented by  $x(t) = t^2 + 2$ ,  $y(t) = t^3 - 4t$ , where the tangent line is horizontal or where it is vertical.  
 (b) Show that  $C$  has two tangent lines at the point  $(6, 0)$ .  
 (c) Find equations of these tangent lines.

 (d) Graph  $C$ .

### 46. Tangent Lines

- (a) Find all the points on the plane curve  $C$  represented by  $x(t) = 2t^2$ ,  $y(t) = 8t - t^3$ , where the tangent line is horizontal or where it is vertical.  
 (b) Show that  $C$  has two tangent lines at the point  $(16, 0)$ .  
 (c) Find equations of these tangent lines.

 (d) Graph  $C$ .

### 47. Arc Length

- (a) Find the arc length of one arch of the four-cusped hypocycloid  $x(t) = b \sin^3 t$ ,  $y(t) = b \cos^3 t$ ,  $0 \leq t \leq \frac{\pi}{2}$ .

 (b) Graph the portion of the curve for  $0 \leq t \leq \frac{\pi}{2}$ .

### 48. Arc Length

- (a) Find the arc length of the spiral  $x(t) = t \cos t$ ,  $y(t) = t \sin t$ ,  $0 \leq t \leq \pi$ .

 (b) Graph the portion of the curve for  $0 \leq t \leq \pi$ .

**Distance Traveled** In Problems 49–54, find the distance a particle travels along the given path over the indicated time interval.

49.  $x(t) = 3t$ ,  $y(t) = t^2 - 3$ ;  $0 \leq t \leq 2$   
 50.  $x(t) = t^2$ ,  $y(t) = 3t$ ;  $0 \leq t \leq 2$   
 51.  $x(t) = \frac{t^2}{2} + 1$ ,  $y(t) = \frac{1}{3}(2t + 3)^{3/2}$ ;  $0 \leq t \leq 2$   
 52.  $x(t) = a \cos t$ ,  $y(t) = a \sin t$ ;  $a > 0$ ,  $0 \leq t \leq \pi$   
 53.  $x(t) = \cos(2t)$ ,  $y(t) = \sin^2 t$ ;  $0 \leq t \leq \frac{\pi}{2}$   
 54.  $x(t) = \frac{1}{t}$ ,  $y(t) = \ln t$ ;  $1 \leq t \leq 2$

In Problems 55–57, find the speed at time  $t$  of an object moving along each curve.

55.  $x(t) = 20t$ ,  $y(t) = -16t^2$

56.  $x(t) = t + \cos t$ ,  $y(t) = 2t - \sin t$

57.  $x(t) = 20 \sin(2t)$ ,  $y(t) = 6 \cos t$

**58. Arc Length along a Circle** Use the arc length formula for parametric equations to show that for a circle of radius  $r$ , the length  $s$  of the arc subtended by a central angle of  $\theta$  radians is  $s = r\theta$ .

**59.** If the smooth curve  $C$ , represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , is the graph of a function  $y = f(x)$ , then  $x$  can be used in place of the parameter  $t$ , and the parametric equations for  $C$  are  $x = t$ ,  $y = f(t)$ ,  $a \leq t \leq b$ . Show that the arc length formula for these parametric equations takes the form

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \int_a^b \sqrt{1 + [f'(x)]^2} dx$$

**Using Differentials to Approximate Arc Length** Problems 60–63 use the following discussion:

For a smooth curve  $C$  represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , the arc length  $s$  satisfies the

equation  $\frac{ds}{dt} = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}$ , so that

$\left(\frac{ds}{dt}\right)^2 = \left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2$ . In terms of differentials, this can be written as

$$(ds)^2 = (dx)^2 + (dy)^2$$

$$ds = \sqrt{(dx)^2 + (dy)^2}$$

Geometrically, the differential  $ds = \sqrt{(dx)^2 + (dy)^2}$  is the length of the hypotenuse of a right triangle with sides of lengths  $dx$  and  $dy$ , as shown in the figure.

Because  $\frac{dy}{dx}$  is the slope of the tangent line, the hypotenuse

lies on the tangent line to the curve at  $x$ . Then the differential  $ds$  can be used to approximate the arc length  $s$  between two nearby points. Using a differential to approximate arc length is particularly useful when it is difficult, or impossible, to find the arc length using

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt.$$

Use the differential  $ds$  to approximate each arc length.

60.  $x(t) = t^{1/3}$ ,  $y(t) = t^2$  from  $t = 1$  to  $t = 1.1$

61.  $x(t) = \sqrt{t}$ ,  $y(t) = t^3$  from  $t = 1$  to  $t = 1.2$

62.  $x(t) = a \sin t$ ,  $y(t) = b \cos t$  from  $t = 0$  to  $t = 0.1$

63.  $x(t) = e^{at}$ ,  $y(t) = e^{bt}$  from  $t = 0$  to  $t = 0.2$

### Challenge Problems

**64.** Show that a smooth curve  $x = f(t)$ ,  $y = g(t)$ , for which  $\frac{dx}{dt}$  is never 0, can be represented by a rectangular equation  $y = F(x)$ , where  $F$  is differentiable. [Hint: Use the fact that  $t = f^{-1}(x)$  exists and is differentiable.]

**65.** Find the point on the curve  $x = \frac{4}{3}t^3 + 3t^2$ ,  $y = t^3 - 4t^2$ , for which the length of the curve from  $(0, 0)$  to  $(x, y)$  is  $\frac{80\sqrt{2} - 40}{3}$ .

**66. Higher-Order Derivatives** Find an expression for  $\frac{d^2y}{dx^2}$  if  $x = f(t)$ ,  $y = g(t)$ , where  $f$  and  $g$  have second-order derivatives, and  $\frac{dx}{dt}$  is never 0.

**67.** Find  $\frac{d^2y}{dx^2}$  if  $x(\theta) = a \cos^3 \theta$ ,  $y(\theta) = a \sin^3 \theta$ .

**68.** Consider the cycloid defined by  $x(t) = a(t - \sin t)$ ,  $y(t) = a(1 - \cos t)$ ,  $a > 0$ . Discuss the behavior of the tangent line to the cycloid at  $t = 0$ .

## 9.3 Surface Area of a Solid of Revolution

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the surface area of a solid of revolution obtained from parametric equations (p. 658)
- 2 Find the surface area of a solid of revolution obtained from a rectangular equation (p. 659)

In Chapter 6, we used a definite integral to find the *volume* of a solid of revolution. To obtain the solid of revolution, we revolved a region around an axis. Here, we are interested in finding the *surface area* of the solid of revolution. To obtain the surface, we revolve a smooth curve about an axis.

Consider a line segment of length  $L$  that lies above the  $x$ -axis. See Figure 19(a). If the region bounded by the line segment and the  $x$ -axis from  $a$  to  $b$  is revolved about an axis, the resulting solid of revolution is a **frustum**. The frustum of a right circular cone has slant height  $L$  and base radii  $r_1$  and  $r_2$ . See Figure 19(b).

**NOTE** A frustum is a portion of a solid of revolution that lies between two parallel planes.

Figure 19

The surface area  $S$  of the frustum is

$$S = 2\pi \left( \frac{r_1 + r_2}{2} \right) L$$

That is, the surface area  $S$  equals the product of  $2\pi$ , the average radius of the frustum, and the slant height of the frustum. This equation forms the basis for the formula for the surface area of a solid of revolution.

Suppose  $C$  is a smooth curve represented by the parametric equations

$$x = x(t) \quad y = y(t) \quad a \leq t \leq b$$

where  $y = y(t) \geq 0$  on the closed interval  $[a, b]$ , as shown in Figure 20. Revolving  $C$  about the  $x$ -axis generates a solid of revolution with surface area  $S$ . To find  $S$ , we partition the interval  $[a, b]$  into  $n$  subintervals:

$$[a, t_1], [t_1, t_2], \dots, [t_{i-1}, t_i], \dots, [t_{n-1}, b]$$

each of length  $\Delta t = \frac{b-a}{n}$ . Corresponding to each number  $a, t_1, t_2, \dots, t_{i-1}, t_i, \dots,$

$t_{n-1}, b$ , there is a point  $P_0, P_1, \dots, P_{i-1}, P_i, \dots, P_{n-1}, P_n$  on the curve  $C$ . We join each point  $P_{i-1}$  to the next point  $P_i$  with a line segment and focus on the line segment joining the points  $P_{i-1}$  and  $P_i$ . See Figure 21(a). When this line segment of length  $d(P_{i-1}, P_i)$  is revolved about the  $x$ -axis, it generates a frustum of a right circular cone whose surface

Figure 20

area  $S_i$  is

$$S_i = 2\pi \left[ \frac{y(t_{i-1}) + y(t_i)}{2} \right] [d(P_{i-1}, P_i)] \quad (1)$$

See Figure 21(b).

Figure 21

We follow the same reasoning used for finding the arc length of a smooth curve, (Section 9.2). Using the distance formula, the length of the  $i$ th line segment is

$$d(P_{i-1}, P_i) = \sqrt{[x(t_i) - x(t_{i-1})]^2 + [y(t_i) - y(t_{i-1})]^2}$$

Now we apply the Mean Value Theorem to  $x(t)$  and  $y(t)$ . There are numbers  $u_i$  and  $v_i$  in each open interval  $(t_{i-1}, t_i)$  for which

$$x(t_i) - x(t_{i-1}) = \left[ \frac{dx}{dt}(u_i) \right] \Delta t \quad \text{and} \quad y(t_i) - y(t_{i-1}) = \left[ \frac{dy}{dt}(v_i) \right] \Delta t$$

So,

$$\begin{aligned} d(P_{i-1}, P_i) &= \sqrt{\left\{ \left[ \frac{dx}{dt}(u_i) \right] \Delta t \right\}^2 + \left\{ \left[ \frac{dy}{dt}(v_i) \right] \Delta t \right\}^2} \\ &= \sqrt{\left[ \frac{dx}{dt}(u_i) \right]^2 + \left[ \frac{dy}{dt}(v_i) \right]^2} \Delta t \end{aligned}$$

where  $u_i$  and  $v_i$  are numbers in the  $i$ th subinterval.

Now we replace  $d(P_{i-1}, P_i)$  in equation (1) with  $\sqrt{\left[ \frac{dx}{dt}(u_i) \right]^2 + \left[ \frac{dy}{dt}(v_i) \right]^2} \Delta t$ .

Then the surface area generated by the sum of the line segments is

$$\sum_{i=1}^n S_i = \sum_{i=1}^n 2\pi \left[ \frac{y(t_{i-1}) + y(t_i)}{2} \right] \sqrt{\left[ \frac{dx}{dt}(u_i) \right]^2 + \left[ \frac{dy}{dt}(v_i) \right]^2} \Delta t$$

These sums approximate the surface area generated by revolving  $C$  about the  $x$ -axis and lead to the following result.

### THEOREM Surface Area of a Solid of Revolution

The surface area  $S$  of a solid of revolution generated by revolving the smooth curve  $C$  represented by  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , where  $y(t) \geq 0$ , about the  $x$ -axis is

$$S = 2\pi \int_a^b y(t) \sqrt{\left( \frac{dx}{dt} \right)^2 + \left( \frac{dy}{dt} \right)^2} dt \quad (2)$$

## 1 Find the Surface Area of a Solid of Revolution Obtained from Parametric Equations

### EXAMPLE 1 Finding the Surface Area of a Solid of Revolution Obtained from Parametric Equations

Find the surface area of the solid generated by revolving the smooth curve  $C$  represented by the parametric equations  $x(t) = 2t^3$ ,  $y(t) = 3t^2$ ,  $0 \leq t \leq 1$ , about the  $x$ -axis.

**Solution** We begin by graphing the smooth curve  $C$  and revolving it about the  $x$ -axis. See Figure 22.

Figure 22

We use formula (2) with  $\frac{dx}{dt} = \frac{d}{dt}(2t^3) = 6t^2$  and  $\frac{dy}{dt} = \frac{d}{dt}(3t^2) = 6t$ . Then

$$\begin{aligned}
 S &= 2\pi \int_a^b y(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = 2\pi \int_0^1 3t^2 \sqrt{(6t^2)^2 + (6t)^2} dt \\
 &= 2\pi \int_0^1 3t^2 \sqrt{36t^4 + 36t^2} dt = 36\pi \int_0^1 t^3 \sqrt{t^2 + 1} dt = \frac{36\pi}{2} \int_1^2 (u-1) \sqrt{u} du \\
 &\quad \begin{array}{c} \text{when } t=0, u=1; \text{ when } t=1, u=2 \\ \text{when } t=0, u=1; \text{ when } t=1, u=2 \end{array} \\
 &= 18\pi \left[ \frac{2}{5} u^{5/2} - \frac{2}{3} u^{3/2} \right]_1^2 = \frac{24\pi}{5} (\sqrt{2} + 1)
 \end{aligned}$$

The surface area of the solid of revolution is  $\frac{24\pi}{5}(\sqrt{2} + 1) \approx 36.405$  square units. ■

### NOW WORK Problem 5.

To help remember the formula for the surface area of a solid of revolution, think of the integrand as the product of the slant height  $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}$  and the circumference  $2\pi y$  of the circle traced by a point  $(x, y)$  on the corresponding sub-arc. Also keep in mind that the limits of integration are parameter values, not  $x$  values.

If the curve is revolved about the  $y$ -axis, we have a similar formula for the surface area of the solid of revolution.

### THEOREM Surface Area of a Solid of Revolution

The surface area  $S$  of a solid of revolution generated by revolving the smooth curve  $C$  represented by  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , where  $x = x(t) \geq 0$ , about the  $y$ -axis is

$$S = 2\pi \int_a^b x(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

## 2 Find the Surface Area of a Solid of Revolution Obtained from a Rectangular Equation

Let  $C$  be a smooth curve represented by a rectangular equation  $y = f(x)$ ,  $a \leq x \leq b$ , where  $f(x) \geq 0$  on  $[a, b]$ . A set of parametric equations for this curve is  $x(t) = t$  and  $y(t) = f(t)$ . Then  $\frac{dx}{dt} = 1$ ,  $dx = dt$ , and  $\frac{dy}{dt} = \frac{dy}{dx} \frac{dx}{dt} = \frac{dy}{dx} \cdot 1 = f'(x)$ . The surface area  $S$  of the solid of revolution obtained by revolving  $C$ ,  $a \leq x \leq b$ , about the  $x$ -axis is  $S = 2\pi \int_a^b y(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$ . So in terms of  $y = f(x)$ ,  $a \leq x \leq b$ , we have

$$S = 2\pi \int_a^b f(x) \sqrt{1 + [f'(x)]^2} dx \quad (3)$$

### EXAMPLE 2 Finding the Surface Area of a Solid of Revolution Obtained from a Rectangular Equation

Find the surface area of the solid generated by revolving the curve represented by  $y = \sqrt{x}$ , from  $x = 0$  to  $x = 1$ , about the  $x$ -axis.

**Solution** We begin with the graph of  $y = \sqrt{x}$ ,  $0 \leq x \leq 1$ , and revolve it about the  $x$ -axis, as shown in Figure 23.

Figure 23

We use formula (3) with  $f(x) = \sqrt{x}$  and  $f'(x) = \frac{1}{2\sqrt{x}}$ . The surface area  $S$  we seek is

$$\begin{aligned} S &= 2\pi \int_a^b f(x) \sqrt{1 + [f'(x)]^2} dx = 2\pi \int_0^1 \sqrt{x} \sqrt{1 + \left(\frac{1}{2\sqrt{x}}\right)^2} dx \\ &= 2\pi \int_0^1 \sqrt{x \left(1 + \frac{1}{4x}\right)} dx = 2\pi \int_0^1 \frac{1}{2} \sqrt{4x + 1} dx \\ &= \pi \int_1^5 \sqrt{u} \left(\frac{du}{4}\right) = \frac{\pi}{4} \left[ \frac{u^{3/2}}{\frac{3}{2}} \right]_1^5 = \frac{\pi}{6} (5\sqrt{5} - 1) \\ &\quad \uparrow \\ &\quad u = 4x + 1; \frac{du}{4} = dx \\ &\quad \text{when } x = 0, u = 1; \text{ when } x = 1, u = 5 \end{aligned}$$

The surface area of the solid of revolution is  $\frac{\pi}{6} (5\sqrt{5} - 1) \approx 5.330$  square units. ■

**NOW WORK** Problem 11.

## 9.3 Assess Your Understanding

### Concepts and Vocabulary

- True or False** When a smooth curve  $C$  represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $y \geq 0$ ,  $a \leq t \leq b$ , is revolved about the  $x$ -axis, the surface area  $S$  of the solid of revolution is given by  $S = 2\pi \int_a^b x(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$ .
- The surface area  $S$  of a solid of revolution generated by revolving the smooth curve  $C$  represented by  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$ , where  $x(t) \geq 0$ , about the  $y$ -axis is  $S =$  \_\_\_\_\_.

### Skill Building

In Problems 3–14, find the surface area of the solid generated by revolving each curve about the  $x$ -axis.

- $x(t) = 3t^2$ ,  $y(t) = 6t$ ;  $0 \leq t \leq 1$
- $x(t) = t^2$ ,  $y(t) = 2t$ ;  $0 \leq t \leq 3$
- $x(\theta) = \cos^3 \theta$ ,  $y(\theta) = \sin^3 \theta$ ;  $0 \leq \theta \leq \frac{\pi}{2}$
- $x(t) = t - \sin t$ ,  $y(t) = 1 - \cos t$ ;  $0 \leq t \leq \pi$
- $y = x^3$ ,  $0 \leq x \leq 1$
- $y = 4x^3$ ,  $0 \leq x \leq 2$
- $y = \frac{x^4}{8} + \frac{1}{4x^2}$ ,  $1 \leq x \leq 2$
- $y = \sqrt{x}$ ;  $1 \leq x \leq 9$
- $y = e^x$ ,  $0 \leq x \leq 1$
- $y = e^{-x}$ ,  $0 \leq x \leq 1$
- $y = \sqrt{a^2 - x^2}$ ,  $-a \leq x \leq a$
- $y = \frac{a}{2}(e^{x/a} + e^{-x/a})$ ,  $0 \leq x \leq a$

In Problems 15–20, find the surface area of the solid generated by revolving each curve about the  $y$ -axis.

- $x(t) = 3t^2$ ,  $y(t) = 2t^3$ ;  $0 \leq t \leq 1$
- $x(t) = 2t + 1$ ,  $y(t) = t^2 + 3$ ;  $0 \leq t \leq 3$
- $x(t) = 2 \sin t$ ,  $y(t) = 2 \cos t$ ;  $0 \leq t \leq \frac{\pi}{2}$
- $x(t) = 3 \cos t$ ,  $y(t) = 2 \sin t$ ;  $0 \leq t \leq \frac{\pi}{2}$
- $x = \frac{1}{4}y^2$ ,  $0 \leq y \leq 2$
- $x^{2/3} + y^{2/3} = a^{2/3}$ ;  $x \geq 0$ ,  $0 \leq y \leq a$
- Find the surface area of the solid generated by revolving one arch of the cycloid  $x(t) = 6(t - \sin t)$ ,  $y(t) = 6(1 - \cos t)$  about the  $x$ -axis.
- CAS** Find the surface area of the solid generated by revolving the graph of  $y = \ln x$ ,  $1 \leq x \leq 10$ , about the  $x$ -axis.

### Applications and Extensions

- Gabriel's Horn** The surface formed by revolving the region between the graph of  $y = \frac{1}{x}$ ,  $x \geq 1$ , and the  $x$ -axis about the  $x$ -axis is called **Gabriel's horn**. See the figure.
  - Find the surface area of Gabriel's horn.
  - Find the volume of Gabriel's horn.

*Interesting Note:* The volume of Gabriel's horn is finite, but the surface area of Gabriel's horn is infinite.

- Surface Area** Find the surface area of the solid of revolution obtained by revolving the graph of  $y = e^{-x}$ ,  $x \geq 0$ , about the  $x$ -axis.
- Surface Area of a Catenoid** When an arc of a catenary  $y = \cosh x$ ,  $a \leq x \leq b$ , is revolved about the  $x$ -axis, it generates a surface called a **catenoid**, which has the least surface area of all surfaces generated by rotating curves having the same endpoints. Find its surface area. See the figure.

- Surface Area of a Sphere** Find a formula for the surface area of a sphere of radius  $R$ .
- Surface Area** Show that the surface area  $S$  of a right circular cone of altitude  $h$  and radius  $b$  is  $S = \pi b \sqrt{h^2 + b^2}$ .

### Challenge Problems

- Searchlight** The reflector of a searchlight is formed by revolving an arc of a parabola about its axis. Find the surface area of the reflector if it measures 1 m across its widest point and is  $\frac{1}{4}$  m deep.

- 29. Surface Area of a Bead** A sphere of radius  $R$  has a hole of radius  $a < R$  drilled through its center. The axis of the hole coincides with a diameter of the sphere. Find the surface area of the part of the sphere that remains.

- 30. Surface Area of a Plug** A plug is made to repair the hole in the sphere in Problem 29. What is the surface area of the plug?

## 9.4 Polar Coordinates

**OBJECTIVES** When you finish this section, you should be able to:

- 1** Plot points using polar coordinates (p. 661)
- 2** Convert between rectangular coordinates and polar coordinates (p. 664)
- 3** Identify and graph polar equations (p. 666)

Figure 24

In a rectangular coordinate system, there are two perpendicular axes, one horizontal (the  $x$ -axis) and one vertical (the  $y$ -axis). The point of intersection of the axes is the origin and is labeled  $O$ . A point is represented by a pair of numbers  $(x, y)$ , where  $x$  and  $y$  equal the signed distance of the point from the  $y$ -axis and the  $x$ -axis, respectively. A polar coordinate system is constructed by selecting a point  $O$ , called the **pole**, and a ray with its vertex at the pole, called the **polar axis**. It is customary to have the pole coincide with the origin and the polar axis coincide with the positive  $x$ -axis of the rectangular coordinate system, as shown in Figure 24.

### 1 Plot Points Using Polar Coordinates

A point  $P$  in the polar coordinate system is represented by an ordered pair of numbers  $(r, \theta)$ , called the **polar coordinates** of  $P$ . If  $r > 0$ , then  $r$  is the distance of the point from the **pole** (the origin), and  $\theta$  is an angle (measured in radians or degrees) whose initial side is the **polar axis** (the positive  $x$ -axis) and whose terminal side is a ray from the pole through the point  $P$ . See Figure 25.

As an example, suppose the polar coordinates of a point  $P$  are  $\left(3, \frac{2\pi}{3}\right)$ . We locate  $P$  by drawing an angle of  $\frac{2\pi}{3}$  radians with its vertex at the pole and its initial side along the polar axis. Then  $P$  is the point on the terminal side of the angle that is 3 units from the pole. See Figure 26.

Figure 25 Polar Coordinates.

Figure 26

If  $r = 0$ , then the point  $P = (0, \theta)$  is at the pole for any  $\theta$ . If  $r < 0$ , the location of the point  $P$  is *not* on the terminal side of  $\theta$ . Instead,  $P$  is on the extension through the pole of the ray forming the terminal side of  $\theta$  and at a distance  $|r|$  from the pole. See Figure 27. So, the point  $\left(-3, \frac{2\pi}{3}\right)$  is located 3 units from the pole on the extension through the pole of the ray that forms the angle  $\frac{2\pi}{3}$  with the polar axis. See Figure 28.

**NOTE** The points  $(r, \theta)$  and  $(-r, \theta)$  are reflections about the pole.

Figure 27

Figure 28

### EXAMPLE 1 Plotting Points Using Polar Coordinates

Plot the points with the following polar coordinates:

- (a)  $\left(3, \frac{5\pi}{3}\right)$     (b)  $\left(2, -\frac{\pi}{4}\right)$     (c)  $(3, 0)$     (d)  $\left(-2, \frac{\pi}{4}\right)$

**Solution** Figure 29 shows the points.

Figure 29

### NOW WORK Problems 17 and 23.

The polar coordinates  $\left(3, \frac{2\pi}{3}\right)$  of the point  $P$  shown in Figure 30(a) on page 663 are one of many possible polar coordinates of  $P$ . For example, since the angles  $\frac{8\pi}{3}$  and  $-\frac{4\pi}{3}$  have the same terminal side as the angle  $\frac{2\pi}{3}$ , the point  $P$  can be represented by any of the polar coordinates  $\left(3, \frac{2\pi}{3}\right)$ ,  $\left(3, \frac{8\pi}{3}\right)$ , and  $\left(3, -\frac{4\pi}{3}\right)$ , as shown in Figures 30(a)–(c). The point  $\left(3, \frac{2\pi}{3}\right)$  can also be represented by the polar coordinates  $\left(-3, -\frac{\pi}{3}\right)$ , as illustrated in Figure 30(d).

Figure 30

So, there is a major difference between rectangular and polar coordinate systems. In a rectangular system, each point in the plane corresponds to exactly one pair of rectangular coordinates; in a polar coordinate system, every point in the plane can be represented by infinitely many polar coordinates.

### EXAMPLE 2 Plotting a Point Using Polar Coordinates

Plot the point  $P$  whose polar coordinates are  $\left(-2, -\frac{3\pi}{4}\right)$ . Then find three other polar coordinates of the same point with the properties:

- (a)  $r > 0$  and  $0 < \theta < 2\pi$     (b)  $r > 0$  and  $-2\pi < \theta < 0$   
 (c)  $r < 0$  and  $0 < \theta < 2\pi$

Figure 31

**Solution** The point  $\left(-2, -\frac{3\pi}{4}\right)$  is located by first drawing the angle  $-\frac{3\pi}{4}$ . Then  $P$  is on the extension of the terminal side of  $\theta$  through the pole at a distance 2 units from the pole, as shown in Figure 31.

- (a) The point  $P = (r, \theta)$ ,  $r > 0$ ,  $0 < \theta < 2\pi$  is  $\left(2, \frac{\pi}{4}\right)$ , as shown in Figure 32(a).  
 (b) The point  $P = (r, \theta)$ ,  $r > 0$ ,  $-2\pi < \theta < 0$  is  $\left(2, -\frac{7\pi}{4}\right)$ , as shown in Figure 32(b).  
 (c) The point  $P = (r, \theta)$ ,  $r < 0$ ,  $0 < \theta < 2\pi$  is  $\left(-2, \frac{5\pi}{4}\right)$ , as shown in Figure 32(c).

Figure 32

### NOW WORK Problem 25.

## Summary

- A point  $P$  with polar coordinates  $(r, \theta)$  also can be represented by

$$(r, \theta + 2n\pi) \quad \text{or} \quad (-r, \theta + (2n + 1)\pi) \quad n \text{ is an integer}$$

- The polar coordinates of the pole are  $(0, \theta)$ , where  $\theta$  is any angle.

Figure 33

**NEED TO REVIEW?** The definitions of the trigonometric functions and their properties are discussed in Appendix A.4, pp. A27–A32.

## 2 Convert Between Rectangular Coordinates and Polar Coordinates

It is sometimes useful to transform coordinates or equations in rectangular form into polar form, or vice versa. To do this, recall that the origin in the rectangular coordinate system coincides with the pole in the polar coordinate system and the positive  $x$ -axis in the rectangular system coincides with the polar axis in the polar system. The positive  $y$ -axis in the rectangular system is the ray  $\theta = \frac{\pi}{2}$  in the polar system.

Suppose a point  $P$  has the polar coordinates  $(r, \theta)$  and the rectangular coordinates  $(x, y)$ , as shown in Figure 33. If  $r > 0$ , then  $P$  is on the terminal side of  $\theta$ , and

$$\cos \theta = \frac{x}{r} \quad \text{and} \quad \sin \theta = \frac{y}{r}$$

If  $r < 0$ , then  $P = (r, \theta)$  can be represented as  $(-r, \pi + \theta)$ , where  $-r > 0$ . Since

$$\cos(\theta + \pi) = -\cos \theta = \frac{x}{-r} \quad \text{and} \quad \sin(\theta + \pi) = -\sin \theta = \frac{y}{-r}$$

then, whether  $r > 0$  or  $r < 0$ ,

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta$$

If  $r = 0$ , then  $P$  is the pole and the same relationships hold.

### THEOREM Conversion from Polar Coordinates to Rectangular Coordinates

If  $P$  is a point with polar coordinates  $(r, \theta)$ , then the rectangular coordinates  $(x, y)$  of  $P$  are given by

$$x = r \cos \theta \quad \text{and} \quad y = r \sin \theta$$

### EXAMPLE 3 Converting from Polar Coordinates to Rectangular Coordinates

Find the rectangular coordinates of each point whose polar coordinates are:

- (a)  $\left(4, \frac{\pi}{3}\right)$     (b)  $\left(-2, \frac{3\pi}{4}\right)$     (c)  $\left(-3, -\frac{5\pi}{6}\right)$

**Solution** (a) We use the equations  $x = r \cos \theta$  and  $y = r \sin \theta$  with  $r = 4$  and  $\theta = \frac{\pi}{3}$ .

$$x = 4 \cos \frac{\pi}{3} = 4 \left(\frac{1}{2}\right) = 2 \quad \text{and} \quad y = 4 \sin \frac{\pi}{3} = 4 \left(\frac{\sqrt{3}}{2}\right) = 2\sqrt{3}$$

The rectangular coordinates are  $(2, 2\sqrt{3})$ .

(b) We use the equations  $x = r \cos \theta$  and  $y = r \sin \theta$  with  $r = -2$  and  $\theta = \frac{3\pi}{4}$ .

$$x = -2 \cos \frac{3\pi}{4} = -2 \left(-\frac{\sqrt{2}}{2}\right) = \sqrt{2} \quad \text{and} \quad y = -2 \sin \frac{3\pi}{4} = -2 \left(\frac{\sqrt{2}}{2}\right) = -\sqrt{2}$$

The rectangular coordinates are  $(\sqrt{2}, -\sqrt{2})$ .

(c) We use the equations  $x = r \cos \theta$  and  $y = r \sin \theta$  with  $r = -3$  and  $\theta = -\frac{5\pi}{6}$ .

$$x = -3 \cos \left(-\frac{5\pi}{6}\right) = -3 \left(-\frac{\sqrt{3}}{2}\right) = \frac{3\sqrt{3}}{2}$$

$$y = -3 \sin \left(-\frac{5\pi}{6}\right) = -3 \left(-\frac{1}{2}\right) = \frac{3}{2}$$

The rectangular coordinates are  $\left(\frac{3\sqrt{3}}{2}, \frac{3}{2}\right)$ . ■

Figure 34

The points  $(4, \frac{\pi}{3})$ ,  $(-2, \frac{3\pi}{4})$ , and  $(-3, -\frac{5\pi}{6})$  and the points  $(2, 2\sqrt{3})$ ,  $(\sqrt{2}, -\sqrt{2})$ , and  $(\frac{3\sqrt{3}}{2}, \frac{3}{2})$  are graphed in their respective coordinate systems in Figure 34.

**NOW WORK** Problems 33 and 39.

Now suppose  $P$  has the rectangular coordinates  $(x, y)$ . To represent  $P$  in polar coordinates, refer again to Figure 33. The point  $P$  lies on a circle with radius  $r$  and center at  $(0, 0)$ , so  $x^2 + y^2 = r^2$ . Since  $\tan \theta = \frac{y}{x}$ , if  $x \neq 0$ , we have

$$r^2 = x^2 + y^2 \quad \text{and} \quad \tan \theta = \frac{y}{x} \quad x \neq 0$$

If  $x = 0$ , the point  $P = (x, y)$  is on the  $y$ -axis. So,  $r = y$  and  $\theta = \frac{\pi}{2}$ .

**THEOREM Conversion from Rectangular Coordinates to Polar Coordinates**

If  $P$  is any point in the plane with rectangular coordinates  $(x, y)$ , the polar coordinates  $(r, \theta)$  of  $P$  are given by

$$r = \sqrt{x^2 + y^2} \quad \text{and} \quad \tan \theta = \frac{y}{x} \quad \text{if } x \neq 0$$

$$r = y \quad \text{and} \quad \theta = \frac{\pi}{2} \quad \text{if } x = 0$$

Be careful when applying this theorem. If  $x \neq 0$ ,  $\tan \theta = \frac{y}{x}$  and  $\theta = \tan^{-1} \frac{y}{x}$ ,  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$ , placing  $\theta$  in quadrant I or IV. If the point lies in quadrant II or III, we must find  $\tan^{-1} \left( \frac{y}{x} \right)$  in quadrant I or IV, respectively, and then add  $\pi$  to the result. It is advisable to plot the point  $(x, y)$  at the start to identify the quadrant that contains the point.

**Converting from Rectangular Coordinates to Polar Coordinates**

**EXAMPLE 4**

Find polar coordinates of each point whose rectangular coordinates are:

- (a)  $(4, -4)$       (b)  $(-1, -\sqrt{3})$       (c)  $(4, -1)$

**Solution** (a) The point  $(4, -4)$ , plotted in Figure 35, is in quadrant IV. The distance from the pole to the point  $(4, -4)$  is

$$r = \sqrt{x^2 + y^2} = \sqrt{4^2 + (-4)^2} = \sqrt{32} = 4\sqrt{2}$$

Since the point  $(4, -4)$  is in quadrant IV,  $-\frac{\pi}{2} < \theta < 0$ . So,

$$\theta = \tan^{-1} \left( \frac{y}{x} \right) = \tan^{-1} \left( \frac{-4}{4} \right) = \tan^{-1}(-1) = -\frac{\pi}{4}$$

**NEED TO REVIEW?** The inverse tangent function is discussed in Section P.7, pp. 58–60.

Figure 35

Figure 36

Figure 37

A pair of polar coordinates for this point is  $(4\sqrt{2}, -\frac{\pi}{4})$ . Other possible representations include  $(-4\sqrt{2}, \frac{3\pi}{4})$  and  $(4\sqrt{2}, \frac{7\pi}{4})$ .

(b) The point  $(-1, -\sqrt{3})$ , plotted in Figure 36, is in quadrant III. The distance from the pole to the point  $(-1, -\sqrt{3})$  is

$$r = \sqrt{(-1)^2 + (-\sqrt{3})^2} = \sqrt{1+3} = 2$$

Since the point  $(-1, -\sqrt{3})$  lies in quadrant III and the inverse tangent function gives an angle in quadrant I, we add  $\pi$  to  $\tan^{-1}(\frac{y}{x})$  to obtain an angle in quadrant III.

$$\theta = \tan^{-1}\left(\frac{-\sqrt{3}}{-1}\right) + \pi = \tan^{-1}(\sqrt{3}) + \pi = \frac{\pi}{3} + \pi = \frac{4\pi}{3}$$

A pair of polar coordinates for the point is  $(2, \frac{4\pi}{3})$ . Other possible representations include  $(-2, \frac{\pi}{3})$  and  $(2, -\frac{2\pi}{3})$ .

(c) The point  $(4, -1)$ , plotted in Figure 37, lies in quadrant IV. The distance from the pole to the point  $(4, -1)$  is

$$r = \sqrt{x^2 + y^2} = \sqrt{4^2 + (-1)^2} = \sqrt{17}$$

Since the point  $(4, -1)$  is in quadrant IV,  $-\frac{\pi}{2} < \theta < 0$ . So,

$$\theta = \tan^{-1}\left(\frac{y}{x}\right) = \tan^{-1}\left(\frac{-1}{4}\right) \approx -0.245 \text{ radians}$$

A pair of polar coordinates for this point is  $(\sqrt{17}, -0.245)$ . Other possible representations for the point include  $(\sqrt{17}, \tan^{-1}(-\frac{1}{4}) + 2\pi) \approx (\sqrt{17}, 6.038)$  and  $(-\sqrt{17}, \tan^{-1}(-\frac{1}{4}) + \pi) \approx (-\sqrt{17}, 2.897)$ . ■

### NOW WORK Problems 41 and 47.

## 3 Identify and Graph Polar Equations

Just as a rectangular grid is used to plot points given by rectangular coordinates, a *polar grid* is used to plot points given by polar coordinates. A **polar grid** consists of concentric circles centered at the pole and of rays with vertices at the pole, as shown in Figure 38. An equation whose variables are polar coordinates is called a **polar equation**, and the **graph of a polar equation** is the set of all points for which at least one of the polar coordinate representations satisfies the equation.

Polar equations of circles with their center at the pole, lines containing the pole, horizontal and vertical lines, and circles containing the pole have simple polar equations. In Section 9.5, we graph other important polar equations.

There are occasions when geometry is all that is needed to graph a polar equation. But usually other methods are required. One method used to graph polar equations is to convert the equation to rectangular coordinates. In the discussion that follows,  $(x, y)$  represents the rectangular coordinates of a point  $P$ , and  $(r, \theta)$  represents polar coordinates of the point  $P$ .

Figure 38 Polar grid

Figure 39  $r = 3$  or  $x^2 + y^2 = 9$ .Figure 40  $\theta = \frac{\pi}{4}$  or  $y = x$ .Figure 41  $r \sin \theta = 2$  or  $y = 2$ .Figure 42  $r = 4 \sin \theta$  or  $x^2 + (y - 2)^2 = 4$ .**EXAMPLE 5** Identifying and Graphing a Polar Equation

Identify and graph each equation:

(a)  $r = 3$       (b)  $\theta = \frac{\pi}{4}$

**Solution** (a) If  $r$  is fixed at 3 and  $\theta$  is allowed to vary, the graph is a circle with its center at the pole and radius 3, as shown in Figure 39. To confirm this, we convert the polar equation  $r = 3$  to a rectangular equation.

$$\begin{aligned} r &= 3 \\ r^2 &= 9 && \text{Square both sides.} \\ x^2 + y^2 &= 9 && r^2 = x^2 + y^2 \end{aligned}$$

(b) If  $\theta$  is fixed at  $\frac{\pi}{4}$  and  $r$  is allowed to vary, the result is a line containing the pole, making an angle of  $\frac{\pi}{4}$  with the polar axis. That is, the graph of  $\theta = \frac{\pi}{4}$  is a line containing the pole with slope  $\tan \theta = \tan \frac{\pi}{4} = 1$ , as shown in Figure 40. To confirm this, we convert the polar equation to a rectangular equation.

$$\begin{aligned} \theta &= \frac{\pi}{4} \\ \tan \theta &= \tan \frac{\pi}{4} \\ \frac{y}{x} &= 1 \\ y &= x \end{aligned}$$

**NOW WORK** Problems 51 and 61.**EXAMPLE 6** Identifying and Graphing Polar Equations

Identify and graph the equations:

(a)  $r \sin \theta = 2$       (b)  $r = 4 \sin \theta$

**Solution** (a) Here, both  $r$  and  $\theta$  are allowed to vary, so the graph of the equation is not as obvious. If we use the fact that  $y = r \sin \theta$ , the equation  $r \sin \theta = 2$  becomes  $y = 2$ . So, the graph of  $r \sin \theta = 2$  is the horizontal line  $y = 2$  that lies 2 units above the pole, as shown in Figure 41.

(b) To convert the equation  $r = 4 \sin \theta$  to rectangular coordinates, we multiply the equation by  $r$  to obtain

$$r^2 = 4r \sin \theta$$

Now we use the formulas  $r^2 = x^2 + y^2$  and  $y = r \sin \theta$ . Then

$$\begin{aligned} r^2 &= 4r \sin \theta \\ x^2 + y^2 &= 4y && r^2 = x^2 + y^2, \quad r \sin \theta = y \\ x^2 + (y^2 - 4y) &= 0 \\ x^2 + (y^2 - 4y + 4) &= 4 && \text{Complete the square in } y. \\ x^2 + (y - 2)^2 &= 4 && \text{Factor.} \end{aligned}$$

This is the standard form of the equation of a circle with its center at the point  $(0, 2)$  and radius 2 in rectangular coordinates. See Figure 42. Notice that the circle passes through the pole. ■

**NOW WORK** Problems 65 and 67.

Table 1 summarizes and extends the results of Examples 5 and 6.

TABLE 1

| Description          | Line passing through the pole making an angle $\alpha$ with the polar axis         | Vertical line                                                                                                         | Horizontal line                                                                                                       |

## 9.4 Assess Your Understanding

### Concepts and Vocabulary

- In a polar coordinate system, the origin is called the \_\_\_\_\_, and the \_\_\_\_\_ coincides with the positive  $x$ -axis of the rectangular coordinate system.
- True or False** Another representation in polar coordinates for the point  $(2, \frac{\pi}{3})$  is  $(2, \frac{4\pi}{3})$ .
- True or False** In a polar coordinate system, each point in the plane has exactly one pair of polar coordinates.
- True or False** In a rectangular coordinate system, each point in the plane has exactly one pair of rectangular coordinates.
- True or False** In polar coordinates  $(r, \theta)$ , the number  $r$  can be negative.
- True or False** If  $(r, \theta)$  are the polar coordinates of the point  $P$ , then  $|r|$  is the distance of the point  $P$  from the pole.
- To convert the point  $(r, \theta)$  in polar coordinates to a point  $(x, y)$  in rectangular coordinates, use the formulas  $x = \underline{\hspace{2cm}}$  and  $y = \underline{\hspace{2cm}}$ .
- An equation whose variables are polar coordinates is called a(n) \_\_\_\_\_.

### Skill Building

In Problems 9–16, match each point in polar coordinates with A, B, C, or D on the graph.

- $(2, -\frac{11\pi}{6})$
- $(-2, -\frac{\pi}{6})$
- $(-2, \frac{\pi}{6})$
- $(2, \frac{7\pi}{6})$
- $(2, \frac{5\pi}{6})$
- $(-2, \frac{5\pi}{6})$
- $(-2, \frac{7\pi}{6})$
- $(2, \frac{11\pi}{6})$

In Problems 17–24, polar coordinates of a point are given. Plot each point in a polar coordinate system.

- $(4, \frac{\pi}{3})$
- $(-4, \frac{\pi}{3})$
- $(-4, -\frac{\pi}{3})$
- $(4, -\frac{\pi}{3})$
- $(\sqrt{2}, \frac{\pi}{4})$
- $(7, -\frac{7\pi}{4})$
- $(-6, \frac{4\pi}{3})$
- $(5, \frac{\pi}{2})$

In Problems 25–32, polar coordinates of a point are given. Find other polar coordinates  $(r, \theta)$  of the point for which:

(a)  $r > 0, -2\pi \leq \theta < 0$

(b)  $r < 0, 0 \leq \theta < 2\pi$

(c)  $r > 0, 2\pi \leq \theta < 4\pi$

25.  $\left(5, \frac{2\pi}{3}\right)$       26.  $\left(4, \frac{3\pi}{4}\right)$       27.  $(-2, 3\pi)$

28.  $(-3, 4\pi)$       29.  $\left(1, \frac{\pi}{2}\right)$       30.  $(2, \pi)$

31.  $\left(-3, -\frac{\pi}{4}\right)$       32.  $\left(-2, -\frac{2\pi}{3}\right)$

In Problems 33–40, polar coordinates of a point are given. Find the rectangular coordinates of each point.

33.  $\left(6, \frac{\pi}{6}\right)$       34.  $\left(-6, \frac{\pi}{6}\right)$       35.  $\left(-6, -\frac{\pi}{6}\right)$

36.  $\left(6, -\frac{\pi}{6}\right)$       37.  $\left(5, \frac{\pi}{2}\right)$       38.  $\left(8, \frac{\pi}{4}\right)$

39.  $\left(2\sqrt{2}, -\frac{\pi}{4}\right)$       40.  $\left(-5, -\frac{\pi}{3}\right)$

In Problems 41–50, rectangular coordinates of a point are given. Plot the point. Find polar coordinates  $(r, \theta)$  of each point for which  $r > 0$  and  $0 \leq \theta < 2\pi$ .

41.  $(5, 0)$       42.  $(2, -2)$       43.  $(-2, 2)$       44.  $(-2, -2\sqrt{3})$

45.  $(\sqrt{3}, 1)$       46.  $(0, -3)$       47.  $(-\sqrt{3}, 1)$       48.  $(3\sqrt{2}, -3\sqrt{2})$

49.  $(3, 2)$       50.  $(-6.5, 1.2)$

In Problems 51–58, match each of the graphs (A) through (H) to one of the following polar equations.

51.  $r = 2$       52.  $\theta = \frac{\pi}{4}$       53.  $r = 2 \cos \theta$

54.  $r \cos \theta = 2$       55.  $r = -2 \cos \theta$       56.  $r = 2 \sin \theta$

57.  $\theta = \frac{3\pi}{4}$       58.  $r \sin \theta = 2$

(A)

(B)

(C)

(D)

(E)

(F)

(G)

(H)

In Problems 59–74, identify and graph each polar equation. Convert to a rectangular equation if necessary.

59.  $r = 4$

60.  $r = 2$

61.  $\theta = \frac{\pi}{3}$

62.  $\theta = -\frac{\pi}{4}$

63.  $r \sin \theta = 4$

64.  $r \cos \theta = 4$

65.  $r \cos \theta = -2$

66.  $r \sin \theta = -2$

67.  $r = 2 \cos \theta$

68.  $r = 2 \sin \theta$

69.  $r = -4 \sin \theta$

70.  $r = -4 \cos \theta$

71.  $r \sec \theta = 4$

72.  $r \csc \theta = 8$

73.  $r \csc \theta = -2$

74.  $r \sec \theta = -4$

In Problems 75–82, the letters  $x$  and  $y$  represent rectangular coordinates. Write each equation in polar coordinates  $r$  and  $\theta$ .

75.  $\frac{x^2}{4} + \frac{y^2}{9} = 1$

76.  $x - 4y + 4 = 0$

77.  $x^2 + y^2 - 4x = 0$

78.  $y = -6$

79.  $x^2 = 1 - 4y$

80.  $y^2 = 1 - 4x$

81.  $xy = 1$

82.  $x^2 + y^2 - 2x + 4y = 0$

In Problems 83–94, the letters  $r$  and  $\theta$  represent polar coordinates. Write each equation in rectangular coordinates  $x$  and  $y$ .

83.  $r = \cos \theta$

84.  $r = 2 + \cos \theta$

85.  $r^2 = \sin \theta$

86.  $r^2 = 1 - \sin \theta$

87.  $r = \frac{4}{1 - \cos \theta}$

88.  $r = \frac{3}{3 - \cos \theta}$

89.  $r^2 = \theta$

90.  $\theta = -\frac{\pi}{4}$

91.  $r = 2$

92.  $r = -5$

93.  $\tan \theta = 4$

94.  $\cot \theta = 3$

## Applications and Extensions

**95. Chicago** In Chicago, the road system is based on a rectangular coordinate system, with the intersection of Madison and State Streets at the origin, and east as the positive  $x$ -axis. Intersections are indicated by the number of blocks they are from the origin. For example, Wrigley Field is located at 1060 West Addison, which is 10 blocks west of State Street and 36 blocks north of Madison Street.

- Write the location of Wrigley Field using rectangular coordinates.
- Write the location of Wrigley Field using polar coordinates. Use east as the polar axis.
- U.S. Cellular Field is located at 35th Street and Princeton, which is 3 blocks west of State Street and 35 blocks south of Madison Street. Write the location of U.S. Cellular Field using rectangular coordinates.
- Write the location of U.S. Cellular Field using polar coordinates.

**96.** Show that the formula for the distance  $d$  between two points  $P_1 = (r_1, \theta_1)$  and  $P_2 = (r_2, \theta_2)$  is

$$d = \sqrt{r_1^2 + r_2^2 - 2r_1r_2 \cos(\theta_2 - \theta_1)}$$

**97. Horizontal Line** Show that the graph of the equation  $r \sin \theta = a$  is a horizontal line  $a$  units above the pole if  $a > 0$ , and  $|a|$  units below the pole if  $a < 0$ .

**98. Vertical Line** Show that the graph of the equation  $r \cos \theta = a$  is a vertical line  $a$  units to the right of the pole if  $a > 0$ , and  $|a|$  units to the left of the pole if  $a < 0$ .

**99. Circle** Show that the graph of the equation  $r = 2a \sin \theta$ ,  $a > 0$ , is a circle of radius  $a$  with its center at the rectangular coordinates  $(0, a)$ .

**100. Circle** Show that the graph of the equation  $r = -2a \sin \theta$ ,  $a > 0$ , is a circle of radius  $a$  with its center at the rectangular coordinates  $(0, -a)$ .

**101. Circle** Show that the graph of the equation  $r = 2a \cos \theta$ ,  $a > 0$ , is a circle of radius  $a$  with its center at the rectangular coordinates  $(a, 0)$ .

**102. Circle** Show that the graph of the equation  $r = -2a \cos \theta$ ,  $a > 0$ , is a circle of radius  $a$  with its center at the rectangular coordinates  $(-a, 0)$ .

**103. Exploring Using Graphing Technology**

- Use a square screen to graph  $r_1 = \sin \theta$ ,  $r_2 = 2 \sin \theta$ , and  $r_3 = 3 \sin \theta$ .
- Describe how varying the constant  $a$ ,  $a > 0$ , alters the graph of  $r = a \sin \theta$ .
- Graph  $r_1 = -\sin \theta$ ,  $r_2 = -2 \sin \theta$ , and  $r_3 = -3 \sin \theta$ .
- Describe how varying the constant  $a$ ,  $a < 0$ , alters the graph of  $r = a \sin \theta$ .

**104. Exploring Using Graphing Technology**

- Use a square screen to graph  $r_1 = \cos \theta$ ,  $r_2 = 2 \cos \theta$ , and  $r_3 = 3 \cos \theta$ .
- Describe how varying the constant  $a$ ,  $a > 0$ , alters the graph of  $r = a \cos \theta$ .
- Graph  $r_1 = -\cos \theta$ ,  $r_2 = -2 \cos \theta$ , and  $r_3 = -3 \cos \theta$ .
- Describe how varying the constant  $a$ ,  $a < 0$ , alters the graph of  $r = a \cos \theta$ .

## Challenge Problems

**105.** Show that  $r = a \sin \theta + b \cos \theta$ ,  $a, b$  not both zero, is the equation of a circle. Find the center and radius of the circle.

**106.** Express  $r^2 = \cos(2\theta)$  in rectangular coordinates free of radicals.

**107.** Prove that the area of the triangle with vertices  $(0, 0)$ ,  $(r_1, \theta_1)$ ,  $(r_2, \theta_2)$  is

$$A = \frac{1}{2} r_1 r_2 \sin(\theta_2 - \theta_1) \quad 0 \leq \theta_1 < \theta_2 \leq \pi$$

## 9.5 Polar Equations; Parametric Equations of Polar Equations; Arc Length of Polar Equations

**OBJECTIVES** When you finish this section, you should be able to:

- Graph a polar equation; find parametric equations (p. 671)
- Find the arc length of a curve represented by a polar equation (p. 675)

In the previous section, we identified the graphs of polar equations by using geometry or by converting the equation to rectangular coordinates. Since many polar equations cannot be identified in these ways, in this section we graph a polar equation by constructing a table and plotting points. We also show how to find parametric equations for a polar

equation. We end the section by finding the length of a curve represented by polar coordinates.

## 1 Graph a Polar Equation; Find Parametric Equations

### EXAMPLE 1 Graphing a Polar Equation (Cardioid); Finding Parametric Equations

- (a) Graph the polar equation  $r = 1 - \sin \theta$ ,  $0 \leq \theta \leq 2\pi$ .  
 (b) Find parametric equations for  $r = 1 - \sin \theta$ .

**Solution** (a) The polar equation  $r = 1 - \sin \theta$  contains  $\sin \theta$ , which has the period  $2\pi$ . We construct Table 2 using common values of  $\theta$  that range from 0 to  $2\pi$ , plot the points  $(r, \theta)$ , and trace out the graph, beginning at the point  $(1, 0)$  and ending at the point  $(1, 2\pi)$ , as shown in Figure 43(a). Figure 43(b) shows the graph using technology.

TABLE 2

| $\theta$          | $r = 1 - \sin \theta$              | $(r, \theta)$                    |
|-------------------|------------------------------------|----------------------------------|
| 0                 | $1 - 0 = 1$                        | $(1, 0)$                         |
| $\frac{\pi}{6}$   | $1 - \frac{1}{2} = \frac{1}{2}$    | $(\frac{1}{2}, \frac{\pi}{6})$   |
| $\frac{\pi}{2}$   | $1 - 1 = 0$                        | $(0, \frac{\pi}{2})$             |
| $\frac{5\pi}{6}$  | $1 - \frac{1}{2} = \frac{1}{2}$    | $(\frac{1}{2}, \frac{5\pi}{6})$  |
| $\pi$             | $1 - 0 = 1$                        | $(1, \pi)$                       |
| $\frac{7\pi}{6}$  | $1 - (-\frac{1}{2}) = \frac{3}{2}$ | $(\frac{3}{2}, \frac{7\pi}{6})$  |
| $\frac{3\pi}{2}$  | $1 - (-1) = 2$                     | $(2, \frac{3\pi}{2})$            |
| $\frac{11\pi}{6}$ | $1 - (-\frac{1}{2}) = \frac{3}{2}$ | $(\frac{3}{2}, \frac{11\pi}{6})$ |
| $2\pi$            | $1 - 0 = 1$                        | $(1, 2\pi)$                      |

Figure 43 The cardioid  $r = 1 - \sin \theta$ .

**NOTE** Graphs of polar equations of the form

$$\begin{array}{ll} r = a(1 + \cos \theta) & r = a(1 + \sin \theta) \\ r = a(1 - \cos \theta) & r = a(1 - \sin \theta) \end{array}$$

where  $a > 0$ , are called **cardioids**. A cardioid contains the pole and is heart-shaped (giving the curve its name).

- (b) We obtain parametric equations for  $r = 1 - \sin \theta$  by using the conversion formulas  $x = r \cos \theta$  and  $y = r \sin \theta$ :

$$x = r \cos \theta = (1 - \sin \theta) \cos \theta \quad y = r \sin \theta = (1 - \sin \theta) \sin \theta$$

Here,  $\theta$  is the parameter, and if  $0 \leq \theta \leq 2\pi$ , then the graph is traced out exactly once in the counterclockwise direction. ■

### NOW WORK Problem 5.

### EXAMPLE 2 Graphing a Polar Equation (Limaçon Without an Inner Loop); Finding Parametric Equations

- (a) Graph the polar equation  $r = 3 + 2 \cos \theta$ ,  $0 \leq \theta \leq 2\pi$ .  
 (b) Find parametric equations for  $r = 3 + 2 \cos \theta$ .

**Solution** (a) The polar equation  $r = 3 + 2 \cos \theta$  contains  $\cos \theta$ , which has the period  $2\pi$ . We construct Table 3 using common values of  $\theta$  that range from 0 to  $2\pi$ , plot the points  $(r, \theta)$ , and trace out the graph, beginning at the point  $(5, 0)$  and ending at the point  $(5, 2\pi)$ , as shown in Figure 44(a). Figure 44(b) shows the graph using technology.

**NOTE** Limaçon (pronounced “leema sown”) is a French word for “snail.”

TABLE 3

| $\theta$         | $r = 3 + 2 \cos \theta$              | $(r, \theta)$                    |
|------------------|--------------------------------------|----------------------------------|
| 0                | $3 + 2(1) = 5$                       | $(5, 0)$                         |
| $\frac{\pi}{3}$  | $3 + 2\left(\frac{1}{2}\right) = 4$  | $\left(4, \frac{\pi}{3}\right)$  |
| $\frac{\pi}{2}$  | $3 + 2(0) = 3$                       | $\left(3, \frac{\pi}{2}\right)$  |
| $\frac{2\pi}{3}$ | $3 + 2\left(-\frac{1}{2}\right) = 2$ | $\left(2, \frac{2\pi}{3}\right)$ |
| $\pi$            | $3 + 2(-1) = 1$                      | $(1, \pi)$                       |
| $\frac{4\pi}{3}$ | $3 + 2\left(-\frac{1}{2}\right) = 2$ | $\left(2, \frac{4\pi}{3}\right)$ |
| $\frac{3\pi}{2}$ | $3 + 2(0) = 3$                       | $\left(3, \frac{3\pi}{2}\right)$ |
| $\frac{5\pi}{3}$ | $3 + 2\left(\frac{1}{2}\right) = 4$  | $\left(4, \frac{5\pi}{3}\right)$ |
| $2\pi$           | $3 + 2(1) = 5$                       | $(5, 2\pi)$                      |

**NOTE** Graphs of polar equations of the form

$$\begin{array}{ll} r = a + b \cos \theta & r = a + b \sin \theta \\ r = a - b \cos \theta & r = a - b \sin \theta \end{array}$$

where  $a > b > 0$ , are called

**limaçons without an inner loop.**

A limaçon without an inner loop does not pass through the pole.

TABLE 4

| $\theta$         | $r = 1 + 2 \cos \theta$              | $(r, \theta)$                    |
|------------------|--------------------------------------|----------------------------------|
| 0                | $1 + 2(1) = 3$                       | $(3, 0)$                         |
| $\frac{\pi}{3}$  | $1 + 2\left(\frac{1}{2}\right) = 2$  | $\left(2, \frac{\pi}{3}\right)$  |
| $\frac{\pi}{2}$  | $1 + 2(0) = 1$                       | $\left(1, \frac{\pi}{2}\right)$  |
| $\frac{2\pi}{3}$ | $1 + 2\left(-\frac{1}{2}\right) = 0$ | $\left(0, \frac{2\pi}{3}\right)$ |
| $\pi$            | $1 + 2(-1) = -1$                     | $(-1, \pi)$                      |
| $\frac{4\pi}{3}$ | $1 + 2\left(-\frac{1}{2}\right) = 0$ | $\left(0, \frac{4\pi}{3}\right)$ |
| $\frac{3\pi}{2}$ | $1 + 2(0) = 1$                       | $\left(1, \frac{3\pi}{2}\right)$ |
| $\frac{5\pi}{3}$ | $1 + 2\left(\frac{1}{2}\right) = 2$  | $\left(2, \frac{5\pi}{3}\right)$ |
| $2\pi$           | $1 + 2(1) = 3$                       | $(3, 2\pi)$                      |

(a)

(b)

Figure 44 The limaçon  $r = 3 + 2 \cos \theta$ .

(b) We obtain parametric equations for  $r = 3 + 2 \cos \theta$  by using the conversion formulas  $x = r \cos \theta$  and  $y = r \sin \theta$ :

$$x = r \cos \theta = (3 + 2 \cos \theta) \cos \theta \quad y = r \sin \theta = (3 + 2 \cos \theta) \sin \theta$$

Here,  $\theta$  is the parameter, and if  $0 \leq \theta \leq 2\pi$ , then the graph is traced out exactly once in the counterclockwise direction. ■

### NOW WORK Problem 7.

### EXAMPLE 3 Graphing a Polar Equation (Limaçon with an Inner Loop); Finding Parametric Equations

(a) Graph the polar equation  $r = 1 + 2 \cos \theta$ ,  $0 \leq \theta \leq 2\pi$ .

(b) Find parametric equations for  $r = 1 + 2 \cos \theta$ .

**Solution** (a) The polar equation  $r = 1 + 2 \cos \theta$  contains  $\cos \theta$ , which has the period  $2\pi$ . We construct Table 4 using common values of  $\theta$  that range from 0 to  $2\pi$ , plot the points  $(r, \theta)$ , and trace out the graph, beginning at the point  $(3, 0)$  and ending at the point  $(3, 2\pi)$ , as shown in Figure 45(a). Figure 45(b) shows the graph using technology.

(a)

(b)

Figure 45 The limaçon  $r = 1 + 2 \cos \theta$ .

**NOTE** Graphs of polar equations of the form

$$\begin{array}{ll} r = a + b \cos \theta & r = a + b \sin \theta \\ r = a - b \cos \theta & r = a - b \sin \theta \end{array}$$

where  $0 < a < b$ , are called

**limaçons with an inner loop.**

A limaçon with an inner loop passes through the pole twice.

(b) We obtain parametric equations for  $r = 1 + 2 \cos \theta$  by using the conversion formulas  $x = r \cos \theta$  and  $y = r \sin \theta$ :

$$x = r \cos \theta = (1 + 2 \cos \theta) \cos \theta \quad y = r \sin \theta = (1 + 2 \cos \theta) \sin \theta$$

Here,  $\theta$  is the parameter, and if  $0 \leq \theta \leq 2\pi$ , then the graph is traced out exactly once in the counterclockwise direction. ■

**NOW WORK** Problem 9.

**EXAMPLE 4** Graphing a Polar Equation (Rose); Finding Parametric Equations

(a) Graph the polar equation  $r = 2 \cos(2\theta)$ ,  $0 \leq \theta \leq 2\pi$ .

(b) Find parametric equations for  $r = 2 \cos(2\theta)$ .

**Solution** (a) The polar equation  $r = 2 \cos(2\theta)$  contains  $\cos(2\theta)$ , which has the period  $\pi$ . So, we construct Table 5 using common values of  $\theta$  that range from 0 to  $2\pi$ , noting that the values for  $\pi \leq \theta \leq 2\pi$  repeat the values for  $0 \leq \theta \leq \pi$ . Then we plot the points  $(r, \theta)$  and trace out the graph. Figure 46(a) on page 674 shows the graph from the point  $(2, 0)$  to the point  $(2, \pi)$ . Figure 46(b) completes the graph from the point  $(2, \pi)$  to the point  $(2, 2\pi)$ .

**TABLE 5**

| $\theta$         | $r = 2 \cos(2\theta)$             | $(r, \theta)$                     | $\theta$          | $r = 2 \cos(2\theta)$             | $(r, \theta)$                     |
|------------------|-----------------------------------|-----------------------------------|-------------------|-----------------------------------|-----------------------------------|
| 0                | $2(1) = 2$                        | $(2, 0)$                          | $\frac{7\pi}{6}$  | $2\left(\frac{1}{2}\right) = 1$   | $\left(1, \frac{7\pi}{6}\right)$  |
| $\frac{\pi}{6}$  | $2\left(\frac{1}{2}\right) = 1$   | $\left(1, \frac{\pi}{6}\right)$   | $\frac{5\pi}{4}$  | $2(0) = 0$                        | $\left(0, \frac{5\pi}{4}\right)$  |
| $\frac{\pi}{4}$  | $2(0) = 0$                        | $\left(0, \frac{\pi}{4}\right)$   | $\frac{4\pi}{3}$  | $2\left(-\frac{1}{2}\right) = -1$ | $\left(-1, \frac{4\pi}{3}\right)$ |
| $\frac{\pi}{3}$  | $2\left(-\frac{1}{2}\right) = -1$ | $\left(-1, \frac{\pi}{3}\right)$  | $\frac{3\pi}{2}$  | $2(-1) = -2$                      | $\left(-2, \frac{3\pi}{2}\right)$ |
| $\frac{\pi}{2}$  | $2(-1) = -2$                      | $\left(-2, \frac{\pi}{2}\right)$  | $\frac{5\pi}{3}$  | $2\left(-\frac{1}{2}\right) = -1$ | $\left(-1, \frac{5\pi}{3}\right)$ |
| $\frac{2\pi}{3}$ | $2\left(-\frac{1}{2}\right) = -1$ | $\left(-1, \frac{2\pi}{3}\right)$ | $\frac{7\pi}{4}$  | $2(0) = 0$                        | $\left(0, \frac{7\pi}{4}\right)$  |
| $\frac{3\pi}{4}$ | $2(0) = 0$                        | $\left(0, \frac{3\pi}{4}\right)$  | $\frac{11\pi}{6}$ | $2\left(\frac{1}{2}\right) = 1$   | $\left(1, \frac{11\pi}{6}\right)$ |
| $\frac{5\pi}{6}$ | $2\left(\frac{1}{2}\right) = 1$   | $\left(1, \frac{5\pi}{6}\right)$  | $2\pi$            | $2(1) = 2$                        | $(2, 2\pi)$                       |
| $\pi$            | $2(1) = 2$                        | $(2, \pi)$                        |                   |                                   |                                   |

**NOTE** Graphs of polar equations of the form  $r = a \cos(n\theta)$  or  $r = a \sin(n\theta)$ ,  $a > 0$ ,  $n$  an integer, are called **roses**. If  $n$  is an even integer, the rose has  $2n$  petals and passes through the pole  $4n$  times. If  $n$  is an odd integer, the rose has  $n$  petals and passes through the pole  $2n$  times.

(b) Parametric equations for  $r = 2 \cos(2\theta)$ :

$$x = r \cos \theta = 2 \cos(2\theta) \cos \theta \quad y = r \sin \theta = 2 \cos(2\theta) \sin \theta$$

where  $\theta$  is the parameter, and if  $0 \leq \theta \leq 2\pi$ , then the graph is traced out exactly once in the counterclockwise direction. ■

**NOW WORK** Problem 11.

Figure 46 A rose with four petals.

**NOTE** Graphs of polar equations of the form  $r = e^{\theta/a}$ ,  $a > 0$ , are called **logarithmic spirals**, since the equation can be written as  $\theta = a \ln r$ . A logarithmic spiral spirals infinitely both toward the pole and away from it.

### EXAMPLE 5 Graphing a Polar Equation (Spiral); Finding Parametric Equations

- (a) Graph the equation  $r = e^{\theta/5}$ .  
 (b) Find parametric equations for  $r = e^{\theta/5}$ .

**Solution** The polar equation  $r = e^{\theta/5}$  lacks the symmetry you may have observed in the previous examples. Since there is no number  $\theta$  for which  $r = 0$ , the graph does not contain the pole. Also observe that:

- $r$  is positive for all  $\theta$ .
- $r$  increases as  $\theta$  increases.
- $r \rightarrow 0$  as  $\theta \rightarrow -\infty$ .
- $r \rightarrow \infty$  as  $\theta \rightarrow \infty$ .

TABLE 6

| $\theta$          | $r = e^{\theta/5}$ | $(r, \theta)$             |
|-------------------|--------------------|---------------------------|
| $-\frac{3\pi}{2}$ | 0.39               | $(0.39, -\frac{3\pi}{2})$ |
| $-\pi$            | 0.53               | $(0.53, -\pi)$            |
| $-\frac{\pi}{2}$  | 0.73               | $(0.73, -\frac{\pi}{2})$  |
| $-\frac{\pi}{4}$  | 0.85               | $(0.85, -\frac{\pi}{4})$  |
| 0                 | 1                  | $(1, 0)$                  |
| $\frac{\pi}{4}$   | 1.17               | $(1.17, \frac{\pi}{4})$   |
| $\frac{\pi}{2}$   | 1.37               | $(1.37, \frac{\pi}{2})$   |
| $\pi$             | 1.87               | $(1.87, \pi)$             |
| $\frac{3\pi}{2}$  | 2.57               | $(2.57, \frac{3\pi}{2})$  |
| $2\pi$            | 3.51               | $(3.51, 2\pi)$            |

We use a calculator to obtain Table 6. Figure 47(a) shows part of the graph  $r = e^{\theta/5}$ .

Figure 47(b) shows the graph for  $\theta = -\frac{3\pi}{2}$  to  $\theta = 2\pi$  using technology.

Figure 47 The spiral  $r = e^{\theta/5}$ .

- (b) We obtain parametric equations for  $r = e^{\theta/5}$  by using the conversion formulas  $x = r \cos \theta$  and  $y = r \sin \theta$ :

$$x = r \cos \theta = e^{\theta/5} \cos \theta \quad y = r \sin \theta = e^{\theta/5} \sin \theta$$

where  $\theta$  is the parameter and  $\theta$  is any real number. ■

## 2 Find the Arc Length of a Curve Represented by a Polar Equation

Suppose a curve  $C$  is represented by the polar equation  $r = f(\theta)$ ,  $\alpha \leq \theta \leq \beta$ , where both  $f$  and its derivative  $f'(\theta) = \frac{dr}{d\theta}$  are continuous on an interval containing  $\alpha$  and  $\beta$ .

Using  $\theta$  as the parameter, parametric equations for the curve  $C$  are

$$x(\theta) = r \cos \theta = f(\theta) \cos \theta \quad y(\theta) = r \sin \theta = f(\theta) \sin \theta$$

Then

$$\frac{dx}{d\theta} = -f(\theta) \sin \theta + f'(\theta) \cos \theta \quad \frac{dy}{d\theta} = f(\theta) \cos \theta + f'(\theta) \sin \theta$$

After simplification,

$$\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2 = [f(\theta)]^2 + [f'(\theta)]^2 = r^2 + \left(\frac{dr}{d\theta}\right)^2 \quad r = f(\theta)$$

Since we are using parametric equations, the length  $s$  of  $C$  from  $\theta = \alpha$  to  $\theta = \beta$  is

$$s = \int_{\alpha}^{\beta} \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$$

### THEOREM Arc Length of the Graph of a Polar Equation

If a curve  $C$  is represented by the polar equation  $r = f(\theta)$ ,  $\alpha \leq \theta \leq \beta$ , and if  $f'(\theta) = \frac{dr}{d\theta}$  is continuous on an interval containing  $\alpha$  and  $\beta$ , then the arc length  $s$  of  $C$  from  $\theta = \alpha$  to  $\theta = \beta$  is

$$s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$$

**EXAMPLE 6** Finding the Arc Length of a Logarithmic Spiral

Find the arc length  $s$  of the logarithmic spiral represented by  $r = f(\theta) = e^{3\theta}$  from  $\theta = 0$  to  $\theta = 2$ .

**Solution** We use the arc length formula  $s = \int_{\alpha}^{\beta} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$  with  $r = e^{3\theta}$ .

Then  $\frac{dr}{d\theta} = 3e^{3\theta}$  and

$$\begin{aligned} s &= \int_0^2 \sqrt{(e^{3\theta})^2 + (3e^{3\theta})^2} d\theta = \int_0^2 \sqrt{10e^{6\theta}} d\theta = \sqrt{10} \int_0^2 e^{3\theta} d\theta \\ &= \sqrt{10} \left[ \frac{e^{3\theta}}{3} \right]_0^2 = \frac{\sqrt{10}}{3} (e^6 - 1) \end{aligned}$$

**NOW WORK** Problem 19.

## 9.5 Assess Your Understanding

## Concepts and Vocabulary

- True or False** A cardioid passes through the pole.
- Multiple Choice** The equations for cardioids and limaçons are very similar. They all have the form  

$$r = a \pm b \cos \theta \quad \text{or} \quad r = a \pm b \sin \theta, \quad a > 0, b > 0$$

The equations represent a limaçon with an inner loop if [(a)  $a < b$ , (b)  $a > b$ , (c)  $a = b$ ]; a cardioid if [(a)  $a < b$ , (b)  $a > b$ , (c)  $a = b$ ]; and a limaçon without an inner loop if [(a)  $a < b$ , (b)  $a > b$ , (c)  $a = b$ ].

- True or False** The graph of  $r = \sin(4\theta)$  is a rose.
- The rose  $r = \cos(3\theta)$  has \_\_\_\_\_ petals.

## Skill Building

In Problems 5–12, for each polar equation:

- Graph the equation.
- Find parametric equations that represent the equation.

- $r = 2 + 2 \cos \theta$
- $r = 3 - 3 \sin \theta$
- $r = 4 - 2 \cos \theta$
- $r = 2 + \sin \theta$
- $r = 1 + 2 \sin \theta$
- $r = 2 - 3 \cos \theta$
- $r = \sin(3\theta)$
- $r = 4 \cos(4\theta)$

In Problems 13–18, graph each pair of polar equations on the same polar grid. Find polar coordinates of the point(s) of intersection and label the point(s) on the graph.

- $r = 8 \cos \theta, \quad r = 2 \sec \theta$
- $r = 8 \sin \theta, \quad r = 4 \csc \theta$
- $r = \sin \theta, \quad r = 1 + \cos \theta$
- $r = 3, \quad r = 2 + 2 \cos \theta$
- $r = 1 + \sin \theta, \quad r = 1 + \cos \theta$
- $r = 1 + \cos \theta, \quad r = 3 \cos \theta$

In Problems 19–22, find the arc length of each curve.

- $r = f(\theta) = e^{\theta/2}$  from  $\theta = 0$  to  $\theta = 2$
- $r = f(\theta) = e^{2\theta}$  from  $\theta = 0$  to  $\theta = 2$

- $r = f(\theta) = \cos^2 \frac{\theta}{2}$  from  $\theta = 0$  to  $\theta = \pi$

- $r = f(\theta) = \sin^2 \frac{\theta}{2}$  from  $\theta = 0$  to  $\theta = \pi$

## Applications and Extensions

In Problems 23–26, the polar equation for each graph is either  $r = a \pm b \cos \theta$  or  $r = a \pm b \sin \theta$ ,  $a > 0, b > 0$ . Select the correct equation and find the values of  $a$  and  $b$ .

In Problems 27–32, find an equation of the tangent line to each curve at the given number. (Hint: Find parametric equations that represent each polar equation. See Section 9.2.)

- $r = 2 \cos(3\theta)$  at  $\theta = \frac{\pi}{6}$
- $r = 3 \sin(3\theta)$  at  $\theta = \frac{\pi}{3}$
- $r = 2 + \cos \theta$  at  $\theta = \frac{\pi}{4}$
- $r = 3 - \sin \theta$  at  $\theta = \frac{\pi}{6}$

$$31. r = 4 + 5 \sin \theta \text{ at } \theta = \frac{\pi}{4} \quad 32. r = 1 - 2 \cos \theta \text{ at } \theta = \frac{\pi}{4}$$

**Lemniscates** Graphs of polar equations of the form  $r^2 = a^2 \cos(2\theta)$  or  $r^2 = a^2 \sin(2\theta)$ , where  $a \neq 0$ , are called **lemniscates**. A lemniscate passes through the pole twice and is shaped like the infinity symbol  $\infty$ .

In Problems 33–36, for each equation:

- (a) Graph the lemniscate.  
 (b) Find parametric equations that represent the equation.

$$33. r^2 = 4 \sin(2\theta) \quad 34. r^2 = 9 \cos(2\theta)$$

$$35. r^2 = \cos(2\theta) \quad 36. r^2 = 16 \sin(2\theta)$$

In Problems 37–48:

- (a) Graph each polar equation.  
 (b) Find parametric equations that represent each equation.

$$37. r = \frac{2}{1 - \cos \theta} \text{ (parabola)} \quad 38. r = \frac{1}{1 - \cos \theta} \text{ (parabola)}$$

$$39. r = \frac{1}{3 - 2 \cos \theta} \text{ (ellipse)} \quad 40. r = \frac{2}{1 - 2 \cos \theta} \text{ (hyperbola)}$$

$$41. r = \theta; \theta \geq 0 \text{ (spiral of Archimedes)}$$

$$42. r = \frac{3}{\theta}; \theta > 0 \text{ (reciprocal spiral)}$$

$$43. r = \csc \theta - 2; 0 < \theta < \pi \text{ (conchoid)}$$

$$44. r = 3 - \frac{1}{2} \csc \theta \text{ (conchoid)}$$

$$45. r = \sin \theta \tan \theta \text{ (cissoid)} \quad 46. r = \cos \frac{\theta}{2}$$

$$47. r = \tan \theta \text{ (kappa curve)} \quad 48. r = \cot \theta \text{ (kappa curve)}$$

$$49. \text{Show that } r = 4(\cos \theta + 1) \text{ and } r = 4(\cos \theta - 1) \text{ have the same graph.}$$

$$50. \text{Show that } r = 5(\sin \theta + 1) \text{ and } r = 5(\sin \theta - 1) \text{ have the same graph.}$$

$$51. \text{Arc Length} \text{ Find the arc length of the spiral } r = \theta \text{ from } \theta = 0 \text{ to } \theta = 2\pi.$$

$$52. \text{Arc Length} \text{ Find the arc length of the spiral } r = 3\theta \text{ from } \theta = 0 \text{ to } \theta = 2\pi.$$

$$53. \text{Perimeter} \text{ Find the perimeter of the cardioid } r = f(\theta) = 1 - \cos \theta, -\pi \leq \theta \leq \pi.$$

#### 54. Exploring Using Graphing Technology

- (a) Graph  $r_1 = 2 \cos(4\theta)$ . Clear the screen and graph  $r_2 = 2 \cos(6\theta)$ . How many petals does each of the graphs have?  
 (b) Clear the screen and graph, in order, each on a clear screen,  $r_1 = 2 \cos(3\theta)$ ,  $r_2 = 2 \cos(5\theta)$ , and  $r_3 = 2 \cos(7\theta)$ . What do you notice about the number of petals? Do the results support the definition of a rose?

#### 55. Exploring Using Graphing Technology

Graph  $r_1 = 3 - 2 \cos \theta$ . Clear the screen and graph  $r_2 = 3 + 2 \cos \theta$ . Clear the screen and graph  $r_3 = 3 + 2 \sin \theta$ . Clear the screen and graph  $r_4 = 3 - 2 \sin \theta$ . Describe the pattern.

**56. Horizontal and Vertical Tangent Lines** Find the horizontal and vertical tangent lines of the cardioid  $r = 1 - \sin \theta$  discussed in Example 1.

**57. Horizontal and Vertical Tangent Lines** Find the horizontal and vertical tangent lines of the cardioid  $r = 3 + 3 \cos \theta$ .

**CAS** **58. Horizontal and Vertical Tangent Lines** Find the horizontal and vertical tangent lines of the limaçon with an inner loop  $r = 1 + 2 \cos \theta$  discussed in Example 3.

**CAS** **59. Horizontal and Vertical Tangent Lines** Find the horizontal and vertical tangent lines of the rose with four petals  $r = 2 \cos(2\theta)$ ,  $0 \leq \theta \leq 2\pi$ , discussed in Example 4.

**CAS** **60. Horizontal and Vertical Tangent Lines** Find the horizontal and vertical tangent lines of the spiral  $r = e^{\theta/5}$  discussed in Example 5.

**CAS** **61. Horizontal and Vertical Tangent Lines** Find the horizontal and vertical tangent lines of the lemniscate  $r^2 = 4 \sin(2\theta)$ .

**62. Test for Symmetry** Symmetry with respect to the polar axis can be tested by replacing  $\theta$  with  $-\theta$ . If an equivalent equation results, the graph is symmetric with respect to the polar axis.

- (a) Explain why this test is valid.  
 (b) Use the test to show that  $r = 3 + 2 \cos \theta$  is symmetric with respect to the polar axis.

**63. Test for Symmetry** Symmetry with respect to the pole can be tested by replacing  $r$  by  $-r$  or by replacing  $\theta$  by  $\theta + \pi$ . If either substitution produces an equivalent equation, the graph is symmetric with respect to the pole.

(a) Explain why these tests are valid.

(b) Show that  $r^2 = 4 \sin(2\theta)$  is symmetric with respect to the pole.

**64. Test for Symmetry** Symmetry with respect to the line  $\theta = \frac{\pi}{2}$  can be tested by replacing  $\theta$  by  $\pi - \theta$ . If an equivalent equation results, the graph is symmetric with respect to the line  $\theta = \frac{\pi}{2}$ .

(a) Explain why this test is valid.

(b) Use the test to show that  $r = 2 \cos(2\theta)$  is symmetric with respect to the line  $\theta = \frac{\pi}{2}$ .

#### Challenge Problems

**Tests for Symmetry** The three tests for symmetry described in Problems 62–64 are *sufficient* conditions for symmetry, but they are not *necessary* conditions. That is, an equation may fail these tests and still have a graph that is symmetric with respect to the polar axis, the line

$$\theta = \frac{\pi}{2}, \text{ or the pole.}$$

**65. Testing for Symmetry** The graph of  $r = \sin(2\theta)$  (a rose with four petals) is symmetric with respect to the polar axis, the line  $\theta = \frac{\pi}{2}$ , and the pole. Show that the test for symmetry with respect to the pole (see Problem 63) works, but the test for symmetry with respect to the polar axis fails (see Problem 62).

**66. Arc Length** Find the entire arc length of the curve  
 $r = a \sin^3 \frac{\theta}{3}$ ,  $a > 0$ . (Hint: Use parametric equations.)

**CAS 67. Arc Length of a Rose Petal**

(a) Graph the rose  $r = 4 \sin(5\theta)$ .

- (b) The petal in the first quadrant begins when  $\theta = 0$  and ends when  $\theta = \alpha$ . Find  $\alpha$ .
- (c) Find the length  $s$  of the petal described in (b).

## 9.6 Area in Polar Coordinates

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the area of a region enclosed by the graph of a polar equation (p. 678)
- 2 Find the area of a region enclosed by the graphs of two polar equations (p. 681)
- 3 Find the surface area of a solid of revolution obtained from the graph of a polar equation (p. 682)

**RECALL** The area  $A$  of the sector of a circle of radius  $r$  formed by a central angle of  $\theta$  radians is  $A = \frac{1}{2}r^2\theta$ .

Figure 48

Figure 49

Figure 50

In this section, we find the area of a region enclosed by the graph of a polar equation and two rays that have the pole as a common vertex. The technique used is similar to that used in Chapter 5, except, instead of approximating the area using rectangles, we approximate the area using sectors of a circle. Figure 48 illustrates the area of a sector of a circle.

### 1 Find the Area of a Region Enclosed by the Graph of a Polar Equation

In Figure 49,  $r = f(\theta)$  is a function that is nonnegative and continuous on the interval  $\alpha \leq \theta \leq \beta$ . Let  $A$  denote the area of the region enclosed by the graph of  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$ , where  $0 \leq \alpha < \beta \leq 2\pi$ . It is helpful to think of the region  $R$  as being “swept out” by rays, beginning with the ray  $\theta = \alpha$  and continuing to the ray  $\theta = \beta$ .

We partition the closed interval  $[\alpha, \beta]$  into  $n$  subintervals:

$$[\alpha, \theta_1], [\theta_1, \theta_2], \dots, [\theta_{i-1}, \theta_i], \dots, [\theta_{n-1}, \beta]$$

each of length  $\Delta\theta = \frac{\beta - \alpha}{n}$ . As shown in Figure 50, we select an angle  $\theta_i^*$  in each subinterval  $[\theta_{i-1}, \theta_i]$ . The quantity  $\frac{1}{2}[f(\theta_i^*)]^2\Delta\theta$  is the area of the circular sector with radius  $r = f(\theta_i^*)$  and central angle  $\Delta\theta$ . The sums of the areas of these sectors

$$\sum_{i=1}^n \frac{1}{2}[f(\theta_i^*)]^2\Delta\theta$$

are an approximation of the area  $A$  we seek. As the number  $n$  of subintervals increases, the sums  $\sum_{i=1}^n \frac{1}{2}[f(\theta_i^*)]^2\Delta\theta$  become better approximations to the total area  $A$ . The

sums  $\sum_{i=1}^n \frac{1}{2}[f(\theta_i^*)]^2\Delta\theta$  are Riemann sums, and since  $r = f(\theta)$  is continuous, the limit exists and equals a definite integral.

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n \frac{1}{2}[f(\theta_i^*)]^2\Delta\theta = \int_{\alpha}^{\beta} \frac{1}{2}[f(\theta)]^2 d\theta = \int_{\alpha}^{\beta} \frac{1}{2}r^2 d\theta$$

**NEED TO REVIEW?** The definite integral is discussed in Section 5.2, pp. 353–359.

### THEOREM Area in Polar Coordinates

If  $r = f(\theta)$  is nonnegative and continuous on the closed interval  $[\alpha, \beta]$ , where  $\alpha < \beta$  and  $\beta - \alpha \leq 2\pi$ , then the area  $A$  of the region enclosed by the graph of  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$  is given by

$$A = \int_{\alpha}^{\beta} \frac{1}{2} r^2 d\theta$$

Be sure to graph the equation  $r = f(\theta)$ ,  $\alpha \leq \theta \leq \beta$ , before using the formula. In drawing the graph, include the rays  $\theta = \alpha$ , indicating the start, and  $\theta = \beta$ , indicating the end, of the region whose area is to be found. These rays determine the limits of integration in the area formula.

### EXAMPLE 1 Finding the Area Enclosed by a Part of a Cardioid

Find the area of the region enclosed by the cardioid  $r = 1 - \sin \theta$ ,  $0 \leq \theta \leq \frac{\pi}{2}$ .

**Solution** The cardioid represented by  $r = 1 - \sin \theta$  is shown in Figure 51(a) and the area enclosed by the cardioid from  $\theta = 0$  to  $\theta = \frac{\pi}{2}$  is shaded.

The region is swept out beginning with the ray  $\theta = 0$  and ending with the ray  $\theta = \frac{\pi}{2}$ , as shown in Figure 51(b). The limits of integration are 0 and  $\frac{\pi}{2}$  and the area  $A$  is

$$\begin{aligned} A &= \int_{\alpha}^{\beta} \frac{1}{2} r^2 d\theta = \int_0^{\pi/2} \frac{1}{2} (1 - \sin \theta)^2 d\theta = \frac{1}{2} \int_0^{\pi/2} (1 - 2 \sin \theta + \sin^2 \theta) d\theta \\ &= \frac{1}{2} \int_0^{\pi/2} \left\{ 1 - 2 \sin \theta + \frac{1}{2} [1 - \cos(2\theta)] \right\} d\theta \quad \sin^2 \theta = \frac{1 - \cos(2\theta)}{2} \\ &= \frac{1}{2} \int_0^{\pi/2} \left[ \frac{3}{2} - 2 \sin \theta - \frac{1}{2} \cos(2\theta) \right] d\theta \\ &= \frac{1}{2} \left[ \frac{3}{2} \theta + 2 \cos \theta - \frac{1}{4} \sin(2\theta) \right]_0^{\pi/2} = \frac{3\pi - 8}{8} \end{aligned}$$

### NOW WORK Problem 9.

### EXAMPLE 2 Finding the Area Enclosed by a Cardioid

Find the area enclosed by the cardioid  $r = 1 - \sin \theta$ .

**Solution** Look again at the cardioid in Figure 51(a). The region enclosed by the cardioid is swept out beginning with the ray  $\theta = 0$  and ending with the ray  $\theta = 2\pi$ . So, the limits of integration are 0 and  $2\pi$ , and the area  $A$  is

$$A = \int_0^{2\pi} \frac{1}{2} (1 - \sin \theta)^2 d\theta = \frac{1}{2} \left[ \frac{3}{2} \theta + 2 \cos \theta - \frac{1}{4} \sin(2\theta) \right]_0^{2\pi} = \frac{3\pi}{2}$$

### NOW WORK Problem 13.

Figure 51  $r = 1 - \sin \theta$ ,  $0 \leq \theta \leq \frac{\pi}{2}$

Figure 52  $r = 2 \cos(3\theta)$ 

**NEED TO REVIEW?** Solving trigonometric equations is discussed in Section P.7, pp. 61–63.

### EXAMPLE 3 Finding the Area Enclosed by a Rose

Find the area enclosed by the graph of  $r = 2 \cos(3\theta)$ , a rose with three petals.

**Solution** Figure 52 shows the rose. The area of the blue shaded region in quadrant I equals one-sixth of the area  $A$  enclosed by the graph.\* The shaded region in quadrant I is swept out beginning with the ray  $\theta = 0$ . It ends at the point  $(0, \theta)$ ,  $0 < \theta < \frac{\pi}{2}$ , where  $\theta$  is the solution of the equation.

$$2 \cos(3\theta) = 0 \quad 0 < \theta < \frac{\pi}{2}$$

$$\cos(3\theta) = 0$$

$$3\theta = \frac{\pi}{2} + 2k\pi$$

$$\theta = \frac{\pi}{6} + \frac{2k\pi}{3}$$

Since  $0 < \theta < \frac{\pi}{2}$ , we have  $\theta = \frac{\pi}{6}$ . The area of the shaded region in quadrant I swept

out by the rays  $\theta = 0$  and  $\theta = \frac{\pi}{6}$  is given by  $\int_0^{\pi/6} \frac{1}{2} r^2 d\theta$ , and the area  $A$  of the region we seek is 6 times this area.

$$\begin{aligned} A &= 6 \int_0^{\pi/6} \frac{1}{2} r^2 d\theta = 3 \int_0^{\pi/6} 4 \cos^2(3\theta) d\theta = 12 \int_0^{\pi/6} \cos^2(3\theta) d\theta \\ &= 12 \int_0^{\pi/6} \frac{1 + \cos(6\theta)}{2} d\theta \quad \cos^2(3\theta) = \frac{1 + \cos(6\theta)}{2} \\ &= 6 \left[ \theta + \frac{1}{6} \sin(6\theta) \right]_0^{\pi/6} = 6 \left( \frac{\pi}{6} \right) = \pi \end{aligned}$$

### NOW WORK Problem 17.

### EXAMPLE 4 Finding the Area Enclosed by a Limaçon

Find the area of the region enclosed by the limaçon  $r = 2 + \cos \theta$ .

**Solution** Figure 53 shows the graph of  $r = 2 + \cos \theta$ , a limaçon without an inner loop.

We see that the region above the polar axis equals the region below it, so the area  $A$  of the region enclosed by the limaçon equals twice the area of the region enclosed by  $r = 2 + \cos \theta$  and swept out by the rays  $\theta = 0$  and  $\theta = \pi$ .

$$\begin{aligned} A &= 2 \int_0^{\pi} \frac{1}{2} r^2 d\theta = \int_0^{\pi} (2 + \cos \theta)^2 d\theta = \int_0^{\pi} (4 + 4 \cos \theta + \cos^2 \theta) d\theta \\ &= \int_0^{\pi} \left[ 4 + 4 \cos \theta + \frac{1 + \cos(2\theta)}{2} \right] d\theta \quad \cos^2 \theta = \frac{1 + \cos(2\theta)}{2} \\ &= \left[ 4\theta + 4 \sin \theta + \frac{\theta}{2} + \frac{1}{4} \sin(2\theta) \right]_0^{\pi} = \frac{9\pi}{2} \end{aligned}$$

### NOW WORK Problem 21.

Figure 53  $r = 2 + \cos \theta$ 

\*We need to exploit symmetry here since there are intervals on which  $r < 0$ , and the area formula requires that  $r > 0$ .

## 2 Find the Area of a Region Enclosed by the Graphs of Two Polar Equations

To find the area  $A$  of the region enclosed by the graphs of two polar equations, we begin by graphing the equations and finding their points of intersection, if any.

### EXAMPLE 5 Finding the Area of the Region Enclosed by the Graphs of Two Polar Equations

Find the area of the region that lies outside the cardioid  $r = 1 + \cos \theta$  and inside the circle  $r = 3 \cos \theta$ .

**Solution** We begin by graphing each equation. See Figure 54(a). Then we find the points of intersection of the two graphs by solving the equation,

$$3 \cos \theta = 1 + \cos \theta$$

$$2 \cos \theta = 1$$

$$\cos \theta = \frac{1}{2}$$

$$\theta = -\frac{\pi}{3} \quad \text{or} \quad \theta = \frac{\pi}{3}$$

The graphs intersect at the points  $\left(\frac{3}{2}, -\frac{\pi}{3}\right)$  and  $\left(\frac{3}{2}, \frac{\pi}{3}\right)$ .

Figure 54

The area  $A$  of the region that lies outside the cardioid and inside the circle is shown as the shaded portion in Figure 54(b). Notice that the area  $A$  is the difference between the area of the region enclosed by the circle  $r = 3 \cos \theta$  swept out by the rays  $\theta = -\frac{\pi}{3}$  and  $\theta = \frac{\pi}{3}$ , and the area of the region enclosed by the cardioid  $r = 1 + \cos \theta$  swept out by the same rays. So,

$$\begin{aligned} A &= \int_{-\pi/3}^{\pi/3} \frac{1}{2} (3 \cos \theta)^2 d\theta - \int_{-\pi/3}^{\pi/3} \frac{1}{2} (1 + \cos \theta)^2 d\theta = \frac{1}{2} \int_{-\pi/3}^{\pi/3} [9 \cos^2 \theta - (1 + 2 \cos \theta + \cos^2 \theta)] d\theta \\ &= \frac{1}{2} \int_{-\pi/3}^{\pi/3} (8 \cos^2 \theta - 1 - 2 \cos \theta) d\theta = \frac{1}{2} \int_{-\pi/3}^{\pi/3} \left[ 8 \left( \frac{1 + \cos(2\theta)}{2} \right) - 1 - 2 \cos \theta \right] d\theta \\ &= \frac{1}{2} \int_{-\pi/3}^{\pi/3} [3 + 4 \cos(2\theta) - 2 \cos \theta] d\theta = \frac{1}{2} [3\theta + 2 \sin(2\theta) - 2 \sin \theta]_{-\pi/3}^{\pi/3} = \pi \end{aligned}$$

**CAUTION** The circle and the cardioid shown in Figure 54(a) actually intersect in a third point, the pole. The pole is not identified when we solve the equation to find the points of intersection because the pole has coordinates  $(0, \pi)$  on  $r = 1 + \cos \theta$ , but it has coordinates  $(0, \frac{\pi}{2})$  and  $(0, \frac{3\pi}{2})$  on  $r = 3 \cos \theta$ . This demonstrates the importance of graphing polar equations when looking for their points of intersection. Since the pole presents particular difficulties, let  $r = 0$  in each equation to determine whether the graph passes through the pole.

### 3 Find the Surface Area of a Solid of Revolution Obtained from a Polar Equation

Suppose a smooth curve  $C$  is given by the polar equation  $r = f(\theta)$ ,  $\alpha \leq \theta \leq \beta$ . Parametric equations for this curve are

$$x(\theta) = r \cos \theta = f(\theta) \cos \theta \quad y(\theta) = r \sin \theta = f(\theta) \sin \theta$$

Then

$$\frac{dx}{d\theta} = f'(\theta) \cos \theta - f(\theta) \sin \theta \quad \frac{dy}{d\theta} = f'(\theta) \sin \theta + f(\theta) \cos \theta$$

$$\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2 = [f(\theta)]^2 + [f'(\theta)]^2 = r^2 + \left(\frac{dr}{d\theta}\right)^2$$

Since the surface area  $S$  of the solid of revolution obtained by revolving  $C$  about the polar axis ( $x$ -axis) when using parametric equations is

$$S = 2\pi \int_{\alpha}^{\beta} y(\theta) \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} d\theta$$

the surface area  $S$  using a polar equation is

$$S = 2\pi \int_{\alpha}^{\beta} r \sin \theta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta = 2\pi \int_{\alpha}^{\beta} f(\theta) \sin \theta \sqrt{[f(\theta)]^2 + [f'(\theta)]^2} d\theta \quad (1)$$

#### EXAMPLE 6 Finding the Surface Area of a Solid of Revolution

Find the surface area of the solid of revolution generated by revolving the arc of the circle  $r = a$ ,  $a > 0$ ,  $0 \leq \theta \leq \frac{\pi}{4}$ , about the polar axis.

**Solution** See Figure 55 on page 683. We find the surface area  $S$  using formula (1). Since  $r = f(\theta) = a$ ,  $f'(\theta) = 0$ . Then

$$\begin{aligned} S &= 2\pi \int_{\alpha}^{\beta} f(\theta) \sin \theta \sqrt{[f(\theta)]^2 + [f'(\theta)]^2} d\theta \\ &= 2\pi \int_0^{\pi/4} a \sin \theta \sqrt{a^2} d\theta = 2\pi a^2 \int_0^{\pi/4} \sin \theta d\theta \\ &= 2\pi a^2 [-\cos \theta]_0^{\pi/4} = 2\pi a^2 \left(-\frac{\sqrt{2}}{2} + 1\right) = \pi a^2 (2 - \sqrt{2}) \end{aligned}$$

**NOW WORK** Problem 27.

## 9.6 Assess Your Understanding

### Concepts and Vocabulary

- The area  $A$  of the sector of a circle of radius  $r$  and central angle  $\theta$  is  $A = \underline{\hspace{2cm}}$ .
- True or False** The area enclosed by the graph of a polar equation and two rays that have the pole as a common vertex is found by approximating the area using sectors of a circle.
- True or False** The area  $A$  enclosed by the graph of the equation  $r = f(\theta)$ ,  $r \geq 0$ , and the rays  $\theta = \alpha$  and  $\theta = \beta$ , is given by  $A = \int_{\alpha}^{\beta} f(\theta) d\theta$ .
- True or False** If  $x(\theta) = r \cos \theta$ ,  $y(\theta) = r \sin \theta$  are parametric equations of the polar equation  $r = f(\theta)$ , then  $\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2 = r^2 + \left(\frac{dr}{d\theta}\right)^2$ .

In Problems 9–12, find the area of the region enclosed by the graph of each polar equation swept out by the given rays.

- $r = 3 \cos \theta$ ;  $\theta = 0$  to  $\theta = \frac{\pi}{3}$
- $r = 3 \sin \theta$ ;  $\theta = 0$  to  $\theta = \frac{\pi}{4}$
- $r = a \theta$ ;  $\theta = 0$  to  $\theta = 2\pi$
- $r = e^{a\theta}$ ;  $\theta = 0$  to  $\theta = \frac{\pi}{2}$

In Problems 13–18, find the area of the region enclosed by the graph of each polar equation.

- $r = 1 + \cos \theta$
- $r = 2 - 2 \sin \theta$
- $r = 3 + \sin \theta$
- $r = 3(2 - \sin \theta)$
- $r = 8 \sin(3\theta)$
- $r = \cos(4\theta)$

### Skill Building

In Problems 5–8, find the area of the shaded region.

5.  $r = \cos(2\theta)$

6.  $r = 2 \sin(3\theta)$

7.  $r = 2 + 2 \sin \theta$

8.  $r = 3 - 3 \cos \theta$

In Problems 19–22, find the area of the region enclosed by one loop of the graph of each polar equation.

- $r = 4 \sin(2\theta)$
- $r = 5 \cos(3\theta)$
- $r^2 = 4 \cos(2\theta)$
- $r = a^2 \cos(2\theta)$

In Problems 23–26, find the area of each region described.

- Inside  $r = 2 \sin \theta$ ; outside  $r = 1$
- Inside  $r = 4 \cos \theta$ ; outside  $r = 2$
- Inside  $r = \sin \theta$ ; outside  $r = 1 - \cos \theta$
- Inside  $r^2 = 4 \cos(2\theta)$ ; outside  $r = \sqrt{2}$

In Problems 27–30, find the surface area of the solid of revolution generated by revolving each curve about the polar axis.

- $r = \sin \theta$ ,  $0 \leq \theta \leq \frac{\pi}{2}$
- $r = 1 + \cos \theta$ ,  $0 \leq \theta \leq \pi$
- $r = e^{\theta}$ ,  $0 \leq \theta \leq \pi$
- $r = 2a \cos \theta$ ,  $0 \leq \theta \leq \frac{\pi}{2}$

### Applications and Extensions

In Problems 31–48, find the area of the region:

- enclosed by the small loop of the limaçon  $r = 1 + 2 \cos \theta$ .
- enclosed by the small loop of the limaçon  $r = 1 + 2 \sin \theta$ .

33. enclosed by the loop of the graph of  $r = 2 - \sec \theta$ .
34. enclosed by the loop of the graph of  $r = 5 + \sec \theta$ .
35. enclosed by  $r = 2 \sin^2 \frac{\theta}{2}$ .
36. enclosed by  $r = 6 \cos^2 \theta$ .
37. inside the circle  $r = 8 \cos \theta$  and to the right of the line  $r = 2 \sec \theta$ .
38. inside the circle  $r = 10 \sin \theta$  and above the line  $r = 2 \csc \theta$ .
39. outside the circle  $r = 3$  and inside the cardioid  $r = 2 + 2 \cos \theta$ .
40. inside the circle  $r = \sin \theta$  and outside the cardioid  $r = 1 + \cos \theta$ .
41. common to the circle  $r = \cos \theta$  and the cardioid  $r = 1 - \cos \theta$ .
42. common to the circles  $r = \cos \theta$  and  $r = \sin \theta$ .
43. common to the inside of the cardioid  $r = 1 + \sin \theta$  and the outside of the cardioid  $r = 1 + \cos \theta$ .
44. common to the inside of the lemniscate  $r^2 = 8 \cos(2\theta)$  and the outside of the circle  $r = 2$ .
45. enclosed by the rays  $\theta = 0$  and  $\theta = 1$  and  $r = e^{-\theta}$ ,  $0 \leq \theta \leq 1$ .
46. enclosed by the rays  $\theta = 0$  and  $\theta = 1$  and  $r = e^{\theta}$ ,  $0 \leq \theta \leq 1$ .
47. enclosed by the rays  $\theta = 1$  and  $\theta = \pi$  and  $r = \frac{1}{\theta}$ ,  $1 \leq \theta \leq \pi$ .
48. inside the outer loop but outside the inner loop of  $r = 1 + 2 \sin \theta$ .
49. **Area** Find the area of the loop of the graph of  $r = \sec \theta + 2$ .

51. **Surface Area of a Bead** A sphere of radius  $R$  has a hole of radius  $a < R$  drilled through it. See the figure. The axis of the hole coincides with a diameter of the sphere.

- (a) Find the surface area of that part of the sphere that remains.

- (b) Is the area found in Problem 29, Section 9.3, the same as the area found here? If not, justify the difference.

52. **Surface Area of a Plug** A plug is made to repair the hole in the sphere in Problem 51.

- (a) What is the surface area of the plug?
- (b) Is the area found in Problem 30, Section 9.3, the same as the area found here? If not, justify the difference.

53. **Area** Find the area enclosed by the loop of the **strophoid**  $r = \sec \theta - 2 \cos \theta$ ,  $-\frac{\pi}{2} < \theta < \frac{\pi}{2}$  as shown in the figure.

**CAS** 54. **Area**

- (a) Graph the limaçon  $r = 2 - 3 \cos \theta$ .
- (b) Find the area enclosed by the inner loop. Round the answer to three decimal places.

### Challenge Problems

55. Show that the area enclosed by the graph of  $r\theta = a$  and the rays  $\theta = \theta_1$  and  $\theta = \theta_2$  is proportional to the difference of the radii,  $r_1 - r_2$ , where  $r_1 = \frac{a}{\theta_1}$  and  $r_2 = \frac{a}{\theta_2}$ .
56. Find the area of the region that lies outside the circle  $r = 1$  and inside the rose  $r = 3 \sin(3\theta)$ .
57. Find the area of the region that lies inside the circle  $r = 2$  and outside the rose  $r = 3 \sin(2\theta)$ .

Figure 56

## 9.7 The Polar Equation of a Conic

**OBJECTIVE** When you finish this section, you should be able to:

**1** Express a conic as a polar equation (p. 686)

The polar equation of a conic is used to explain and to derive Kepler's Laws of Planetary Motion, which are discussed in Chapter 11. The word "conic" is derived from the word "cone," which is a geometric figure that can be constructed in the following way: Let  $a$  and  $g$  be two distinct lines that intersect at a point  $V$ . Fix the line  $a$  and revolve the line  $g$  about  $a$  while keeping the angle between the lines constant. The collection of points swept out by the line  $g$  is called a **right circular cone**. See Figure 56. The fixed line  $a$  is called the **axis** of the cone; the point  $V$  is its **vertex**. Any line passing through  $V$  that makes the same angle with  $a$  as the original line  $g$  is called a **generator** of the cone.

Each generator lies entirely on the cone. The cone consists of two parts, called **nappes**, that intersect at the vertex.

**Conics**, an abbreviation for **conic sections**, are curves that result when a right circular cone and a plane intersect. The conics discussed here arise when the plane does not contain the vertex of the cone, as shown in Figure 57. If the plane contains the vertex, the intersection of the plane and the cone is a point, a line, or a pair of lines. These are called **degenerate cases**.

Figure 57

A conic is:

- an **ellipse**, when the plane intersects the axis  $a$  at an angle greater than the angle between  $a$  and  $g$ . An ellipse lies on only one nappe of the cone. See Figure 57(a).
- a **parabola**, when the plane intersects the axis  $a$  at the same angle as the line  $g$ ; that is, the plane is parallel to exactly one generator. A parabola lies on only one nappe of the cone. See Figure 57(b).
- a **hyperbola**, when the plane intersects the axis  $a$  at an angle smaller than the angle between  $a$  and  $g$ . A hyperbola lies on both nappes of the cone. See Figure 57(c).

In Appendix A.3, pp. A-22 to A-25, we discuss the rectangular equations of a parabola, an ellipse, and a hyperbola. To obtain the polar equations, we use a unified definition that simultaneously defines all three conics.

#### DEFINITION

Let  $D$  denote a fixed line called the **directrix**; let  $F$  denote a fixed point called the **focus**, which is not on  $D$ ; and let  $e$  be a fixed positive number called the **eccentricity**. A **conic** is the set of points  $P$  in the plane for which the ratio of the distance from  $F$  to  $P$  to the distance from  $D$  to  $P$  equals  $e$ . That is, a **conic** is the collection of points  $P$  for which

$$\frac{d(F, P)}{d(D, P)} = e \quad (1)$$

- If  $e = 1$ , the conic is a parabola.
- If  $e < 1$ , the conic is an ellipse.
- If  $e > 1$ , the conic is a hyperbola.

Figure 58 illustrates the definition.

- In a parabola, the **axis** is the line through the focus perpendicular to the directrix.
- In an ellipse, the **major axis** is the line through the focus perpendicular to the directrix.
- In a hyperbola, the **transverse axis** is the line through the focus perpendicular to the directrix.

Figure 58  $\frac{d(F, P)}{d(D, P)} = e$ .

Figure 59

## 1 Express a Conic as a Polar Equation

The equations for the conics in polar coordinates are derived by positioning the focus  $F$  at the pole (the origin) and the directrix  $D$  either parallel to or perpendicular to the polar axis.

Suppose the directrix  $D$  is perpendicular to the polar axis at a distance  $p$  units to the left of the pole (the focus  $F$ ), as shown in Figure 59. If  $P = (r, \theta)$  is any point on the conic, then by (1),

$$\frac{d(F, P)}{d(D, P)} = e \quad \text{or} \quad d(F, P) = e \cdot d(D, P)$$

Now drop the perpendicular from the point  $P$  to the polar axis. Using the point of intersection  $Q$ , we have  $d(O, Q) = r \cos \theta$ . Then

$$d(D, P) = p + d(O, Q) = p + r \cos \theta$$

Since  $d(F, P) = d(O, P) = r$ ,

$$d(F, P) = e \cdot d(D, P)$$

$$r = e(p + r \cos \theta) \quad d(F, P) = r; d(D, P) = p + r \cos \theta$$

$$r - er \cos \theta = ep$$

$$r = \frac{ep}{1 - e \cos \theta}$$

### THEOREM The Polar Equation of a Conic

The polar equation of a conic with focus at the pole and directrix perpendicular to the polar axis at a distance  $p$  to the left of the pole is

$$\boxed{r = \frac{ep}{1 - e \cos \theta}} \quad (2)$$

where  $e$  is the eccentricity of the conic.

### EXAMPLE 1 Identifying and Graphing the Polar Equation of a Conic

- (a) Identify and graph the equation  $r = \frac{4}{2 - \cos \theta}$ .  
 (b) Convert the polar equation to a rectangular equation.  
 (c) Find parametric equations for the polar equation.

**Solution** (a) We divide the numerator and the denominator by 2 to express the equation in the form  $r = \frac{ep}{1 - e \cos \theta}$ .

$$r = \frac{4}{2 - \cos \theta} = \frac{2}{1 - \frac{1}{2} \cos \theta} \quad r = \frac{ep}{1 - e \cos \theta}$$

Now we see that  $e = \frac{1}{2}$ . Since  $ep = 2$ , we find  $p = \frac{2}{e} = \frac{2}{\frac{1}{2}} = 4$ . This is an ellipse,

because  $e = \frac{1}{2} < 1$ . One focus is at the pole, and the directrix is perpendicular to the polar axis a distance of  $p = 4$  units to the left of the pole. The major axis is along the polar axis.

Letting  $\theta = 0$  and  $\theta = \pi$ , we can find the vertices of the ellipse.

$$r = \frac{4}{2 - \cos 0} = \frac{4}{2 - 1} = 4 \quad \text{and} \quad r = \frac{4}{2 - \cos \pi} = \frac{4}{2 - (-1)} = \frac{4}{3}$$

Figure 60

So, the vertices of the ellipse are the points whose polar coordinates are  $(4, 0)$  and  $(\frac{4}{3}, \pi)$ . The  $y$ -intercepts of the ellipse are at  $\theta = \frac{\pi}{2}$  and  $\theta = \frac{3\pi}{2}$ , which give rise to the points  $(2, \frac{\pi}{2})$  and  $(2, \frac{3\pi}{2})$ . The graph of the ellipse is shown in Figure 60.

(b) To obtain a rectangular equation of the ellipse, we eliminate the fraction and then square the resulting polar equation.

$$\begin{aligned}
 r &= \frac{4}{2 - \cos \theta} \\
 r(2 - \cos \theta) &= 4 \\
 2r - r \cos \theta &= 4 \\
 2r &= 4 + r \cos \theta \\
 4r^2 &= (4 + r \cos \theta)^2 && \text{Square the equation.} \\
 4(x^2 + y^2) &= (4 + x)^2 && r^2 = x^2 + y^2, \quad x = r \cos \theta \\
 4x^2 + 4y^2 &= 16 + 8x + x^2 \\
 3\left(x^2 - \frac{8}{3}x\right) + 4y^2 &= 16 \\
 3\left(x - \frac{4}{3}\right)^2 + 4y^2 &= 16 + 3\left(\frac{16}{9}\right) = \frac{64}{3} && \text{Complete the square in } x.
 \end{aligned}$$

This is the equation of an ellipse in rectangular coordinates, with its center at the point  $(\frac{4}{3}, 0)$  in rectangular coordinates.

(c) Parametric equations of the ellipse  $r = \frac{4}{2 - \cos \theta}$  are

$$x(\theta) = r \cos \theta = \frac{4 \cos \theta}{2 - \cos \theta} \quad y(\theta) = r \sin \theta = \frac{4 \sin \theta}{2 - \cos \theta} \quad 0 \leq \theta \leq 2\pi$$

where  $\theta$  is the parameter. ■

There are four possibilities for the position of the directrix relative to the polar axis. These are summarized in Table 8.

TABLE 8 Polar Equations of Conics (Focus at the Pole, Eccentricity  $e$ )

| Equation                           | Description                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------|
| $r = \frac{ep}{1 - e \cos \theta}$ | Directrix is perpendicular to the polar axis a distance $p$ units to the left of the pole.  |
| $r = \frac{ep}{1 + e \cos \theta}$ | Directrix is perpendicular to the polar axis a distance $p$ units to the right of the pole. |
| $r = \frac{ep}{1 + e \sin \theta}$ | Directrix is parallel to the polar axis a distance $p$ units above the pole.                |
| $r = \frac{ep}{1 - e \sin \theta}$ | Directrix is parallel to the polar axis a distance $p$ units below the pole.                |

#### Eccentricity

If  $e = 1$ , the conic is a parabola; the axis of symmetry is perpendicular to the directrix.

If  $e < 1$ , the conic is an ellipse; the major axis is perpendicular to the directrix.

If  $e > 1$ , the conic is a hyperbola; the transverse axis is perpendicular to the directrix.

**EXAMPLE 2** Analyzing the Orbit of an Exoplanet

Many hundreds of planets beyond our solar system have been discovered. They are known as **exoplanets**. One of these exoplanets, HD 190360b, orbits the star HD 190360 (most stars do not have names) in an elliptical orbit given by the polar equation

$$r = \frac{3.575}{1 - 0.316 \cos \theta}$$

where the star HD 190360 is at the pole, the major axis is along the polar axis, and  $r$  is measured in astronomical units (AU). (One AU =  $1.5 \times 10^{11}$  m, which is the average distance from Earth to the Sun.)

- What is the eccentricity of the exoplanet HD 190360b's orbit?
- Find the distance from the exoplanet HD 190360b to the star HD 190360 at periapsis (shortest distance).
- Find the distance from the exoplanet HD 190360b to the star HD 190360 at apoapsis (greatest distance).

**Solution** (a) The equation of HD 190360b's orbit is in the form  $r = \frac{ep}{1 - e \cos \theta}$ . So, the eccentricity of the orbit is  $e = 0.316$ . See Figure 61.

(b) Periapsis occurs when  $r$  is a minimum. Since  $r$  is minimum when  $\cos \theta = -1$ , periapsis occurs for

$$r = \frac{3.575}{1 - 0.316 \cos \theta} = \frac{3.575}{1 - 0.316(-1)} = \frac{3.575}{1.316} \approx 2.717$$

The periapsis is at the point  $(2.717, \pi)$ . The exoplanet HD 190360b is approximately 2.717 AU from the star HD 190360 at periapsis.

(c) The apoapsis occurs when  $r$  is a maximum. Since  $r$  is maximum when  $\cos \theta = 1$ , the apoapsis occurs for

$$r = \frac{3.575}{1 - 0.316 \cos \theta} = \frac{3.575}{1 - 0.316(1)} = \frac{3.575}{0.684} \approx 5.227$$

The apoapsis is at the point  $(5.227, 0)$ . The exoplanet HD 190360b is approximately 5.227 AU from the star HD 190360 at apoapsis. ■

**Figure 61**  $r = \frac{3.575}{1 - 0.316 \cos \theta}$ . The orbit of exoplanet HD 190360b about star HD 190360.

**NOW WORK** Problem 33.**9.7 Assess Your Understanding****Concepts and Vocabulary**

- Multiple Choice** A(n) [(a) parabola, (b) ellipse, (c) hyperbola] is the set of points  $P$  in the plane for which the distance from a fixed point called the focus to  $P$  equals the distance from a fixed line called the directrix to  $P$ .
- In your own words, explain what is meant by the eccentricity  $e$  of a conic.
- Identify the graphs of each of these polar equations:  
 $r = \frac{2}{1 + \sin \theta}$  and  $r = \frac{2}{1 + \cos \theta}$ . How are they the same? How are they different?
- True or False** The polar equation of a conic with focus at the pole and directrix perpendicular to the polar axis at a distance  $p$  to the left of the pole is  $r = \frac{ep}{1 - p \cos \theta}$ , where  $e$  is the eccentricity of the conic.

**Skill Building**

In Problems 5–12, identify each conic. Find its eccentricity  $e$  and the position of its directrix.

- $r = \frac{1}{1 + \cos \theta}$
- $r = \frac{3}{1 - \sin \theta}$
- $r = \frac{4}{2 - 3 \sin \theta}$
- $r = \frac{2}{1 + 2 \cos \theta}$
- $r = \frac{3}{4 - 2 \cos \theta}$
- $r = \frac{6}{8 + 2 \cos \theta}$
- $r = \frac{4}{3 + 3 \sin \theta}$
- $r = \frac{1}{6 + 2 \sin \theta}$

In Problems 13–20, for each polar equation:

- Identify and graph the equation.
- Convert the polar equation to a rectangular equation.
- Find parametric equations for the polar equation.

13.  $r = \frac{8}{4 + 3 \sin \theta}$

14.  $r = \frac{10}{5 + 4 \cos \theta}$

15.  $r = \frac{9}{3 - 6 \cos \theta}$

16.  $r = \frac{12}{4 + 8 \sin \theta}$

17.  $r(3 - 2 \sin \theta) = 6$

18.  $r(2 - \cos \theta) = 2$

19.  $r = \frac{6 \sec \theta}{2 \sec \theta - 1}$

20.  $r = \frac{3 \csc \theta}{\csc \theta - 1}$

**Applications and Extensions**

In Problems 21–26, find the slope of the tangent line to the graph of each conic at  $\theta$ .

21.  $r = \frac{9}{4 - \cos \theta}, \quad \theta = 0$

22.  $r = \frac{3}{1 - \sin \theta}, \quad \theta = 0$

23.  $r = \frac{8}{4 + \sin \theta}, \quad \theta = \frac{\pi}{2}$

24.  $r = \frac{10}{5 + 4 \sin \theta}, \quad \theta = \pi$

25.  $r(2 + \cos \theta) = 4, \quad \theta = \pi$

26.  $r(3 - 2 \sin \theta) = 6, \quad \theta = \frac{\pi}{2}$

In Problems 27–32, find a polar equation for each conic. For each equation, a focus is at the pole.

27.  $e = \frac{4}{5}$ ; directrix is perpendicular to the polar axis 3 units to the left of the pole.

28.  $e = \frac{2}{3}$ ; directrix is parallel to the polar axis 3 units above the pole.

29.  $e = 1$ ; directrix is parallel to the polar axis 1 unit above the pole.

30.  $e = 1$ ; directrix is parallel to the polar axis 2 units below the pole.

31.  $e = 6$ ; directrix is parallel to the polar axis 2 units below the pole.

32.  $e = 5$ ; directrix is perpendicular to the polar axis 3 units to the right of the pole.

**33. Halley's Comet** As with most comets, Halley's comet has a highly elliptical orbit about the Sun, given by the polar equation

$$r = \frac{1.155}{1 - 0.967 \cos \theta}$$

where the Sun is at the pole, the semimajor axis is along the polar axis, and  $r$  is measured in AU (astronomical unit). One AU =  $1.5 \times 10^{11}$  m, which is the average distance from Earth to the Sun.

- What is the eccentricity of the comet's orbit?
- Find the distance from Halley's comet to the Sun at perihelion (shortest distance from the Sun).
- Find the distance from Halley's comet to the Sun at aphelion (greatest distance from the Sun).

(d) Graph the orbit of Halley's comet.

**34. Orbit of Mercury** The planet Mercury travels around the Sun in an elliptical orbit given approximately by

$$r = \frac{(3.442) 10^7}{1 - 0.206 \cos \theta}$$

where  $r$  is measured in miles and the Sun is at the pole.

- What is the eccentricity of Mercury's orbit?
- Find the distance from Mercury to the Sun at perihelion (shortest distance from the Sun).
- Find the distance from Mercury to the Sun at aphelion (greatest distance from the Sun).

(d) Graph the orbit of Mercury.

**35. The Effect of Eccentricity**

- Graph the conic  $r = \frac{2e}{1 - e \cos \theta}$  for the following values of  $e$ : (i)  $e = 0.2$ , (ii)  $e = 0.6$ , (iii)  $e = 0.9$ , (iv)  $e = 1$ , (v)  $e = 2$ , (vi)  $e = 4$ .
- Describe how the shape of the conic changes as  $e > 1$  gets larger.
- Describe how the shape of the conic changes as  $e < 1$  gets closer to 0.

**36.** Show that the polar equation for a conic with its focus at the pole and whose directrix is perpendicular to the polar axis at a distance  $p$  units to the right of the pole is given by

$$r = \frac{ep}{1 + e \cos \theta}$$

**37.** Show that the polar equation for a conic with its focus at the pole and whose directrix is parallel to the polar axis at a distance  $p$  units above the pole is given by  $r = \frac{ep}{1 + e \sin \theta}$ .

**38.** Show that the polar equation for a conic with its focus at the pole and whose directrix is parallel to the polar axis at a distance  $p$  units below the pole is given by  $r = \frac{ep}{1 - e \sin \theta}$ .

**Challenge Problems**

**39.** Show that the surface area of the solid generated by revolving the first-quadrant arc of the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, x \geq 0, y \geq 0$ , about the  $x$ -axis is

$$S = \pi b^2 + \frac{\pi ab}{e} \sin^{-1} e$$

where  $e$  is the eccentricity of the ellipse.

**40.** In this section, one focus of each conic has been at the pole. Write the general equation for a conic in polar coordinates if there is no focus at the pole. That is, suppose the focus  $F$  has polar coordinates  $(r_1, \theta_1)$ , and the directrix  $D$  is given by  $r \cos(\theta + \theta_0) = -d$ , where  $d > 0$ . Let the eccentricity be  $e$ .

# Chapter Review

## THINGS TO KNOW

### 9.1 Parametric Equations

- Parametric equations  $x = x(t)$ ,  $y = y(t)$ , where  $t$  is the parameter (p. 637)
- Plane curve  $C$ : the collection of points  $(x, y) = (x(t), y(t))$  (p. 637)
- Orientation: the direction a point on the curve defined for  $a \leq t \leq b$  moves as  $t$  moves from  $a$  to  $b$  (p. 637)
- Convert between parametric equations and rectangular equations (p. 638–640)
- Cycloid: the curve represented by  $x(t) = a(t - \sin t)$ ,  $y(t) = a(1 - \cos t)$  (p. 642)

### 9.2 Tangent Lines; Arc Length

- Smooth curve (p. 647)
- Slope of a tangent line to a smooth curve  $C$   

$$\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}}, \frac{dx}{dt} \neq 0 \text{ (p. 648)}$$
- Vertical tangent line to a smooth curve  $C$ :  

$$\frac{dx}{dt} = 0, \text{ but } \frac{dy}{dt} \neq 0 \text{ (p. 648)}$$
- Horizontal tangent line to a smooth curve  $C$ :  

$$\frac{dy}{dt} = 0, \text{ but } \frac{dx}{dt} \neq 0 \text{ (p. 648)}$$
- Arc length formula for parametric equations:

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt \text{ (p. 651)}$$

### 9.3 Surface Area of a Solid of Revolution

The surface area  $S$  of the solid of revolution generated by revolving a smooth curve  $C$  represented by the parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$

- about the  $x$ -axis:  $S = 2\pi \int_a^b y(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$  (p. 657)
- about the  $y$ -axis:  $S = 2\pi \int_a^b x(t) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$  (p. 658)
- about the  $x$ -axis: if the smooth curve  $C$  is represented by a rectangular equation  $y = f(x)$ :  

$$S = 2\pi \int_a^b f(x) \sqrt{1 + [f'(x)]^2} dx \text{ (p. 659)}$$

### 9.4 Polar Coordinates

- Polar coordinates  $(r, \theta)$ ; pole  $O$ ; polar axis (p. 661)
- A point  $P$  with polar coordinates  $(r, \theta)$  also can be represented by  $(r, \theta + 2n\pi)$  or  $(-r, \theta + (2n + 1)\pi)$ ,  $n$  an integer. (p. 663)
- The polar coordinates of the pole are  $(0, \theta)$ , where  $\theta$  is any angle. (p. 663)
- For polar coordinates  $(r, \theta)$  and rectangular coordinates  $(x, y)$ :
  - $x = r \cos \theta$ ,  $y = r \sin \theta$  (p. 664)
  - $r^2 = x^2 + y^2$  and  $\tan \theta = \frac{y}{x}$ ,  $x \neq 0$  (p. 665)
  - $r = y$  and  $\theta = \frac{\pi}{2}$  if  $x = 0$  (p. 665)
- Table 1 gives polar equations for some lines and circles. (p. 668)

### 9.5 Polar Equations; Parametric Equations of Polar Equations; Arc Length of Polar Equations

- Library of Polar Equations (Table 7) (p. 675)
- Arc length  $s$  of a curve represented by a polar equation from  $\theta = \alpha$  to  $\theta = \beta$ ,  $\alpha \leq \theta \leq \beta$ :  $s = \int_\alpha^\beta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta$  (p. 675)

### 9.6 Area in Polar Coordinates

- The area  $A$  enclosed by the graph of  $r = f(\theta)$  and the rays  $\theta = \alpha$  and  $\theta = \beta$ :  $A = \int_\alpha^\beta \frac{1}{2} r^2 d\theta$  (p. 679)
- The surface area  $S$  of the solid of revolution obtained by revolving  $r = f(\theta)$ ,  $\alpha \leq \theta \leq \beta$ ,  $0 \leq \alpha < \beta \leq 2\pi$ , about the polar axis:

$$\begin{aligned} S &= 2\pi \int_\alpha^\beta f(\theta) \sin \theta \sqrt{[f(\theta)]^2 + [f'(\theta)]^2} d\theta \\ &= 2\pi \int_\alpha^\beta r \sin \theta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} d\theta \end{aligned}$$

(p. 682)

### 9.7 The Polar Equation of a Conic

- The polar equation of a conic: Table 8 (p. 687)
- Eccentricity: Parabola:  $e = 1$ ; ellipse:  $e < 1$ ; hyperbola:  $e > 1$  (p. 687)

## OBJECTIVES

| Section | You should be able to ...                                                                             | Examples | Review Exercises     |
|---------|-------------------------------------------------------------------------------------------------------|----------|----------------------|
| 9.1     | 1 Graph parametric equations (p. 637)                                                                 | 1        | 1(b)–6(b)            |
|         | 2 Find a rectangular equation for a curve represented parametrically (p. 638)                         | 2–4      | 1(a)–6(a), 1(c)–6(c) |
|         | 3 Use time as the parameter in parametric equations (p. 640)                                          | 5        | 13, 48, 49           |
|         | 4 Convert a rectangular equation to parametric equations (p. 641)                                     | 6, 7     | 11, 12               |
| 9.2     | 1 Find an equation of the tangent line at a point on a plane curve (p. 648)                           | 1–4      | 7–10, 50, 51         |
|         | 2 Find arc length of a plane curve (p. 651)                                                           | 5, 6     | 52–55                |
| 9.3     | 1 Find the surface area of a solid of revolution obtained from parametric equations (p. 658)          | 1        | 63, 64               |
|         | 2 Find the surface area of a solid of revolution obtained from a rectangular equation (p. 659)        | 2        | 65, 66               |
| 9.4     | 1 Plot points using polar coordinates (p. 661)                                                        | 1, 2     | 14–17                |
|         | 2 Convert between rectangular coordinates and polar coordinates (p. 664)                              | 3, 4     | 14–31                |
|         | 3 Identify and graph polar equations (p. 666)                                                         | 5, 6     | 32–35                |
| 9.5     | 1 Graph a polar equation; find parametric equations (p. 671)                                          | 1–5      | 36–45                |
|         | 2 Find the arc length of a curve represented by a polar equation (p. 675)                             | 6        | 56–59                |
| 9.6     | 1 Find the area of a region enclosed by the graph of a polar equation (p. 678)                        | 1–4      | 60                   |
|         | 2 Find the area of a region enclosed by the graphs of two polar equations (p. 681)                    | 5        | 61, 62               |
|         | 3 Find the surface area of a solid of revolution obtained from the graph of a polar equation (p. 682) | 6        | 67                   |
| 9.7     | 1 Express a conic as a polar equation (p. 686)                                                        | 1, 2     | 46, 47               |

## REVIEW EXERCISES

In Problems 1–6:

- Find the rectangular equation of each curve.
- Graph each plane curve whose parametric equations are given and show its orientation.
- Determine the restrictions on  $x$  and  $y$  that make the rectangular equation identical to the plane curve.

- $x(t) = 4t - 2$ ,  $y(t) = 1 - t$ ;  $-\infty < t < \infty$
- $x(t) = 2t^2 + 6$ ,  $y(t) = 5 - t$ ;  $-\infty < t < \infty$
- $x(t) = e^t$ ,  $y(t) = e^{-t}$ ;  $-\infty < t < \infty$
- $x(t) = \ln t$ ,  $y(t) = t^3$ ;  $t > 0$
- $x(t) = \sec^2 t$ ,  $y(t) = \tan^2 t$ ;  $0 \leq t \leq \frac{\pi}{4}$
- $x(t) = t^{3/2}$ ,  $y(t) = 2t + 4$ ;  $t \geq 0$

In Problems 7–10, for the parametric equations below:

- Find an equation of the tangent line to the curve at  $t$ .
- Graph the curve and the tangent line.

- $x(t) = t^2 - 4$ ,  $y(t) = t$  at  $t = 1$
- $x(t) = 3 \sin t$ ,  $y(t) = 4 \cos t + 2$  at  $t = \frac{\pi}{4}$
- $x(t) = \frac{1}{t^2}$ ,  $y(t) = \sqrt{t^2 + 1}$  at  $t = 3$
- $x(t) = \frac{t^2}{1+t}$ ,  $y(t) = \frac{t}{1+t}$  at  $t = 0$

In Problems 11 and 12, find two different pairs of parametric equations for each rectangular equation.

- $y = -2x + 4$
- $y = 2x$
- Describe the motion of an object that moves so that at time  $t$  (in seconds) it has coordinates  $x(t) = 2 \cos t$ ,  $y(t) = \sin t$ ,  $0 \leq t \leq 2\pi$ .

In Problems 14–17, the polar coordinates of a point are given. Plot each point in a polar coordinate system, and find its rectangular coordinates.

- $\left(3, \frac{\pi}{6}\right)$
- $\left(-2, \frac{4\pi}{3}\right)$
- $\left(3, -\frac{\pi}{2}\right)$
- $\left(-4, -\frac{\pi}{4}\right)$

In Problems 18–21, the rectangular coordinates of a point are given. Find two pairs of polar coordinates  $(r, \theta)$  for each point, one with  $r > 0$  and the other with  $r < 0$ ,  $0 \leq \theta < 2\pi$ .

- $(2, 0)$
- $(3, 4)$
- $(-5, 12)$
- $(-3, 3)$

In Problems 22–27, the letters  $r, \theta$  represent polar coordinates. Write each equation in terms of the rectangular coordinates  $x, y$ .

- $r = 4 \sin(2\theta)$
- $r = e^{\theta/2}$
- $r = \frac{1}{1 + 2 \cos \theta}$
- $r = a - \sin \theta$
- $r^2 = 4 \cos(2\theta)$
- $r = \theta$

In Problems 28–31, the letters  $x, y$  represent rectangular coordinates. Write each equation in terms of the polar coordinates  $r, \theta$ .

- $x^2 + y^2 = x$
- $(x^2 + y^2)^2 = x^2 - y^2$
- $y^2 = (x^2 + y^2) \cos^2[(x^2 + y^2)^{1/2}]$
- $\frac{x^2}{2^2} + \frac{y^2}{3^2} = 1$

In Problems 32–35, identify and graph each polar equation. Convert it to a rectangular equation if necessary.

- $r \sin \theta = 1$
- $r \sec \theta = 2$
- $r = \sin \theta$
- $r = -5 \cos \theta$

In Problems 36–45, for each equation:

- (a) Graph the equation.  
 (b) Find parametric equations that represent the equation.

36.  $r = 1 - \sin \theta$       37.  $r = 4 \cos(2\theta)$   
 38.  $r = \frac{1}{2} - \sin \theta$       39.  $r = \frac{4}{1 - 2 \cos \theta}$   
 40.  $r = 4 \sin(3\theta)$       41.  $r = 2 - 2 \cos \theta$   
 42.  $r = 2 - \sin \theta$       43.  $r = e^{0.5\theta}$   
 44.  $r^2 = 1 - \sin^2 \theta$       45.  $r^2 = 1 + \sin^2 \theta$

In Problems 46 and 47, for each polar equation:

- (a) Identify and graph the equation.  
 (b) Convert the polar equation to a rectangular equation.  
 (c) Find parametric equations for the polar equation.

46.  $r = \frac{2}{1 - \cos \theta}$       47.  $r = \frac{1}{1 - \frac{1}{6} \cos \theta}$

In Problems 48 and 49, find parametric equations for an object that moves along the ellipse  $\frac{x^2}{16} + \frac{y^2}{9} = 1$  with the motion described.

48. The motion begins at (4, 0), is counterclockwise, and requires 4 seconds for a complete revolution.  
 49. The motion begins at (0, 3), is clockwise, and requires 5 seconds for a complete revolution.

In Problems 50 and 51, find the points (if any) on the curve at which the tangent line is vertical or horizontal.

50.  $x(t) = t^3 - 1$ ,  $y(t) = 2t^2 + 1$   
 51.  $x(t) = 1 - \sin t$ ,  $y(t) = 2 + 3 \cos t$ ,  $0 \leq t \leq 2\pi$

In Problems 52–55, find the arc length of each plane curve.

52.  $x(t) = \sinh^{-1} t$ ,  $y(t) = \sqrt{t^2 + 1}$  from  $t = 0$  to  $t = 1$   
 53.  $x(t) = \tan t$ ,  $y(t) = \frac{1}{3}(\sec^2 t + 1)$  from  $t = 0$  to  $t = \frac{\pi}{4}$

54.  $x(t) = e^t$ ,  $y(t) = \frac{1}{2}e^{2t} - \frac{1}{4}t$  from  $t = 0$  to  $t = 2$

55.  $x = \frac{1}{2}y^2 - \frac{1}{4} \ln y$  from  $y = 1$  to  $y = 2$

In Problems 56–59, find the arc length of each curve represented by a polar equation.

56.  $r = 2 \sin \theta$  from  $\theta = 0$  to  $\theta = \pi$

57.  $r = e^{-\theta}$  from  $\theta = 0$  to  $\theta = 2\pi$

58.  $r = 3\theta$  from  $\theta = 0$  to  $\theta = 2\pi$

59.  $r = 2 \sin^2 \frac{\theta}{2}$  from  $\theta = -\frac{\pi}{2}$  to  $\theta = \frac{\pi}{2}$

60. **Area** Find the area of the region inside the circle  $r = 4 \sin \theta$  and above the line  $r = 3 \csc \theta$ .

61. **Area** Find the area of the region that lies inside the rose  $r = 4 \cos(2\theta)$  and outside the circle  $r = \sqrt{2}$ .

62. **Area** Find the area of the region common to the graphs of  $r = \cos \theta$  and  $r = 1 - \cos \theta$ .

63. **Surface Area** Find the surface area of the solid generated by revolving the smooth curve represented by the parametric equations  $x(t) = \sinh^{-1} t$ ,  $y(t) = \sqrt{t^2 + 1}$  from  $0 \leq t \leq 1$  about the  $x$ -axis.

64. **Surface Area** Find the surface area of the solid generated by revolving the smooth curve represented by  $x(t) = e^t - t$ ,  $y(t) = 4e^{t/2}$  from  $t = 0$  to  $t = 1$  about the  $x$ -axis.

65. **Surface Area** Find the surface area of the solid of revolution generated by revolving the curve represented by  $x = y^2 + 1$ ,  $0 \leq y \leq 2$ , about the  $y$ -axis.

66. **Surface Area** Find the surface area of the solid generated by revolving the curve represented by  $y = \cos\left(\frac{x}{2}\right)$ ,  $0 \leq x \leq \pi$  about the  $x$ -axis.

67. **Surface Area** Find the surface area of the solid of revolution generated by revolving the arc of the circle  $r = 4$ ,  $0 \leq \theta \leq \frac{\pi}{3}$ , about the  $x$ -axis.

## CHAPTER 9 PROJECT

### Polar Graphs and Microphones

Microphones can be configured to have different sensitivities which are best modeled using various polar patterns. The oldest example is an **omnidirectional microphone** which records sound equally from all directions.

Omnidirectional microphones

can be a good option when recording jungle sounds or general ambient noise, or when recording for your cell phone. The recording pattern for this microphone is virtually circular, and a good polar model is

$$r = k$$

where  $k > 0$  is the sensitivity parameter. Notice that by adjusting  $k$  (say using 1, 4, or 8) we obtain concentric circles. Rotating any one of

these circles around a diameter results in a sphere. Notice that the microphone receiver is at the center of the sphere and that sound from all directions is received equally.

For this model, say when  $k = 1$ , we can convert the polar equation to parametric equations obtaining

$$x = \cos t \quad y = \sin t \quad 0 \leq t \leq 2\pi$$

Sound technicians have several things to consider when using microphones, including finding the best location to place the microphone and the best location to place any monitors. Since an omnidirectional microphone collects sound equally from all directions, the microphone should be placed directly in the center of the sounds being recorded with the most important sounds positioned closest to the microphone. Unfortunately, monitors cannot be used with an omnidirectional microphone since there is no place to put them where the microphone does not pick up their sound. To help remedy this and other possible issues, different types of microphone models are used.

A **cardioid microphone** is used when we want to pick up sounds mostly from the front of the microphone. Cardioid microphones are considered “unidirectional”. A polar model for a cardioid microphone is

$$r = k(1 + \cos \theta) \quad 0 \leq \theta \leq 2\pi \quad k > 0$$

Notice that the microphone is placed with the transducer at the pole and pointing toward the polar axis. A cardioid microphone is formed by rotating the cardioid about the polar axis. See the figure.

1. Sketch several cardioids using  $k = 1, 4, 8$ .
2. Explain why any noise created by the person's hand or the microphone stand is unlikely to be picked up by a cardioid microphone.
3. Using  $k = 1$ , convert the cardioid polar equation to a pair of parametric equations.
4. To determine the percentage of the sound that comes from the “front” of the microphone, we consider the sound coming at the

microphone with angles in the polar wedge  $-\frac{\pi}{4} \leq \theta \leq \frac{\pi}{4}$ . With  $k = 1$ , determine the proportion of the surface area coming in from the front relative to that coming in from all directions.

5. Determine the proportion of the sound that is picked up from behind the microphone in the polar wedge  $\frac{3\pi}{4} \leq \theta \leq \frac{5\pi}{4}$ .

Since less than 1% of all the sound received comes from the backside of a cardioid microphone, monitors can be placed directly behind the microphone.

A **hypercardioid microphone** is used to pick up sounds mostly from in front of the microphone, but it also receives some sound from the rear. A polar model for such a hypercardioid microphone is

$$r = \frac{k|1 + 2\cos \theta|}{3} \quad 0 \leq \theta \leq 2\pi \quad k > 0$$

6. Sketch several hypercardioid graphs using  $k = 1, 4$ , and 8.
7. Express the hypercardioid polar equation with  $k = 1$ , as a pair of parametric equations.
8. Determine the proportion of the sound that is picked up from the front of a hypercardioid microphone  $r = \frac{|1 + 2\cos \theta|}{3}$  by finding percentage of sound coming at the microphone from the polar wedge  $-\frac{\pi}{4} \leq \theta \leq \frac{\pi}{4}$ .
9. Determine the proportion of the sound that is picked up from behind the hypercardioid microphone in the polar wedge  $\frac{3\pi}{4} \leq \theta \leq \frac{5\pi}{4}$ .
10. Compare the results of Problems 4, 5, 8, and 9, and describe how the microphones differ.

### The Hall Effect

In our ever-growing electronic environment, sensors of various types, shapes, and sizes have been developed to advance the detection and analysis of information. Sensors often collect data that are then fed to other electronic components that can be programmed to react based on the results. Detecting the presence and strength of a magnetic field can be accomplished by using a sensor, called a Hall probe, a device that operates based on an electromagnetic property of a material—the *Hall effect*. The Hall effect was discovered by physicist Edwin H. Hall in the late nineteenth century, decades before semiconductors and other technologies allowed for the full breadth of applications of this theory to be realized. Today we see the Hall effect put into use in disk drives, laptops and mobile phones, vending machines, automobile sensors, camera equipment, electronic locks, magnetic card sensors, spacecraft thrusters, prosthetic limbs and countless other areas.

The Hall effect is observed when an electric current is run through a material that is in the presence of an external magnetic field. The voltage related to the strength of the magnetic field is measured on either side of the material. Alternatively, a materials scientist could make a similar measurement of this voltage while controlling an external magnetic field in order to benchmark the ability of a particular material to carry a current, and identify the number density and type of charge carriers.

**CHAPTER 10 PROJECT** The Chapter Project on p. 755 uses vector algebra and properties of vectors to model the Hall effect.

**I**n this chapter, we extend the rectangular coordinate system from two dimensions, the so-called Cartesian plane, to three dimensions, *space*. Just as lines, circles, and conics are important in two dimensions, lines, planes, spheres, and *quadric surfaces* play an important role in space.

We also introduce *vectors*, both in the plane and in space. Vectors, which are objects that have both magnitude and direction, are particularly useful in describing the way forces behave, such as the force of the wind on an airplane. Vectors are also used to find the work done by a constant force in moving an object when the direction of the force is not along the line of motion.

## 10.1 Rectangular Coordinates in Space

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Locate points in space (p. 695)
- 2 Find the distance between two points in space (p. 696)
- 3 Find the equation of a sphere (p. 697)

A two-dimensional rectangular coordinate system is represented by a plane in which every point  $P$  corresponds to exactly one ordered pair of real numbers  $(x, y)$ , the coordinates of  $P$ . In space every point  $P$  corresponds to exactly one *ordered triple* of real numbers  $(x, y, z)$ .

### 1 Locate Points in Space

We begin by selecting a fixed point called the **origin**  $O$ . Through the origin, draw three mutually perpendicular number lines, called the **coordinate axes**. The coordinate axes are usually labeled the  **$x$ -axis**, the  **$y$ -axis**, and the  **$z$ -axis**. On each axis choose one direction as positive and select an appropriate scale, as shown in Figure 1.

Notice in Figure 1 that the positive  $z$ -axis points upward, the positive  $y$ -axis points toward the right, and the positive  $x$ -axis points forward. This is known as a **right-handed** system because it conforms to the *right-hand rule*. The **right-hand rule** states: if the index finger of the right hand points in the direction of the positive  $x$ -axis and the other fingers point in the direction of the positive  $y$ -axis, then the thumb will point in the direction of the positive  $z$ -axis, as shown in Figure 2.

Figure 1

Figure 2 Right hand rule

**NOTE** There is also a left-handed system and a left-handed rule; we use only a right-handed system.

Figure 3

As in the plane, we assign coordinates to each point  $P$  in space, but in space we use an ordered triple of real numbers  $(x, y, z)$ . For example, the point  $(3, 5, 7)$  is the point for which 3 is the  $x$ -coordinate, 5 is the  $y$ -coordinate, and 7 is the  $z$ -coordinate. The point  $(3, 5, 7)$  is plotted by starting at the origin, moving 3 units along the positive  $x$ -axis, 5 units in the direction of the positive  $y$ -axis, and 7 units in the direction of the positive  $z$ -axis. See Figure 3.

Figure 3 also shows the points  $(3, 0, 0)$ ,  $(0, 5, 0)$ ,  $(0, 0, 7)$ ,  $(3, 5, 0)$ ,  $(3, 0, 7)$ ,  $(0, 5, 7)$ , and  $(0, 0, 0)$ , which form a box with the points  $(0, 0, 0)$  and  $(3, 5, 7)$  as opposite vertices.

**NOW WORK** Problems 11 and 15.

Points of the form  $(x, 0, 0)$  lie on the  $x$ -axis, while points of the form  $(0, y, 0)$  and  $(0, 0, z)$  lie on the  $y$ -axis and  $z$ -axis, respectively.

Points of the form  $(x, y, 0)$  lie on a plane called the  **$xy$ -plane**. The  $xy$ -plane is perpendicular to the  $z$ -axis and its equation is  $z = 0$ . This is the plane used in the familiar two-dimensional rectangular coordinate system.

Points of the form  $(x, 0, z)$  lie on the  **$xz$ -plane**. The  $xz$ -plane is perpendicular to the  $y$ -axis, and its equation is  $y = 0$ . Finally, points of the form  $(0, y, z)$  lie on the

$yz$ -plane, which is perpendicular to the  $x$ -axis, and its equation is  $x = 0$ . Collectively, these three planes are referred to as **coordinate planes**. See Figure 4.

In general, for any real number  $k$ , the graph of  $x = k$  is a plane parallel to the  $yz$ -plane; the graph of  $y = k$  is a plane parallel to the  $xz$ -plane; and the graph of  $z = k$  is a plane parallel to the  $xy$ -plane. As shown in Figure 5, the graph of the equation  $z = 5$  is a plane parallel to and 5 units above the  $xy$ -plane.

DF Figure 4

Figure 5  $z = 5$

### NOW WORK Problem 19.

## 2 Find the Distance Between Two Points in Space

The formula for the distance between two points in space is an extension of the distance formula in the plane.

To find the distance  $|P_1 P_2|$  between two points  $P_1 = (x_1, y_1, z_1)$  and  $P_2 = (x_2, y_2, z_2)$ , we use the Pythagorean Theorem twice. Figure 6 shows the points  $P_1$  and  $P_2$  and a third point  $A = (x_2, y_2, z_1)$ . The first application of the Pythagorean Theorem involves observing that the triangle  $P_1 A P_2$  is a right triangle where the side of length  $|P_1 P_2|$  is the hypotenuse. As a result,

$$|P_1 P_2| = \sqrt{|P_1 A|^2 + |A P_2|^2} \quad \text{Pythagorean Theorem}$$

The points  $P_1$  and  $A$  lie in a plane parallel to the  $xy$ -plane. Do you see why? To find  $|P_1 A|$ , we use the distance formula in the plane:

$$|P_1 A| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

The points  $P_2$  and  $A$  lie on a line parallel to the  $z$ -axis, so that  $|A P_2| = |z_2 - z_1|$  and  $|A P_2|^2 = (z_2 - z_1)^2$ . Combining these results, we obtain a formula for the distance between two points in space.

### THEOREM Distance Formula in Space

The distance between two points  $P_1 = (x_1, y_1, z_1)$  and  $P_2 = (x_2, y_2, z_2)$  in space, denoted by  $|P_1 P_2|$ , is

$$|P_1 P_2| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

### EXAMPLE 1 Finding the Distance Between Two Points in Space

Find the distance between  $P_1 = (1, 3, -2)$  and  $P_2 = (2, -1, -3)$ .

**Solution**

$$|P_1 P_2| = \sqrt{(2 - 1)^2 + (-1 - 3)^2 + (-3 - (-2))^2} = \sqrt{1 + 16 + 1} = \sqrt{18} = 3\sqrt{2}$$

### NOW WORK Problem 31.

**NEED TO REVIEW?** The distance formula appears in Appendix A.3, p. A-16.

Figure 6

Figure 7  $(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = R^2$

### 3 Find the Equation of a Sphere

The collection of all points in space that are a fixed distance  $R$  from a fixed point  $P_0 = (x_0, y_0, z_0)$  is called a **sphere**. See Figure 7. The fixed distance  $R$  is called the **radius**, and the fixed point  $P_0$  is called the **center** of the sphere. The distance from any point  $P = (x, y, z)$  on a sphere of radius  $R$  to the center point  $P_0 = (x_0, y_0, z_0)$  is  $|PP_0| = R$ . The Distance Formula in space shows that

$$|PP_0| = \sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2} = R$$

Squaring both sides gives the standard form of the equation of a sphere.

#### THEOREM Standard Form of the Equation of a Sphere

The equation of a sphere with center at the point  $P_0 = (x_0, y_0, z_0)$  and radius  $R$  is

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = R^2$$

Figure 8  $(x + 1)^2 + (y - 2)^2 + z^2 = 4$

#### EXAMPLE 2 Finding the Equation of a Sphere

The standard form of the equation of the sphere shown in Figure 8, with radius 2 and center at  $(-1, 2, 0)$ , is

$$(x + 1)^2 + (y - 2)^2 + z^2 = 4$$

#### NOW WORK Problem 37.

#### EXAMPLE 3 Finding the Center and Radius of a Sphere

Show that

$$x^2 + y^2 + z^2 + 2x + 4y - 2z = 10$$

is the equation of a sphere. Find its center and radius.

**Solution** We begin by writing the equation as

$$(x^2 + 2x) + (y^2 + 4y) + (z^2 - 2z) = 10$$

and then we complete the square three times. The result is

$$\begin{aligned} (x^2 + 2x + 1) + (y^2 + 4y + 4) + (z^2 - 2z + 1) &= 10 + 1 + 4 + 1 \\ (x + 1)^2 + (y + 2)^2 + (z - 1)^2 &= 16 \end{aligned}$$

This is the equation of a sphere with radius 4 and center at  $(-1, -2, 1)$ . ■

#### NOW WORK Problem 39.

**NEED TO REVIEW?** Completing the square is discussed in Appendix A.1, pp. A-2 to A-3.

## 10.1 Assess Your Understanding

### Concepts and Vocabulary

- True or False** Each point in space is denoted by an ordered triple of real numbers.
- True or False** The point  $(0, 4, 0)$  lies on the  $z$ -axis.
- True or False** The right-hand rule states that if your index finger points toward the positive  $x$ -axis, and your other fingers point toward the positive  $y$ -axis, then your thumb points toward the positive  $z$ -axis.
- True or False** In space, the equation  $y = 3$  describes a plane.

- In space, the set of all points a fixed distance  $R$  from a fixed point  $(x_0, y_0, z_0)$  is called a(n) \_\_\_\_\_.

- The equation  $x^2 + y^2 + z^2 = 8$  describes a sphere whose center is at the point \_\_\_\_\_.

### Skill Building

In Problems 7–12, plot each point in space.

- |                  |                  |                   |
|------------------|------------------|-------------------|
| 7. $(1, 1, 1)$   | 8. $(0, 0, 1)$   | 9. $(0, 2, 5)$    |
| 10. $(-1, 0, 5)$ | 11. $(-3, 1, 0)$ | 12. $(4, -1, -3)$ |

In Problems 13–18, opposite vertices of a rectangular box whose edges are parallel to the coordinate axes are given. List the coordinates of the other six vertices of the box.

13.  $(0, 0, 0)$ ;  $(2, 1, 3)$       14.  $(0, 0, 0)$ ;  $(4, 2, 2)$   
 15.  $(1, 2, 3)$ ;  $(3, 4, 5)$       16.  $(5, 6, 1)$ ;  $(3, 8, 2)$   
 17.  $(-1, 0, 2)$ ;  $(4, 2, 5)$       18.  $(-2, -3, 0)$ ;  $(-6, 7, 1)$

In Problems 19–28, describe in words the set of all points  $(x, y, z)$  that satisfy the given statements.

19.  $y = -2$       20.  $z = -3$   
 21.  $x = 0$       22.  $z = 5$   
 23.  $x = 1$  and  $y = 0$       24.  $x = y$  and  $z = 0$   
 25.  $x > -2$       26.  $0 \leq y \leq 4$   
 27.  $x^2 + y^2 + z^2 \leq 1$       28.  $x^2 + y^2 + z^2 \geq 25$

In Problems 29–34, find the distance between each pair of points.

29.  $(3, 2, 5)$  and  $(-1, 2, 2)$       30.  $(12, -5, 16)$  and  $(21, 15, 4)$   
 31.  $(-1, 2, -3)$  and  $(4, -2, 1)$   
 32.  $(1.0, 3.2, 4.5)$  and  $(1.4, 1.0, 6.5)$   
 33.  $(4, -2, -2)$  and  $(3, 2, 1)$       34.  $(2, -3, -3)$  and  $(4, 1, -1)$

In Problems 35–38, find the equation of a sphere with radius  $R$  and center at  $P_0$ .

35.  $R = 1$ ;  $P_0 = (3, 1, 1)$       36.  $R = 2$ ;  $P_0 = (1, 2, 2)$   
 37.  $R = 3$ ;  $P_0 = (-1, 1, 2)$       38.  $R = 1$ ;  $P_0 = (-3, 1, -1)$

In Problems 39–44, find the radius and center of each sphere.

39.  $x^2 + y^2 + z^2 + 2x - 2y = 2$   
 40.  $x^2 + y^2 + z^2 + 2x - 2z = -1$   
 41.  $x^2 + y^2 + z^2 + 4x - 4y + 2z = 0$   
 42.  $x^2 + y^2 + z^2 - 4x = 0$   
 43.  $2x^2 + 2y^2 + 2z^2 - 8x + 5z + 1 = 0$   
 44.  $3x^2 + 3y^2 + 3z^2 + 6x - y - 3 = 0$

## Applications and Extensions

In Problems 45–50, write the equation of each sphere.

45. The endpoints of a diameter are  $(-2, 0, 4)$  and  $(2, 6, 8)$ .  
 46. The endpoints of a diameter are  $(1, 3, 6)$  and  $(-3, 1, 4)$ .  
 47. The center is at  $(-3, 2, 1)$ , and the sphere passes through the point  $(4, -1, 3)$ .  
 48. The center is at  $(0, -3, 4)$ , and the sphere passes through the point  $(2, 1, 1)$ .  
 49. The center is at  $(2, 1, -2)$  and the sphere is tangent to the  $xy$ -plane.  
 50. The center is at  $(1, 5, 4)$  and the sphere is tangent to the  $yz$ -plane.

**51. Chemistry: Iron Crystals** In its solid form, iron forms a crystal lattice known as a body-centered cubic (bcc). This crystal consists of eight iron atoms at the corners of a cube plus one more atom at the center of the cube. The sides of the cube are 0.287 nm long ( $1 \text{ nm} = 10^{-9} \text{ m}$ ). Put one corner of the cube at the origin, and place three of the faces along the positive coordinate planes.

- (a) Assign coordinates to each atom in the crystal.  
 (b) What are the coordinates of the atom that is furthest from the origin?  
 (c) What are the coordinates of the atom at the center of the cube?  
 (d) Find the distance between the iron atom at the center of the cube and the atom in the  $xz$ -plane that is farthest from the origin.

**52. Equilateral Triangle** Show that the points  $(2, 4, 2)$ ,  $(2, 1, 5)$ , and  $(5, 1, 2)$  are the vertices of an equilateral triangle.

## 53. Sphere

- (a) Find an equation of the sphere with center at  $(4, 0, -2)$  and radius 5.  
 (b) Describe the intersection of the sphere and the  $xy$ -plane.

## 54. Right Triangle Inscribed in a Sphere

- (a) Show that the points  $(-2, 6, 0)$ ,  $(4, 9, 1)$ , and  $(-3, 2, 18)$  are the vertices of a right triangle.  
 (b) Find an equation of the sphere that passes through the vertices of the right triangle and that has a diameter along its hypotenuse.

**55. Distance** Find the shortest distance from the point  $(4, 2, -1)$  to the  $xy$ -plane.

**56. Midpoint Formula** Derive a formula to find the midpoint of the line segment joining two points in space.

## Challenge Problems

**57. Sphere** Find an equation of the sphere passing through  $(3, 0, 0)$ ,  $(0, 0, 1)$ ,  $(-1, -3, 1)$ , and  $(2, 0, 1)$ .

## 58. Sphere

- (a) Show that the graph of  $Ax^2 + Ay^2 + Az^2 + Dx + Ey + Fz = G$ ,  $A > 0$  is a sphere, a point, or the empty set.  
 (b) When is it a sphere? What are its center and radius?

## 10.2 Introduction to Vectors

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Represent vectors geometrically (p. 699)
- 2 Use properties of vectors (p. 702)

**NOTE** The word *vector* comes from the Latin word, meaning “to carry.”

Figure 9

Figure 10  $\mathbf{F} = m\mathbf{a}$

**NOTE** In print, boldface letters are used to denote vectors, to distinguish them from scalars. For handwritten work, an arrow is placed over a letter to denote a vector.

Geometrically, a **vector** is an object that has both magnitude and direction, and is often represented by an arrow pointing in the *direction* of the vector. The length of the arrow represents the *magnitude* of the vector.

Velocity is a vector. The velocity of an airplane can be represented by an arrow that points in the direction of its flight; the length of the arrow represents its speed (the magnitude of the velocity). See Figure 9. If the airplane speeds up, the length of the arrow increases.

When working with vectors, we refer to real numbers as *scalars*. **Scalars** are quantities that have magnitude, but no direction. Physical examples of scalar quantities are time, mass, temperature, and speed.

*Force* and *acceleration* are also vectors. If a force  $\mathbf{F}$  is exerted on an object of mass  $m$ , the force causes the object to accelerate in the direction of the force. See Figure 10. If  $\mathbf{a}$  is the acceleration, then  $\mathbf{F}$  and  $\mathbf{a}$  are related by the equation  $\mathbf{F} = m\mathbf{a}$ .

### 1 Represent Vectors Geometrically

Vectors are closely related to the geometric idea of a *directed line segment*. If  $P$  and  $Q$  are distinct points, there is exactly one line containing both  $P$  and  $Q$ . See Figure 11(a). The points  $P$  and  $Q$ , and those on the line between  $P$  and  $Q$ , form the **line segment**  $\overline{PQ}$ . See Figure 11(b). If the points are ordered so they begin with  $P$  and end with  $Q$ , then we have a **directed line segment from  $P$  to  $Q$** , denoted by  $\overrightarrow{PQ}$ . For the directed line segment  $\overrightarrow{PQ}$ , the point  $P$  is the **initial point** and the point  $Q$  is the **terminal point**. See Figure 11(c).

The **magnitude** of the directed line segment  $\overrightarrow{PQ}$  is the distance from the point  $P$  to the point  $Q$ ; that is, it is the length of the line segment  $\overline{PQ}$ . The **direction** of  $\overrightarrow{PQ}$  is from  $P$  to  $Q$ . If a vector  $\mathbf{v}$  has the same magnitude and the same direction as the directed line segment  $\overrightarrow{PQ}$ , then

$$\mathbf{v} = \overrightarrow{PQ}$$

The vector whose magnitude is 0 is called the **zero vector**  $\mathbf{0}$ . The zero vector is assigned no direction.

Two vectors  $\mathbf{v}$  and  $\mathbf{w}$  are **equal**, written  $\mathbf{v} = \mathbf{w}$ , if they have the same magnitude and the same direction. For example, the vectors in Figure 12 are equal even though they have different initial points and terminal points.

Figure 11

Figure 12 The vectors  $\overrightarrow{PQ}$ ,  $\overrightarrow{RS}$ , and  $\overrightarrow{TU}$  are equal.

**Figure 13** The sum of vectors  $\mathbf{v}$  and  $\mathbf{w}$  is found by positioning the initial point of  $\mathbf{w}$  at the terminal point of  $\mathbf{v}$ .

**Figure 14**  $\mathbf{F}_1 + \mathbf{F}_2$  is the resultant force.

As a result, it is useful to think of a vector simply as an arrow, keeping in mind that two arrows (vectors) are equal if they have the same direction and the same length (magnitude).

Since location does not affect a vector, we **add** two vectors  $\mathbf{v}$  and  $\mathbf{w}$  by positioning vector  $\mathbf{w}$  so that its initial point coincides with the terminal point of  $\mathbf{v}$ . The **vector sum**  $\mathbf{v} + \mathbf{w}$  is the unique vector represented by the arrow from the initial point of  $\mathbf{v}$  to the terminal point of  $\mathbf{w}$ , as shown in Figure 13.

We said that forces can be represented by vectors. But how do we know that forces “add” the same way vectors do? Well, physicists say they do, and laboratory experiments bear it out. So if  $\mathbf{F}_1$  and  $\mathbf{F}_2$  are two forces simultaneously acting on an object, the vector sum  $\mathbf{F}_1 + \mathbf{F}_2$  is equal to the force that produces the same effect as that obtained when the forces  $\mathbf{F}_1$  and  $\mathbf{F}_2$  are applied at the same time to the same object. The force  $\mathbf{F}_1 + \mathbf{F}_2$  is called the **resultant force**. See Figure 14.

### NOW WORK Problem 23.

If  $\mathbf{w}$  is a vector describing the velocity of the wind relative to Earth and if  $\mathbf{v}$  is a vector describing the velocity of an airplane in the air, then  $\mathbf{w} + \mathbf{v}$  is a vector describing the velocity of the airplane relative to Earth. See Figure 15.

(a) Velocity of the wind relative to Earth

(b) Velocity of an airplane relative to the air

(c) Resultant equals the velocity of an airplane relative to Earth

**Figure 15**

**Figure 16**

**Figure 17**

### EXAMPLE 1 Graphing a Resultant Vector

A swimmer swims at a constant speed of 3 miles per hour (mi/h) and heads directly across a river whose current is 4 mi/h.

- Draw vectors representing the swimmer and the current.
- Draw the resultant vector.
- Interpret the result.

**Solution** (a) We represent the swimmer by a vector pointing directly across the river and the current by a vector pointing parallel to a straight shore line. Since the swimmer's speed is 3 mi/h, and the current's speed is 4 mi/h, the length of the vector representing the swimmer is 3 units, and the length of the vector representing the current is 4 units. See Figure 16.

(b) The resultant vector is the sum of the vectors in (a). See Figure 17.

(c) The resultant vector shows the true speed of the swimmer and true direction of the swim. In fact, the true speed is 5 mi/h, and the true direction can be described in terms of the angle  $\theta$  as  $\theta = \tan^{-1} \frac{4}{3} \approx 53.1^\circ$ . ■

### NOW WORK Problem 25.

Next, we examine properties of vectors. Many of these properties are similar to properties of real numbers.

**DF** Figure 18  $w + v = v + w$

Figure 19  $u + (v + w) = (u + v) + w$

Figure 20  $v + (-v) = 0$

Figure 21

Figure 22 Scalar multiples of  $v$

## Properties of Vector Addition

Let  $u$ ,  $v$ , and  $w$  represent any three vectors.

- **Commutative property of vector addition** (Figure 18):

$$w + v = v + w$$

- **Associative property of vector addition** (Figure 19):

$$u + (v + w) = (u + v) + w$$

- **Additive identity property** The zero vector  $0$  is called the **additive identity**. The sum of any vector  $v$  and the zero vector  $0$  equals  $v$ .

$$v + 0 = 0 + v = v$$

- **Additive inverse property** For any vector  $v$ , the vector  $-v$ , called the **additive inverse** of  $v$ , has the same magnitude as  $v$ , but the opposite direction, as shown in Figure 20. The sum of  $v$  and its additive inverse  $-v$  is the zero vector  $0$ .

$$v + (-v) = (-v) + v = 0$$

## DEFINITION Difference of Two Vectors

The **difference** of two vectors  $v - w$  is defined as

$$v - w = v + (-w)$$

The difference  $v - w$  between two vectors can be obtained by positioning  $v$  and  $w$  so their initial points coincide. Then the vector from the terminal point of  $w$  to the terminal point of  $v$  is the difference  $v - w$ , as shown in Figure 21.

The product of a vector  $v$  and a scalar  $a$  produces a vector called the *scalar multiple* of  $v$ .

## DEFINITION Scalar Multiple

If  $a$  is a scalar and  $v$  is a vector, the product  $av$ , called a **scalar multiple** of  $v$ , is the vector with magnitude  $|a|$  times the magnitude of  $v$ , in the same direction as  $v$  when  $a > 0$  and in the opposite direction from  $v$  when  $a < 0$ .

If either  $a = 0$  or  $v = 0$ , then  $av = 0$ .

See Figure 22 for illustrations of scalar multiples of  $v$ . Notice that the additive inverse of  $v$  can be represented as the scalar multiple  $(-1)v$ .

We saw earlier that if  $a$  is the acceleration of an object of mass  $m$  due to a force  $F$  being exerted, then by Newton's second law of motion,  $F = ma$ . Here,  $ma$  is the product of the scalar  $m$  and the vector  $a$ .

Scalar multiples have the following properties:

## Properties of Scalar Multiplication

If  $v$  and  $w$  are any two vectors and  $0$  is the zero vector, then:

- $0v = 0$
- $1v = v$
- $(-1)v = -v$
- $(a + b)v = av + bv$
- $a(v + w) = av + aw$
- $a(bv) = (ab)v$

## 2 Use Properties of Vectors

### EXAMPLE 2 Using Properties of Vectors

Use the vectors illustrated in Figure 23 to graph each of the following vectors:

(a)  $\mathbf{v} - \mathbf{w}$       (b)  $2\mathbf{v} - \mathbf{w} + \mathbf{u}$       (c)  $\frac{2}{3}\mathbf{u} + \frac{1}{2}(\mathbf{v} - \mathbf{w})$

**Solution** We reposition the vectors in Figure 23 as shown in Figure 24 to graph the desired vectors.

Figure 23

Figure 24

### NOW WORK Problems 7 and 11.

## 10.2 Assess Your Understanding

### Concepts and Vocabulary

- True or False** A vector is an object that has magnitude and direction.
- Scalars are quantities that have only \_\_\_\_\_.
- The product of a scalar  $a$  and a vector  $\mathbf{v}$  is called a(n) \_\_\_\_\_ of  $\mathbf{v}$ .
- Multiple Choice** The vectors  $-\mathbf{v}$  and  $\mathbf{v}$  have [(a) the same, (b) different] magnitude and the [(c) same, (d) opposite] direction.

### Skill Building

- State which of the following are scalars and which are vectors:  
(a) Volume    (b) Speed    (c) Force    (d) Work    (e) Mass  
(f) Distance    (g) Age    (h) Velocity

In Problems 6–14, use the vectors in the figure (top, right) to graph each of the following vectors:

- $2\mathbf{v}$
- $-\mathbf{v}$
- $\mathbf{v} + \mathbf{w}$
- $\mathbf{v} - \mathbf{w}$
- $\mathbf{w} - \mathbf{v}$
- $\mathbf{v} - 2\mathbf{w}$
- $(\mathbf{v} + \mathbf{w}) + 3\mathbf{u}$
- $\mathbf{v} + (\mathbf{w} + 3\mathbf{u})$
- $2\mathbf{u} - \frac{1}{3}(\mathbf{v} - \mathbf{w})$

In Problems 15–22, use the vectors in the figure below.

- Find the vector  $\mathbf{x}$  if  $\mathbf{x} + \mathbf{B} = \mathbf{F}$ .
- Find the vector  $\mathbf{x}$  if  $\mathbf{x} + \mathbf{K} = \mathbf{C}$ .

17. Write  $\mathbf{C}$  in terms of  $\mathbf{E}$ ,  $\mathbf{D}$ , and  $\mathbf{F}$ .
18. Write  $\mathbf{G}$  in terms of  $\mathbf{C}$ ,  $\mathbf{D}$ ,  $\mathbf{E}$ , and  $\mathbf{K}$ .
19. Write  $\mathbf{E}$  in terms of  $\mathbf{G}$ ,  $\mathbf{H}$ , and  $\mathbf{D}$ .
20. Write  $\mathbf{E}$  in terms of  $\mathbf{A}$ ,  $\mathbf{B}$ ,  $\mathbf{C}$ , and  $\mathbf{D}$ .
21. What is  $\mathbf{A} + \mathbf{B} + \mathbf{K} + \mathbf{G}$ ?
22. What is  $\mathbf{A} + \mathbf{B} + \mathbf{C} + \mathbf{H} + \mathbf{G}$ ?

### Applications and Extensions

- 23. Resultant Force** Two forces  $\mathbf{F}_1$  and  $\mathbf{F}_2$  act on an object shown in the figure. Graph the vector representing the resultant force; that is, find  $\mathbf{F}_1 + \mathbf{F}_2$ .

- 24. Resultant Force** Two forces  $\mathbf{F}_1$  and  $\mathbf{F}_2$  act on an object shown in the figure. Graph the vector representing the resultant force; that is, find  $\mathbf{F}_1 + \mathbf{F}_2$ .

- 25. Air Travel** An airplane is flying due north at a constant airspeed of 560 mi/h. There is a wind 75 mi/h blowing from the east.

- (a) Draw vectors representing the velocities of the airplane and the wind.
- (b) Draw the vector representing the airplane's ground speed.
- (c) Interpret the result.

- 26. Air Travel** An airplane maintains a constant airspeed of 500 km/h headed due west. There is a tail wind blowing at 130 km/h.

- (a) Draw vectors representing the velocities of the airplane and the tail wind.
- (b) Draw the vector representing the airplane's ground speed.
- (c) Interpret the result.

- 27.** Suppose  $\mathbf{v}$  and  $\mathbf{w}$  are nonzero vectors represented by arrows with the same initial point, and that the terminal points of  $\mathbf{v}$  and  $\mathbf{w}$  are  $P$  and  $Q$ , respectively. Suppose the vector  $\mathbf{u}$  is represented by an arrow from the initial point of  $\mathbf{v}$  to the midpoint of the directed line segment  $\overrightarrow{PQ}$ . Write  $\mathbf{u}$  in terms of  $\mathbf{v}$  and  $\mathbf{w}$ .

- 28.** Find nonzero scalars  $a$  and  $b$  so that

$$4\mathbf{v} + a(\mathbf{v} - \mathbf{w}) + b(\mathbf{v} + \mathbf{w}) = \mathbf{0}$$

for every pair of vectors  $\mathbf{v}$  and  $\mathbf{w}$ .

## 10.3 Vectors in the Plane and in Space

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Represent a vector algebraically (p. 703)
- 2 Add, subtract, and find scalar multiples of vectors (p. 705)
- 3 Find the magnitude of a vector (p. 707)
- 4 Find a unit vector (p. 708)
- 5 Find a vector in the plane from its direction and magnitude (p. 709)

We have been treating vectors geometrically, but to use vectors in a meaningful way, we need to look at vectors algebraically as well. To do this, we use a rectangular coordinate system: with two dimensions for vectors in the plane and with three dimensions for vectors in space.

### 1 Represent a Vector Algebraically

If  $\mathbf{v}$  is a vector in a plane, and if its initial point is at the origin and its terminal point is at the point  $(v_1, v_2)$ , then we may represent  $\mathbf{v}$  by the ordered pair.

$$\mathbf{v} = \langle v_1, v_2 \rangle$$

The numbers  $v_1$  and  $v_2$  are called the **components** of  $\mathbf{v}$ .

Similarly, if  $\mathbf{v}$  is a vector in space with its initial point at the origin and its terminal point at the point  $(v_1, v_2, v_3)$ , then  $\mathbf{v}$  is represented by the ordered triple.

$$\mathbf{v} = \langle v_1, v_2, v_3 \rangle$$

The numbers  $v_1$ ,  $v_2$ , and  $v_3$  are called the **components** of  $\mathbf{v}$ .

The vectors defined here, as well as any other vector whose initial point is at the origin, are called **position vectors**. See Figure 25 on page 704.

Figure 25

Any vector whose initial point is not at the origin is equal to a unique position vector. If  $\mathbf{v}$  is a vector in the plane with initial point  $P_1 = (x_1, y_1)$  and terminal point  $P_2 = (x_2, y_2)$ , then  $\mathbf{v}$  equals the position vector

$$\mathbf{v} = \langle x_2 - x_1, y_2 - y_1 \rangle$$

Similarly, if  $\mathbf{v}$  is a vector in space with initial point  $P_1 = (x_1, y_1, z_1)$  and terminal point  $P_2 = (x_2, y_2, z_2)$ , then  $\mathbf{v}$  equals the position vector

$$\mathbf{v} = \langle x_2 - x_1, y_2 - y_1, z_2 - z_1 \rangle$$

As Figure 26 illustrates, this feature allows us to move vectors around in applications.

Figure 26

**IN WORDS** Every vector can be represented by a unique vector whose initial point is at the origin.

If both the initial point and the terminal point of vector  $\mathbf{v}$  are at the origin, then  $\mathbf{v}$  is the **zero vector**. As a result,

$$\mathbf{0} = \langle 0, 0 \rangle \text{ in the plane} \quad \text{and} \quad \mathbf{0} = \langle 0, 0, 0 \rangle \text{ in space}$$

### EXAMPLE 1 Finding a Position Vector

Find the unique position vector  $\mathbf{v}$  of a vector whose initial point is  $P_1$  and whose terminal point is  $P_2$ .

- (a)  $P_1 = (-1, 2)$ ,  $P_2 = (4, 6)$       (b)  $P_1 = (3, 4, 2)$ ,  $P_2 = (7, -8, 5)$

**Solution** To find  $\mathbf{v}$ , subtract corresponding components.

- (a) Then  $\mathbf{v} = \langle 4 - (-1), 6 - 2 \rangle = \langle 5, 4 \rangle$ , as shown in Figure 27.  
 (b) Here,  $\mathbf{v} = \langle 7 - 3, -8 - 4, 5 - 2 \rangle = \langle 4, -12, 3 \rangle$

Figure 27

**NOW WORK** Problems 9(a) and 13(a).

Two position vectors  $\mathbf{v}$  and  $\mathbf{w}$  are equal if and only if the terminal point of  $\mathbf{v}$  is the same as the terminal point of  $\mathbf{w}$ .

$$\mathbf{v} = \langle v_1, v_2 \rangle \text{ and } \mathbf{w} = \langle w_1, w_2 \rangle \text{ are equal if and only if } v_1 = w_1 \text{ and } v_2 = w_2.$$

Unless otherwise specified, we will represent a vector by the unique position vector equal to it.

## 2 Add, Subtract, and Find Scalar Multiples of Vectors

In Section 10.2, we described the operations of addition, subtraction, and scalar multiplication geometrically. Here, we present them algebraically.

Vectors are added or subtracted and scalar multiples are formed using the components of the vectors.

### DEFINITION Operations with Vectors

If  $\mathbf{v} = \langle v_1, v_2 \rangle$  and  $\mathbf{w} = \langle w_1, w_2 \rangle$  are two vectors in the plane and if  $a$  is a scalar, then

$$\begin{aligned} \bullet \mathbf{v} + \mathbf{w} &= \langle v_1 + w_1, v_2 + w_2 \rangle & \bullet \mathbf{v} - \mathbf{w} &= \langle v_1 - w_1, v_2 - w_2 \rangle \\ \bullet a\mathbf{v} &= \langle av_1, av_2 \rangle \end{aligned}$$

If  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  and  $\mathbf{w} = \langle w_1, w_2, w_3 \rangle$  are two vectors in space and if  $a$  is a scalar, then

$$\begin{aligned} \bullet \mathbf{v} + \mathbf{w} &= \langle v_1 + w_1, v_2 + w_2, v_3 + w_3 \rangle & \bullet \mathbf{v} - \mathbf{w} &= \langle v_1 - w_1, v_2 - w_2, v_3 - w_3 \rangle \\ \bullet a\mathbf{v} &= \langle av_1, av_2, av_3 \rangle \end{aligned}$$

Figure 28

For example, if  $\mathbf{v} = \langle 2, 3 \rangle$  and  $\mathbf{w} = \langle 1, 4 \rangle$ , then  $\mathbf{v} + \mathbf{w} = \langle 2 + 1, 3 + 4 \rangle = \langle 3, 7 \rangle$ . See Figure 28.

Notice that the algebraic sum  $\mathbf{v} + \mathbf{w}$  is the same as the resultant vector obtained geometrically. In other words, the algebraic representation of vectors agrees with the geometric representation discussed in Section 10.2.

### EXAMPLE 2 Adding and Subtracting Vectors Algebraically

If  $\mathbf{v} = \langle 2, 3, -1 \rangle$  and  $\mathbf{w} = \langle -1, -2, 4 \rangle$ , find:

- (a)  $\mathbf{v} + \mathbf{w}$       (b)  $\mathbf{w} - \mathbf{v}$       (c)  $\frac{1}{2}\mathbf{w}$       (d)  $2\mathbf{v} + 3\mathbf{w}$

#### Solution

$$(a) \mathbf{v} + \mathbf{w} = \langle 2, 3, -1 \rangle + \langle -1, -2, 4 \rangle = \langle 2 + (-1), 3 + (-2), -1 + 4 \rangle = \langle 1, 1, 3 \rangle$$

$$(b) \mathbf{w} - \mathbf{v} = \langle -1, -2, 4 \rangle - \langle 2, 3, -1 \rangle = \langle -1 - 2, -2 - 3, 4 - (-1) \rangle = \langle -3, -5, 5 \rangle$$

$$(c) \frac{1}{2}\mathbf{w} = \frac{1}{2}\langle -1, -2, 4 \rangle = \left\langle \frac{1}{2}(-1), \frac{1}{2}(-2), \frac{1}{2}(4) \right\rangle = \left\langle -\frac{1}{2}, -1, 2 \right\rangle$$

$$(d) 2\mathbf{v} + 3\mathbf{w} = 2\langle 2, 3, -1 \rangle + 3\langle -1, -2, 4 \rangle = \langle 4, 6, -2 \rangle + \langle -3, -6, 12 \rangle = \langle 1, 0, 10 \rangle$$

The properties listed below for vectors are similar to the properties of real numbers.

### THEOREM Properties of Vector Addition and Scalar Multiplication

If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors and if  $a$  and  $b$  are scalars, then the following properties hold:

- **Commutative property of vector addition:**

$$\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$$

- **Associative property of vector addition:**

$$\mathbf{u} + (\mathbf{v} + \mathbf{w}) = (\mathbf{u} + \mathbf{v}) + \mathbf{w}$$

- **Additive identity  $\mathbf{0}$ :**

$$\mathbf{v} + \mathbf{0} = \mathbf{0} + \mathbf{v} = \mathbf{v}$$

- **Additive inverse property:**

$$\mathbf{v} + (-\mathbf{v}) = \mathbf{0}$$

- **Distributive property of scalar multiplication over vector addition:**

$$a(\mathbf{u} + \mathbf{v}) = a\mathbf{u} + a\mathbf{v}$$

- **Distributive property of scalar multiplication over scalar addition:**

$$(a + b)\mathbf{v} = a\mathbf{v} + b\mathbf{v}$$

- **Linearity property of scalar multiplication:**

$$a(b\mathbf{v}) = (ab)\mathbf{v}$$

- **Scalar multiplication identity:**

$$1\mathbf{v} = \mathbf{v}$$

We proved some of these properties geometrically. For example, in Figure 18, we gave a geometric proof of the commutative property of addition. Here, we algebraically prove the commutative property for vectors in the plane and the scalar multiplication identity property for vectors in space. The remaining proofs are left as exercises. See Problems 106 and 107.

**Proof** Commutative property of vector addition (in the plane): If  $\mathbf{u} = \langle u_1, u_2 \rangle$  and if  $\mathbf{v} = \langle v_1, v_2 \rangle$ , then

$$\begin{aligned}\mathbf{u} + \mathbf{v} &= \langle u_1, u_2 \rangle + \langle v_1, v_2 \rangle = \langle u_1 + v_1, u_2 + v_2 \rangle = \langle v_1 + u_1, v_2 + u_2 \rangle \\ &= \langle v_1, v_2 \rangle + \langle u_1, u_2 \rangle = \mathbf{v} + \mathbf{u}\end{aligned}$$

Scalar multiplication identity (in space): If  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ , then

$$1\mathbf{v} = \langle 1v_1, 1v_2, 1v_3 \rangle = \langle v_1, v_2, v_3 \rangle = \mathbf{v}$$

### DEFINITION Parallel Vectors

Let  $\mathbf{v}$  and  $\mathbf{w}$  be two distinct nonzero vectors. If there is a nonzero scalar  $a$  for which  $\mathbf{v} = a\mathbf{w}$ , then  $\mathbf{v}$  and  $\mathbf{w}$  are called **parallel vectors**.

**EXAMPLE 3** Showing Two Vectors Are Parallel

(a) The vectors

$$\mathbf{v} = \langle 2, 3, -1 \rangle \quad \text{and} \quad \mathbf{w} = \langle 4, 6, -2 \rangle$$

are parallel, since  $\mathbf{v} = \frac{1}{2}\mathbf{w}$ . In this case,  $\mathbf{v}$  and  $\mathbf{w}$  have the same direction.

(b) The vectors

$$\mathbf{v} = \langle 1, 2, 3 \rangle \quad \text{and} \quad \mathbf{w} = \langle -3, -6, -9 \rangle$$

are parallel, since  $\mathbf{w} = -3\mathbf{v}$ . In this case,  $\mathbf{v}$  and  $\mathbf{w}$  have opposite directions. ■

**NOW WORK** Problem 75.**3 Find the Magnitude of a Vector**

The representation of  $\mathbf{v}$  as the vector  $\langle v_1, v_2 \rangle$  gives the direction of  $\mathbf{v}$ . The definition below gives the magnitude of  $\mathbf{v}$ .

**DEFINITION**

The **magnitude** or **length** of a vector  $\mathbf{v}$ , denoted by the symbol  $\|\mathbf{v}\|$ , is the distance from the initial point to the terminal point of  $\mathbf{v}$ .  $\|\mathbf{v}\|$  is also called the **norm** of the vector  $\mathbf{v}$ .

**THEOREM** Magnitude of a Vector

If  $\mathbf{v} = \langle v_1, v_2 \rangle$  is a vector in the plane, the magnitude of  $\mathbf{v}$  is

$$\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2}$$

If  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  is a vector in space, the magnitude of  $\mathbf{v}$  is

$$\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2 + v_3^2}$$

The proof follows from the Distance Formula.

**EXAMPLE 4** Finding the Magnitude of a Vector

Find the magnitude of  $\mathbf{v}$  if:

$$(a) \mathbf{v} = \langle 3, -4 \rangle \quad (b) \mathbf{v} = \langle 2, 3, -1 \rangle$$

$$\text{Solution } (a) \|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2} = \sqrt{3^2 + (-4)^2} = \sqrt{9 + 16} = 5$$

$$(b) \|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2 + v_3^2} = \sqrt{2^2 + 3^2 + (-1)^2} = \sqrt{4 + 9 + 1} = \sqrt{14} \quad \blacksquare$$

**NOW WORK** Problem 21.**THEOREM** Magnitude of the Scalar Multiple of a Vector

If  $a$  is scalar and  $\mathbf{v}$  is a vector, then

$$\|a\mathbf{v}\| = |a|\|\mathbf{v}\|$$

We prove the theorem for a vector  $\mathbf{v}$  in the plane. The proof for a vector  $\mathbf{v}$  in space is left as an exercise (Problem 108).

**Proof** Suppose  $\mathbf{v} = \langle v_1, v_2 \rangle$ . Then the scalar multiple of  $a$  and  $\mathbf{v}$  is  $a\mathbf{v} = \langle av_1, av_2 \rangle$  and

$$\begin{aligned}\|a\mathbf{v}\| &= \sqrt{(av_1)^2 + (av_2)^2} = \sqrt{a^2v_1^2 + a^2v_2^2} = \sqrt{a^2(v_1^2 + v_2^2)} \\ &= \sqrt{a^2}\sqrt{v_1^2 + v_2^2} = |a|\|\mathbf{v}\|\end{aligned}$$

## 4 Find a Unit Vector

### DEFINITION

A vector with magnitude 1 is called a **unit vector**.

In many applications, it is necessary to find the unit vector with the same direction as a given vector  $\mathbf{v}$ .

### THEOREM Unit Vector in the Direction of $\mathbf{v}$

For any nonzero vector  $\mathbf{v}$ , the vector

$$\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|}$$

is the unit vector that has the same direction as  $\mathbf{v}$ .

**Proof** Since  $\frac{1}{\|\mathbf{v}\|}$  is a positive scalar, the vector  $\mathbf{u} = \frac{1}{\|\mathbf{v}\|}\mathbf{v}$  has the same direction as  $\mathbf{v}$ . Next we show that the magnitude of  $\mathbf{u}$  is 1.

$$\|\mathbf{u}\| = \left\| \frac{\mathbf{v}}{\|\mathbf{v}\|} \right\| = \left\| \frac{1}{\|\mathbf{v}\|}\mathbf{v} \right\| = \frac{1}{\|\mathbf{v}\|}\|\mathbf{v}\| = 1$$

Since  $\|\mathbf{u}\| = 1$ ,  $\mathbf{u}$  is a unit vector in the direction of  $\mathbf{v}$ . ■

Multiplying a nonzero vector  $\mathbf{v}$  by  $\frac{1}{\|\mathbf{v}\|}$  to obtain a unit vector that has the same direction as  $\mathbf{v}$  is called **normalizing  $\mathbf{v}$** .

### EXAMPLE 5 Normalizing a Vector

Normalize each vector. That is, find a unit vector  $\mathbf{u}$  that has the same direction as:

(a)  $\mathbf{v} = \langle 3, -4 \rangle$       (b)  $\mathbf{v} = \langle -1, 2, -2 \rangle$

**Solution** (a) Since  $\mathbf{v} = \langle 3, -4 \rangle$ , then  $\|\mathbf{v}\| = \sqrt{9 + 16} = 5$ . The unit vector  $\mathbf{u}$  in the same direction as  $\mathbf{v}$  is

$$\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{\mathbf{v}}{5} = \left\langle \frac{3}{5}, -\frac{4}{5} \right\rangle$$

(b) Since  $\mathbf{v} = \langle -1, 2, -2 \rangle$ , then  $\|\mathbf{v}\| = \sqrt{1 + 4 + 4} = 3$ . The unit vector  $\mathbf{u}$  in the same direction as  $\mathbf{v}$  is

$$\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{\mathbf{v}}{3} = \left\langle -\frac{1}{3}, \frac{2}{3}, -\frac{2}{3} \right\rangle$$

### NOW WORK Problem 43.

Unit vectors directed along the positive coordinate axes are called **standard basis vectors**. In the plane, the standard basis vectors are

$$\mathbf{i} = \langle 1, 0 \rangle \quad \mathbf{j} = \langle 0, 1 \rangle$$

Figure 29

In space, the standard basis vectors are

$$\mathbf{i} = \langle 1, 0, 0 \rangle \quad \mathbf{j} = \langle 0, 1, 0 \rangle \quad \mathbf{k} = \langle 0, 0, 1 \rangle$$

See Figure 29(a) and 29(b).

### THEOREM Writing a Vector in Terms of Standard Basis Vectors

Every vector  $\mathbf{v} = \langle v_1, v_2 \rangle$  in the plane can be written in terms of the standard basis vectors  $\mathbf{i}$  and  $\mathbf{j}$  as

$$\mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j}$$

Every vector  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  in space can be written in terms of the standard basis vectors  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  as

$$\mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j} + v_3 \mathbf{k}$$

The proof for vectors in the plane follows. The proof for vectors in space is left as an exercise (Problem 109).

**Proof**  $\mathbf{v} = \langle v_1, v_2 \rangle = \langle v_1, 0 \rangle + \langle 0, v_2 \rangle = v_1 \langle 1, 0 \rangle + v_2 \langle 0, 1 \rangle = v_1 \mathbf{i} + v_2 \mathbf{j}$  ■

### EXAMPLE 6 Writing a Vector Using Standard Basis Vectors

- (a)  $\langle 4, 3 \rangle = 4\mathbf{i} + 3\mathbf{j}$       (b)  $\langle 2, -3 \rangle = 2\mathbf{i} + (-3)\mathbf{j} = 2\mathbf{i} - 3\mathbf{j}$   
 (c)  $\langle 1, -3, 2 \rangle = \mathbf{i} - 3\mathbf{j} + 2\mathbf{k}$       (d)  $\langle 0, 3, 4 \rangle = 0\mathbf{i} + 3\mathbf{j} + 4\mathbf{k} = 3\mathbf{j} + 4\mathbf{k}$  ■

**NOW WORK** Problems 9(b) and 13(b).

### EXAMPLE 7 Working with Standard Basis Vectors

- (a) If  $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j}$  and  $\mathbf{w} = -\mathbf{i} + 2\mathbf{j}$ , find  $4\mathbf{v} - \mathbf{w}$ .  
 (b) If  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$  and  $\mathbf{w} = -\mathbf{i} - 2\mathbf{j} + 4\mathbf{k}$ , find  $2\mathbf{v} - 3\mathbf{w}$ .

**Solution** (a)  $4\mathbf{v} - \mathbf{w} = 4(2\mathbf{i} - 3\mathbf{j}) - (-\mathbf{i} + 2\mathbf{j}) = (8\mathbf{i} - 12\mathbf{j}) + (\mathbf{i} - 2\mathbf{j}) = 9\mathbf{i} - 14\mathbf{j}$   
 (b)  $2\mathbf{v} - 3\mathbf{w} = 2(2\mathbf{i} + 3\mathbf{j} - \mathbf{k}) - 3(-\mathbf{i} - 2\mathbf{j} + 4\mathbf{k})$   
 $= (4\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}) + (3\mathbf{i} + 6\mathbf{j} - 12\mathbf{k}) = 7\mathbf{i} + 12\mathbf{j} - 14\mathbf{k}$  ■

**NOW WORK** Problems 55 and 65.

## 5 Find a Vector in the Plane from Its Direction and Magnitude

Often a vector is described by its magnitude and direction, rather than by its components. For example, a weather report warning of 40 mi/h southwesterly winds (from the southwest) describes a velocity vector, but to work with it requires finding its components. A nonzero vector  $\mathbf{v}$  in the plane can be described by specifying the angle  $\theta$ ,  $0 \leq \theta < 2\pi$ , between  $\mathbf{v}$  and the positive  $x$ -axis, which gives its direction, and by specifying its magnitude  $\|\mathbf{v}\|$ . See Figure 30. If  $\mathbf{v} = x\mathbf{i} + y\mathbf{j}$ , then  $x = \|\mathbf{v}\| \cos \theta$  and  $y = \|\mathbf{v}\| \sin \theta$ . So,  $\mathbf{v} = \|\mathbf{v}\| \cos \theta \mathbf{i} + \|\mathbf{v}\| \sin \theta \mathbf{j} = \|\mathbf{v}\|(\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$ .

### THEOREM

If  $\mathbf{v}$  is a nonzero vector, and if  $\theta$  is the angle between  $\mathbf{v}$  and the positive  $x$ -axis, then

$$\mathbf{v} = \|\mathbf{v}\| (\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$$

Figure 30  $\mathbf{v} = \|\mathbf{v}\|(\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$

**NOTE** Wind direction is measured from where it blows.

Figure 31

Figure 32

### EXAMPLE 8 Using Standard Basis Vectors to Model a Problem

An airplane has an air speed of 400 km/h and is headed east. There is a northwesterly wind of 80 km/h. (Northwesterly winds blow toward the southeast.)

- Find a vector representing the velocity of the airplane in the air.
- Find a vector representing the wind velocity.
- Find a vector representing the velocity of the airplane relative to the ground.
- Find the true speed of the airplane.

**Solution** We use a two-dimensional coordinate system with the direction north along the positive  $y$ -axis. Then the direction east is along the positive  $x$ -axis.

Using a scale of 1 unit = 1 km/h, define

$\mathbf{v}_a$  = Velocity of the airplane in the air

$\mathbf{v}_w$  = Velocity of the wind

$\mathbf{v}_g$  = Velocity of the airplane relative to the ground

Figure 31 shows the vectors  $\mathbf{v}_a$ ,  $\mathbf{v}_w$ ,  $\mathbf{v}_g$ .

- The vector  $\mathbf{v}_a$  has magnitude 400 and direction  $\mathbf{i}$ , so  $\mathbf{v}_a = 400\mathbf{i}$ .
- The vector  $\mathbf{v}_w$  has magnitude 80 and makes an angle of  $\frac{7\pi}{4}$  with the positive  $x$ -axis, as shown in Figure 32. Since the magnitude of  $\mathbf{v}_w$  is 80,
 
$$\mathbf{v}_w = 80 \left( \cos \frac{7\pi}{4} \mathbf{i} + \sin \frac{7\pi}{4} \mathbf{j} \right) = 80 \left( \frac{\sqrt{2}}{2} \mathbf{i} - \frac{\sqrt{2}}{2} \mathbf{j} \right) = 40\sqrt{2}\mathbf{i} - 40\sqrt{2}\mathbf{j}$$
- The velocity  $\mathbf{v}_g$  of the airplane relative to the ground is the resultant of  $\mathbf{v}_a$  and  $\mathbf{v}_w$ .
 
$$\mathbf{v}_g = \mathbf{v}_a + \mathbf{v}_w = 400\mathbf{i} + [40\sqrt{2}\mathbf{i} - 40\sqrt{2}\mathbf{j}] = (400 + 40\sqrt{2})\mathbf{i} - 40\sqrt{2}\mathbf{j}$$
- The true speed of the airplane is the magnitude of the vector  $\mathbf{v}_g$ .

$$\|\mathbf{v}_g\| = \sqrt{(400 + 40\sqrt{2})^2 + (40\sqrt{2})^2} \approx 460.060$$

The true speed of the airplane is approximately 460.060 km/h. ■

The direction of the airplane relative to the ground can be found using trigonometry, but we provide an easier method in the next section.

### NOW WORK Problem 93.

Figure 33

When multiple forces  $\mathbf{F}_1, \mathbf{F}_2, \dots, \mathbf{F}_n$  simultaneously act on an object, the vector sum  $\mathbf{F}_1 + \mathbf{F}_2 + \dots + \mathbf{F}_n$  is the **resultant force**. The resultant force produces the same effect on the object as that obtained when each of the forces  $\mathbf{F}_1, \mathbf{F}_2, \dots, \mathbf{F}_n$  acts on the same object at the same time. An object is in **static equilibrium** if the object is at rest and the resultant force is  $\mathbf{0}$ .

### EXAMPLE 9 Finding the Tension in Cable

A commercial air conditioner weighing 8600 lb is suspended from two cables, as shown in Figure 33. What is the tension in each cable?

Figure 34

**Solution** We represent the cables and the air conditioner with a force diagram, as shown in Figure 34.

The tension in each cable is the magnitude of  $\|\mathbf{F}_1\|$  and  $\|\mathbf{F}_2\|$ , respectively. The weight of the air conditioner is  $\|\mathbf{F}_3\| = 8600$  lb.

$$\mathbf{F}_1 = \|\mathbf{F}_1\| (\cos 45^\circ \mathbf{i} + \sin 45^\circ \mathbf{j}) = \|\mathbf{F}_1\| \left( \frac{\sqrt{2}}{2} \mathbf{i} + \frac{\sqrt{2}}{2} \mathbf{j} \right)$$

$$\mathbf{F}_2 = \|\mathbf{F}_2\| (\cos 140^\circ \mathbf{i} + \sin 140^\circ \mathbf{j})$$

$$\mathbf{F}_3 = -8600\mathbf{j}$$

For the air conditioner to be in static equilibrium, the sum of the forces acting on it must equal  $\mathbf{0}$ . That is,

$$\begin{aligned} \mathbf{F}_1 + \mathbf{F}_2 + \mathbf{F}_3 &= \left( \frac{\sqrt{2}}{2} \|\mathbf{F}_1\| \mathbf{i} + \frac{\sqrt{2}}{2} \|\mathbf{F}_1\| \mathbf{j} \right) \\ &\quad + (\cos 140^\circ \|\mathbf{F}_2\| \mathbf{i} + \sin 140^\circ \|\mathbf{F}_2\| \mathbf{j}) - 8600\mathbf{j} = \mathbf{0} \end{aligned}$$

Since both the  $\mathbf{i}$  and  $\mathbf{j}$  components equal 0, we have a system of two equations:

$$\begin{cases} \frac{\sqrt{2}}{2} \|\mathbf{F}_1\| + \cos 140^\circ \|\mathbf{F}_2\| = 0 & (1) \\ \frac{\sqrt{2}}{2} \|\mathbf{F}_1\| + \sin 140^\circ \|\mathbf{F}_2\| - 8600 = 0 & (2) \end{cases}$$

We solve equation (1) for  $\|\mathbf{F}_1\|$ :

$$\|\mathbf{F}_1\| = -\frac{2 \cos 140^\circ \|\mathbf{F}_2\|}{\sqrt{2}} \quad (3)$$

and substitute the result into equation (2).

$$\begin{aligned} \frac{\sqrt{2}}{2} \left( -\frac{2 \cos 140^\circ \|\mathbf{F}_2\|}{\sqrt{2}} \right) + \sin 140^\circ \|\mathbf{F}_2\| - 8600 &= 0 \\ [-\cos 140^\circ + \sin 140^\circ] \|\mathbf{F}_2\| &= 8600 \\ \|\mathbf{F}_2\| &= \frac{8600}{\sin 140^\circ - \cos 140^\circ} \approx 6104 \end{aligned}$$

Then from (3)

$$\|\mathbf{F}_1\| = -\frac{2 \cos 140^\circ \|\mathbf{F}_2\|}{\sqrt{2}} \approx -\frac{2 \cos 140^\circ}{\sqrt{2}} (6104) \approx 6613$$

The left cable has a tension of approximately 6104 lb and the right cable has a tension of approximately 6613 lb. ■

### NOW WORK Problem 97.

## Vectors in $n$ Dimensions

In a space of  $n$  dimensions, the rectangular coordinates of a point are given by an ordered  $n$ -tuple  $(v_1, v_2, \dots, v_n)$  of real numbers. A vector  $\mathbf{v}$  in  $n$ -space whose initial point is at the origin and whose terminal point is at  $(v_1, v_2, \dots, v_n)$  is defined as

$$\mathbf{v} = \langle v_1, v_2, \dots, v_n \rangle$$

where the numbers  $v_1, v_2, \dots, v_n$  are the **components** of  $\mathbf{v}$ . In  $n$ -space there are  $n$  coordinate axes and, along each positive axis, a standard basis vector is defined as follows:

$$\mathbf{e}_1 = \langle 1, 0, \dots, 0 \rangle, \quad \mathbf{e}_2 = \langle 0, 1, \dots, 0 \rangle, \quad \dots, \quad \mathbf{e}_n = \langle 0, 0, \dots, 1 \rangle$$

Any vector  $\mathbf{v} = \langle v_1, v_2, \dots, v_n \rangle$  in  $n$ -space can be written in terms of the standard basis vectors  $\mathbf{e}_1, \mathbf{e}_2, \dots, \mathbf{e}_n$  as

$$\mathbf{v} = v_1\mathbf{e}_1 + v_2\mathbf{e}_2 + \dots + v_n\mathbf{e}_n$$

We add two vectors in  $n$ -space by adding respective components. The scalar multiple  $a\mathbf{v}$  of a vector is found by multiplying each component by the scalar  $a$ . The magnitude of the vector  $\mathbf{v} = v_1\mathbf{e}_1 + v_2\mathbf{e}_2 + \dots + v_n\mathbf{e}_n$  is  $\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2 + \dots + v_n^2}$ .

## 10.3 Assess Your Understanding

### Concepts and Vocabulary

- In space, the standard basis vectors are  $\mathbf{i} = \underline{\hspace{2cm}}$ ,  $\mathbf{j} = \underline{\hspace{2cm}}$ , and  $\mathbf{k} = \underline{\hspace{2cm}}$ .
- A vector whose magnitude is 1 is called a(n)            vector.
- $v_1, v_2$ , and  $v_3$  are called the            of  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ .
- True or False* If  $\mathbf{w} = 4\mathbf{v}$ , then  $\mathbf{w}$  has the same direction as  $\mathbf{v}$ .
- True or False* The magnitude of a vector is found by adding its components.
- True or False* In the plane, if the angle between a nonzero vector  $\mathbf{v}$  and the unit vector  $\mathbf{i}$  is  $\theta$ , then  $\mathbf{v} = \|\mathbf{v}\|(\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$ .
- If  $\mathbf{v} = \mathbf{i} + \mathbf{j} + \mathbf{k}$ , the unit vector  $\mathbf{u}$  in the direction of  $\mathbf{v}$  is  $\mathbf{u} = \underline{\hspace{2cm}}$ .
- True or False* For a vector  $\mathbf{v}$  in the plane,

$$\|-2\mathbf{v}\| = -2\|\mathbf{v}\|$$

In Problems 17–24, use  $\mathbf{v} = \langle 3, -1 \rangle$  and  $\mathbf{w} = \langle -3, 2 \rangle$  to find each quantity.

- |                                                     |                                   |                                                     |
|-----------------------------------------------------|-----------------------------------|-----------------------------------------------------|
| 17. $2\mathbf{v} - \mathbf{w}$                      | 18. $\mathbf{v} + 5\mathbf{w}$    | 19. $\frac{1}{3}\mathbf{v} + \frac{1}{2}\mathbf{w}$ |
| 20. $\frac{2}{3}\mathbf{v} - \frac{1}{2}\mathbf{w}$ | 21. $\ \mathbf{v}\ $              | 22. $\ \mathbf{w}\ $                                |
| 23. $\ 2\mathbf{v} - \mathbf{w}\ $                  | 24. $\ \mathbf{v} + \mathbf{w}\ $ |                                                     |

In Problems 25–32, use  $\mathbf{u} = \langle 1, 1, -6 \rangle$ ,  $\mathbf{v} = \langle 3, 0, 8 \rangle$ , and  $\mathbf{w} = \langle -3, -1, 2 \rangle$  to find each quantity.

- |                                                 |                                                         |                                               |

| 47. $\mathbf{v} = \frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j}$                    | 48. $\mathbf{v} = \frac{\sqrt{2}}{2}(\mathbf{i} - \mathbf{j})$                                  |
| 49. $\mathbf{v} = \langle 1, 1, 1 \rangle$                                                 | 50. $\mathbf{v} = \langle 1, -1, -1 \rangle$                                                    |
| 51. $\mathbf{v} = (\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j} + 2\sqrt{2}\mathbf{k}$ |                                                                                                 |
| 52. $\mathbf{v} = (\sin \theta)\mathbf{i} + (\cos \theta)\mathbf{j} + \mathbf{k}$          |                                                                                                 |
| 53. $\mathbf{v} = 3\mathbf{i} - 4\mathbf{j} + 12\mathbf{k}$                                | 54. $\mathbf{v} = \frac{1}{2}\mathbf{i} - \frac{1}{2}\mathbf{j} + \frac{\sqrt{2}}{2}\mathbf{k}$ |

### Skill Building

In Problems 9–16, the vector  $\mathbf{v}$  has initial point  $P_1$  and terminal point  $P_2$ .

- Write each vector  $\mathbf{v}$  as a position vector.
- Write each vector  $\mathbf{v}$  in terms of the standard basis vectors.

- $P_1 = (2, 3)$  and  $P_2 = (6, -2)$
- $P_1 = (4, -1)$  and  $P_2 = (-3, 2)$
- $P_1 = (0, 5)$  and  $P_2 = (-1, 6)$
- $P_1 = (-2, 0)$  and  $P_2 = (3, 2)$
- $P_1 = (6, 2, 1)$  and  $P_2 = (3, 0, 2)$
- $P_1 = (4, 7, 0)$  and  $P_2 = (0, 5, 6)$
- $P_1 = (-1, 0, 1)$  and  $P_2 = (2, 0, 0)$
- $P_1 = (6, 2, 2)$  and  $P_2 = (2, 6, 2)$

In Problems 55–60, use  $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} + 2\mathbf{j}$  to find the indicated quantity.

55.  $2\mathbf{v} - \mathbf{w}$       56.  $\mathbf{v} + 5\mathbf{w}$       57.  $\frac{1}{3}\mathbf{v} + \frac{1}{2}\mathbf{w}$   
 58.  $\frac{2}{3}\mathbf{v} - \frac{1}{2}\mathbf{w}$       59.  $\|\mathbf{v} - \mathbf{w}\|$       60.  $\|\mathbf{v} + \mathbf{w}\|$

In Problems 61–70, use  $\mathbf{u} = \mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$ ,  $\mathbf{v} = 3\mathbf{i} + \mathbf{j} - \mathbf{k}$ , and  $\mathbf{w} = 6\mathbf{i} + \mathbf{j} + \mathbf{k}$  to find the indicated quantity.

61.  $3\mathbf{v} - 2\mathbf{w}$       62.  $-2\mathbf{v} + \mathbf{w}$       63.  $2\mathbf{u} - 3\mathbf{v} + 4\mathbf{w}$   
 64.  $5\mathbf{u} - \mathbf{v} + \mathbf{w}$       65.  $\|\mathbf{v} - \mathbf{w}\|$       66.  $\|2\mathbf{v} + \mathbf{w}\|$   
 67.  $\|\mathbf{u}\| + \|\mathbf{v}\| + \|\mathbf{w}\|$       68.  $\|\mathbf{u} + \mathbf{v} + \mathbf{w}\|$       69.  $\frac{\mathbf{u} + \mathbf{v}}{\|\mathbf{w}\|}$   
 70.  $\frac{\mathbf{u}}{\|\mathbf{v} + \mathbf{w}\|}$

In Problems 71–76, determine whether the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are parallel. If the vectors are parallel, are their directions the same or opposite?

71.  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$ ,  $\mathbf{w} = 3\mathbf{i} + \frac{9}{2}\mathbf{j}$   
 72.  $\mathbf{v} = 3\mathbf{i} + 2\mathbf{j}$ ,  $\mathbf{w} = 6\mathbf{i} - 4\mathbf{j}$   
 73.  $\mathbf{v} = \langle 2, 6, -12 \rangle$ ,  $\mathbf{w} = \langle -1, -3, 4 \rangle$   
 74.  $\mathbf{v} = \langle \sqrt{2}, 1, 3 \rangle$ ,  $\mathbf{w} = \langle 2, 1, 9 \rangle$   
 75.  $\mathbf{v} = \langle 12, 3, -9 \rangle$ ,  $\mathbf{w} = \langle -4, -1, 3 \rangle$   
 76.  $\mathbf{v} = \langle -6, 8, 2 \rangle$ ,  $\mathbf{w} = \langle -3, 4, 0 \rangle$

### Applications and Extensions

77. Find a vector whose magnitude is 4 that is parallel to  $2\mathbf{i} - 3\mathbf{j} + 4\mathbf{k}$ .  
 78. Find a vector whose magnitude is 2 that is parallel to  $-\mathbf{i} + \mathbf{j} + 2\mathbf{k}$ .  
 79. Find  $a$  so that the vectors  $2\mathbf{i} + \mathbf{j} - \mathbf{k}$  and  $2a\mathbf{i} + \mathbf{j} + \mathbf{k}$  have the same magnitude.  
 80. Find  $a$  so that  $\|a\mathbf{i} + (a+1)\mathbf{j} + 2\mathbf{k}\| = 3$ .  
 81. If  $\mathbf{v} = 2\mathbf{i} + \mathbf{j}$  and  $\mathbf{w} = x\mathbf{i} + 3\mathbf{j}$ , find all numbers  $x$  so that  $\|\mathbf{v} + \mathbf{w}\| = 5$ .  
 82. A vector  $\mathbf{v}$  has initial point  $P_1 = (-3, 1)$  and terminal point  $P_2 = (x, 4)$ . Find all numbers  $x$  so that  $\mathbf{v}$  has length 5.

In Problems 83–88, find all vectors  $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$  that have the indicated properties.

83. Magnitude of  $\mathbf{v}$  is 4;  $\mathbf{v}$  makes an angle of  $30^\circ$  with the positive  $x$ -axis.  
 84. Magnitude of  $\mathbf{v}$  is 2;  $\mathbf{v}$  makes an angle of  $45^\circ$  with the positive  $x$ -axis.  
 85. Magnitude of  $\mathbf{v}$  is 5; the  $\mathbf{i}$  component is twice the  $\mathbf{j}$  component.  
 86. Magnitude of  $\mathbf{v}$  is 5; the  $\mathbf{i}$  component equals the  $\mathbf{j}$  component.  
 87. The  $\mathbf{j}$  component of  $\mathbf{v}$  is 1;  $\mathbf{v}$  makes an angle of  $135^\circ$  with the positive  $x$ -axis.

88. The  $\mathbf{i}$  component of  $\mathbf{v}$  is  $-3$ ;  $\mathbf{v}$  makes an angle of  $210^\circ$  with the positive  $x$ -axis.  
 89. **Acceleration** A force  $\mathbf{F} = 10\mathbf{i} - 15\mathbf{j} + 25\mathbf{k}$ , measured in newtons (N), is applied to an object of mass 10 kg, causing it to accelerate in the direction of  $\mathbf{F}$ . Find the magnitude of the acceleration of the object (in newtons per kilogram).

### 90. Computer Graphics

In computer graphics, vectors are used to translate points. For example, if the point  $(-3, 2)$  is translated by the vector  $\mathbf{v} = \langle 5, 2 \rangle$ , then the new location will be

$\mathbf{u}' = \mathbf{u} + \mathbf{v} = \langle -3, 2 \rangle + \langle 5, 2 \rangle = \langle 2, 4 \rangle$ , as shown in the figure.

**Source:** Phil Dadd. *Vectors and matrices: A primer.*

<http://www.gamedev.net/reference/articles/article1832.asp>.

- (a) Determine the new coordinates of  $(3, -1)$  if it is translated by  $\mathbf{v} = \langle -4, 5 \rangle$ .  
 (b) Illustrate the translation graphically.
91. **Computer Graphics** The points  $(-3, 0)$ ,  $(-1, -2)$ ,  $(3, 1)$ , and  $(1, 3)$  are the vertices of a parallelogram  $ABCD$ .  
 (a) If  $ABCD$  is translated by  $\mathbf{v} = \langle 3, -2 \rangle$ , find the vertices of the new parallelogram  $A'B'C'D'$ .  
 (b) If  $ABCD$  is translated by  $\frac{1}{2}\mathbf{v}$ , find the vertices of the new parallelogram  $A'B'C'D'$ .
92. **Ground Speed of an Airplane** An airplane has an air speed of 500 km/h in an easterly direction. If there is a southeast wind of 60 km/h, find the speed of the airplane relative to the ground.
93. **Position of an Airplane** An airplane travels 200 mi due west and then travels 150 mi in a direction  $60^\circ$  north of west. Find the vector that gives the position of the airplane.
94. **Average Air Speed of an Airplane** An airplane, after 1 h of flying, arrives at a point 200 mi due south of the departure point. If, during the flight, there was a steady northwest wind of 20 mi/h, what was the airplane's average air speed?
95. **Static Equilibrium** Forces  $\mathbf{F}_1, \mathbf{F}_2, \mathbf{F}_3, \mathbf{F}_4$  act on an object  $Q$  as shown in the figure. Draw the force  $\mathbf{F}$  needed to prevent  $Q$  from moving.

96. **Overcoming a Force** Two friends are trying to pull a car out of a ditch. They apply forces, measured in pounds, of  $\mathbf{F}_1 = 200\mathbf{i} + 350\mathbf{j} + 100\mathbf{k}$  and  $\mathbf{F}_2 = 250\mathbf{i} + 300\mathbf{j} + 150\mathbf{k}$ , respectively, to the car, but it does not move. Find the third force  $\mathbf{F}_3$ , due to the mud and ground, acting on the car and preventing it from moving.

**97. Static Equilibrium**

A weight of 1000 lb is suspended from two cables, as shown in the figure. What is the tension in each cable?

**98. Static Equilibrium**

A weight of 800 lb is suspended from two cables attached to a horizontal steel beam, as shown in the figure. What is the tension in each cable?

**99. Tug of War** Three pieces of rope are knotted together for use in a three-team tug of war. Each rope is pulled parallel to the ground. As viewed from above, Team A pulls with a force of 1100 lb at an angle of  $0^\circ$ , Team B pulls with a force of 1050 lb at an angle of  $120^\circ$ , and Team C pulls with a force of 1000 lb at an angle of  $240^\circ$ .

(a) Draw a force diagram representing the forces acting on the knot.

(b) Find the net force acting on the knot.

**100. Pushing a Wheelbarrow** A man pushes a wheelbarrow up an incline of  $20^\circ$  to the ground with a force of 100 lb. Represent graphically this force.

**101. Pulling a Wagon** A child pulls a wagon with a force of 40 lb. The handle of the wagon makes an angle of  $30^\circ$  with the ground. Represent graphically this force.

**102. Orthopedics** A patient with a broken tibia has the lower half of his leg suspended horizontally by a cable attached to the center of his foot. See the figure. The tension in the cable needs to exert a force of 25 N horizontally for traction and 40 N vertically upward to support the leg. Find the tension in the cable. (Hint: Put the center of the patient's foot at the origin of an  $xy$ -plane.)

**103. Chemistry: Gold Crystals**

In its solid form, gold forms a crystal lattice known as a face-centered cubic (fcc). The crystal consists of eight gold atoms at the corners of a cube plus six more atoms, one at the center of each face of the cube, as shown in the figure. The sides of the cube are 0.408 nm long ( $1 \text{ nm} = 10^{-9} \text{ m}$ ). Put

one corner of the cube at the origin, and place three of the faces along the positive coordinate planes.

(a) Assign coordinates to each atom in the crystal.

(b) Find a vector that represents each of the following atoms:

(i) The atom furthest from the origin

(ii) The atom in the center of the cube face that is parallel to the  $xz$ -plane, but not in that plane

(iii) The atom in the center of the cube face that is parallel to the  $xy$ -plane, but not in that plane

(c) What is the magnitude of each of the vectors found in (b)?

**104. Theoretical Speed** An airplane travels in a northeasterly direction at 250 km/h relative to the ground, due to the fact that there is an easterly wind of 50 km/h relative to the ground. How fast would the plane be going if there were no wind?

**105. Wind Velocity** A woman on a bike traveling east at 8 mi/h finds that the wind appears to be coming from the north. Upon doubling her speed, she finds that the wind appears to be coming from the northeast. Find the velocity of the wind.

**106.** Show that the properties of vector addition and scalar multiplication (p. 706) hold for vectors in the plane.

**107.** Show that the properties of vector addition and scalar multiplication (p. 706) hold for vectors in space.

**108.** Show that if  $a$  is scalar and  $\mathbf{v}$  is a vector, then  $\|a\mathbf{v}\| = |a|\|\mathbf{v}\|$  for vectors in space.

**109.** Show that every vector  $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$  in space can be written in terms of the vectors  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  as  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ .

**Challenge Problems**

**110. Geometry** Let  $A$ ,  $B$ ,  $C$ , and  $D$  be the vertices of a tetrahedron (triangular pyramid) in space. Let  $\mathbf{b} = \overrightarrow{AB}$ ,  $\mathbf{c} = \overrightarrow{AC}$ , and  $\mathbf{d} = \overrightarrow{AD}$ . Express the directed edges  $\overrightarrow{BC}$ ,  $\overrightarrow{BD}$ , and  $\overrightarrow{CD}$  of the tetrahedron in terms of the vectors  $\mathbf{b}$ ,  $\mathbf{c}$ , and  $\mathbf{d}$ .

**111. Geometry** Let  $A$ ,  $B$ ,  $C$ ,  $D$ ,  $E$ ,  $F$ ,  $G$ , and  $H$  be the vertices of a parallelepiped in space, whose faces are the parallelograms  $ABCD$ ,  $ABFE$ ,  $AEHD$ , and so forth. Let  $\mathbf{b} = \overrightarrow{AB}$ ,  $\mathbf{e} = \overrightarrow{AE}$ , and  $\mathbf{d} = \overrightarrow{AD}$ . Express the vectors  $\overrightarrow{AC}$ ,  $\overrightarrow{AF}$ ,  $\overrightarrow{AG}$ ,  $\overrightarrow{FG}$ , and  $\overrightarrow{EG}$  in terms of  $\mathbf{b}$ ,  $\mathbf{e}$ , and  $\mathbf{d}$ .

**112.** Let points  $P_1 = (x_1, y_1, z_1)$  and  $P_2 = (x_2, y_2, z_2)$  have respective position vectors  $\mathbf{r}_1$  and  $\mathbf{r}_2$ . Show that the point  $P = (x, y, z)$  that divides the segment  $P_1P_2$  in the ratio  $t = \frac{\overrightarrow{P_1P}}{\overrightarrow{P_1P_2}}$  has position vector  $\mathbf{r} = \mathbf{r}_1 + t(\mathbf{r}_2 - \mathbf{r}_1)$ . From this,

conclude that

$$x = x_1 + t(x_2 - x_1)$$

$$y = y_1 + t(y_2 - y_1)$$

$$z = z_1 + t(z_2 - z_1)$$

113. Let  $\mathbf{u}$  and  $\mathbf{v}$  be two nonparallel, nonzero vectors in the plane. Show that for each vector  $\mathbf{w}$  there exist unique scalars  $s$  and  $t$  so that  $\mathbf{w} = s\mathbf{u} + t\mathbf{v}$ . Interpret the result geometrically.

## 10.4 The Dot Product

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the dot product of two vectors (p. 715)
- 2 Find the angle between two vectors (p. 716)
- 3 Determine whether two vectors are orthogonal (p. 718)
- 4 Find a vector in space from its magnitude and direction (p. 718)
- 5 Find the projection of a vector (p. 719)
- 6 Compute work (p. 720)

When working with vectors there are three types of multiplication. In Sections 10.1 and 10.2, we defined the scalar multiple of a vector  $\mathbf{v}$  as the *product of a scalar and a vector*. The resulting product is a vector. Now we discuss the second of the three types of multiplication, the *dot product*. The dot product is the *product of two vectors*, but the result is a *scalar*. In Section 10.5, we investigate the third type of multiplication, called the *cross product*. One important use of the dot product is to find the angle between two vectors.

### DEFINITION Dot Product

If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j}$  are two vectors in the plane, the **dot product**  $\mathbf{v} \cdot \mathbf{w}$  is defined as

$$\mathbf{v} \cdot \mathbf{w} = v_1w_1 + v_2w_2$$

Similarly, if  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$  are two vectors in space, the dot product  $\mathbf{v} \cdot \mathbf{w}$  is defined as

$$\mathbf{v} \cdot \mathbf{w} = v_1w_1 + v_2w_2 + v_3w_3$$

**NOTE** The dot product of two vectors is not a vector. It is a scalar. The dot product is sometimes called the **scalar product**.

### 1 Find the Dot Product of Two Vectors

#### EXAMPLE 1 Finding the Dot Product of Two Vectors

- (a) If  $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j}$  and  $\mathbf{w} = \mathbf{i} + \mathbf{j}$ , then

$$\mathbf{v} \cdot \mathbf{w} = (2)(1) + (-3)(1) = 2 - 3 = -1 \quad \mathbf{w} \cdot \mathbf{v} = (1)(2) + (1)(-3) = 2 - 3 = -1$$

$$\mathbf{v} \cdot \mathbf{v} = 2^2 + (-3)^2 = 4 + 9 = 13 \quad \mathbf{w} \cdot \mathbf{w} = 1^2 + 1^2 = 2$$

- (b) If  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = 4\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ , then

$$\mathbf{v} \cdot \mathbf{w} = (2)(4) + (-1)(2) + (1)(-1) \quad \mathbf{w} \cdot \mathbf{v} = (4)(2) + (2)(-1) + (-1)(1)$$

$$= 8 - 2 - 1 = 5 \quad = 8 - 2 - 1 = 5$$

$$\mathbf{v} \cdot \mathbf{v} = 4 + 1 + 1 = 6 \quad \mathbf{w} \cdot \mathbf{w} = 16 + 4 + 1 = 21$$

**NOW WORK** Problem 7(a).

The results from Example 1 suggest some of the properties of the dot product.

### THEOREM Properties of the Dot Product

If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors and  $a$  is any scalar, then:

- **Magnitude property:**

$$\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$$

- **Commutative property:**

$$\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$$

- **Distributive property:**

$$\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$$

- **Linearity property:**

$$a(\mathbf{u} \cdot \mathbf{v}) = (a\mathbf{u}) \cdot \mathbf{v}$$

- **Zero-vector property:**

$$\mathbf{0} \cdot \mathbf{v} = 0$$

We prove the magnitude property  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$  and the commutative property for vectors in space. The remaining proofs are left as exercises (see Problems 78–82).

**Proof** To show  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$ , we let  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ . Then

$$\mathbf{v} \cdot \mathbf{v} = v_1v_1 + v_2v_2 + v_3v_3 = v_1^2 + v_2^2 + v_3^2 = \|\mathbf{v}\|^2$$

Commutative Property: Let  $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$  and  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ . Then

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3 = v_1u_1 + v_2u_2 + v_3u_3 = \mathbf{v} \cdot \mathbf{u} \quad \blacksquare$$

A consequence of the property  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$  is that for any vector  $\mathbf{v}$ ,

$$\mathbf{v} \cdot \mathbf{v} \geq 0 \quad \text{and} \quad \mathbf{v} \cdot \mathbf{v} = 0 \quad \text{if and only if} \quad \mathbf{v} = \mathbf{0}$$

Figure 35

**NEED TO REVIEW?** The Law of Cosines states that  $c^2 = a^2 + b^2 - 2ab \cos \theta$ , where  $a$ ,  $b$ , and  $c$  are the lengths of the sides of a triangle and  $\theta$  is the angle opposite the side of length  $c$ . The Law of the Cosines is discussed in Appendix A.4, p. A-37.

## 2 Find the Angle Between Two Vectors

If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors, we can position  $\mathbf{v}$  and  $\mathbf{w}$  so they have the same initial point. Then the vectors  $\mathbf{v}$ ,  $\mathbf{w}$ , and  $\mathbf{w} - \mathbf{v}$  form a triangle, as shown in Figure 35. We want to find an expression for the angle  $\theta$  between the vectors  $\mathbf{v}$  and  $\mathbf{w}$ .

Since the sides of the triangle have lengths  $\|\mathbf{v}\|$ ,  $\|\mathbf{w}\|$ , and  $\|\mathbf{w} - \mathbf{v}\|$ , we can use the Law of Cosines to find the cosine of angle  $\theta$ .

$$\|\mathbf{w} - \mathbf{v}\|^2 = \|\mathbf{v}\|^2 + \|\mathbf{w}\|^2 - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos \theta \quad (1)$$

Now we use properties of the dot product to write this equation in terms of dot products. Since  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$ , we can write (1) in the form

$$(\mathbf{w} - \mathbf{v}) \cdot (\mathbf{w} - \mathbf{v}) = \mathbf{v} \cdot \mathbf{v} + \mathbf{w} \cdot \mathbf{w} - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos \theta \quad (2)$$

Now we use the distributive property twice on the term  $(\mathbf{w} - \mathbf{v}) \cdot (\mathbf{w} - \mathbf{v})$ .

$$\begin{aligned} (\mathbf{w} - \mathbf{v}) \cdot (\mathbf{w} - \mathbf{v}) &= \mathbf{w} \cdot (\mathbf{w} - \mathbf{v}) - \mathbf{v} \cdot (\mathbf{w} - \mathbf{v}) \\ &= \mathbf{w} \cdot \mathbf{w} - \mathbf{w} \cdot \mathbf{v} - \mathbf{v} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{v} \\ &= \mathbf{w} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{v} - 2(\mathbf{v} \cdot \mathbf{w}) \end{aligned}$$

We substitute this result back into equation (2) and simplify. This yields

$$\mathbf{w} \cdot \mathbf{w} + \mathbf{v} \cdot \mathbf{v} - 2(\mathbf{v} \cdot \mathbf{w}) = \mathbf{v} \cdot \mathbf{v} + \mathbf{w} \cdot \mathbf{w} - 2\|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

$$\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$$

We have proved the following result.

### THEOREM Angle Between Vectors

The angle  $\theta$ , where  $0 \leq \theta \leq \pi$ , between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  is given by the formula

$$\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}$$

**NOTE** If  $\mathbf{v} \cdot \mathbf{w} > 0$ , the angle between  $\mathbf{v}$  and  $\mathbf{w}$  is acute. If  $\mathbf{v} \cdot \mathbf{w} < 0$ , the angle between  $\mathbf{v}$  and  $\mathbf{w}$  is obtuse.

Figure 36

### EXAMPLE 2 Finding the Angle Between Two Vectors

Find the angle between the vectors  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = -\mathbf{i} + \mathbf{j}$ .

**Solution** We find  $\mathbf{v} \cdot \mathbf{w}$ ,  $\|\mathbf{v}\|$ , and  $\|\mathbf{w}\|$ .

$$\mathbf{v} \cdot \mathbf{w} = (2)(-1) + (-1)(1) + (1)(0) = -2 - 1 + 0 = -3$$

$$\|\mathbf{v}\| = \sqrt{2^2 + (-1)^2 + 1^2} = \sqrt{6}$$

$$\|\mathbf{w}\| = \sqrt{(-1)^2 + 1^2} = \sqrt{2}$$

Then if  $\theta$  is the angle between  $\mathbf{v}$  and  $\mathbf{w}$ ,

$$\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|} = \frac{-3}{(\sqrt{6})(\sqrt{2})} = \frac{-3}{\sqrt{12}} = -\frac{\sqrt{3}}{2}$$

Since  $0 \leq \theta \leq \pi$ , the angle  $\theta$  between  $\mathbf{v}$  and  $\mathbf{w}$  is  $\frac{5\pi}{6}$  radians. See Figure 36. ■

**NOW WORK** Problem 7(b).

### EXAMPLE 3 Finding the True Direction of an Airplane

An airplane has an air speed of 400 km/h and is headed east. Find the true direction of the airplane relative to the ground if there is a northwesterly wind of 80 km/h.

**Solution** This is the same situation from Example 8 of Section 10.3. There, we found the velocity of the airplane relative to the ground is  $\mathbf{v}_g = (400 + 40\sqrt{2})\mathbf{i} - 40\sqrt{2}\mathbf{j}$ .

The angle  $\theta$  between  $\mathbf{v}_g$  and the vector  $\mathbf{i}$  (the positive  $x$ -axis) is given by

$$\cos\theta = \frac{\mathbf{v}_g \cdot \mathbf{i}}{\|\mathbf{v}_g\|\|\mathbf{i}\|} = \frac{400 + 40\sqrt{2}}{460.06} \approx 0.9924$$

$$\theta \approx \cos^{-1}(0.9924) \approx 7.07^\circ$$

The true direction of the plane is approximately  $7.07^\circ$  south of east. See Figure 37. ■

**NOW WORK** Problem 35.

Two nonzero vectors are **orthogonal** if the angle between them is a right angle ( $90^\circ$ ). Whether two nonzero vectors are parallel or orthogonal is determined by the angle  $\theta$  between the two vectors.

If the angle  $\theta$  between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  is 0 or  $\pi$ , the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are parallel.

If the angle  $\theta$  between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  is  $\frac{\pi}{2}$ , the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal.

Figure 37

**THEOREM** Orthogonal Vectors

Two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal if and only if

$$\mathbf{v} \cdot \mathbf{w} = 0$$

**Proof** We use the formula for the angle between two nonzero vectors, namely  $\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|}$ .

If the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal, then the angle  $\theta$  between  $\mathbf{v}$  and  $\mathbf{w}$  is  $\frac{\pi}{2}$ . Since  $\cos \frac{\pi}{2} = 0$ , it follows that  $\mathbf{v} \cdot \mathbf{w} = 0$ .

Conversely, if  $\mathbf{v} \cdot \mathbf{w} = 0$ , then  $\mathbf{v} = \mathbf{0}$  or  $\mathbf{w} = \mathbf{0}$ , or  $\cos \theta = 0$ . Since  $\mathbf{v}$  and  $\mathbf{w}$  are nonzero vectors,  $\cos \theta = 0$ , so  $\theta = \frac{\pi}{2}$  and  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal. ■

**NOTE** *Orthogonal*, *perpendicular*, and *normal* are all terms that mean “meet at a right angle.” It is customary to refer to two vectors as *orthogonal*, two lines as *perpendicular*, and a line and a plane or a vector and a plane as *normal*.

**3 Determine Whether Two Vectors Are Orthogonal****EXAMPLE 4** Showing that Two Vectors Are Orthogonal

The vectors  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + 5\mathbf{k}$  and  $\mathbf{w} = 3\mathbf{i} + \mathbf{j} - \mathbf{k}$  are orthogonal, since

$$\mathbf{v} \cdot \mathbf{w} = 6 - 1 - 5 = 0$$

Since  $\mathbf{i} \cdot \mathbf{j} = 1 \cdot 0 + 0 \cdot 1 = 0$ , the standard basis vectors  $\mathbf{i}$  and  $\mathbf{j}$  in the plane are orthogonal. The standard basis vectors  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  in space are mutually orthogonal, since  $\mathbf{i} \cdot \mathbf{j} = 0$ ,  $\mathbf{j} \cdot \mathbf{k} = 0$ , and  $\mathbf{k} \cdot \mathbf{i} = 0$ .

**EXAMPLE 5** Making Two Vectors Orthogonal

Find a scalar  $a$  so that the vectors  $\mathbf{v} = 2a\mathbf{i} + \mathbf{j} - \mathbf{k}$  and  $\mathbf{w} = \mathbf{i} - a\mathbf{j} + \mathbf{k}$  are orthogonal.

**Solution** The vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal if  $\mathbf{v} \cdot \mathbf{w} = 0$ . So,

$$\mathbf{v} \cdot \mathbf{w} = 2a - a - 1 = 0$$

$$a = 1$$

The vectors  $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$  and  $\mathbf{w} = \mathbf{i} - \mathbf{j} + \mathbf{k}$  are orthogonal. ■

**NOW WORK** Problem 17.**4 Find a Vector in Space from Its Magnitude and Direction**

A nonzero vector  $\mathbf{v}$  in space can be described by specifying its direction, given by three *direction angles*  $\alpha$ ,  $\beta$ ,  $\gamma$ , and its magnitude  $\|\mathbf{v}\|$ . The **direction angles** as shown in Figure 38 are defined as

$\alpha$  = Angle between  $\mathbf{v}$  and  $\mathbf{i}$ , the positive  $x$ -axis,  $0 \leq \alpha \leq \pi$

$\beta$  = Angle between  $\mathbf{v}$  and  $\mathbf{j}$ , the positive  $y$ -axis,  $0 \leq \beta \leq \pi$

$\gamma$  = Angle between  $\mathbf{v}$  and  $\mathbf{k}$ , the positive  $z$ -axis,  $0 \leq \gamma \leq \pi$

We seek expressions for  $\alpha$ ,  $\beta$ , and  $\gamma$  in terms of the components of a nonzero vector  $\mathbf{v}$ . Let  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  denote a nonzero vector. The angle  $\alpha$  between  $\mathbf{v}$  and  $\mathbf{i}$ , which lies on the positive  $x$ -axis, is given by

$$\cos \alpha = \frac{\mathbf{v} \cdot \mathbf{i}}{\|\mathbf{v}\| \|\mathbf{i}\|} = \frac{v_1}{\|\mathbf{v}\|}$$

Similarly,

$$\cos \beta = \frac{\mathbf{v} \cdot \mathbf{j}}{\|\mathbf{v}\| \|\mathbf{j}\|} = \frac{v_2}{\|\mathbf{v}\|} \quad \text{and} \quad \cos \gamma = \frac{\mathbf{v} \cdot \mathbf{k}}{\|\mathbf{v}\| \|\mathbf{k}\|} = \frac{v_3}{\|\mathbf{v}\|}$$

Figure 38

The components of  $\mathbf{v}$  are

$$v_1 = \|\mathbf{v}\| \cos \alpha \quad v_2 = \|\mathbf{v}\| \cos \beta \quad v_3 = \|\mathbf{v}\| \cos \gamma$$

### THEOREM

If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  is a nonzero vector in space, then

$$\begin{aligned} \cos \alpha &= \frac{v_1}{\sqrt{v_1^2 + v_2^2 + v_3^2}} = \frac{v_1}{\|\mathbf{v}\|} & \cos \beta &= \frac{v_2}{\sqrt{v_1^2 + v_2^2 + v_3^2}} = \frac{v_2}{\|\mathbf{v}\|} \\ \cos \gamma &= \frac{v_3}{\sqrt{v_1^2 + v_2^2 + v_3^2}} = \frac{v_3}{\|\mathbf{v}\|} \end{aligned}$$

$$\mathbf{v} = \|\mathbf{v}\| [\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}]$$

This result gives the vector  $\mathbf{v}$  when its magnitude and direction are known. The numbers  $\cos \alpha$ ,  $\cos \beta$ , and  $\cos \gamma$  are called the **direction cosines** of the vector  $\mathbf{v}$ . In Problem 62, you are asked to show that  $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$ . In other words, the vector  $\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$  is a unit vector.

### EXAMPLE 6 Finding the Direction Cosines of a Vector

- (a) Find the magnitude and the direction cosines of  $\mathbf{v} = -3\mathbf{i} + 2\mathbf{j} - 6\mathbf{k}$ .  
 (b) Write  $\mathbf{v}$  in terms of its magnitude and its direction cosines.

**Solution** (a) The magnitude of  $\mathbf{v}$  is

$$\|\mathbf{v}\| = \sqrt{(-3)^2 + 2^2 + (-6)^2} = \sqrt{49} = 7$$

The direction cosines of the vector  $\mathbf{v}$  are

$$\cos \alpha = \frac{v_1}{\|\mathbf{v}\|} = \frac{-3}{7} \quad \cos \beta = \frac{v_2}{\|\mathbf{v}\|} = \frac{2}{7} \quad \cos \gamma = \frac{v_3}{\|\mathbf{v}\|} = \frac{-6}{7}$$

- (b) Now  $\mathbf{v} = \|\mathbf{v}\| [\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}] = 7 \left( -\frac{3}{7}\mathbf{i} + \frac{2}{7}\mathbf{j} - \frac{6}{7}\mathbf{k} \right)$ . ■

### NOW WORK Problem 19.

## 5 Find the Projection of a Vector

In many applications, it is important to find “how much” of a vector is applied along a given direction. In Figure 39, the force  $\mathbf{F}$  due to gravity pulls the block toward the center of Earth. To study the effect of gravity on the block, it is necessary to determine how much of  $\mathbf{F}$  is actually pulling the block down the incline ( $\mathbf{F}_1$ ) and how much is pressing the block against the incline ( $\mathbf{F}_2$ ) at a right angle to the incline. Decomposing  $\mathbf{F}$  into  $\mathbf{F}_1$  and  $\mathbf{F}_2$  allows us to determine when friction is overcome, allowing the block to slide down the incline.

Figure 39  $\mathbf{F} = \mathbf{F}_1 + \mathbf{F}_2$

**NOTE** The vector  $\mathbf{v}_2$  orthogonal to  $\mathbf{w}$  is sometimes denoted by  $\text{orth}_{\mathbf{w}}\mathbf{v}$ .

Suppose  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors with the same initial point  $P$ . We seek to decompose  $\mathbf{v}$  into two vectors:  $\mathbf{v}_1$ , parallel to  $\mathbf{w}$ , and  $\mathbf{v}_2$ , orthogonal to  $\mathbf{w}$ . The vector  $\mathbf{v}_1$  is called the **vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$**  and is denoted by  $\text{proj}_{\mathbf{w}}\mathbf{v}$ . See Figure 40(a) and 40(b) on page 720.

We obtain the vector  $\mathbf{v}_1$  as follows: We drop a perpendicular from the terminal point of  $\mathbf{v}$  to the line containing  $\mathbf{w}$ . The vector  $\mathbf{v}_1$  is the vector from  $P$  to the intersection of the line containing  $\mathbf{w}$  and the perpendicular. Since  $\mathbf{v} = \mathbf{v}_1 + \mathbf{v}_2$ , the dot product  $\mathbf{v} \cdot \mathbf{w}$  is

$$\begin{aligned} \mathbf{v} \cdot \mathbf{w} &= (\mathbf{v}_1 + \mathbf{v}_2) \cdot \mathbf{w} = \mathbf{v}_1 \cdot \mathbf{w} + \mathbf{v}_2 \cdot \mathbf{w} & (1) \\ &\quad \uparrow \quad \quad \quad \uparrow \\ &\quad \mathbf{v} = \mathbf{v}_1 + \mathbf{v}_2 \quad \quad \text{Distribute} \end{aligned}$$

Figure 40  $\mathbf{v} = \mathbf{v}_1 + \mathbf{v}_2$ 

Since  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ , the dot product  $\mathbf{v}_2 \cdot \mathbf{w} = 0$ . Since  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$ , there is a scalar  $a$  for which  $\mathbf{v}_1 = a\mathbf{w}$ . We make these substitutions in equation (1).

$$\begin{aligned}\mathbf{v} \cdot \mathbf{w} &= a\mathbf{w} \cdot \mathbf{w} + 0 = a\|\mathbf{w}\|^2 \\ a &= \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}\end{aligned}$$

Then

$$\mathbf{v}_1 = a\mathbf{w} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}$$

### THEOREM Vector Projection

If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors, the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$  is

$$\text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}$$

The decomposition of  $\mathbf{v}$  into  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ , is

$$\mathbf{v}_1 = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} \quad \mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1$$

### EXAMPLE 7 Decomposing a Vector into Two Orthogonal Vectors

Find the vector projection of  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  onto  $\mathbf{w} = \mathbf{i} + \mathbf{j} + \mathbf{k}$ . Decompose  $\mathbf{v}$  into two vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

**Solution** We use the formula for the projection of  $\mathbf{v}$  onto  $\mathbf{w}$ .

$$\begin{aligned}\mathbf{v}_1 = \text{proj}_{\mathbf{w}} \mathbf{v} &= \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w} = \frac{2}{(\sqrt{3})^2} \mathbf{w} = \frac{2}{3}(\mathbf{i} + \mathbf{j} + \mathbf{k}) = \frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{2}{3}\mathbf{k} \\ &\quad \begin{array}{c} \mathbf{v} \cdot \mathbf{w} = 2 - 1 + 1 = 2 \\ \|\mathbf{w}\| = \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3} \end{array}\end{aligned}$$

$$\mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1 = (2\mathbf{i} - \mathbf{j} + \mathbf{k}) - \left(\frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} + \frac{2}{3}\mathbf{k}\right) = \frac{4}{3}\mathbf{i} - \frac{5}{3}\mathbf{j} + \frac{1}{3}\mathbf{k} \quad \blacksquare$$

### NOW WORK Problem 27.

## 6 Compute Work

**Work** is defined as the energy transferred to or from an object by a **force** acting on the object.

The work  $W$  done by a *constant* force  $\mathbf{F}$  in moving an object from  $A$  to  $B$  along a straight line in the direction of  $\mathbf{F}$  is defined to be

$$W = \|\mathbf{F}\| \|\vec{AB}\| \quad \text{Work} = \text{force} \times \text{distance}$$

In this definition, it is assumed that the constant force  $\mathbf{F}$  is applied along the line of motion  $\vec{AB}$ , as shown in Figure 41.

If the constant force  $\mathbf{F}$  is not along the line of motion, but instead is at an angle  $\theta$  to the direction of motion, as in Figure 42, then the **work**  $W$  **done by**  $\mathbf{F}$  in moving an object from  $A$  to  $B$  is defined as the dot product.

$$W = \mathbf{F} \cdot \vec{AB}$$

Figure 41  $W = \|\mathbf{F}\| \|\vec{AB}\|$ .Figure 42  $W = \mathbf{F} \cdot \vec{AB}$ .

This definition is compatible with the force times distance definition, since

$$\begin{aligned} W &= (\text{Amount of force in the direction of } \vec{AB})(\text{distance}) \\ &= \|\text{proj}_{\vec{AB}} \mathbf{F}\| \|\vec{AB}\| = \left[ \frac{\mathbf{F} \cdot \vec{AB}}{\|\vec{AB}\|^2} \|\vec{AB}\| \right] \|\vec{AB}\| = \mathbf{F} \cdot \vec{AB} \end{aligned}$$

### EXAMPLE 8 Computing Work

Find the work done by a force of 2 newtons (N) acting in the direction  $\mathbf{i} + \mathbf{j} + \mathbf{k}$  in moving an object 1 m from  $(0, 0, 0)$  to  $(1, 0, 0)$ .

**Solution** We need to express the force  $\mathbf{F}$  in terms of its magnitude and direction. The unit vector  $\mathbf{u}$  in the direction  $\mathbf{v} = \mathbf{i} + \mathbf{j} + \mathbf{k}$  is

$$\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|} = \frac{\mathbf{i} + \mathbf{j} + \mathbf{k}}{\sqrt{3}} = \frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k}$$

Since the force vector  $\mathbf{F}$  has magnitude 2, we have

$$\mathbf{F} = 2 \left( \frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k} \right) = \frac{2}{\sqrt{3}}(\mathbf{i} + \mathbf{j} + \mathbf{k})$$

The line of motion of the object from  $(0, 0, 0)$  to  $(1, 0, 0)$  is  $\vec{AB} = \mathbf{i}$ . The work  $W$  is therefore

$$W = \mathbf{F} \cdot \vec{AB} = \frac{2}{\sqrt{3}}(\mathbf{i} + \mathbf{j} + \mathbf{k}) \cdot \mathbf{i} = \frac{2}{\sqrt{3}} \text{ joules}$$

**RECALL** 1 joule = 1 newton·meter;  
1 J = 1 N · m.

**NOW WORK** Problem 43.

### EXAMPLE 9 Computing Work

Figure 43 shows a man pushing on a lawn mower handle with a force of 30 lb. How much work is done in moving the lawn mower a distance of 75 ft if the handle makes an angle of  $60^\circ$  with the ground?

**Solution** We set up the coordinate system so that the lawn mower is moved from  $(0, 0)$  to  $(75, 0)$ . Then the motion occurs along  $\vec{AB} = 75\mathbf{i}$ . The force vector  $\mathbf{F}$ , as shown in Figure 44, makes an angle of  $300^\circ$  to the positive  $x$ -axis. Since  $\|\mathbf{F}\| = 30$ ,  $\mathbf{F}$  is given by

$$\mathbf{F} = 30[(\cos 300^\circ)\mathbf{i} + (\sin 300^\circ)\mathbf{j}] = 30 \left[ \frac{1}{2}\mathbf{i} - \frac{\sqrt{3}}{2}\mathbf{j} \right] = 15\mathbf{i} - 15\sqrt{3}\mathbf{j}$$

Then the work  $W$  done is

$$W = \mathbf{F} \cdot \vec{AB} = (15\mathbf{i} - 15\sqrt{3}\mathbf{j}) \cdot 75\mathbf{i} = 1125 \text{ ft}\cdot\text{lb}$$

Figure 43  $\vec{AB} = 75\mathbf{i}$

Figure 44  $\|\mathbf{F}\| = 30$

## 10.4 Assess Your Understanding

## Concepts and Vocabulary

1. **True or False** If  $\mathbf{v}$  is a nonzero vector, then  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|$ .
2. **True or False** If two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  are parallel, then  $\mathbf{v} \cdot \mathbf{w} = 0$ .
3. If  $\theta$  is the angle between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ , then  $\cos \theta =$  \_\_\_\_\_.
4. **True or False** If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  is a nonzero vector in space, then  $\mathbf{v} = \|\mathbf{v}\| [\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}]$ , where  $\cos \alpha = \frac{v_1}{\|\mathbf{v}\|}$ ,  $\cos \beta = \frac{v_2}{\|\mathbf{v}\|}$ , and  $\cos \gamma = \frac{v_3}{\|\mathbf{v}\|}$ .
5. **True or False** The dot product of two vectors is sometimes called the vector product.
6. **True or False** For any two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ , the vector  $\mathbf{v}$  can be decomposed into two vectors, one parallel to  $\mathbf{w}$  and the other orthogonal to  $\mathbf{w}$ .

## Skill Building

In Problems 7–14, for each pair of vectors  $\mathbf{v}$  and  $\mathbf{w}$ :

- (a) Find the dot product  $\mathbf{v} \cdot \mathbf{w}$ .
- (b) Find the angle  $\theta$  between  $\mathbf{v}$  and  $\mathbf{w}$ .

7.  $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j} + \mathbf{k}$
8.  $\mathbf{v} = -3\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$
9.  $\mathbf{v} = \mathbf{i} - \mathbf{j}$ ,  $\mathbf{w} = \mathbf{j} + \mathbf{k}$
10.  $\mathbf{v} = \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} + \mathbf{k}$
11.  $\mathbf{v} = 3\mathbf{i} + \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = -2\mathbf{i} - \mathbf{j} + \mathbf{k}$
12.  $\mathbf{v} = \mathbf{i} - 3\mathbf{j} + 4\mathbf{k}$ ,  $\mathbf{w} = 4\mathbf{i} - \mathbf{j} + 3\mathbf{k}$
13.  $\mathbf{v} = \mathbf{i} - \mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} + \mathbf{j}$
14.  $\mathbf{v} = 3\mathbf{i} + 4\mathbf{j}$ ,  $\mathbf{w} = -6\mathbf{i} - 8\mathbf{j}$

In Problems 15–18, find a scalar  $a$  so that the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal.

15.  $\mathbf{v} = 2a\mathbf{i} + \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j} + \mathbf{k}$
16.  $\mathbf{v} = \mathbf{i} + 2a\mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j} + \mathbf{k}$
17.  $\mathbf{v} = a\mathbf{i} + \mathbf{j} + \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} + a\mathbf{j} + 4\mathbf{k}$
18.  $\mathbf{v} = \mathbf{i} - a\mathbf{j} + 2\mathbf{k}$ ,  $\mathbf{w} = 2a\mathbf{i} + \mathbf{j} + \mathbf{k}$

In Problems 19–26:

- (a) Find the magnitude and the direction cosines of each vector  $\mathbf{v}$ .
- (b) Write  $\mathbf{v}$  in terms of its magnitude and its direction cosines.

19.  $\mathbf{v} = 3\mathbf{i} - 6\mathbf{j} - 2\mathbf{k}$
20.  $\mathbf{v} = -6\mathbf{i} + 12\mathbf{j} + 4\mathbf{k}$
21.  $\mathbf{v} = \mathbf{i} + \mathbf{j} + \mathbf{k}$
22.  $\mathbf{v} = \mathbf{i} - \mathbf{j} - \mathbf{k}$
23.  $\mathbf{v} = \mathbf{i} - \mathbf{k}$
24.  $\mathbf{v} = \mathbf{j} + \mathbf{k}$
25.  $\mathbf{v} = 3\mathbf{i} - 5\mathbf{j} + 2\mathbf{k}$
26.  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$

In Problems 27–32:

- (a) Find the vector projection of  $\mathbf{v}$  onto  $\mathbf{w}$ .
- (b) Decompose  $\mathbf{v}$  into two vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .

27.  $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j} + \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j} + \mathbf{k}$

28.  $\mathbf{v} = -3\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$

29.  $\mathbf{v} = \mathbf{i} - \mathbf{j}$ ,  $\mathbf{w} = \mathbf{j} + \mathbf{k}$

30.  $\mathbf{v} = \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} + \mathbf{k}$

31.  $\mathbf{v} = 3\mathbf{i} + \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = -2\mathbf{i} - \mathbf{j} + \mathbf{k}$

32.  $\mathbf{v} = \mathbf{i} - 3\mathbf{j} + 4\mathbf{k}$ ,  $\mathbf{w} = 4\mathbf{i} - \mathbf{j} + 3\mathbf{k}$

33. Find a scalar  $a$  so that the angle between the vectors  $\mathbf{v} = a\mathbf{i} + \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = \mathbf{i} + a\mathbf{j} + \mathbf{k}$  is  $\frac{\pi}{3}$ .

34. Find a scalar  $a$  so that the angle between the vectors  $\mathbf{v} = a\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = \mathbf{i} - \mathbf{j} + a\mathbf{k}$  is  $\frac{2\pi}{3}$ .

## Applications and Extensions

35. **Ground Speed and Direction** An airplane flying due north has an air speed of 500 km/h. There is a northwesterly wind of 60 km/h. Find the true speed and direction of the plane relative to the ground.

36. **Ground Speed and Direction** A bird flying west has an air speed of 12 km/h. If there is a southeasterly wind of 5 km/h, find the true speed and direction of the bird relative to the ground.

37. **Steering a Boat** A stream 1 km wide has a constant current of 5 km/h. At what angle to the shore should a person navigate a boat, which is maintaining a constant speed of 15 km/h, in order to reach a point directly opposite?

38. **Swimming to a Destination** A river is 500 m wide and has a current of 1 km/h. If a swimmer can swim at a constant speed of 2 km/h, at what angle to the shore should she swim if she wishes to reach the shore at a point directly opposite? How long will it take her to cross the river?

39. **Braking Load** A car with a gross weight of 5300 lb is parked on a street with an  $8^\circ$  grade, as shown in the figure below. Find the magnitude of the force required to keep the car from rolling down the street. What is the magnitude of the force perpendicular to the street?

40. **Ramp Angle** Billy stops while rolling a 250-lb piano up a ramp. If the angle of inclination of the ramp is  $20^\circ$ , how many pounds of force must Billy exert to hold the piano in position?

41. **Work** A wagon is pulled horizontally by exerting a force of 20 lb on the handle at an angle of  $30^\circ$  with the horizontal. How much work is done in moving the wagon 100 ft?

42. **Work** Find the work done by a force of 1 N acting in the direction  $2\mathbf{i} + 2\mathbf{j} + \mathbf{k}$  in moving an object 3 m from  $(0, 0, 0)$  to  $(1, 2, 2)$ .

- 43. Work** Find the work done by a force of 3 N acting in the direction  $2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$  in moving an object 2 m from  $(0, 0, 0)$  to  $(0, 2, 0)$ .

- 44. Work** Find the work done by gravity when an object of mass  $m$  moves once around the triangle shown in the figure. (The force of gravity is  $mg$ , where  $g = 9.80 \text{ m/s}^2$ .)

- 45. Work** Two workers, A and B, are each pulling identical crates of tools a distance of 10 m along a level floor. Worker A pulls the crate with a force of 850 N at an angle of  $30^\circ$  with respect to the floor, and Worker B also pulls the crate with a force of 850 N, but at an angle of  $45^\circ$  with respect to the floor. Assume that in both cases, the crates are moved from  $(0, 0, 0)$  to  $(10, 0, 0)$ , and the  $z$ -axis points upward, perpendicular to the floor.

- (a) Find the amount of work done by each person in moving the crate.  
(b) Which person do you think took less time moving the crate? Explain your reasoning.

- 46.** A horse pulls a plow a distance of 15 meters along the ground from  $(0, 0)$  to  $(15, 0)$ , during which a force of 725 newtons is applied at an angle of  $15^\circ$  with respect to the ground.

- (a) What is the work done by the horse?  
(b) During this motion, the force of friction is also acting on the plow. Friction is directed parallel to the surface and opposes the motion. If the friction force has a magnitude of 625 newtons, what is the work done by friction on the plow?

- 47. Parallelogram** Show that the points  $(2, 2, 2)$ ,  $(0, 1, 2)$ ,  $(-1, 3, 3)$ , and  $(3, 0, 1)$  are the vertices of a parallelogram.

- 48. Rectangle** Show that the points  $(2, 2, 2)$ ,  $(2, 0, 1)$ ,  $(4, 1, -1)$ , and  $(4, 3, 0)$  are the vertices of a rectangle.

- 49. Right Triangle** Show that the points  $(-2, 6, 0)$ ,  $(4, 9, 1)$ , and  $(-3, 2, 18)$  are the vertices of a right triangle.

- 50. Right Triangle** Find all scalars  $c$  so that the triangle with vertices  $A = (1, -1, 0)$ ,  $B = (-2, 2, 1)$ , and  $C = (1, 2, c)$  is a right triangle with its right angle at  $C$ .

- 51. Work** Find the acute angle that a constant unit force vector makes with the positive  $x$ -axis in moving an object from  $(0, 0)$  to  $(4, 0)$  if the work done by the force equals 2.

- 52. Work** In the definition of work  $W = \mathbf{F} \cdot \overrightarrow{AB}$ , what is the work done if  $\mathbf{F}$  is orthogonal to  $\overrightarrow{AB}$ ?

- 53.** Let  $\mathbf{u}$  and  $\mathbf{w}$  be two unit vectors and let  $\theta$  be the angle between them. Find  $\left\| \frac{1}{2}\mathbf{u} - \mathbf{w} \right\|$  in terms of  $\theta$ .

- 54.** Show that the vector projection of  $\mathbf{v}$  on  $\mathbf{i}$  is  $(\mathbf{v} \cdot \mathbf{i})\mathbf{i}$ . Then show that a vector  $\mathbf{v}$  can always be written as

$$\mathbf{v} = (\mathbf{v} \cdot \mathbf{i})\mathbf{i} + (\mathbf{v} \cdot \mathbf{j})\mathbf{j} + (\mathbf{v} \cdot \mathbf{k})\mathbf{k}$$

- 55.** If  $\|\mathbf{v}\| = 2$ ,  $\|\mathbf{w}\| = 6$ , and the angle between  $\mathbf{v}$  and  $\mathbf{w}$  is  $\frac{\pi}{3}$ , find  $\|\mathbf{v} + \mathbf{w}\|$  and  $\|\mathbf{v} - \mathbf{w}\|$ .

- 56.** Find all numbers  $a$  and  $b$  for which the vectors  $\mathbf{v} = 2a\mathbf{i} - 2\mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = b\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$  are orthogonal and have the same magnitude.

- 57.** Suppose  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors. Show that the vector  $\mathbf{v} - a\mathbf{w}$  is orthogonal to  $\mathbf{w}$  if  $a = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2}$ .

- 58.** Let  $\mathbf{v}$  and  $\mathbf{w}$  be nonzero vectors. Show that the vectors  $\|\mathbf{w}\|\mathbf{v} + \|\mathbf{v}\|\mathbf{w}$  and  $\|\mathbf{w}\|\mathbf{v} - \|\mathbf{v}\|\mathbf{w}$  are orthogonal.

- 59.** Let  $\mathbf{w}$  be a nonzero vector and let  $\mathbf{u}$  be a unit vector. Show that the unit vector  $\mathbf{u}$  that makes  $\mathbf{w} \cdot \mathbf{u}$  a maximum is the unit vector pointing in the same direction as  $\mathbf{w}$ .

- 60. Cauchy–Schwarz Inequality** Show that if  $\mathbf{v}$  and  $\mathbf{w}$  are two vectors, then  $|\mathbf{v} \cdot \mathbf{w}| \leq \|\mathbf{v}\| \|\mathbf{w}\|$ . Under what conditions is the Cauchy–Schwarz inequality an equality?

- 61. Triangle Inequality** Show that if  $\mathbf{v}$  and  $\mathbf{w}$  are vectors, then  $\|\mathbf{v} + \mathbf{w}\| \leq \|\mathbf{v}\| + \|\mathbf{w}\|$ . (Hint: Use the Cauchy–Schwarz inequality, Problem 60.)

- 62.** Show that if  $\alpha$ ,  $\beta$ , and  $\gamma$  are the direction angles of a nonzero vector  $\mathbf{v}$  in space, then  $\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma = 1$ .

- 63.** The vector  $\mathbf{v}$  makes an angle of  $\alpha = \frac{\pi}{3}$  with the positive  $x$ -axis, an angle of  $\beta = \frac{\pi}{3}$  with the positive  $y$ -axis, and an acute angle  $\gamma$  with the positive  $z$ -axis. Find  $\gamma$ . (Hint: Use the result from Problem 62.)

In Problems 64–67, use the result from Problem 62 to find a vector  $\mathbf{v}$  in space that has the given magnitude and direction angles.

- 64.**  $\|\mathbf{v}\| = 3$ ,  $\alpha = \frac{\pi}{3}$ ,  $\beta = \frac{\pi}{4}$ ,  $0 < \gamma < \frac{\pi}{2}$

- 65.**  $\|\mathbf{v}\| = 2$ ,  $\alpha = \frac{\pi}{4}$ ,  $\frac{\pi}{2} < \beta < \pi$ ,  $\gamma = \frac{\pi}{3}$

- 66.**  $\|\mathbf{v}\| = 3$ , the direction angles are equal, and  $\mathbf{v}$  has positive components.

- 67.**  $\|\mathbf{v}\| = \frac{1}{2}$ ,  $\cos \alpha > 0$ ,  $\cos \beta = \frac{1}{4}$ ,  $\cos \gamma = \sqrt{\frac{7}{8}}$

- 68. Orthogonal Vectors** Let  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = 4\mathbf{i} + 2\mathbf{j} - \mathbf{k}$  be two nonzero vectors that are not parallel. Find a vector  $\mathbf{u} \neq \mathbf{0}$  that is orthogonal to both  $\mathbf{v}$  and  $\mathbf{w}$ .

- 69.** If  $\mathbf{v}$  is a vector for which  $\mathbf{v} \cdot \mathbf{i} = 0$ ,  $\mathbf{v} \cdot \mathbf{j} = 0$ , and  $\mathbf{v} \cdot \mathbf{k} = 0$ , find  $\mathbf{v}$ .

- 70.** Solve for  $\mathbf{x}$  in terms of  $a$ ,  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$ , if  $a\mathbf{x} + (\mathbf{x} \cdot \mathbf{b})\mathbf{a} = \mathbf{c}$ ,  $a \neq 0$ ,  $a + \mathbf{a} \cdot \mathbf{b} \neq 0$ . (Hint: First find  $\mathbf{x} \cdot \mathbf{b}$ , then  $\mathbf{x}$ .)

- 71.** Show that:

- (a) There is no vector with direction angles  $\alpha = \frac{\pi}{6}$  and  $\beta = \frac{\pi}{4}$ .

- (b) If  $\alpha$  and  $\beta$  are positive acute direction angles of a vector, then  $\alpha + \beta \geq \frac{\pi}{2}$ .

- 72. Geometry**

- (a) Show that the vectors  $\mathbf{u} = 3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ ,  $\mathbf{v} = -\mathbf{i} + 3\mathbf{j} + 4\mathbf{k}$ , and  $\mathbf{w} = 4\mathbf{i} - 2\mathbf{j} - 6\mathbf{k}$  form the sides of a triangle.

- (b) Find the lengths of the medians of the triangle.

- 73.** Suppose  $(r, \theta)$  are polar coordinates of a point, where  $r \geq 0$ . Let

$$\mathbf{u}_r = (\cos \theta)\mathbf{i} + (\sin \theta)\mathbf{j} \quad \mathbf{u}_\theta = (-\sin \theta)\mathbf{i} + (\cos \theta)\mathbf{j}$$

- (a) Show that  $\mathbf{u}_r$  and  $\mathbf{u}_\theta$  are unit vectors.  
 (b) Show that  $\mathbf{u}_r$  and  $\mathbf{u}_\theta$  are orthogonal.  
 (c) Show that  $\mathbf{u}_r$  has the same direction as the ray from the origin to  $(r, \theta)$  and that  $\mathbf{u}_\theta$  is  $90^\circ$  counterclockwise from  $\mathbf{u}_r$ .
74. Find an example of three nonzero vectors  $\mathbf{a}$ ,  $\mathbf{b}$ , and  $\mathbf{c}$  for which  $\mathbf{b} \neq \mathbf{c}$ , neither  $\mathbf{b}$  nor  $\mathbf{c}$  is orthogonal to  $\mathbf{a}$ , and  $\mathbf{a} \cdot \mathbf{b} = \mathbf{a} \cdot \mathbf{c}$ . Discuss whether there is a Cancellation Property for dot products.
75. If  $\theta$  is the angle between the nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ , where  $0 \leq \theta \leq \pi$ , show that

$$\sin^2 \theta = \frac{\|\mathbf{v}\|^2 \|\mathbf{w}\|^2 - (\mathbf{v} \cdot \mathbf{w})^2}{\|\mathbf{v}\|^2 \|\mathbf{w}\|^2}$$

76. Let  $\theta$  be the angle between the nonzero vectors  $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$  and  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ . Show that
- $$\sin^2 \theta = \frac{(u_2v_3 - u_3v_2)^2 + (u_1v_3 - u_3v_1)^2 + (u_1v_2 - u_2v_1)^2}{\|\mathbf{u}\|^2 \|\mathbf{v}\|^2}$$

(Hint: Begin with  $\sin^2 \theta = 1 - \cos^2 \theta$ .)

77. Suppose that  $\mathbf{v} = c_1\mathbf{u}_1 + c_2\mathbf{u}_2$ , where  $\mathbf{u}_1, \mathbf{u}_2$  are nonzero, nonparallel vectors, is a vector in the plane. Find  $c_1$  and  $c_2$  in terms of  $\mathbf{u}_1$  and  $\mathbf{u}_2$ , and  $\mathbf{v}$ . What are  $c_1$  and  $c_2$  if  $\mathbf{u}_1$  and  $\mathbf{u}_2$  are orthogonal unit vectors?
78. Prove the distributive property of the dot product:  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$  for vectors in the plane and in space.
79. Prove the linearity property:  $a(\mathbf{u} \cdot \mathbf{v}) = (a\mathbf{u}) \cdot \mathbf{v}$ , for vectors in the plane and in space.
80. Prove the zero-vector property:  $\mathbf{0} \cdot \mathbf{v} = 0$  for vectors in the plane and in space.
81. Prove the commutative property of the dot product:  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$  for vectors in the plane.
82. Prove the magnitude property:  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$  for vectors in the plane.
83. The dot product of two vectors  $\mathbf{v} = v_1\mathbf{e}_1 + v_2\mathbf{e}_2 + \cdots + v_n\mathbf{e}_n$  and  $\mathbf{w} = w_1\mathbf{e}_1 + w_2\mathbf{e}_2 + \cdots + w_n\mathbf{e}_n$  in  $n$ -space is defined as

$$\mathbf{v} \cdot \mathbf{w} = v_1w_1 + v_2w_2 + \cdots + v_nw_n$$

Show that the five properties of the dot product on p. 716 hold for vectors in  $n$ -space.

### Challenge Problems

84. Show that  $\mathbf{w} = \|\mathbf{v}\|\mathbf{u} + \|\mathbf{u}\|\mathbf{v}$  bisects the angle between  $\mathbf{u}$  and  $\mathbf{v}$ .
85. Prove the **polarization identity**:  $\|\mathbf{u} + \mathbf{v}\|^2 - \|\mathbf{u} - \mathbf{v}\|^2 = 4(\mathbf{u} \cdot \mathbf{v})$ .

86. (a) If  $\mathbf{u}$  and  $\mathbf{v}$  are two vectors having the same magnitude, show that  $\mathbf{u} + \mathbf{v}$  and  $\mathbf{u} - \mathbf{v}$  are orthogonal.  
 (b) Use this to prove that an angle inscribed in a semicircle is a right angle (see the figure).

87. Suppose  $\mathbf{v}$  and  $\mathbf{w}$  are unit vectors in the plane, making angles  $\alpha$  and  $\beta$ , respectively, with the positive  $x$ -axis.

- (a) Show that  $\mathbf{v} = (\cos \alpha)\mathbf{i} + (\sin \alpha)\mathbf{j}$  and  $\mathbf{w} = (\cos \beta)\mathbf{i} + (\sin \beta)\mathbf{j}$ .

- (b) Use the dot product  $\mathbf{v} \cdot \mathbf{w}$  to prove the sum and difference formulas

$$\cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$\cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

88. **Gram–Schmidt Orthogonalization Process** Let  $\mathbf{u}_1, \mathbf{u}_2$ , and  $\mathbf{u}_3$  be three noncoplanar vectors. Let  $\mathbf{w}_1 = \frac{\mathbf{u}_1}{\|\mathbf{u}_1\|}$ ,  $\mathbf{v}_2 = \mathbf{u}_2 - (\mathbf{u}_2 \cdot \mathbf{w}_1)\mathbf{w}_1$ ,  $\mathbf{w}_2 = \frac{\mathbf{v}_2}{\|\mathbf{v}_2\|}$ ,  $\mathbf{v}_3 = \mathbf{u}_3 - (\mathbf{u}_3 \cdot \mathbf{w}_1)\mathbf{w}_1 - (\mathbf{u}_3 \cdot \mathbf{w}_2)\mathbf{w}_2$ , and  $\mathbf{w}_3 = \frac{\mathbf{v}_3}{\|\mathbf{v}_3\|}$ . Show that  $\mathbf{w}_1, \mathbf{w}_2$ , and  $\mathbf{w}_3$  are mutually orthogonal unit vectors.

89. **Orthogonal Vectors** Use the Gram–Schmidt orthogonalization process (Problem 88) to transform  $-\mathbf{i} + \mathbf{j}$ ,  $2\mathbf{i} + \mathbf{k}$ , and  $3\mathbf{i} - \mathbf{j} + 2\mathbf{k}$  into a set of mutually orthogonal unit vectors.

90. Generalize the Gram–Schmidt orthogonalization process (Problem 88) to vectors in  $n$  dimensions.

91. Let  $\mathbf{u}$  and  $\mathbf{v}$  be fixed vectors and define  $g(t) = \|\mathbf{u} - t\mathbf{v}\|^2$ . Find the minimum value of  $g$  and deduce the Cauchy–Schwarz inequality  $|\mathbf{u} \cdot \mathbf{v}| \leq \|\mathbf{u}\|\|\mathbf{v}\|$ .

92. Show that two vectors in the plane are parallel if and only if their projections on two fixed mutually orthogonal vectors are proportional.

93. Sketch the set of points in the plane with position vector  $\mathbf{r}$  satisfying  $\mathbf{r} \cdot (\mathbf{i} + \mathbf{j}) \geq 0$ .

94. Show that  $(\mathbf{r} - \mathbf{b}) \cdot (\mathbf{r} + \mathbf{b}) = 0$  is a vector equation of the sphere, with  $\mathbf{b}$  and  $-\mathbf{b}$  as endpoints of a diameter. Show that  $(\mathbf{r} - \mathbf{r}_0 - \mathbf{b}) \cdot (\mathbf{r} - \mathbf{r}_0 + \mathbf{b}) = 0$  is a vector equation of the sphere with center  $\mathbf{r}_0$  and radius  $\|\mathbf{b}\|$ .

## 10.5 The Cross Product

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the cross product of two vectors (p. 725)
- 2 Prove algebraic properties of the cross product (p. 726)
- 3 Apply geometric properties of the cross product (p. 727)

The *cross product* of two vectors, defined only for vectors in space, is a third type of vector multiplication. It is of special interest for those studying physics, particularly mechanics and electricity, since it is used to describe angular velocity, torque, and angular momentum.

**DEFINITION** Cross Product

If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$  are two vectors in space, the **cross product**  $\mathbf{v} \times \mathbf{w}$  is defined as the vector

$$\mathbf{v} \times \mathbf{w} = (v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}$$

Because the cross product  $\mathbf{v} \times \mathbf{w}$  of two vectors is a vector, it is sometimes referred to as the **vector product**.

**1 Find the Cross Product of Two Vectors****EXAMPLE 1** Finding the Cross Product of Two Vectors

If  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = 4\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ , then using the definition of the cross product, we get

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= [(-1)(-1) - (1)(2)]\mathbf{i} - [(2)(-1) - (1)(4)]\mathbf{j} + [(2)(2) - (-1)(4)]\mathbf{k} \\ &= -\mathbf{i} + 6\mathbf{j} + 8\mathbf{k}\end{aligned}$$

**NOW WORK** Problem 13(a).

*Determinants* are helpful for finding a cross product. A **2 by 2 determinant** is a number or expression associated with an array containing two rows and two columns and is denoted by

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$$

A **3 by 3 determinant** is a number or expression associated with an array containing three rows and three columns. Its value is given by

$$\begin{vmatrix} A & B & C \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix} A - \begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix} B + \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} C$$

$$= (b_1c_2 - b_2c_1)A - (a_1c_2 - a_2c_1)B + (a_1b_2 - a_2b_1)C$$

**NOTE** Notice the minus sign in the middle term.

**EXAMPLE 2** Evaluating Determinants

$$(a) \begin{vmatrix} 2 & 3 \\ -1 & 2 \end{vmatrix} = (2)(2) - (-1)(3) = 4 + 3 = 7$$

$$\begin{aligned}(b) \begin{vmatrix} A & B & C \\ 2 & 3 & 1 \\ -1 & 2 & -1 \end{vmatrix} &= \begin{vmatrix} 3 & 1 \\ 2 & -1 \end{vmatrix} A - \begin{vmatrix} 2 & 1 \\ -1 & -1 \end{vmatrix} B + \begin{vmatrix} 2 & 3 \\ -1 & 2 \end{vmatrix} C \\ &= (-3 - 2)A - (-2 + 1)B + (4 + 3)C = -5A + B + 7C\end{aligned}$$

**NOW WORK** Problem 11.

The cross product of the vectors  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$ :

$$\mathbf{v} \times \mathbf{w} = (v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}$$

can be written symbolically as a determinant.

$$\begin{aligned}\mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} = \begin{vmatrix} v_2 & v_3 \\ w_2 & w_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} v_1 & v_3 \\ w_1 & w_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} v_1 & v_2 \\ w_1 & w_2 \end{vmatrix} \mathbf{k} \\ &= (v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}\end{aligned}$$

**EXAMPLE 3** Finding a Cross Product Using Determinants

If  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = 4\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ , find

(a)  $\mathbf{v} \times \mathbf{w}$                       (b)  $\mathbf{w} \times \mathbf{v}$                       (c)  $\mathbf{v} \times \mathbf{v}$

**Solution** (a)  $\mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 1 \\ 4 & 2 & -1 \end{vmatrix} = (1-2)\mathbf{i} - (-2-4)\mathbf{j} + (4+4)\mathbf{k} = -\mathbf{i} + 6\mathbf{j} + 8\mathbf{k}$

(b)  $\mathbf{w} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 4 & 2 & -1 \\ 2 & -1 & 1 \end{vmatrix} = (2-1)\mathbf{i} - (4+2)\mathbf{j} + (-4-4)\mathbf{k} = \mathbf{i} - 6\mathbf{j} - 8\mathbf{k} = -(\mathbf{v} \times \mathbf{w})$

(c)  $\mathbf{v} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 1 \\ 2 & -1 & 1 \end{vmatrix} = 0\mathbf{i} - 0\mathbf{j} + 0\mathbf{k} = \mathbf{0} \quad \blacksquare$

**NOTE** The cross product is not a commutative operation. That is,  $\mathbf{v} \times \mathbf{w} \neq \mathbf{w} \times \mathbf{v}$ .

**NOW WORK** Problem 15(a).**2 Prove Algebraic Properties of the Cross Product**

Example 3 illustrates two properties of the cross product. Parts (a) and (b) suggest that  $\mathbf{v} \times \mathbf{w} = -(\mathbf{w} \times \mathbf{v})$  and (c) suggests that the cross product of a vector with itself equals the zero vector  $\mathbf{0}$ . These and other properties of the cross product are listed in the theorem below.

**THEOREM** Algebraic Properties of the Cross Product

If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors in space and if  $a$  is a scalar, then

- |                                                                                                                   |     |
|-------------------------------------------------------------------------------------------------------------------|-----|
| • $\mathbf{v} \times \mathbf{v} = \mathbf{0}$                                                                     | (1) |
| • $\mathbf{v} \times \mathbf{w} = -(\mathbf{w} \times \mathbf{v})$                                                | (2) |
| • $a(\mathbf{v} \times \mathbf{w}) = (a\mathbf{v}) \times \mathbf{w} = \mathbf{v} \times (a\mathbf{w})$           | (3) |
| • $\mathbf{v} \times (\mathbf{w} + \mathbf{u}) = (\mathbf{v} \times \mathbf{w}) + (\mathbf{v} \times \mathbf{u})$ | (4) |
| • $\ \mathbf{v} \times \mathbf{w}\ ^2 = \ \mathbf{v}\ ^2 \ \mathbf{w}\ ^2 - (\mathbf{v} \cdot \mathbf{w})^2$      | (5) |

We prove (1), (2), and (5), and leave the proofs of (3) and (4) as exercises (Problems 56 and 57).

**Proof** Let  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$ .

(1)  $\mathbf{v} \times \mathbf{v} = (v_2v_3 - v_2v_3)\mathbf{i} - (v_1v_3 - v_1v_3)\mathbf{j} + (v_1v_2 - v_1v_2)\mathbf{k} = \mathbf{0}$

(2)  $\mathbf{v} \times \mathbf{w} = (v_2w_3 - w_2v_3)\mathbf{i} - (v_1w_3 - w_1v_3)\mathbf{j} + (v_1w_2 - w_1v_2)\mathbf{k}$

$\mathbf{w} \times \mathbf{v} = (w_2v_3 - v_2w_3)\mathbf{i} - (w_1v_3 - v_1w_3)\mathbf{j} + (w_1v_2 - v_1w_2)\mathbf{k}$

Consequently,  $\mathbf{v} \times \mathbf{w} = -(\mathbf{w} \times \mathbf{v})$ .

(5) First we find  $\|\mathbf{v} \times \mathbf{w}\|^2$ .

$$\begin{aligned} \mathbf{v} \times \mathbf{w} &= (v_2w_3 - w_2v_3)\mathbf{i} - (v_1w_3 - w_1v_3)\mathbf{j} + (v_1w_2 - w_1v_2)\mathbf{k} \\ \|\mathbf{v} \times \mathbf{w}\|^2 &= (v_2w_3 - w_2v_3)^2 + (v_1w_3 - w_1v_3)^2 + (v_1w_2 - w_1v_2)^2 \\ &= [(v_2w_3)^2 - 2v_2w_2v_3w_3 + (w_2v_3)^2] + [(v_1w_3)^2 - 2v_1w_1v_3w_3 + (w_1v_3)^2] \\ &\quad + [(v_1w_2)^2 - 2v_1w_1v_2w_2 + (w_1v_2)^2] \end{aligned}$$

Then we find  $\|\mathbf{v}\|^2 \|\mathbf{w}\|^2 - (\mathbf{v} \cdot \mathbf{w})^2$ .

$$\begin{aligned} \|\mathbf{v}\|^2 \|\mathbf{w}\|^2 - (\mathbf{v} \cdot \mathbf{w})^2 &= [(v_1^2 + v_2^2 + v_3^2)(w_1^2 + w_2^2 + w_3^2)] - (v_1w_1 + v_2w_2 + v_3w_3)^2 \\ &= (v_1w_2)^2 + (v_1w_3)^2 + (v_2w_1)^2 + (v_2w_3)^2 + (v_3w_1)^2 + (v_3w_2)^2 \\ &\quad - 2v_1v_2w_1w_2 - 2v_1v_3w_1w_3 - 2v_2v_3w_2w_3 \end{aligned}$$

Reordering the terms in each equation proves the property.  $\blacksquare$

The cross products of the unit vectors  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  are particularly useful:

$$\mathbf{i} \times \mathbf{j} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{vmatrix} = 0\mathbf{i} + 0\mathbf{j} + \mathbf{k} = \mathbf{k}$$

$$\mathbf{j} \times \mathbf{k} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{vmatrix} = \mathbf{i}$$

$$\mathbf{k} \times \mathbf{i} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 0 & 1 \\ 1 & 0 & 0 \end{vmatrix} = \mathbf{j}$$

Notice the cyclic pattern for the cross products of  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$ :

$$\boxed{\mathbf{i} \times \mathbf{j} = \mathbf{k} \quad \mathbf{j} \times \mathbf{k} = \mathbf{i} \quad \mathbf{k} \times \mathbf{i} = \mathbf{j}}$$

Figure 45

Figure 45 may be helpful in remembering this pattern.

The remaining cross products involving the unit vectors  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$  are listed below. They are consequences of algebraic properties (1) and (2) of the cross product.

$$\boxed{\begin{array}{lll} \mathbf{j} \times \mathbf{i} = -\mathbf{k} & \mathbf{k} \times \mathbf{j} = -\mathbf{i} & \mathbf{i} \times \mathbf{k} = -\mathbf{j} \\ \mathbf{i} \times \mathbf{i} = \mathbf{0} & \mathbf{j} \times \mathbf{j} = \mathbf{0} & \mathbf{k} \times \mathbf{k} = \mathbf{0} \end{array}}$$

### 3 Apply Geometric Properties of the Cross Product

Besides useful algebraic properties, the cross product has important geometric properties.

#### THEOREM Geometric Properties of the Cross Product

If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors in space, then

- $\mathbf{v} \times \mathbf{w}$  is orthogonal to both  $\mathbf{v}$  and  $\mathbf{w}$  (6)
- $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\|\|\mathbf{w}\|\sin\theta$ , where  $\theta$  is the angle between  $\mathbf{v}$  and  $\mathbf{w}$  (7)
- $\|\mathbf{v} \times \mathbf{w}\|$  is the area of the parallelogram having  $\mathbf{v}$  and  $\mathbf{w}$  as adjacent sides (8)
- $\mathbf{v} \times \mathbf{w} = \mathbf{0}$  if and only if  $\mathbf{v}$  and  $\mathbf{w}$  are parallel vectors (9)

**Proof of (6)** Let  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$ . Then

$$\mathbf{v} \times \mathbf{w} = (v_2w_3 - w_2v_3)\mathbf{i} - (v_1w_3 - w_1v_3)\mathbf{j} + (v_1w_2 - w_1v_2)\mathbf{k}$$

We show that  $\mathbf{v} \times \mathbf{w}$  is orthogonal to  $\mathbf{v}$  by computing the dot product  $\mathbf{v} \cdot (\mathbf{v} \times \mathbf{w})$ .

$$\begin{aligned} \mathbf{v} \cdot (\mathbf{v} \times \mathbf{w}) &= v_1(v_2w_3 - w_2v_3) - v_2(v_1w_3 - w_1v_3) + v_3(v_1w_2 - w_1v_2) \\ &= v_1v_2w_3 - v_1w_2v_3 - v_2v_1w_3 + v_2w_1v_3 + v_3v_1w_2 - v_3w_1v_2 = 0 \end{aligned}$$

So,  $\mathbf{v} \times \mathbf{w}$  is orthogonal to  $\mathbf{v}$ .

Now we show  $\mathbf{v} \times \mathbf{w}$  is orthogonal to  $\mathbf{w}$  by computing the dot product  $\mathbf{w} \cdot (\mathbf{v} \times \mathbf{w})$ .

$$\begin{aligned} \mathbf{w} \cdot (\mathbf{v} \times \mathbf{w}) &= w_1(v_2w_3 - w_2v_3) - w_2(v_1w_3 - w_1v_3) + w_3(v_1w_2 - w_1v_2) \\ &= w_1v_2w_3 - w_1w_2v_3 - w_2v_1w_3 + w_2w_1v_3 + w_3v_1w_2 - w_3w_1v_2 = 0 \end{aligned}$$

So,  $\mathbf{v} \times \mathbf{w}$  is orthogonal to  $\mathbf{w}$ . ■

Any two nonparallel vectors  $\mathbf{v}$  and  $\mathbf{w}$  lie in a single plane. Since the vector  $\mathbf{v} \times \mathbf{w}$  is orthogonal to both vectors  $\mathbf{v}$  and  $\mathbf{w}$ , it follows that the vector  $\mathbf{v} \times \mathbf{w}$  is normal to the plane containing  $\mathbf{v}$  and  $\mathbf{w}$ . As Figure 46 illustrates, there actually are two directions that are normal to the plane containing  $\mathbf{v}$  and  $\mathbf{w}$ ; one directed up and the other directed down.

Figure 46

Figure 47 Right-hand rule

Which is the direction of  $\mathbf{v} \times \mathbf{w}$ ? It can be shown that the direction of  $\mathbf{v} \times \mathbf{w}$  is determined by the thumb of the right hand when the other fingers of the right hand are cupped so that they point in the direction from  $\mathbf{v}$  to  $\mathbf{w}$ , as shown in Figure 47. As in Section 10.1, this is usually referred to as the **right-hand rule**.

#### EXAMPLE 4 Finding a Vector Orthogonal to Two Given Vectors

Find a vector orthogonal to the vectors  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$  and  $\mathbf{w} = 2\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ .

**Solution** Since  $\mathbf{v} \times \mathbf{w}$  is orthogonal to both the vector  $\mathbf{v}$  and the vector  $\mathbf{w}$ , a vector orthogonal to  $\mathbf{v}$  and  $\mathbf{w}$  is

$$\mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & -1 & 1 \\ 2 & 2 & -1 \end{vmatrix} = -\mathbf{i} + 4\mathbf{j} + 6\mathbf{k}$$

#### NOW WORK Problem 29.

Next we prove Property (7).

Property (7):  $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\|\|\mathbf{w}\|\sin\theta$ , where  $\theta$  is the angle between  $\mathbf{v}$  and  $\mathbf{w}$ .

**Proof of (7)** Let  $\theta$  be the angle between the nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ . Then from algebraic property (5), we have

$$\|\mathbf{v} \times \mathbf{w}\|^2 = \|\mathbf{v}\|^2\|\mathbf{w}\|^2 - (\mathbf{v} \cdot \mathbf{w})^2 \quad (5)$$

Since  $\cos\theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\|\|\mathbf{w}\|}$ , we have  $\mathbf{v} \cdot \mathbf{w} = \|\mathbf{v}\|\|\mathbf{w}\|\cos\theta$  and

$$\begin{aligned} \|\mathbf{v} \times \mathbf{w}\|^2 &= \|\mathbf{v}\|^2\|\mathbf{w}\|^2 - \|\mathbf{v}\|^2\|\mathbf{w}\|^2\cos^2\theta & (\mathbf{v} \cdot \mathbf{w})^2 &= \|\mathbf{v}\|^2\|\mathbf{w}\|^2\cos^2\theta \\ &= \|\mathbf{v}\|^2\|\mathbf{w}\|^2(1 - \cos^2\theta) & \text{Factor out } \|\mathbf{v}\|^2\|\mathbf{w}\|^2 \\ &= \|\mathbf{v}\|^2\|\mathbf{w}\|^2\sin^2\theta & 1 - \cos^2\theta &= \sin^2\theta \end{aligned}$$

Since  $0 \leq \theta \leq \pi$ , we know  $\sin\theta \geq 0$ . Now take the square root of both sides to obtain  $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\|\|\mathbf{w}\|\sin\theta$ . ■

Property (7) is used to prove property (8):  $\|\mathbf{v} \times \mathbf{w}\|$  equals the area of the parallelogram with adjacent sides  $\mathbf{v}$  and  $\mathbf{w}$ .

**Proof of (8)** If  $\mathbf{v}$  and  $\mathbf{w}$  are nonzero vectors and  $\theta$  is the angle between  $\mathbf{v}$  and  $\mathbf{w}$ , then  $\|\mathbf{v}\|$  and  $\|\mathbf{w}\|$  represent the lengths of the sides of a parallelogram. As shown in Figure 48, the base of the parallelogram is  $\|\mathbf{v}\|$  and its altitude is  $\|\mathbf{w}\|\sin\theta$ , so its area  $A$  is

$$A = (\text{base})(\text{altitude}) = \|\mathbf{v}\|\|\mathbf{w}\|\sin\theta$$

Since  $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\|\|\mathbf{w}\|\sin\theta$ , the magnitude of  $\mathbf{v} \times \mathbf{w}$  is the area of the parallelogram whose sides are the vectors  $\mathbf{v}$  and  $\mathbf{w}$ . ■

#### EXAMPLE 5 Finding the Area of a Parallelogram

Find the area  $A$  of the parallelogram shown in Figure 49, which has vertices at the points  $P_1 = (0, 0, 0)$ ,  $P_2 = (-1, 2, 4)$ ,  $P_3 = (1, 1, 8)$ , and  $P_4 = (2, -1, 4)$ .

**Solution** The area  $A$  of a parallelogram is  $\|\mathbf{v} \times \mathbf{w}\|$ , where  $\mathbf{v}$  and  $\mathbf{w}$  are two adjacent sides of the parallelogram. Be careful! Not all pairs of vertices give a side. For example,  $\overrightarrow{P_1P_3}$  is not a side; it is a diagonal of the parallelogram. It is helpful to sketch the parallelogram

Figure 48 Area = base  $\times$  altitude  
 $= \|\mathbf{v}\|\|\mathbf{w}\|\sin\theta$

Figure 49

before choosing  $\mathbf{v}$  and  $\mathbf{w}$ . Choose

$$\mathbf{v} = \overrightarrow{P_1 P_2} = \langle -1, 2, 4 \rangle = -\mathbf{i} + 2\mathbf{j} + 4\mathbf{k}$$

and

$$\mathbf{w} = \overrightarrow{P_1 P_4} = \langle 2, -1, 4 \rangle = 2\mathbf{i} - \mathbf{j} + 4\mathbf{k}$$

Then

$$\mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -1 & 2 & 4 \\ 2 & -1 & 4 \end{vmatrix} = 12\mathbf{i} + 12\mathbf{j} - 3\mathbf{k}$$

The area of the parallelogram is

$$\|\mathbf{v} \times \mathbf{w}\| = \sqrt{144 + 144 + 9} = \sqrt{297} \approx 17.234 \text{ square units}$$

### NOW WORK Problems 37 and 45.

Property (9):  $\mathbf{v} \times \mathbf{w} = \mathbf{0}$  if and only if  $\mathbf{v}$  and  $\mathbf{w}$  are parallel nonzero vectors.

**Proof of (9)** If  $\mathbf{v}$  and  $\mathbf{w}$  are parallel nonzero vectors, then the angle  $\theta$  between the vectors  $\mathbf{v}$  and  $\mathbf{w}$  is either  $\theta = 0$  or  $\theta = \pi$ . For either angle,  $\sin \theta = 0$ , and

$$\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\| \|\mathbf{w}\| \sin \theta = 0 \quad \text{so} \quad \mathbf{v} \times \mathbf{w} = \mathbf{0}$$

Now suppose  $\mathbf{v} \times \mathbf{w} = \mathbf{0}$ . Since  $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\| \|\mathbf{w}\| \sin \theta$ , we have

$$\|\mathbf{v}\| \|\mathbf{w}\| \sin \theta = 0$$

$$\sin \theta = 0 \quad \mathbf{v} \neq \mathbf{0}, \quad \mathbf{w} \neq \mathbf{0}$$

$$\theta = 0 \quad \text{or} \quad \theta = \pi$$

That is, the vectors  $\mathbf{v}$  and  $\mathbf{w}$  are parallel. ■

### EXAMPLE 6 Verifying Two Vectors Are Parallel

Show that the vectors  $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$  and  $\mathbf{w} = -4\mathbf{i} - 2\mathbf{j} + 2\mathbf{k}$  are parallel.

**Solution** We show that  $\mathbf{v} \times \mathbf{w} = \mathbf{0}$ .

$$\begin{aligned} \mathbf{v} \times \mathbf{w} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 1 & -1 \\ -4 & -2 & 2 \end{vmatrix} = \begin{vmatrix} 1 & -1 \\ -2 & 2 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -1 \\ -4 & 2 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & 1 \\ -4 & -2 \end{vmatrix} \mathbf{k} \\ &= 0\mathbf{i} + 0\mathbf{j} + 0\mathbf{k} = \mathbf{0} \end{aligned}$$

For the vectors  $\mathbf{v}$  and  $\mathbf{w}$  in Example 6, notice that  $\mathbf{w} = -2\mathbf{v}$ . So, the magnitude of  $\mathbf{w}$  is twice that of  $\mathbf{v}$ , and  $\mathbf{v}$  and  $\mathbf{w}$  are opposite in direction.

### Application: Angular Velocity

Figure 50 illustrates a rigid body that is rotating about a fixed axis  $l$  with a constant angular speed  $\omega$ . The **angular velocity**  $\boldsymbol{\omega}$  is defined as the vector of magnitude  $\omega$  whose direction is parallel to the axis  $l$ , so that if the fingers of the right hand are wrapped about  $l$  in the direction of the rotation, the thumb will point in the direction of  $\boldsymbol{\omega}$ .

We seek a formula for the velocity  $\mathbf{v}$  of an object on the rigid body. Let the origin  $O$  be on the axis  $l$  of rotation, let  $\mathbf{r}$  denote the position of the object, and let  $\theta$  be the angle between  $\mathbf{r}$  and the axis  $l$ . The motion of the object is circular. Since  $\|\mathbf{r}\| \sin \theta$  equals the distance of the object from the axis  $l$ ,  $\|\mathbf{r}\| \sin \theta$  is the radius of the circle. As a result, we have

$$\|\mathbf{v}\| = \|\boldsymbol{\omega}\| \|\mathbf{r}\| \sin \theta \quad \mathbf{v} = r\boldsymbol{\omega} \quad (\text{linear speed} = \text{angular speed} \times \text{radius})$$

DF Figure 50  $\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r}$

**NEED TO REVIEW?** Circular motion is discussed in Appendix A.4, p. A-27.

Since the velocity is tangent to the circle of motion, the velocity  $\mathbf{v}$  is normal to the plane formed by  $\mathbf{r}$  and  $\boldsymbol{\omega}$ . That is,  $\mathbf{v}$  is parallel to  $\boldsymbol{\omega} \times \mathbf{r}$ . Using the right-hand rule to define  $\boldsymbol{\omega}$ , the velocity  $\mathbf{v}$  is in the direction of  $\boldsymbol{\omega} \times \mathbf{r}$ . Since the magnitude of  $\boldsymbol{\omega} \times \mathbf{r}$  is

$$\|\boldsymbol{\omega} \times \mathbf{r}\| = \|\boldsymbol{\omega}\| \|\mathbf{r}\| \sin \theta = \|\mathbf{v}\|$$

it follows that

$$\boxed{\mathbf{v} = \boldsymbol{\omega} \times \mathbf{r}}$$

### EXAMPLE 7 Finding the Speed of an Object in Circular Motion

A rigid body rotates with a constant angular speed of  $\omega$  radians per second about a line through the origin in the direction of the vector  $2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$ . Find the speed of an object on this body at the instant the object passes through the point  $(1, 3, 5)$ . Assume the distance is in meters.

**Solution** The vector  $\boldsymbol{\omega}$  is parallel to the axis of rotation of the rigid body, and so it is in the direction of the vector  $2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$ . Since  $\frac{2\mathbf{i} + \mathbf{j} + 2\mathbf{k}}{\sqrt{2^2 + 1^2 + 2^2}} = \frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k}$  is a unit vector in the direction of  $2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$ , the angular velocity  $\boldsymbol{\omega}$  is

$$\boldsymbol{\omega} = \omega \left( \frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k} \right)$$

The position of the object is  $\mathbf{r} = \mathbf{i} + 3\mathbf{j} + 5\mathbf{k}$ . So, the velocity  $\mathbf{v}$  of the object is

$$\begin{aligned} \mathbf{v} = \boldsymbol{\omega} \times \mathbf{r} &= \left[ \omega \left( \frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} + \frac{2}{3}\mathbf{k} \right) \right] \times [\mathbf{i} + 3\mathbf{j} + 5\mathbf{k}] = \omega \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{2}{3} & \frac{1}{3} & \frac{2}{3} \\ 1 & 3 & 5 \end{vmatrix} \\ &= \omega \left( -\frac{1}{3}\mathbf{i} - \frac{8}{3}\mathbf{j} + \frac{5}{3}\mathbf{k} \right) \end{aligned}$$

The speed  $v$  of the object is  $v = \|\mathbf{v}\| = \omega \sqrt{\frac{1}{9} + \frac{64}{9} + \frac{25}{9}} = \sqrt{10}\omega$  meters per second. ■

### NOW WORK Problem 47.

## 10.5 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The direction of  $\mathbf{v} \times \mathbf{w}$  is determined by the right-hand rule.
- True or False** Since  $\mathbf{i}$  and  $\mathbf{j}$  are orthogonal,  $\mathbf{i} \times \mathbf{j} = \mathbf{0}$ .
- Multiple Choice** The cross product  $\mathbf{v} \times \mathbf{w}$  is [(a) parallel, (b) orthogonal] to the vector  $\mathbf{v}$  and to the vector  $\mathbf{w}$ .
- True or False** The cross product is a commutative operation.
- Multiple Choice** If  $\mathbf{u}$  and  $\mathbf{v}$  are parallel, then  $\mathbf{u} \times \mathbf{v} = [(\mathbf{a}) \mathbf{i}, (\mathbf{b}) \mathbf{j}, (\mathbf{c}) \mathbf{k}, (\mathbf{d}) \mathbf{0}]$ .
- True or False** If  $\mathbf{v}$  and  $\mathbf{w}$  are two nonzero vectors, then  $(\mathbf{v} \times \mathbf{w}) + (\mathbf{w} \times \mathbf{v}) = \mathbf{0}$ .
- Multiple Choice** The area of a parallelogram having vectors  $\mathbf{v}$  and  $\mathbf{w}$  as adjacent sides equals [(a)  $\|\mathbf{v} + \mathbf{w}\|$ , (b)  $\|\mathbf{v} \cdot \mathbf{w}\|$ , (c)  $\|\mathbf{v} \times \mathbf{w}\|$ ].

- True or False** If  $\theta$  is the angle between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ , then  $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\| \|\mathbf{w}\| \cos \theta$ .

### Skill Building

In Problems 9–12, find the value of each determinant.

$$9. \begin{vmatrix} 3 & 4 \\ 1 & 2 \end{vmatrix}$$

$$10. \begin{vmatrix} -2 & 4 \\ 2 & -1 \end{vmatrix}$$

$$11. \begin{vmatrix} 1 & -2 & 2 \\ 1 & 2 & 1 \\ 2 & 1 & 4 \end{vmatrix}$$

$$12. \begin{vmatrix} 7 & 0 & 1 \\ 0 & 2 & 3 \\ 0 & 1 & 3 \end{vmatrix}$$

In Problems 13–22:

- Find the cross product  $\mathbf{v} \times \mathbf{w}$ .
- Check your answer by showing that  $\mathbf{v}$  and  $\mathbf{w}$  are each orthogonal to  $\mathbf{v} \times \mathbf{w}$ .

13.  $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j} + \mathbf{k}$   
 14.  $\mathbf{v} = 4\mathbf{i} - \mathbf{j} + 2\mathbf{k}$ ,  $\mathbf{w} = 2\mathbf{i} + \mathbf{j} + \mathbf{k}$   
 15.  $\mathbf{v} = \mathbf{i} + \mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{k}$   
 16.  $\mathbf{v} = \mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} - \mathbf{j}$   
 17.  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j} + \mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} + \mathbf{j}$   
 18.  $\mathbf{v} = 2\mathbf{i} - \mathbf{j}$ ,  $\mathbf{w} = \mathbf{i} + \mathbf{j} - 3\mathbf{k}$   
 19.  $\mathbf{v} = -\mathbf{i} + 8\mathbf{j} + 3\mathbf{k}$ ,  $\mathbf{w} = 7\mathbf{i} + 2\mathbf{j}$   
 20.  $\mathbf{v} = 2\mathbf{j} - \mathbf{k}$ ,  $\mathbf{w} = -3\mathbf{i} + \mathbf{j} + \mathbf{k}$   
 21.  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$ ,  $\mathbf{w} = -\mathbf{i} + \mathbf{j} - 4\mathbf{k}$   
 22.  $\mathbf{v} = (\cos \theta)\mathbf{i} - (\sin \theta)\mathbf{j}$ ,  $\mathbf{w} = (\sin \theta)\mathbf{i} + (\cos \theta)\mathbf{j}$

In Problems 23–34,  $\mathbf{u} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$ ,  $\mathbf{v} = -3\mathbf{i} + \mathbf{j} - 4\mathbf{k}$ ,  $\mathbf{w} = \mathbf{i} + \mathbf{j} - 3\mathbf{k}$ . Find the following.

23.  $\mathbf{u} \times \mathbf{u}$       24.  $\mathbf{w} \times \mathbf{w}$       25.  $\mathbf{v} \times \mathbf{w}$   
 26.  $\mathbf{u} \times \mathbf{v}$       27.  $(3\mathbf{v}) \times \mathbf{w}$       28.  $\mathbf{u} \times (-\mathbf{v})$   
 29. a vector orthogonal to both  $\mathbf{v}$  and  $\mathbf{w}$   
 30. a vector orthogonal to both  $\mathbf{w}$  and  $\mathbf{u}$   
 31. a vector orthogonal to both  $\mathbf{w}$  and  $\mathbf{i} + \mathbf{j} - \mathbf{k}$   
 32. a vector orthogonal to both  $\mathbf{u}$  and  $\mathbf{k}$   
 33. a unit vector normal to the plane containing  $\mathbf{u}$  and  $\mathbf{v}$   
 34. a unit vector normal to the plane containing  $\mathbf{u}$  and  $\mathbf{w}$   
 35. Find a unit vector normal to the plane containing  $\mathbf{v} = 2\mathbf{i} - 6\mathbf{j} - 3\mathbf{k}$  and  $\mathbf{w} = 4\mathbf{i} + 3\mathbf{j} - \mathbf{k}$ .  
 36. Find a unit vector normal to the plane containing  $\mathbf{v} = \mathbf{i} + \mathbf{j} - 2\mathbf{k}$  and  $\mathbf{w} = 3\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ .

**Area of a Parallelogram** In Problems 37–42, find the area  $A$  of the parallelogram with one corner at  $P$  and sides  $PQ$  and  $PR$ .

37.  $P = (1, -3, 7)$ ;  $Q = (2, 1, 1)$ ;  $R = (6, -1, 2)$   
 38.  $P = (0, 1, 1)$ ;  $Q = (2, 0, -4)$ ;  $R = (-3, -2, 1)$   
 39.  $P = (-2, 1, 6)$ ;  $Q = (2, 1, -7)$ ;  $R = (4, 1, 1)$   
 40.  $P = (0, 0, 3)$ ;  $Q = (2, -5, 3)$ ;  $R = (1, 1, -2)$   
 41.  $P = (1, 1, -6)$ ;  $Q = (5, -3, 0)$ ;  $R = (-2, 4, 1)$   
 42.  $P = (-4, 6, 3)$ ;  $Q = (1, 1, -5)$ ;  $R = (2, 2, 2)$

**Area of a Parallelogram** In Problems 43–46, find the area of the parallelogram whose vertices are  $P_1$ ,  $P_2$ ,  $P_3$ , and  $P_4$ .

43.  $P_1 = (0, 0, 0)$ ;  $P_2 = (1, 2, 3)$ ;  $P_3 = (3, 1, 4)$ ;  
 $P_4 = (2, -1, 1)$   
 44.  $P_1 = (0, 0, 0)$ ;  $P_2 = (-1, 2, 0)$ ;  $P_3 = (1, 5, -4)$ ;  
 $P_4 = (2, 3, -4)$   
 45.  $P_1 = (-2, 1, 6)$ ;  $P_2 = (2, 1, -7)$ ;  $P_3 = (4, 1, 1)$ ;  
 $P_4 = (8, 1, -12)$   
 46.  $P_1 = (-1, 1, 1)$ ;  $P_2 = (-1, 2, 2)$ ;  $P_3 = (-3, 5, -4)$ ;  
 $P_4 = (-3, 4, -5)$

## Applications and Extensions

47. **Angular Velocity** A rigid body rotates about an axis through the origin with a constant angular speed of 30 radians per second. The angular velocity  $\boldsymbol{\omega}$  points in the direction of  $\mathbf{i} + \mathbf{j} + \mathbf{k}$ . Find the speed of an object at the instant it passes through the point  $(-1, 2, 3)$ . Assume the distance scale is in meters.  
 48. **Angular Velocity** A rigid body rotates with constant angular speed  $\omega$  about a line through the origin parallel to  $3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ .  
 (a) Find the speed of an object at the instant that it passes through the point  $(4, 4, 0)$ . Assume that distance is measured in meters.  
 (b) Find  $\omega$  if the speed of the object at the point  $(4, 4, 0)$  is  $8\sqrt{14}$  m/s.  
 49. **Area of a Triangle** Show that the area of the triangle whose vertices are the endpoints of the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  is

$$A = \frac{1}{2} \|(\mathbf{v} - \mathbf{u}) \times (\mathbf{w} - \mathbf{u})\|$$

50. **Area of a Triangle** Use the result of Problem 49 to find the area of the triangle with vertices  $(0, 0, 0)$ ,  $(2, 3, -2)$ , and  $(-1, 1, 4)$ .

Problems 51 and 52 use the following discussion. When a force  $\mathbf{F}$  acts on an object at some distance  $r$  from a point  $P$ , called the pivot point, it can cause the object to rotate rather than translate. The ability of a force to cause rotation is called the **torque** about  $P$  due to the force  $\mathbf{F}$  and is symbolized by the Greek lowercase letter tau  $\tau$ . Torque equals the cross product between the applied force  $\mathbf{F}$  and the distance vector  $\mathbf{r} = \overrightarrow{PQ}$  that points from  $P$  to the point  $Q$  where  $\mathbf{F}$  acts on the object. That is,

$$\boldsymbol{\tau} = \mathbf{r} \times \mathbf{F}$$

51. **Using a Wrench** The figure below shows a wrench that is being used to turn a nut and three separate forces that could be applied to the end of the wrench. The point  $P$  is at the origin of the coordinate system and the point  $Q$  is at the end of the wrench at  $(0.25, 0, 0)$ , where the forces are applied.  
 (a) Describe the direction of the positive  $z$ -axis, given the axes shown in the figure.  
 (b) Find the torque about  $P$  due to each of the three forces shown in the figure. Assume that the magnitude of each force is 250 N and the wrench is 0.25 m long.  
 (c) Which force would be the most effective at causing the wrench to rotate as much as possible?

52. **Exercise Science** Suppose a person lifting a weight, extends his arm upward at  $40^\circ$  above the horizontal while holding a 75-N (about 17-lb) weight in his hand. His arm is 65 cm long from the shoulder socket to the weight. What is the magnitude of the torque?

**53. Lorentz Force** The **Lorentz force** on an electric charge moving through electric and magnetic fields is given by the formula  $\mathbf{F} = q[\mathbf{E} + (\mathbf{v} \times \mathbf{B})]$ . When the charge is expressed in coulombs (C), the electric field in newtons per coulomb (N/C), the magnetic field in teslas (T), and the velocity in meters per second (m/s), then the unit of force is newtons (N). A positive charge ( $q = 2.5$  C) is moving with velocity  $\mathbf{v} = (0.0050\mathbf{i} + 0.0035\mathbf{j})$  m/s through a region of space where there is an electric field  $\mathbf{E} = (0.0064\mathbf{i} - 0.0075\mathbf{j} - 0.0023\mathbf{k})$  N/C and a magnetic field  $\mathbf{B} = (0.47\mathbf{i} + 0.50\mathbf{j} - 0.25\mathbf{k})$  T. Find the Lorentz force acting on this charge.

**54.** Show that if  $\mathbf{u}$  and  $\mathbf{v}$  are orthogonal vectors, then  $\|\mathbf{u} \times \mathbf{v}\| = \|\mathbf{u}\|\|\mathbf{v}\|$ .

**55.** Show that if  $\mathbf{u}$  and  $\mathbf{v}$  are orthogonal unit vectors, then  $\mathbf{u} \times \mathbf{v}$  is also a unit vector.

**56. Algebraic Properties of the Cross Product** Show that if  $\mathbf{v}$  and  $\mathbf{w}$  are vectors and  $a$  is a scalar, then  $a(\mathbf{v} \times \mathbf{w}) = (a\mathbf{v}) \times \mathbf{w} = \mathbf{v} \times (a\mathbf{w})$  [property (3)].

**57. Algebraic Properties of the Cross Product** Show that if  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are vectors, then  $\mathbf{v} \times (\mathbf{w} + \mathbf{u}) = (\mathbf{v} \times \mathbf{w}) + (\mathbf{v} \times \mathbf{u})$  [property (4)].

**58. Algebraic Properties of the Cross Product** Give an example to show that the cross product is not associative. That is, find vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  so that  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) \neq (\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ .

**59. Algebraic Properties of the Cross Product** If  $\mathbf{v} \times \mathbf{w} = \mathbf{0}$  and  $\mathbf{v} \cdot \mathbf{w} = 0$ , can you draw any conclusions about  $\mathbf{v}$  and/or  $\mathbf{w}$ ? Explain.

**Triple Scalar Product** Problems 60–67 require the following definition. If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are three vectors in space, then  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \|\mathbf{u}\| \|\mathbf{v} \times \mathbf{w}\| \cos \theta$ , where  $\theta$  is the angle between  $\mathbf{u}$  and  $\mathbf{v} \times \mathbf{w}$ , is called the **triple scalar product** of  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$ .

In Problems 60 and 61, use the vectors  $\mathbf{u} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$ ,  $\mathbf{v} = -3\mathbf{i} + \mathbf{j} - 4\mathbf{k}$ , and  $\mathbf{w} = \mathbf{i} + \mathbf{j} - 3\mathbf{k}$  to find each triple scalar product.

**60.**  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$                       **61.**  $(\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v}$

**62.** Show that  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ .

**63.** Show that  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$ .

**64.** Show that three nonzero vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  lie in the same plane if and only if  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = 0$ .

**65.** If  $\mathbf{v}$ ,  $\mathbf{w}$ ,  $\mathbf{u}$  and  $\mathbf{v}'$ ,  $\mathbf{w}'$ ,  $\mathbf{u}'$  are vectors for which the following identities hold,

$$\mathbf{v}' \cdot \mathbf{v} = \mathbf{w}' \cdot \mathbf{w} = \mathbf{u}' \cdot \mathbf{u} = 1$$

$$\mathbf{v}' \cdot \mathbf{w} = \mathbf{v}' \cdot \mathbf{u} = \mathbf{w}' \cdot \mathbf{v} = \mathbf{w}' \cdot \mathbf{u} = \mathbf{u}' \cdot \mathbf{v} = \mathbf{u}' \cdot \mathbf{w} = 0$$

show that

$$\mathbf{v}' = \frac{\mathbf{w} \times \mathbf{u}}{\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u})} \quad \mathbf{w}' = \frac{\mathbf{u} \times \mathbf{v}}{\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u})} \quad \mathbf{u}' = \frac{\mathbf{v} \times \mathbf{w}}{\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u})}$$

**Volume of a Parallelepiped** In Problems 66 and 67, find the volume of the parallelepiped whose adjacent sides are the given vectors. The volume  $V$  of a parallelepiped whose adjacent sides are the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  is  $V = |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$ . See the figure. (You are asked to prove this in Problem 76.)

**66.**  $\mathbf{u} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ ,  $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j} + 4\mathbf{k}$ , and  $\mathbf{w} = 3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}$

**67.**  $\mathbf{u} = 8\mathbf{i} - 6\mathbf{j} + 5\mathbf{k}$ ,  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - 8\mathbf{k}$ , and  $\mathbf{w} = \mathbf{i} + 6\mathbf{k}$

**Triple Vector Product** Problems 68 and 69 use the following definition. If  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  are three vectors, the expression  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$  is called the **triple vector product**.

**68.** Show that  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w}$ .

**69.** Show that  $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) + \mathbf{v} \times (\mathbf{w} \times \mathbf{u}) + \mathbf{w} \times (\mathbf{u} \times \mathbf{v}) = \mathbf{0}$ .

**70.** Prove **Lagrange's identity**:  
 $(\mathbf{a} \times \mathbf{b}) \cdot (\mathbf{c} \times \mathbf{d}) = (\mathbf{a} \cdot \mathbf{c})(\mathbf{b} \cdot \mathbf{d}) - (\mathbf{a} \cdot \mathbf{d})(\mathbf{b} \cdot \mathbf{c})$ .

**71.** Prove that  $(\mathbf{a} \times \mathbf{b}) \times (\mathbf{c} \times \mathbf{d}) = [\mathbf{a} \cdot (\mathbf{b} \times \mathbf{d})]\mathbf{c} - [\mathbf{a} \cdot (\mathbf{b} \times \mathbf{c})]\mathbf{d}$ .

**Geometry Proofs** In Problems 72 and 73, use vector methods to prove each statement.

**72.** The diagonals of a parallelogram are perpendicular if and only if the parallelogram is a rhombus.

**73.** The altitudes of a triangle meet at one point; the medians of a triangle meet at one point.

**74.** Solve for  $\mathbf{x}$  in terms of  $\mathbf{a}$ ,  $\mathbf{a}$ , and  $\mathbf{b}$  if  $a\mathbf{x} + \mathbf{x} \times \mathbf{a} = \mathbf{b}$ ,  $a \neq 0$ . (Hint: First find  $\mathbf{x} \cdot \mathbf{a}$ , then  $\mathbf{x} \times \mathbf{a}$ .)

## Challenge Problems

**75.** Prove that if  $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$ ,  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ , and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$  are three vectors, the triple scalar product  $\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$  is given by

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix}$$

**76.** Show that the volume  $V$  of a parallelepiped whose adjacent sides are the vectors  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  is  $V = |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$ .

**77.** The points  $A$ ,  $B$ , and  $C$  determine a plane. If  $\mathbf{u} = \overrightarrow{OA}$ ,  $\mathbf{v} = \overrightarrow{OB}$ , and  $\mathbf{w} = \overrightarrow{OC}$ , show that the vector  $\mathbf{u} \times \mathbf{v} + \mathbf{v} \times \mathbf{w} + \mathbf{w} \times \mathbf{u}$  is normal to the plane.

**78.** Show that the volume of the tetrahedron with adjacent edges  $\mathbf{u}$ ,  $\mathbf{v}$ , and  $\mathbf{w}$  is  $\frac{1}{6} |\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})|$ .

**79. Magnetic Force on a Charge** When a charge  $q$  moves with velocity  $\mathbf{v}$  in a magnetic field  $\mathbf{B}$ , the field exerts a force  $\mathbf{F}$  on the charge that is perpendicular to both  $\mathbf{v}$  and  $\mathbf{B}$ , represented mathematically by  $\mathbf{F}_{\text{mag}} = q\mathbf{v} \times \mathbf{B}$ . In SI units, the charge  $q$  is measured in coulombs (C), the velocity  $\mathbf{v}$  is in meters per second (m/s), the force  $\mathbf{F}$  is in newtons (N), and the magnetic field  $\mathbf{B}$  is in teslas (T). Suppose a proton with a charge of  $q = 1.60 \times 10^{-19}$  C

enters a magnetic field of 1.20 T that is pointing vertically downward and, as a result, experiences a horizontal force of  $1.63 \times 10^{-13}$  N to the left.

- What are the magnitude and direction of the minimum velocity  $\mathbf{v}$  the charge could have had as it entered the field?
- Why is the velocity in part (a) the minimum velocity?

- 80. Magnetic Effect on a TV** In older analog televisions, the image on the screen was formed by a beam of electrons with charge  $q$  hitting the screen and causing it to glow. In some cases, the electrons reach speeds of  $v = 2.0 \times 10^6$  m/s. Earth produces a magnetic field  $\mathbf{B}$  that exerts a magnetic force  $\mathbf{F}_{\text{mag}}$  on the moving electrons. The force  $\mathbf{F}_{\text{mag}}$  is given by  $\mathbf{F}_{\text{mag}} = q\mathbf{v} \times \mathbf{B}$ . Earth's magnetic field is about  $5.0 \times 10^{-3}$  T and generally points horizontally from south to north. If the charge on an electron is  $q = 1.60 \times 10^{-19}$  C, find the magnitude and direction of the magnetic force  $\mathbf{F}_{\text{mag}}$  on the electrons in a TV if the set is oriented so that the electrons move
- from north to south.
  - from west to east.

- 81. Magnetic Force on an Extension Cord** If a straight wire of length  $L$  carrying an electric current  $I$  is in a magnetic field  $\mathbf{B}$ , there will be a magnetic force  $\mathbf{F}_{\text{mag}}$  on the wire. The magnetic force  $\mathbf{F}_{\text{mag}}$  is orthogonal to both the wire and the field  $\mathbf{B}$ , and is given by  $\mathbf{F}_{\text{mag}} = I\mathbf{L} \times \mathbf{B}$ , where the direction of the vector  $\mathbf{L}$  is the direction in which the current is flowing and its magnitude is  $L$ . An extension cord 2 m long carries a typical current  $I = 5.0$  amperes (A) and lies in a horizontal plane. Earth's magnetic field  $\mathbf{B}$  has a magnitude of  $5.0 \times 10^{-3}$  T and points horizontally from south to north. The magnetic force  $\mathbf{F}_{\text{mag}}$  is in newtons.

- What is the minimum force Earth's magnetic field can exert on the cord, and how should the cord be oriented relative to the field?
- What is the maximum magnetic force Earth's magnetic field will exert on the cord, and how should the cord be oriented relative to the field?
- At what angle  $\theta$  relative to the magnetic field  $\mathbf{B}$  should the cord be oriented so that the magnetic force  $\mathbf{F}_{\text{mag}}$  is 50% of its maximum possible value?

## 10.6 Equations of Lines and Planes in Space

**OBJECTIVES** When you finish this section, you should be able to:

- Find a vector equation of a line in space (p. 733)
- Find parametric equations of a line in space (p. 734)
- Find symmetric equations of a line in space (p. 734)
- Determine whether two distinct lines are skew, parallel, or intersecting (p. 736)
- Find an equation of a plane (p. 737)
- Determine whether two distinct planes are parallel or intersecting (p. 738)
- Find the distance from a point to a plane (p. 739)

### 1 Find a Vector Equation of a Line in Space

In space, a line is determined when we know a point on the line and its direction. If  $P_0 = (x_0, y_0, z_0)$  and  $P_1 = (x_1, y_1, z_1)$  are two distinct points on a line, then the vector  $\mathbf{D}$  represented by the directed line segment  $\overrightarrow{P_0P_1}$  is a nonzero vector that gives the direction of the line. Note that  $\mathbf{D}$  is not unique. Any two points on the line can be used to find the direction of the line. See Figure 51.

If  $\mathbf{r}_0$  denotes the vector  $\overrightarrow{OP_0}$  and  $\mathbf{r}$  denotes the vector  $\overrightarrow{OP}$  of any point  $P = (x, y, z)$  on the line, then the vector  $\mathbf{r} - \mathbf{r}_0$  is parallel to the vector  $\mathbf{D}$ . That is,

$$\begin{aligned}\mathbf{r} - \mathbf{r}_0 &= t\mathbf{D} && \text{for some scalar } t \\ \mathbf{r} &= \mathbf{r}_0 + t\mathbf{D}\end{aligned}$$

Figure 51

#### THEOREM Vector Equation of a Line

A vector equation of a line in the direction  $\mathbf{D} \neq \mathbf{0}$  and containing the point  $P_0 = (x_0, y_0, z_0)$  is

$$\mathbf{r} = \mathbf{r}_0 + t\mathbf{D}$$

where  $\mathbf{r}_0$  is the vector  $\overrightarrow{OP_0}$ ,  $\mathbf{r}$  is the vector  $\overrightarrow{OP}$ , and  $P = (x, y, z)$  is any point on the line.

In the vector equation  $\mathbf{r} = \mathbf{r}_0 + t\mathbf{D}$  of a line, both the vector  $\mathbf{r}_0$  and the vector  $\mathbf{D}$  are known. To locate other points  $P$  on the line, we assign values to the scalar  $t$ . For each real number  $t$ , we obtain a vector whose terminal point is on the line. Vector equations of a line are not unique since the choice of a point on the line and the choice of the vector representing the direction of the line can vary.

### EXAMPLE 1 Finding a Vector Equation of a Line in Space

Find a vector equation of the line containing the points  $P_0 = (1, 2, -1)$  and  $P_1 = (4, 3, -2)$ .

**Solution** The vector  $\mathbf{D}$  in the direction from  $P_0 = (1, 2, -1)$  to  $P_1 = (4, 3, -2)$  is

$$\mathbf{D} = \overrightarrow{P_0P_1} = 3\mathbf{i} + \mathbf{j} - \mathbf{k}$$

If we let  $\mathbf{r}_0 = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$ , then a vector equation of the line is

$$\mathbf{r} = \mathbf{r}_0 + t\mathbf{D} = \mathbf{i} + 2\mathbf{j} - \mathbf{k} + t(3\mathbf{i} + \mathbf{j} - \mathbf{k}) = (1 + 3t)\mathbf{i} + (2 + t)\mathbf{j} + (-1 - t)\mathbf{k} \quad \blacksquare$$

### NOW WORK Problem 11(a).

## 2 Find Parametric Equations of a Line in Space

**NEED TO REVIEW?** Parametric equations are discussed in Section 9.1, pp. 637–642.

The vector equation of a line in the direction  $\mathbf{D} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$  and containing the point  $P_0 = (x_0, y_0, z_0)$  can be written as  $\mathbf{r} = \mathbf{r}_0 + t\mathbf{D}$ , where  $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$  and  $\mathbf{r}_0 = x_0\mathbf{i} + y_0\mathbf{j} + z_0\mathbf{k}$ . Then

$$\begin{aligned} x\mathbf{i} + y\mathbf{j} + z\mathbf{k} &= (x_0\mathbf{i} + y_0\mathbf{j} + z_0\mathbf{k}) + t(a\mathbf{i} + b\mathbf{j} + c\mathbf{k}) \\ &= (x_0 + at)\mathbf{i} + (y_0 + bt)\mathbf{j} + (z_0 + ct)\mathbf{k} \end{aligned}$$

Since two vectors are equal if and only if their corresponding components are equal, we have

$$\boxed{x = x_0 + at \quad y = y_0 + bt \quad z = z_0 + ct}$$

These equations are **parametric equations** of the line, and the variable  $t$  is the parameter. Points  $(x, y, z)$  on the line are obtained by assigning values to the parameter  $t$ . For example, when  $t = 0$ , we obtain the point  $(x_0, y_0, z_0)$  on the line.

### EXAMPLE 2 Finding Parametric Equations of a Line in Space

Find parametric equations of the line containing the point  $(2, -3, 1)$  and in the direction of the vector  $4\mathbf{i} + \frac{3}{4}\mathbf{j} - \mathbf{k}$ .

**Solution** Let  $(x_0, y_0, z_0) = (2, -3, 1)$  and  $a\mathbf{i} + b\mathbf{j} + c\mathbf{k} = 4\mathbf{i} + \frac{3}{4}\mathbf{j} - \mathbf{k}$ . Then, the parametric equations of the line are

$$x = x_0 + at = 2 + 4t \quad y = y_0 + bt = -3 + \frac{3}{4}t \quad z = z_0 + ct = 1 - t \quad \blacksquare$$

### NOW WORK Problem 9(b).

## 3 Find Symmetric Equations of a Line in Space

In the parametric equations  $x = x_0 + at$ ,  $y = y_0 + bt$ , and  $z = z_0 + ct$ , if the numbers  $a$ ,  $b$ , and  $c$  (the components of the vector  $\mathbf{D}$ ) are all nonzero, we can solve for  $t$ , obtaining

$$t = \frac{x - x_0}{a} \quad t = \frac{y - y_0}{b} \quad t = \frac{z - z_0}{c}$$

from which

$$\frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$$

These equations are referred to as **symmetric equations of a line**.

**NOTE** The symmetric equations actually represent a pair of equations

$$\frac{x - x_0}{a} = \frac{y - y_0}{b} \text{ and } \frac{x - x_0}{a} = \frac{z - z_0}{c}.$$

### EXAMPLE 3 Finding Symmetric Equations of a Line in Space

Find symmetric equations of the line containing the point  $(1, -1, 2)$  and in the direction of the vector  $5\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$ .

**Solution** The components of the vector  $5\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$  are all nonzero. So, we use  $a = 5$ ,  $b = -2$ , and  $c = 3$  and the coordinates of the point  $(1, -1, 2)$  to obtain the symmetric equations

$$\frac{x - 1}{5} = \frac{y + 1}{-2} = \frac{z - 2}{3}$$

Parametric and symmetric equations of a line are not unique. For example, since the vector  $-10\mathbf{i} + 4\mathbf{j} - 6\mathbf{k}$  is parallel to  $5\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$ , the symmetric equations of the line described in Example 3 can be written as

$$\frac{x - 1}{-10} = \frac{y + 1}{4} = \frac{z - 2}{-6}$$

#### NOW WORK Problem 9(c).

If one of the components of  $\mathbf{D}$  equals 0, the symmetric equations have a different form. For example, if  $\mathbf{D} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$  and  $a = 0$ , but  $b \neq 0$  and  $c \neq 0$ , the symmetric equations of the line are written as

$$x = x_0 \quad \frac{y - y_0}{b} = \frac{z - z_0}{c}$$

where  $P_0 = (x_0, y_0, z_0)$  is a point on the line. This particular line lies in the plane  $x = x_0$ .

### EXAMPLE 4 Finding Symmetric Equations of a Line

Find symmetric equations of the line that contains the point  $(5, -2, 3)$  and is in the direction of the vector  $\mathbf{D} = 3\mathbf{i} - 2\mathbf{k}$ .

**Solution** For  $\mathbf{D} = 3\mathbf{i} - 2\mathbf{k}$ ,  $a = 3$ ,  $b = 0$ , and  $c = -2$ . So, symmetric equations in the direction  $\mathbf{D}$  are

$$\frac{x - 5}{3} = \frac{z - 3}{-2} \quad y = -2$$

#### NOW WORK Problem 17.

### EXAMPLE 5 Analyzing Symmetric Equations of a Line

A line is defined by the symmetric equations  $\frac{x - 6}{3} = \frac{y + 2}{1} = \frac{z + 3}{-2}$ .

- (a) Find a vector in the direction of the line.
- (b) Find two points on the line.

**Solution** (a) From the denominators of the symmetric equations, we find  $a = 3$ ,  $b = 1$ , and  $c = -2$ . So,  $\mathbf{D} = 3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$  is a vector in the direction of the line.

(b) Since the line is defined by the symmetric equations  $\frac{x - 6}{3} = \frac{y + 2}{1} = \frac{z + 3}{-2}$ , one point on the line is  $(6, -2, -3)$ . To find a second point, we assign a value to  $x$  say,

$x = 0$ . Then

$$\begin{aligned}\frac{0-6}{3} &= \frac{y+2}{1} = \frac{z+3}{-2} \\ -2 &= \frac{y+2}{1} = \frac{z+3}{-2}\end{aligned}$$

Now we solve for  $y$  and  $z$ , and find  $y = -4$  and  $z = 1$ . So, another point on the line is  $(0, -4, 1)$ . ■

### NOW WORK Problem 15.

## 4 Determine Whether Two Distinct Lines Are Skew, Parallel, or Intersecting

In the plane, two distinct lines either intersect or are parallel. In space, two distinct lines *intersect*, are *parallel*, or are *skew*. The lines **intersect** when they have exactly one point in common. The lines are **parallel** when they lie in the same plane but do not intersect. The lines are **skew** if they do not intersect and are not parallel. Figure 52 illustrates these possibilities.

Figure 52

As an example of skew lines, think of two airplanes, one flying at an altitude of 1000 m traveling north and the other flying at an altitude of 3000 m traveling east. Since they are flying at different altitudes, they will never collide (intersect). Since they are flying in different directions, they are not parallel.

### EXAMPLE 6 Determining Whether Two Lines Are Skew, Parallel, or Intersecting

Determine whether the lines given below intersect, are parallel, or are skew.

$$\begin{aligned}\text{(a)} \quad l_1: \quad \mathbf{r}_1 &= (3\mathbf{i} + 3\mathbf{j} + \mathbf{k}) + t_1(\mathbf{i} - 2\mathbf{j} + \mathbf{k}) \\ l_2: \quad \mathbf{r}_2 &= (5\mathbf{i} + \mathbf{j} + \mathbf{k}) + t_2(\mathbf{i} - 4\mathbf{j} + 3\mathbf{k}) \\ \text{(b)} \quad l_1: \quad \mathbf{r}_1 &= (3\mathbf{i} + 2\mathbf{j} + \mathbf{k}) + t_1(\mathbf{i} - \mathbf{j} + \mathbf{k}) \\ l_2: \quad \mathbf{r}_2 &= (5\mathbf{i} + 6\mathbf{j} + \mathbf{k}) + t_2(\mathbf{i} - \mathbf{j} + 2\mathbf{k})\end{aligned}$$

**Solution** (a) The line  $l_1$  is in the direction of the vector  $\mathbf{i} - 2\mathbf{j} + \mathbf{k}$  and the line  $l_2$  is in the direction of the vector  $\mathbf{i} - 4\mathbf{j} + 3\mathbf{k}$ . Since these vectors are not parallel (do you know why?),  $l_1$  and  $l_2$  either intersect or are skew.

Suppose the lines intersect. Then there is some value of the parameter  $t_1$  and some value of the parameter  $t_2$  for which  $\mathbf{r}_1 = \mathbf{r}_2$ . Since  $\mathbf{r}_1 = (3 + t_1)\mathbf{i} + (3 - 2t_1)\mathbf{j} + (1 + t_1)\mathbf{k}$  and  $\mathbf{r}_2 = (5 + t_2)\mathbf{i} + (1 - 4t_2)\mathbf{j} + (1 + 3t_2)\mathbf{k}$ , for  $\mathbf{r}_1$  to equal  $\mathbf{r}_2$ , we have

$$(3 + t_1)\mathbf{i} + (3 - 2t_1)\mathbf{j} + (1 + t_1)\mathbf{k} = (5 + t_2)\mathbf{i} + (1 - 4t_2)\mathbf{j} + (1 + 3t_2)\mathbf{k} \quad \mathbf{r}_1 = \mathbf{r}_2$$

We equate the components of each vector to obtain

$$3 + t_1 = 5 + t_2 \quad 3 - 2t_1 = 1 - 4t_2 \quad 1 + t_1 = 1 + 3t_2$$

The result is a system of three equations containing two variables. From the third equation,  $t_1 = 3t_2$ . Now substitute  $t_1 = 3t_2$  into each of the first two equations.

$$\begin{aligned} 3 + t_1 &= 5 + t_2 & 3 - 2t_1 &= 1 - 4t_2 \\ 3 + 3t_2 &= 5 + t_2 & 3 - 6t_2 &= 1 - 4t_2 & t_1 &= 3t_2 \\ t_2 &= 1 & t_2 &= 1 \end{aligned}$$

Backsubstituting, we conclude  $t_1 = 3$  and  $t_2 = 1$ . The point of intersection is found by substituting  $t_1 = 3$  in  $l_1$  or  $t_2 = 1$  in  $l_2$ . The result is  $\mathbf{r}_1 = \mathbf{r}_2 = 6\mathbf{i} - 3\mathbf{j} + 4\mathbf{k}$ . The point of intersection is  $(6, -3, 4)$ .

(b) The line  $l_1$  is in the direction of the vector  $\mathbf{i} - \mathbf{j} + \mathbf{k}$ , and the line  $l_2$  is in the direction of the vector  $\mathbf{i} - \mathbf{j} + 2\mathbf{k}$ . These vectors are not parallel, so the lines  $l_1$  and  $l_2$  either intersect or are skew. As before, suppose they intersect. Then  $\mathbf{r}_1 = \mathbf{r}_2$  so that

$$(3 + t_1)\mathbf{i} + (2 - t_1)\mathbf{j} + (1 + t_1)\mathbf{k} = (5 + t_2)\mathbf{i} + (6 - t_2)\mathbf{j} + (1 + 2t_2)\mathbf{k}$$

$$3 + t_1 = 5 + t_2 \quad 2 - t_1 = 6 - t_2 \quad 1 + t_1 = 1 + 2t_2 \quad \text{Equate components.}$$

Now substitute  $t_1 = 2t_2$  (from the third equation) into each of the first two equations.

$$\begin{aligned} 3 + t_1 &= 5 + t_2 & 2 - t_1 &= 6 - t_2 \\ 3 + 2t_2 &= 5 + t_2 & 2 - 2t_2 &= 6 - t_2 & t_1 &= 2t_2 \\ t_2 &= 2 & t_2 &= -4 \end{aligned}$$

The system of equations has no solution, so the assumption that  $\mathbf{r}_1 = \mathbf{r}_2$ , for some  $t_1$  and some  $t_2$  is false. The lines are neither parallel nor intersecting, so they are skew. ■

**CAUTION** When working with pairs of lines, be sure to use a different parameter for each line.

**NOW WORK** Problems 23(a) and 29(a).

## 5 Find an Equation of a Plane

The vector equation of a line is determined once a point on the line and a vector in the direction of the line are known. To determine the vector equation of a plane, we use a point on the plane and a vector perpendicular to the plane, a **normal** to the plane.

Suppose the point  $P_0 = (x_0, y_0, z_0)$  is on a plane and suppose the nonzero vector  $\mathbf{N}$  is a normal to the plane. See Figure 53. Let  $P = (x, y, z)$  be any other point on the plane. Denote the vectors  $\overrightarrow{OP_0}$  and  $\overrightarrow{OP}$  by  $\mathbf{r}_0$  and  $\mathbf{r}$ , respectively. Since  $P$  is a point on the plane, the vector  $\mathbf{r} - \mathbf{r}_0$  is in the plane and is orthogonal to the vector  $\mathbf{N}$ . Then  $(\mathbf{r} - \mathbf{r}_0) \cdot \mathbf{N} = 0$ .

Figure 53  $(\mathbf{r} - \mathbf{r}_0) \cdot \mathbf{N} = 0$

### THEOREM Vector Equation of a Plane

The vector equation of the plane containing the point  $P_0$  is

$$(\mathbf{r} - \mathbf{r}_0) \cdot \mathbf{N} = 0$$

where  $\mathbf{r}_0$  is the vector  $\overrightarrow{OP_0}$ ,  $\mathbf{r}$  is the vector  $\overrightarrow{OP}$  of any other point  $P$  on the plane, and  $\mathbf{N}$  is normal to the plane.

If the coordinates of  $P_0$  are  $(x_0, y_0, z_0)$  and the vector  $\mathbf{N} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$ , then

$$[(x - x_0)\mathbf{i} + (y - y_0)\mathbf{j} + (z - z_0)\mathbf{k}] \cdot (A\mathbf{i} + B\mathbf{j} + C\mathbf{k}) = 0$$

$$A(x - x_0) + B(y - y_0) + C(z - z_0) = 0$$

If  $D = Ax_0 + By_0 + Cz_0$ , we can write the equation as

$$Ax + By + Cz = D$$

Notice that the coefficients of  $x$ ,  $y$ , and  $z$  in the equation are the components of the normal vector  $\mathbf{N}$ .

**THEOREM** General Equation of a Plane

An equation of the form

$$Ax + By + Cz = D$$

with at least one of the numbers  $A, B, C$  not 0, is called the **general equation of a plane**, and the vector  $A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$  is normal to this plane.

**EXAMPLE 7** Finding the General Equation of a Plane

Find the general equation of the plane containing the point  $(1, 2, -1)$  if the vector  $\mathbf{N} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$  is normal to the plane. Then use the intercepts to graph the plane.

**Solution** The general equation of a plane is  $Ax + By + Cz = D$ , where  $A, B$ , and  $C$  are the components of a normal vector to the plane. Since the normal is  $\mathbf{N} = 2\mathbf{i} + 3\mathbf{j} - 4\mathbf{k}$ , we have

$$2x + 3y - 4z = D$$

To find  $D$ , we use the point  $(1, 2, -1)$ . Then  $D = 2(1) + 3(2) - 4(-1) = 12$ . The general equation of the plane is

$$2x + 3y - 4z = 12$$

We find the intercepts by letting two variables equal zero and then solving for the third variable. For example, to find the  $x$ -intercept, we let  $y = 0$  and  $z = 0$ . Then  $2x = 12$  or  $x = 6$ . Similarly, the  $y$ -intercept is 4 and the  $z$ -intercept is  $-3$ . Figure 54 illustrates how the intercepts are used to graph the plane. ■

Figure 54  $2x + 3y - 4z = 12$

**NOW WORK** Problem 31.

**EXAMPLE 8** Finding the General Equation of a Plane

Find the general equation of the plane containing the points

$$P_1 = (1, -1, 2) \quad P_2 = (3, 0, 0) \quad P_3 = (4, 2, 1)$$

**Solution** The vectors  $\mathbf{v} = \overrightarrow{P_1P_2} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$  and  $\mathbf{w} = \overrightarrow{P_1P_3} = 3\mathbf{i} + 3\mathbf{j} - \mathbf{k}$  lie in the plane. The vector

$$\mathbf{N} = \mathbf{v} \times \mathbf{w} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 1 & -2 \\ 3 & 3 & -1 \end{vmatrix} = \begin{vmatrix} 1 & -2 \\ 3 & -1 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 2 & -2 \\ 3 & -1 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 2 & 1 \\ 3 & 3 \end{vmatrix} \mathbf{k} = 5\mathbf{i} - 4\mathbf{j} + 3\mathbf{k}$$

is orthogonal to both  $\mathbf{v}$  and  $\mathbf{w}$  and so is normal to the plane. Using the point  $(1, -1, 2)$  and the vector  $\mathbf{N}$ , the general equation of the plane is

$$5(x - 1) - 4(y + 1) + 3(z - 2) = 0$$

$$5x - 5 - 4y - 4 + 3z - 6 = 0$$

$$5x - 4y + 3z = 15$$

**NOW WORK** Problem 43(a).

## 6 Determine Whether Two Distinct Planes Are Parallel or Intersecting

Two distinct planes are **parallel** if they have parallel normal vectors, that is, if  $\mathbf{N}_1 = k\mathbf{N}_2$  for some scalar  $k \neq 0$ . For example, the distinct planes

$$p_1: 2x + y - z = 3 \quad \text{and} \quad p_2: 2x + y - z = 4$$

**NOTE** The planes  $p_1: 2x + y - z = 3$  and  $p_2: 4x + 2y - 2z = 6$  are identical. Do you see why?

are parallel because  $\mathbf{N}_1 = 2\mathbf{i} + \mathbf{j} - \mathbf{k} = \mathbf{N}_2$  and  $D_1 = 3$  is not equal to  $D_2 = 4$ . See Figure 55.

If the normal vectors of two planes are not parallel, then the planes intersect in a line, as shown in Figure 56. The line of intersection lies in both planes and so is perpendicular to both  $\mathbf{N}_1$  and  $\mathbf{N}_2$ .

Figure 55 Parallel planes

Figure 56 Intersecting planes

### EXAMPLE 9 Determining the Line of Intersection of Two Nonparallel Planes

Find an equation of the line of intersection of the two planes

$$x - 2y + z = -1 \quad \text{and} \quad 3x + y - z = 4$$

**Solution** First notice that the normals  $\mathbf{N}_1 = \mathbf{i} - 2\mathbf{j} + \mathbf{k}$  and  $\mathbf{N}_2 = 3\mathbf{i} + \mathbf{j} - \mathbf{k}$  of the two planes are not parallel. To find an equation of the line of intersection, we need a point on the line and the direction of the line. Since the line of intersection is perpendicular to both  $\mathbf{N}_1$  and  $\mathbf{N}_2$ , it is parallel to the vector  $\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2$ .

$$\mathbf{D} = \mathbf{N}_1 \times \mathbf{N}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & -2 & 1 \\ 3 & 1 & -1 \end{vmatrix} = \mathbf{i} + 4\mathbf{j} + 7\mathbf{k}$$

The vector  $\mathbf{D}$  gives the direction of the line. We can find a point on the line by locating any point common to both planes. For example, if  $z = 0$ , then  $x - 2y = -1$  and  $3x + y = 4$ . Solving these equations simultaneously, we find  $x = 1$  and  $y = 1$ . So, the point  $(1, 1, 0)$  is on the line, and symmetric equations of the line of intersection are

$$\frac{x - 1}{1} = \frac{y - 1}{4} = \frac{z}{7}$$

**NOTE** We did not have to choose  $z = 0$ ; a value could have been assigned to any of the variables and the resulting two equations solved. Different choices would give equivalent equations of the line.

**NOW WORK** Problem 47.

## 7 Find the Distance from a Point to a Plane

To find the distance from a point  $P_0$  to a plane, we use projections. As Figure 57 illustrates, if  $P_1$  is a point on a plane with a normal vector  $\mathbf{N}$ , then the distance from  $P_0$  to the plane is the magnitude of the projection of  $\overrightarrow{P_1P_0}$  onto  $\mathbf{N}$ .

Suppose a plane is given by the general equation

$$Ax + By + Cz = D$$

A normal vector  $\mathbf{N}$  to the plane is

$$\mathbf{N} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$$

DF Figure 57

The distance from the point  $P_0 = (x_0, y_0, z_0)$  to the plane is

$$\left[ \begin{array}{l} \text{Distance from} \\ P_0 \text{ to the plane} \end{array} \right] = \left\| \text{proj}_{\mathbf{N}} \overrightarrow{P_1 P_0} \right\| = \frac{|\overrightarrow{P_1 P_0} \cdot \mathbf{N}|}{\|\mathbf{N}\|}$$

where  $P_1 = (x_1, y_1, z_1)$  is a point on the plane.

Since  $\overrightarrow{P_1 P_0} = (x_0 - x_1)\mathbf{i} + (y_0 - y_1)\mathbf{j} + (z_0 - z_1)\mathbf{k}$ , then

$$\begin{aligned} \left[ \begin{array}{l} \text{Distance from} \\ P_0 \text{ to the plane} \end{array} \right] &= \frac{|A(x_0 - x_1) + B(y_0 - y_1) + C(z_0 - z_1)|}{\sqrt{A^2 + B^2 + C^2}} \\ &= \frac{|(Ax_0 + By_0 + Cz_0) - (Ax_1 + By_1 + Cz_1)|}{\sqrt{A^2 + B^2 + C^2}} \\ &= \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} \end{aligned}$$

$\uparrow$   
 $P_1$  is on the plane, so  
 $Ax_1 + By_1 + Cz_1 = D$

### THEOREM Distance from a Point to a Plane

The distance  $d$  from the point  $P_0 = (x_0, y_0, z_0)$  to the plane  $Ax + By + Cz = D$  is

$$d = \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} \quad (1)$$

### EXAMPLE 10 Finding the Distance from a Point to a Plane

Find the distance  $d$  from the point  $(2, 3, -1)$  to the plane  $x + 4y + z = 5$ .

**Solution** We use (1) with  $A = 1$ ,  $B = 4$ ,  $C = 1$ ,  $D = 5$ , and  $P_0 = (2, 3, -1)$ . Then

$$d = \frac{|(1)(2) + (4)(3) + (1)(-1) - 5|}{\sqrt{1 + 16 + 1}} = \frac{8}{3\sqrt{2}} = \frac{4\sqrt{2}}{3}$$

### NOW WORK Problem 51.

### EXAMPLE 11 Finding the Distance Between Two Parallel Planes

Find the distance  $d$  between the parallel planes

$$p_1 : 2x + 3y - z = 3 \quad \text{and} \quad p_2 : 2x + 3y - z = 4$$

**Solution** The planes  $p_1$  and  $p_2$  are parallel because  $\mathbf{N}_1 = 2\mathbf{i} + 3\mathbf{j} - \mathbf{k} = \mathbf{N}_2$  and  $D_1 = 3$  is not equal to  $D_2 = 4$ .

We find the distance between the planes by choosing a point on one plane and using the formula for distance from that point to the other plane. A point on  $p_1$  can be found by letting  $x = 0$  and  $y = 0$ . Then  $z = -3$ , and  $(0, 0, -3)$  is a point on  $p_1$ . The distance  $d$  from the point  $(0, 0, -3)$  to the plane  $p_2$  is

$$d = \frac{|2(0) + 3(0) - 1(-3) - 4|}{\sqrt{2^2 + 3^2 + (-1)^2}} = \frac{1}{\sqrt{14}} = \frac{\sqrt{14}}{14}$$

### NOW WORK Problem 55.

## 10.6 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The symmetric equations  $\frac{x-3}{2} = \frac{y-4}{1} = \frac{z+2}{-1}$  represent a line parallel to the vector  $3\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ .
- True or False** Skew lines can sometimes lie in the same plane.
- True or False** If two planes are not parallel, they intersect in a line.
- True or False** The two planes  $p_1: 2x + 3y - z = 3$  and  $p_2: 6x + 3y - 3z = 9$  are parallel.
- True or False** The planes  $x + 2y + z = 3$  and  $x + 2y + z = 4$  are parallel and are 1 unit apart.
- Which of the three representations of a line in space do you like best? Give reasons for your choice.
- Which of the two representations of a plane in space do you like better? Give reasons for your choice.
- Two distinct lines in space that do not intersect and are not parallel are called \_\_\_\_\_.

### Skill Building

In Problems 9–12, find:

- A vector equation
  - Parametric equations
  - Symmetric equations of the line
- containing the point  $(1, 2, 3)$  and in the direction of  $2\mathbf{i} - \mathbf{j} + \mathbf{k}$ .
  - containing the point  $(4, -1, 6)$  and in the direction of  $\mathbf{i} + \mathbf{j}$ .
  - containing the points  $P_0 = (1, -1, 3)$  and  $P_1 = (4, 2, 1)$ .
  - containing the points  $P_0 = (-2, 3, 0)$  and  $P_1 = (1, -1, 2)$ .
  - Find parametric equations of a line containing the point  $(-1, 5, 6)$  and in the direction of the line  $\frac{x+1}{5} = \frac{y-2}{4} = \frac{z-3}{-3}$ .
  - Find parametric equations of a line containing the point  $(1, -2, -3)$  and in the direction of the line  $\frac{x+1}{6} = \frac{y+2}{2} = \frac{z}{-1}$ .
  - Let  $\frac{x-4}{2} = \frac{y+1}{-1} = \frac{z-2}{2}$  be symmetric equations of a line. Find a vector in the direction of the line, and find two points on this line.
  - Let  $x+1 = y+3 = \frac{z+4}{2}$  be symmetric equations of a line. Find a vector in the direction of the line, and find two points on this line.

In Problems 17–22, find symmetric equations of the line containing the point  $P_0$ .

- $P_0 = (4, 2, 1)$  and the line is in the direction of the vector  $\mathbf{D} = 2\mathbf{i} + \mathbf{k}$ .
- $P_0 = (-1, 2, 0)$  and the line is in the direction of the vector  $\mathbf{D} = 2\mathbf{k} - \mathbf{j}$ .

- $P_0 = (0, 0, 0)$  and the line is perpendicular to each of the lines  $\frac{x+1}{2} = \frac{y-1}{3} = \frac{z}{-2}$  and  $\frac{x-3}{3} = \frac{y}{1} = \frac{z+1}{2}$ .
- $P_0 = (0, 0, 0)$  and the line is perpendicular to each of the lines  $\frac{x+2}{4} = \frac{y-1}{2} = z+1$  and  $\frac{x+5}{5} = \frac{y+1}{3} = z$ .
- $P_0 = (1, 2, -1)$  and the line is perpendicular to the vectors  $\mathbf{u} = 2\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$  and  $\mathbf{v} = -3\mathbf{i} - 2\mathbf{j} + \mathbf{k}$ .
- $P_0 = (-1, 3, 2)$  and the line is perpendicular to the vectors  $\mathbf{u} = -2\mathbf{i} + 2\mathbf{j} - 3\mathbf{k}$  and  $\mathbf{v} = 4\mathbf{i} + 2\mathbf{j} + \mathbf{k}$ .

In Problems 23–30:

- Determine whether the lines  $l_1$  and  $l_2$  intersect, are parallel, or are skew.

 (b) Graph the lines. Does the graph confirm the answer to (a)?

- $l_1: \mathbf{r}_1 = 2\mathbf{i} - 2\mathbf{k} + t_1(-3\mathbf{i} + 6\mathbf{j} + 6\mathbf{k})$   
 $l_2: \mathbf{r}_2 = 6\mathbf{i} + 2\mathbf{j} + 5\mathbf{k} + t_2(-\mathbf{i} + 2\mathbf{j} + 2\mathbf{k})$
- $l_1: \mathbf{r}_1 = 3\mathbf{i} + 3\mathbf{k} + t_1(3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k})$   
 $l_2: \mathbf{r}_2 = 3\mathbf{i} + 3\mathbf{k} + t_2(-2\mathbf{i} + 4\mathbf{j} + 7\mathbf{k})$
- $l_1: \mathbf{r}_1 = 4\mathbf{i} + 3\mathbf{j} + t_1(\mathbf{i} - \mathbf{j} + 6\mathbf{k})$   
 $l_2: \mathbf{r}_2 = 4\mathbf{i} + 3\mathbf{j} + 2\mathbf{k} + t_2(\mathbf{i} - \mathbf{j} - 2\mathbf{k})$
- $l_1: \mathbf{r}_1 = 2\mathbf{i} + 7\mathbf{j} + t_1(-2\mathbf{i} + 8\mathbf{j} - 6\mathbf{k})$   
 $l_2: \mathbf{r}_2 = 6\mathbf{i} - 5\mathbf{j} + t_2(\mathbf{i} - 4\mathbf{j} + 3\mathbf{k})$
- $l_1: \frac{x-3}{2} = \frac{y+2}{3} = \frac{z-1}{4}$   
 $l_2: \frac{x+4}{-4} = \frac{y-3}{-6} = \frac{z+4}{-8}$
- $l_1: \frac{x}{3} = \frac{y-2}{4} = \frac{z+4}{1}$   
 $l_2: \frac{x+6}{3} = \frac{y+2}{4} = \frac{z-3}{2}$
- $l_1: \frac{x+1}{5} = \frac{y-2}{4} = \frac{z-3}{-3}$   
 $l_2: \frac{x+1}{6} = \frac{y-2}{3} = \frac{z+3}{2}$
- $l_1: \frac{x+5}{6} = \frac{y-2}{3} = \frac{z-4}{-1}$   
 $l_2: x = \frac{y-2}{3} = \frac{z-8}{2}$

In Problems 31–40, find the general equation of each plane.

- Containing the point  $(1, -1, 2)$  and normal to the vector  $2\mathbf{i} - \mathbf{j} + \mathbf{k}$
- Containing the point  $(-3, 2, 1)$  and normal to the vector  $\mathbf{i} + \mathbf{j} - 2\mathbf{k}$
- Containing the point  $(0, 5, -2)$  and parallel to the plane  $x + 2y - z = 6$
- Containing the point  $(1, -2, 0)$  and parallel to the plane  $2x - y + 3z = 10$
- Containing the point  $(2, 3, -1)$  and normal to the line

$$\frac{x-1}{2} = \frac{y-3}{5} = \frac{z+1}{-2}$$

36. Containing the point
- $(-1, 2, 3)$
- and normal to the line

$$\frac{x+5}{3} = \frac{y+2}{4} = \frac{z-4}{4}$$

37. Parallel to the  $xy$ -plane and containing the point  $(0, 0, 4)$   
 38. Parallel to the  $yz$ -plane and containing the point  $(2, 0, 0)$   
 39. Parallel to the  $xz$ -plane and containing the point  $(1, -2, 3)$   
 40. Parallel to the  $xy$ -plane and containing the point  $(1, -3, 4)$

In Problems 41–46:

- (a) Find the general equation of the plane containing the points
- $P_1$
- ,
- $P_2$
- , and
- $P_3$
- .

**CAS** (b) Graph the plane.

41.  $P_1 = (0, 0, 0)$ ;  $P_2 = (1, 2, -1)$ ;  $P_3 = (-1, 1, 0)$   
 42.  $P_1 = (0, 0, 0)$ ;  $P_2 = (3, -1, 2)$ ;  $P_3 = (-3, 1, 0)$   
 43.  $P_1 = (1, 2, 1)$ ;  $P_2 = (3, 2, 2)$ ;  $P_3 = (4, -1, -1)$   
 44.  $P_1 = (-1, 2, 0)$ ;  $P_2 = (3, 4, -1)$ ;  $P_3 = (-2, -1, 0)$   
 45.  $P_1 = (6, 8, -2)$ ;  $P_2 = (4, -1, 0)$ ;  $P_3 = (1, 0, 0)$   
 46.  $P_1 = (-3, -4, 0)$ ;  $P_2 = (6, -7, 2)$ ;  $P_3 = (0, 0, 1)$

In Problems 47–50, find symmetric equations of the line of intersection of the two planes.

47.  $p_1: x + y - z = -5$  and  $p_2: 2x + 3y - 4z = -1$   
 48.  $p_1: 2x - y + z = 2$  and  $p_2: x + y + z = 3$   
 49.  $p_1: x - y = 2$  and  $p_2: y - z = 2$   
 50.  $p_1: 2x - 3y + z = 1$  and  $p_2: 2x - 3y + 4z = 2$

In Problems 51–54, find the distance from the point to the plane.

51. from  $(1, 2, -1)$  to  $2x - y + z = 1$   
 52. from  $(-1, 3, -2)$  to  $x + 2y - 3z = 4$   
 53. from  $(2, -1, 1)$  to  $-x + y - 3z = 6$   
 54. from  $(-2, 1, 1)$  to  $-3x + 2y + z = 1$

In Problems 55–58, find the distance between the two parallel planes.

55.  $p_1: 2x + y - 2z = -1$  and  $p_2: 2x + y - 2z = 3$   
 56.  $p_1: x + 2y - 2z = -3$  and  $p_2: x + 2y - 2z = 3$   
 57.  $p_1: x - 2z = -1$  and  $p_2: x - 2z = 3$   
 58.  $p_1: -x + y + 2z = -4$  and  $p_2: -x + y + 2z = -1$

In Problem 59–62, find the point of intersection of the plane and the line.

59. Plane  $2x + y - z = 5$ , line  $\frac{x-1}{2} = \frac{y+3}{4} = \frac{z-1}{1}$   
 60. Plane  $x + y - 2z = 8$ , line  $\frac{x+1}{2} = \frac{y-3}{1} = \frac{z-4}{-2}$   
 61. Plane  $2x + 3y + z = 5$ , line  $\frac{x-3}{1} = \frac{y+4}{2} = \frac{z-1}{2}$   
 62. Plane  $x + y - z = 3$ ; line  $\frac{x+2}{2} = \frac{y-3}{1} = \frac{z}{2}$

## Applications and Extensions

In Problems 63–66, find the point of intersection of  $l_1$  and  $l_2$  and the angle between them.

63.  $l_1: \mathbf{r}_1 = (2 - t_1)\mathbf{i} + (4 + 2t_1)\mathbf{j} + (-5 + t_1)\mathbf{k}$

$l_2: \mathbf{r}_2 = (4 - t_2)\mathbf{i} + (3 + t_2)\mathbf{j} + (-13 + 3t_2)\mathbf{k}$

64.  $l_1: \mathbf{r}_1 = (5 + 2t_1)\mathbf{i} + (6 - t_1)\mathbf{j} + 2t_1\mathbf{k}$

$l_2: \mathbf{r}_2 = (7 + 3t_2)\mathbf{i} + (5 - 2t_2)\mathbf{j} + (2 - t_2)\mathbf{k}$

65.  $l_1: \mathbf{r}_1 = t_1\mathbf{i} + (1 + 2t_1)\mathbf{j} + (-3 + t_1)\mathbf{k}$

$l_2: \mathbf{r}_2 = (-3 + t_2)\mathbf{i} + (1 - 4t_2)\mathbf{j} + (2 - 7t_2)\mathbf{k}$

66.  $l_1: \mathbf{r}_1 = (2 - 3t_1)\mathbf{i} + 6t_1\mathbf{j} + (-2 + 5t_1)\mathbf{k}$

$l_2: \mathbf{r}_2 = -2t_2\mathbf{i} + (1 + t_2)\mathbf{j} + 2t_2\mathbf{k}$

67. (a) Find parametric equations of the line containing the point
- $(1, 2, -1)$
- and normal to the plane
- $2x - y + z - 6 = 0$
- .

**CAS** (b) Graph the line and the plane.

68. (a) Find parametric equations of the line containing the point
- $(2, 3, -1)$
- and normal to the plane
- $x + y - z - 3 = 0$
- .

**CAS** (b) Graph the line and the plane.

69. What property can you assign to the lines
- $l_1$
- and
- $l_2$
- , given below, if
- $a_1b_1 + a_2b_2 + a_3b_3 = 0$
- ?

$l_1: \frac{x-x_1}{a_1} = \frac{y-y_1}{a_2} = \frac{z-z_1}{a_3}$

$l_2: \frac{x-x_1}{b_1} = \frac{y-y_1}{b_2} = \frac{z-z_1}{b_3}$

70. What property can you assign to the distinct lines
- $l_1$
- and
- $l_2$
- , given below, if
- $\frac{a_1}{b_1} = \frac{a_2}{b_2} = \frac{a_3}{b_3}$
- ?

$l_1: \frac{x-x_1}{a_1} = \frac{y-y_1}{a_2} = \frac{z-z_1}{a_3}$

$l_2: \frac{x-x_2}{b_1} = \frac{y-y_2}{b_2} = \frac{z-z_2}{b_3}$

Problems 71–76 use the following

discussion. When two planes intersect, the **angle  $\theta$  between the planes** is defined as the non-obtuse angle between their normals. See the figure. If  $\mathbf{N}_1$  and  $\mathbf{N}_2$  are the normals of two intersecting planes, the angle  $\theta$  between these planes is given by

$$\cos \theta = \frac{|\mathbf{N}_1 \cdot \mathbf{N}_2|}{\|\mathbf{N}_1\| \|\mathbf{N}_2\|} \quad 0 \leq \theta \leq \frac{\pi}{2}$$

In Problems 71–76, the two planes intersect. Find the angle between them.

71.  $p_1: 2x - y + z = 2$  and  $p_2: x + y + z = 3$   
 72.  $p_1: x + y - z = 5$ ; and  $p_2: 2x + 3y - 4z = 1$   
 73.  $p_1: 2x - 3y + z = 1$  and  $p_2: 2x - 3y + 4z = 2$

74.  $p_1: x - y = 2$  and  $p_2: y - z = 2$
75.  $p_1: 2x - y + z = 3$  and  $p_2: 4x - y + 6z = 7$
76.  $p_1: x + y - z = 1$  and  $p_2: 2x - 2y + 2z = -2$
77. **Paths of Spacecrafts** Two unidentified flying objects are at the points  $(t, -t, 1 - t)$  and  $(t - 3, 2t, 4t - 1)$  at time  $t, t \geq 0$ .
- Describe the paths of the objects.
  - Find the acute angle between the paths.
  - Find where the paths intersect (or determine that they do not).
  - Will the objects collide?

78. Find symmetric equations of the line passing through the centers of the spheres

$$x^2 + y^2 + z^2 - 2x - 4y + 4z = 8$$

and

$$x^2 + y^2 + z^2 + 2x + 6y + 4z = 20$$

79. Find parametric equation of the line perpendicular to the lines

$$l_1: x = 1 - t, \quad y = t, \quad z = 2t - 1$$

and

$$l_2: x = t + 1, \quad y = -t, \quad z = t - 1$$

at their point of intersection. Why is this line parallel to the  $xy$ -plane?

80. Explain why the set of points  $(x, y, z)$  equidistant from the points  $(1, 3, 0)$  and  $(-1, 1, 2)$  is a plane. Then find its equation in two ways, as follows:
- Use the distance formula to equate the distances between  $(x, y, z)$  and the given points, simplifying the result to obtain an equation of the plane.
  - Find a point on the plane and a vector normal to the plane, and use the answer to find an equation of the plane.
81. Find symmetric equations of the line of intersection of the planes  $2x + y - z = 6$  and  $x - y + 3z = 4$ .
82. Find symmetric equations of the line that contains  $(2, 0, -3)$ , is perpendicular to  $\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ , and is parallel to the plane  $2x + 3y - z = 1$ .
83. Find the point of intersection of the line through the points  $(0, 2, -2)$ , and  $(2, 1, -3)$ , and the plane through the points  $(0, 4, -2)$ ,  $(1, 3, -2)$ , and  $(2, 2, -3)$ .
84. Find an equation of the plane parallel to the line  $\mathbf{r} = 2\mathbf{i} + t(-\mathbf{i} + \mathbf{j} + 2\mathbf{k})$  and containing the points  $(2, 2, -1)$  and  $(1, 0, 1)$ .
85. Find an equation of the plane tangent to the sphere  $(x - 1)^2 + (y + 2)^2 + (z - 2)^2 = 6$  at the point  $(2, -1, 0)$ .

86. **Sphere** Find an equation of the sphere with its center at  $(-2, 1, 5)$  and tangent to  $x + 2y - 2z = 8$ .
87. Find symmetric equations of a line normal to the plane containing the lines
- $$x - 2 = \frac{y + 1}{2} = \frac{z - 1}{2} \quad \text{and} \quad x + 1 = \frac{y + 8}{3} = \frac{z}{-3}$$
- at their point of intersection.

### Challenge Problems

88. Find an equation for the plane containing the origin that is perpendicular to the plane  $x - 2y - z = 0$  and makes an angle of  $60^\circ$  with the positive  $y$ -axis.
89. We proved that the distance between the point  $P_0 = (x_0, y_0, z_0)$  and the plane  $Ax + By + Cz = D$  is

$$d = \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}}$$

Derive this formula differently, as follows:

- Show that the line through  $P_0$  normal to the plane has the parametric equations  $x = x_0 + At, y = y_0 + Bt, z = z_0 + Ct$ .
- If  $P = (x, y, z)$  is the point of intersection of the line in (a) with the plane, show that  $x - x_0 = At, y - y_0 = Bt, z - z_0 = Ct$ , where

$$t = \frac{-(Ax_0 + By_0 + Cz_0) + D}{A^2 + B^2 + C^2}$$

- Explain why  $d$  is the distance between  $P_0$  and  $P$ , and use the distance formula to finish the proof.

90. Prove that the distance between the parallel planes  $Ax + By + Cz = D_1$  and  $Ax + By + Cz = D_2$  is

$$d = \frac{|D_2 - D_1|}{\sqrt{A^2 + B^2 + C^2}}$$

91. Let two skew lines have respective direction vectors  $\mathbf{D}_1$  and  $\mathbf{D}_2$ . Let  $A$  and  $B$  be points on the respective lines, and let  $\mathbf{w} = \overrightarrow{AB}$ . Show that the distance between the two lines is the magnitude of the vector projection of  $\mathbf{w}$  onto  $\mathbf{D}_1 \times \mathbf{D}_2$ :

$$|\text{proj}_{\mathbf{D}_1 \times \mathbf{D}_2} \mathbf{w}| = \frac{|\mathbf{w} \cdot (\mathbf{D}_1 \times \mathbf{D}_2)|}{\|\mathbf{D}_1 \times \mathbf{D}_2\|}$$

(The shortest distance is measured along the common perpendicular to the two lines.)

92. Find the distance between the lines
- $$\frac{x - 3}{2} = \frac{y}{3} = z \quad \text{and} \quad x = \frac{y + 1}{-2} = \frac{z - 2}{-1}.$$
93. What is the minimum distance between the skew lines
- $$x - 1 = y - 2 = z + 6 \quad \text{and} \quad \frac{x - 1}{2} = \frac{y + 2}{-3} = z - 10.$$
- Locate the points on each line at which the distance is minimum.

## 10.7 Quadric Surfaces

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Identify quadric surfaces based on an ellipse (p. 744)
- 2 Identify quadric surfaces based on a hyperbola (p. 746)
- 3 Identify cylinders (p. 748)
- 4 Graph quadric surfaces (p. 750)

The graph of a second degree equation in two variables

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

is a conic (a parabola, an ellipse or a hyperbola), except for degenerate cases.

The graph of a second-degree equation in three variables

$$Ax^2 + By^2 + Cz^2 + Dxy + Exz + Fyz + Gx + Hy + Iz + J = 0 \quad (1)$$

**NEED TO REVIEW?** Conics are discussed in Appendix A.3, pp. A-22 to A-25.

is called a **quadric surface**. There are nine different types of quadric surfaces, excluding the *degenerate cases*. Examples of degenerate quadric surfaces include  $x^2 + y^2 + z^2 = 0$ , whose graph is the point  $(0, 0, 0)$ , and  $2x^2 + 3y^2 + 4z^2 = -2$ , whose graph has no points.

As with conics, when the equation of a quadric surface is written in the form of equation (1), it is in **general form**. On the other hand, if we complete the squares, it is in **standard form**. The equations we consider here are in standard form and the corresponding quadric surfaces are centered at the origin of an  $xyz$ -coordinate system. Variations of these surfaces can be found using transformations (discussed in Chapter P, Section 3.)

A quadric surface is characterized by listing its intercepts, and by finding its *traces*. A **trace** is the intersection of the surface with a coordinate plane or a plane parallel to a coordinate plane. The term **section** (or *cross section*) is sometimes used when the intersection is with a plane other than a coordinate plane.

### 1 Identify Quadric Surfaces Based on an Ellipse

The first three quadric surfaces we investigate are based on an ellipse. Each of these surfaces has at least one trace that is an ellipse.

#### DEFINITION Ellipsoid

The graph of an **ellipsoid** has an equation of the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \quad a > 0, b > 0, c > 0$$

**DF Figure 58** Ellipsoid:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1.$$

See Figure 58. The intercepts of an ellipsoid are the points  $(\pm a, 0, 0)$ ,  $(0, \pm b, 0)$ , and  $(0, 0, \pm c)$ , and every trace is an ellipse. For example, if  $z = 0$ , the trace in the  $xy$ -plane is the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ . The traces parallel to the  $xy$ -plane are the ellipses  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 - \frac{k^2}{c^2}$ , where  $|z| = |k| < c$ . Traces parallel to the  $xz$ - and  $yz$ -planes are the ellipses  $\frac{x^2}{a^2} + \frac{z^2}{c^2} = 1 - \frac{k^2}{b^2}$ , where  $|y| = |k| < b$ , and  $\frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 - \frac{k^2}{a^2}$ , where  $|x| = |k| < a$ , respectively.

An ellipsoid centered at the origin is symmetric with respect to each coordinate plane. The symmetry holds because all three variables are squared. If two of the three

numbers  $a$ ,  $b$ , or  $c$  are equal, the ellipsoid is called an **ellipsoid of revolution**. If all three numbers  $a$ ,  $b$ , and  $c$  are equal, the ellipsoid is a sphere. See Figure 59.

Figure 59

The second quadric surface based on an ellipse is called an *elliptic cone*.

### DEFINITION Elliptic Cone

The graph of an **elliptic cone** has an equation of the form

$$z^2 = \frac{x^2}{a^2} + \frac{y^2}{b^2} \quad a > 0, b > 0$$

See Figure 60(a). The only intercept of an elliptic cone is the origin  $(0, 0, 0)$ , called the **vertex** of the cone. The trace of an elliptic cone in the  $xy$ -plane is the origin. Traces parallel to the  $xy$ -plane are ellipses centered on the  $z$ -axis. The trace in the  $yz$ -plane consists of the pair of intersecting lines  $z = \pm \frac{y}{b}$ , and the trace in the  $xz$ -plane consists of the pair of intersecting lines  $z = \pm \frac{x}{a}$ .

If  $a = b$ , the elliptic cone becomes a *circular cone* and its traces are circles. See Figure 60(b). Other forms of an elliptic cone are

$$x^2 = \frac{y^2}{b^2} + \frac{z^2}{c^2} \quad y^2 = \frac{x^2}{a^2} + \frac{z^2}{c^2} \quad a > 0, b > 0, c > 0$$

The third quadric surface based on the ellipse is the *elliptic paraboloid*.

### DEFINITION Elliptic Paraboloid

The graph of an **elliptic paraboloid** has an equation of the form

$$z = \frac{x^2}{a^2} + \frac{y^2}{b^2} \quad a > 0, b > 0$$

See Figure 61(a). An elliptic paraboloid has only one intercept, the origin  $(0, 0, 0)$ , called the **vertex**. The trace of an elliptic paraboloid in the  $xy$ -plane is the vertex. The traces parallel to the  $xy$ -plane are ellipses. The traces in the other two coordinate planes are parabolas:  $z = \frac{y^2}{b^2}$  in the  $yz$ -plane, and  $z = \frac{x^2}{a^2}$  in the  $xz$ -plane. Traces parallel to the  $xz$ - and  $yz$ -coordinate planes are parabolas. Since  $z \geq 0$ , the surface (except for the origin) lies above the  $xy$ -plane.

If  $a = b$ , the surface is a **paraboloid of revolution**, and the traces parallel to the  $xy$ -plane are circles. See Figure 61(b).

Figure 60

DF Figure 61

Other forms of an elliptic paraboloid are

$$x = \frac{y^2}{b^2} + \frac{z^2}{c^2} \quad y = \frac{x^2}{a^2} + \frac{z^2}{c^2} \quad a > 0, b > 0, c > 0$$

### EXAMPLE 1 Identifying Quadric Surfaces

Identify each quadric surface. List its intercepts and its traces in the coordinate planes.

(a)  $4x^2 + 9y^2 + z^2 = 36$       (b)  $x = \frac{y^2}{4} + z^2$

**Solution** (a) We recognize this as an ellipsoid because it has three squared terms and all the coefficients are positive. To find its intercepts and traces, divide the equation by 36 to put it in standard form.

$$\frac{x^2}{9} + \frac{y^2}{4} + \frac{z^2}{36} = 1$$

$$\frac{x^2}{3^2} + \frac{y^2}{2^2} + \frac{z^2}{6^2} = 1$$

The intercepts of the ellipsoid are  $(3, 0, 0)$ ,  $(-3, 0, 0)$ ,  $(0, 2, 0)$ ,  $(0, -2, 0)$ ,  $(0, 0, 6)$ , and  $(0, 0, -6)$ .

The traces are all ellipses. In the  $xy$ -plane, the trace is  $\frac{x^2}{9} + \frac{y^2}{4} = 1$ ; in the  $xz$ -plane, the trace is  $\frac{x^2}{9} + \frac{z^2}{36} = 1$ ; and in the  $yz$ -plane, the trace is  $\frac{y^2}{4} + \frac{z^2}{36} = 1$ . Figure 62 shows the graph of the ellipsoid.

(b) This equation defines an elliptic paraboloid. Its only intercept (vertex) is  $(0, 0, 0)$ .

The trace in the  $yz$ -plane is the vertex  $(0, 0, 0)$  and traces parallel to the  $yz$ -plane are ellipses, provided  $x > 0$ .

To find the trace in the  $xy$ -plane, let  $z = 0$ . The trace is the parabola  $x = \frac{y^2}{4}$ . To find the trace in the  $xz$ -plane, let  $y = 0$ . The trace is the parabola  $x = z^2$ . ■

Figure 63 shows the graph of the elliptic paraboloid.

**NOW WORK** Problems 9(a) and 9(b).

## 2 Identify Quadric Surfaces Based on a Hyperbola

There are three quadric surfaces that are based on a hyperbola. Each of these surfaces has at least one trace that is a hyperbola.

### DEFINITION Hyperbolic Paraboloid

The graph of a **hyperbolic paraboloid** has an equation of the form

$$z = \frac{y^2}{b^2} - \frac{x^2}{a^2} \quad a > 0, b > 0$$

See Figure 64. The origin is the only intercept of the hyperbolic paraboloid. The trace in the  $xy$ -plane is the pair of lines  $\frac{y}{b} = \pm \frac{x}{a}$ , which intersect at the origin. The

traces parallel to the  $xy$ -plane are hyperbolas given by the equations  $\frac{y^2}{b^2} - \frac{x^2}{a^2} = k$ , where  $z = k$ .

Figure 62  $4x^2 + 9y^2 + z^2 = 36$

Figure 63  $x = \frac{y^2}{4} + z^2$

DF Figure 64 Hyperbolic paraboloid:

$$z = \frac{y^2}{b^2} - \frac{x^2}{a^2}$$

The trace in the  $xz$ -plane is the parabola  $z = -\frac{x^2}{a^2}$ , which opens down. Traces parallel to the  $xz$ -plane are also parabolas that open down. The trace in the  $yz$ -plane is the parabola  $z = \frac{y^2}{b^2}$ , which opens up. Traces parallel to the  $yz$ -plane are also parabolas that open up.

Notice that the origin is a minimum point for the trace in the  $yz$ -plane and is a maximum point for the trace in the  $xz$ -plane. Because of the graph's appearance, the origin is called a **saddle point** of the surface.

Other forms of a hyperbolic paraboloid are

$$x = \frac{y^2}{b^2} - \frac{z^2}{c^2} \quad y = \frac{x^2}{a^2} - \frac{z^2}{c^2} \quad a > 0, b > 0, c > 0$$

(a) Hyperboloid of one sheet

(b) Hyperboloid of revolution

Figure 65

**NOTE** Remember the cooling towers from Chapter 6? They are physical examples of a hyperboloid of revolution.

Figure 66 A hyperboloid of two sheets:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$$

### DEFINITION Hyperboloid of One Sheet

The graph of a **hyperboloid of one sheet** has an equation of the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1 \quad a > 0, b > 0, c > 0$$

See Figure 65(a). The intercepts a hyperboloid of one sheet are  $(\pm a, 0, 0)$  and  $(0, \pm b, 0)$ . The trace in the  $xy$ -plane is the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ , and all traces parallel to the  $xy$ -plane are also ellipses. The trace in the  $yz$ -plane is the hyperbola  $\frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$ ; the trace in the  $xz$ -plane is the hyperbola  $\frac{x^2}{a^2} - \frac{z^2}{c^2} = 1$ . Traces parallel to the  $yz$ - and  $xz$ -planes are also hyperbolas. The  $z$ -axis is called the **axis** of the hyperboloid of one sheet.

If  $a = b$ , the surface is a **hyperboloid of revolution**. See Figure 65(b). Other forms of a hyperboloid of one sheet are

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \quad \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \quad a > 0, b > 0, c > 0$$

The equation defining a hyperboloid of one sheet has a 1 on the right side; the equation defining a *hyperboloid of two sheets* has a  $-1$  on the right.

### DEFINITION Hyperboloid of Two Sheets

The graph of a **hyperboloid of two sheets** has an equation of the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1 \quad a > 0, b > 0, c > 0$$

A hyperboloid of two sheets is shown in Figure 66. It has two intercepts  $(0, 0, c)$  and  $(0, 0, -c)$ . Also, the surface consists of two parts, one for which  $z \geq c$ , and the other for which  $z \leq -c$ .

If  $z = 0$ , the equation has no real solution, so there is no trace in the  $xy$ -plane. Traces parallel to the  $xy$ -plane are ellipses and are defined for  $|z| > c$ . The traces in the  $yz$ -plane and the  $xz$ -plane are the hyperbolas  $\frac{z^2}{c^2} - \frac{y^2}{b^2} = 1$  and  $\frac{z^2}{c^2} - \frac{x^2}{a^2} = 1$ , respectively. Traces parallel to these coordinate planes are also hyperbolas. The  $z$ -axis is called the **axis** of the hyperboloid of two sheets.

Other forms of a hyperboloid of two sheets are

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = -1 \quad -\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = -1 \quad a > 0, b > 0, c > 0$$

### EXAMPLE 2 Identifying Quadric Surfaces

Identify each quadric surface. List its intercepts and its traces in the coordinate planes.

(a)  $x^2 - y^2 + z^2 = -9$       (b)  $z = \frac{x^2}{9} - \frac{y^2}{4}$

**Solution** (a) We begin by dividing the equation by 9 to put it in standard form.

$$\frac{x^2}{9} - \frac{y^2}{9} + \frac{z^2}{9} = -1$$

This is a hyperboloid of two sheets. It has two intercepts  $(0, 3, 0)$  and  $(0, -3, 0)$ . If  $y = 0$ , the equation has no real solution, so there is no trace in the  $xz$ -plane. Traces parallel to the  $xz$ -plane are ellipses and are defined for  $|y| > 3$ . The trace in the  $xy$ -plane is the hyperbola  $\frac{y^2}{9} - \frac{x^2}{9} = 1$  and the trace in the  $yz$ -plane is the hyperbola  $\frac{y^2}{9} - \frac{z^2}{9} = 1$ . Traces parallel to the  $xy$ - and  $yz$ -plane are also hyperbolas.

The  $y$ -axis is the axis of this hyperboloid of two sheets. See Figure 67 for the graph.

(b) This equation defines a hyperbolic paraboloid. The only intercept is at the origin. The trace in the  $xy$ -plane is the pair of lines  $y = \pm \frac{2}{3}x$ , which intersect at the origin. The traces parallel to the  $xy$ -plane are hyperbolas given by the equations  $\frac{x^2}{9} - \frac{y^2}{4} = k$ , where  $z = k$ .

The trace in the  $xz$ -plane is the parabola  $z = \frac{x^2}{9}$ , which opens up. Traces parallel to the  $xz$ -plane are also parabolas that open up. The trace in the  $yz$ -plane is the parabola  $z = -\frac{y^2}{4}$ , which opens down. Traces parallel to the  $yz$ -plane are also parabolas that open down.

The origin is the saddle point of the hyperbolic paraboloid. See Figure 68 for the graph. ■

### NOW WORK Problem 19.

## 3 Identify Cylinders

The three remaining quadric surfaces are called *cylinders*. Their standard equations are characterized by the fact that one of the variables is missing from the equation. In naming these surfaces, we have chosen  $z$  as the missing variable. As a result,  $z$  is an unrestricted variable, so these cylinders will be unbounded in the  $z$  direction.

Cylinders are surfaces that are generated by a line moving along a plane curve while remaining perpendicular\* to the plane. Cylinders are named for the trace in the plane in which the unrestricted variable is 0; here, the  $xy$ -plane ( $z = 0$ ).

Figure 67  $x^2 - y^2 + z^2 = -9$

Figure 68  $z = \frac{x^2}{9} - \frac{y^2}{4}$

**NOTE** Any of the three variables  $x$ ,  $y$ , or  $z$  can be omitted. The corresponding graphs are unbounded in the direction of the missing variable.

\*In general, the line moving along the plane curve can meet the curve at any constant angle. We only discuss cylinders for which this angle is  $90^\circ$ .

**DF** Figure 69 Parabolic cylinder:  $x^2 = 4ay$

**DF** Figure 70 Elliptic cylinder:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

**Figure 71** Hyperbolic cylinder:

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

### DEFINITION Parabolic Cylinder

The graph of a **parabolic cylinder** has an equation of the form

$$x^2 = 4ay \quad a \neq 0$$

See Figure 69. This parabolic cylinder does not include the variable  $z$ , so the trace in the  $xy$ -plane is the parabola  $x^2 = 4ay$ . The surface is generated by moving a line along the parabola while remaining perpendicular to the plane containing the parabola. It can be visualized by taking a piece of paper and bending it so that an edge of the paper traces out a portion of a parabola.

### DEFINITION Elliptic Cylinder

The graph of an **elliptic cylinder** has an equation of the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad a > 0, b > 0$$

See Figure 70. The trace of an elliptic cylinder in the  $xy$ -plane is an ellipse with its center at the origin. The surface is generated by moving a line along the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  while remaining perpendicular to the plane containing the ellipse. An elliptic cylinder can be visualized by taking a piece of paper and attaching the two opposite edges in the shape of an ellipse.

If  $a = b$ , then the trace in the  $xy$ -plane is a circle, and the cylinder is a right circular cylinder with radius  $a$ .

### DEFINITION Hyperbolic Cylinder

The graph of a **hyperbolic cylinder** has an equation of the form

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad a > 0, b > 0$$

See Figure 71. The surface is generated by moving a line along one branch of the hyperbola  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  while remaining perpendicular to the plane containing the hyperbola and then repeating the procedure on the second branch. The intercepts are  $(\pm a, 0, 0)$ . The hyperbolic cylinder consists of two parts, neither of which touches the  $z$ -axis. A hyperbolic cylinder can be visualized by bending two pieces of paper so that the curved edges trace out a portion of a hyperbola.

### EXAMPLE 3 Identifying a Cylinder

Identify the cylinder defined by the equation  $y^2 = 8z$ . Describe how it can be generated.

**Solution**  $y^2 = 8z$  is an equation of a parabolic cylinder. Since  $x$  is the missing variable, the cylinder is generated by moving a line that is perpendicular to the  $yz$ -plane along the parabola  $y^2 = 8z$ . See Figure 72 on page 750. ■

### NOW WORK Problem 23.

The quadric surfaces classified here are in standard position, with centers (or vertices) at the origin and symmetries with respect to the coordinate axes. When the center (or vertex) of a quadric surface is not located at the origin, but there is symmetry with respect to the lines parallel to the coordinate axes, a translation of axes may be applied to put the

Figure 72  $y^2 = 8z$ 

equation in standard form. The correct translation is obtained by completing squares. If the symmetry of the quadric surface is with respect to the lines that are not parallel to the coordinate axes, a rotation of axes, perhaps followed by a translation of axes, is required to put the equation in standard form.

Using rotations and translations, the list of nine basic equations provides an exhaustive classification of quadric surfaces. Rotations in space are somewhat involved and are not discussed here. However, the idea is quite similar to that of rotations in the plane.

## 4 Graph Quadric Surfaces

Quadrics are best graphed using a CAS. Comparing the given equation to those discussed in the section helps to identify the graph. Here are some suggestions to help make the comparison:

- Remember that the equations of the quadric surfaces listed are given in standard form. Interchanging the variables does not affect the classification; it only affects the orientation of the quadric surface. For example,  $z = \frac{x^2}{4} + \frac{y^2}{9}$  is the equation of an elliptic paraboloid whose graph lies above the  $xy$ -plane. The graph of  $y = \frac{x^2}{9} + \frac{z^2}{4}$  is also an elliptic paraboloid, but its graph lies to the right of the  $xz$ -plane.
- Cylinders are characterized by a variable missing from the equation. For example, the graph of the equation  $\frac{y^2}{4} + \frac{z^2}{9} = 1$  is an elliptic cylinder perpendicular to the  $yz$ -plane.
- The technique of completing the square is sometimes required to identify the given quadric surface. In this case, a translation of axes will help to find the correct location of the graph.

Figure 73  $\frac{x^2}{9} - \frac{y^2}{2} + \frac{z^2}{4} = 1$ 

### EXAMPLE 4 Graphing Quadric Surfaces Using a CAS

Identify each equation and use a CAS to obtain its graph.

(a)  $4x^2 - 18y^2 + 9z^2 = 36$       (b)  $4y^2 + 9z^2 - 36x^2 = 0$       (c)  $x^2 + z^2 - 4x = 0$

**Solution** (a) Divide both sides of the equation by 36, obtaining

$$\frac{x^2}{9} - \frac{y^2}{2} + \frac{z^2}{4} = 1$$

This equation has three squared variables, one term negative, with 1 on the right, so it represents a hyperboloid of one sheet. Since the  $y$  term is negative, the  $y$ -axis is the axis of the hyperboloid of one sheet. See Figure 73.

The intercepts are  $(3, 0, 0)$ ,  $(-3, 0, 0)$ ,  $(0, 0, 2)$ , and  $(0, 0, -2)$ . There are no  $y$ -intercepts.

The trace in the  $xz$ -plane is the ellipse  $\frac{x^2}{9} + \frac{z^2}{4} = 1$ , and all traces parallel to the  $xz$ -plane are also ellipses. The trace in the  $xy$ -plane is the hyperbola  $\frac{x^2}{9} - \frac{y^2}{2} = 1$ . The trace in the  $yz$ -plane is the hyperbola  $-\frac{y^2}{2} + \frac{z^2}{4} = 1$ . Traces parallel to the  $xy$ - and  $yz$ -planes are also hyperbolas. The  $y$ -axis is the axis of the hyperboloid of one sheet.

(b) We begin by writing the equation as

$$x^2 = \frac{y^2}{9} + \frac{z^2}{4}$$

Observe that the equation has three variables, all of which are squared, and no constant. This is the equation of an elliptic cone. See Figure 74.

Figure 74  $x^2 = \frac{y^2}{9} + \frac{z^2}{4}$

Figure 75  $(x - 2)^2 + z^2 = 4$ 

The vertex of the cone is at the origin  $(0, 0, 0)$ .

The trace of the elliptic cone in the  $yz$ -plane is the origin. Traces parallel to the  $yz$ -plane are ellipses centered on the  $x$ -axis. The trace in the  $xy$ -plane consists of the pair of intersecting lines  $x = \pm \frac{y}{3}$ , and the trace in the  $xz$ -plane consists of the pair of intersecting lines  $x = \pm \frac{z}{2}$ .

(c) Since the  $y$  variable is missing, the surface is a cylinder. To identify it, we complete the square in  $x$ :

$$x^2 + z^2 - 4x = 0$$

$$(x - 2)^2 + z^2 = 4$$

This is the equation of a right circular cylinder with a radius 2. The trace in the  $xz$ -plane is a circle of radius 2 and with its center at the point  $(2, 0, 0)$ . See Figure 75. ■

## 10.7 Assess Your Understanding

### Concepts and Vocabulary

- Multiple Choice** The trace in the  $xy$ -plane of the graph of the equation  $\frac{x^2}{2} - \frac{y^2}{3} + \frac{z^2}{4} = 1$  is  
 [(a)  $\frac{x^2}{2} + \frac{z^2}{4} = 1$ , (b)  $\frac{x^2}{2} - \frac{y^2}{3} = 0$ , (c)  $\frac{x^2}{2} - \frac{y^2}{3} = 1$ ].
- The intercept(s) of the graph of  $\frac{x^2}{4} - \frac{y^2}{9} - z = 4$  is(are) \_\_\_\_\_.
- True or False** A cylinder is formed when a line moves along a plane curve while remaining perpendicular to the plane containing the curve.
- Multiple Choice** The quadric surface  $z^2 = x^2 + \frac{y^2}{4}$  is called a(n) [(a) elliptic cylinder, (b) elliptic cone, (c) elliptic paraboloid, (d) hyperboloid].
- The quadric surface  $y^2 - x^2 = 4$  is called a(n) \_\_\_\_\_.
- The point  $(0, 0, 0)$  on the hyperbolic paraboloid  $z = \frac{y^2}{2^2} - \frac{x^2}{5^2}$  is called a(n) \_\_\_\_\_.

### Skill Building

In Problems 7–18:

- Identify the equation of each quadric surface.
- List the intercepts and traces.
- Graph each quadric surface.

CAS

- |                             |                            |
|-----------------------------|----------------------------|
| 7. $z = x^2 + y^2$          | 8. $z = x^2 - y^2$         |
| 9. $4x^2 + y^2 + 4z^2 = 4$  | 10. $2x^2 + y^2 + z^2 = 1$ |
| 11. $z^2 = x^2 + 2y^2$      | 12. $x^2 + 2y^2 - z^2 = 1$ |
| 13. $x = 4z^2$              | 14. $x^2 + y^2 = 1$        |
| 15. $x^2 + 2y^2 - z^2 = -4$ | 16. $y^2 - x^2 = 4$        |
| 17. $2x = y^2$              | 18. $4y^2 - x^2 = 1$       |

In Problems 19–24, use the Figures A–F to match each graph to an equation.

19.  $z = 4y^2 - x^2$

20.  $2z = x^2 + 4y^2$

21.  $2x^2 + y^2 - z^2 = 1$

22.  $2x^2 + y^2 + 3z^2 = 1$

23.  $y^2 = 4x$

24.  $x^2 - z^2 = y$

Figures G–L are graphs of quadric surfaces. In Problems 25–30, match each equation with its graph.

25.  $3x^2 + 4y^2 + z = 0$       26.  $3x^2 + 4y^2 + 4y = 0$   
 27.  $3x^2 + 2y^2 - (z - 2)^2 + 1 = 0$       28.  $z^2 - 4x^2 = 3y$   
 29.  $x^2 + 2y^2 - z^2 + 4z = 4$       30.  $3x^2 + 3y^2 + z^2 = 1$

### Applications and Extensions

31. Explain why the graph of  $xy = 1$  in space is a cylinder.  
 32. Explain why the graph of  $z = \sin y$  in space is a cylinder.

**CAS** 33. Graph:

- (a)  $xy = 1$   
 (b)  $z = \sin y$   
 (c)  $z = xy$ . (This surface is a hyperbolic paraboloid rotated  $45^\circ$  about the  $z$ -axis.)

### Challenge Problem

34. Show that through each point on the hyperboloid of one sheet

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$$

there are two lines lying entirely on the surface. (Hint: Write the equation as  $\frac{x^2}{a^2} - \frac{z^2}{c^2} = 1 - \frac{y^2}{b^2}$  and factor.)

## Chapter Review

### THINGS TO KNOW

#### 10.1 Rectangular Coordinates in Space

- The right-hand rule (p. 695)
- The distance formula in space: (p. 696)  
 $|P_1 P_2| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$
- The equation of a sphere: (p. 697)  
 $(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = R^2$   
 Center:  $(x_0, y_0, z_0)$ ; Radius:  $R$

#### 10.2 Introduction to Vectors

- Vectors (p. 699)

**Properties of vector addition:** (p. 701)

- Commutative property:  $\mathbf{w} + \mathbf{v} = \mathbf{v} + \mathbf{w}$
- Associative property:  $\mathbf{u} + (\mathbf{v} + \mathbf{w}) = (\mathbf{u} + \mathbf{v}) + \mathbf{w}$

- Additive identity property:  $\mathbf{v} + \mathbf{0} = \mathbf{0} + \mathbf{v} = \mathbf{v}$
- Additive inverse property:  $\mathbf{v} + (-\mathbf{v}) = (-\mathbf{v}) + \mathbf{v} = \mathbf{0}$

**Properties of scalar multiplication:** (p. 701)

If  $\mathbf{v}$  and  $\mathbf{w}$  are any two vectors, and  $a$  and  $b$  are scalars, then:

- $0\mathbf{v} = \mathbf{0}$
- $1\mathbf{v} = \mathbf{v}$
- $(-1)\mathbf{v} = -\mathbf{v}$
- $(a + b)\mathbf{v} = a\mathbf{v} + b\mathbf{v}$
- $a(\mathbf{v} + \mathbf{w}) = a\mathbf{v} + a\mathbf{w}$
- $a(b\mathbf{v}) = (ab)\mathbf{v}$

#### 10.3 Vectors in the Plane and in Space

- Two vectors are equal if and only if their components are equal. (p. 705)
- Two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  are parallel if there is a nonzero scalar  $a$  for which  $\mathbf{v} = a\mathbf{w}$ . (p. 706)

- Magnitude of a vector  $\mathbf{v}$  in the plane: (p. 707)

$$\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2}, \quad \text{where } \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}$$

in space:

$$\|\mathbf{v}\| = \sqrt{v_1^2 + v_2^2 + v_3^2}, \quad \text{where } \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$$

- A unit vector  $\mathbf{u}$  has magnitude 1; that is,  $\|\mathbf{u}\| = 1$ . (p. 708)
- For any nonzero vector  $\mathbf{v}$ ,  $\mathbf{u} = \frac{\mathbf{v}}{\|\mathbf{v}\|}$  is a unit vector that has the same direction as  $\mathbf{v}$ . (p. 708)
- Standard basis vectors in the plane: (pp. 708–709)

$$\mathbf{i} = \langle 1, 0 \rangle \quad \mathbf{j} = \langle 0, 1 \rangle$$

in space:

$$\mathbf{i} = \langle 1, 0, 0 \rangle \quad \mathbf{j} = \langle 0, 1, 0 \rangle \quad \mathbf{k} = \langle 0, 0, 1 \rangle$$

- If  $\mathbf{v}$  is a nonzero vector in the plane, then  $\mathbf{v} = \|\mathbf{v}\|(\cos \theta \mathbf{i} + \sin \theta \mathbf{j})$ , where  $\theta$  is the angle between  $\mathbf{v}$  and the positive  $x$ -axis. (p. 709)

## 10.4 The Dot Product

**Dot product:** (pp. 715)

- If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j}$ , then  $\mathbf{v} \cdot \mathbf{w} = v_1w_1 + v_2w_2$ .
- If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$ , then  $\mathbf{v} \cdot \mathbf{w} = v_1w_1 + v_2w_2 + v_3w_3$ .

**Properties of the dot product:** (p. 716)

- Magnitude property:  $\mathbf{v} \cdot \mathbf{v} = \|\mathbf{v}\|^2$
- Commutative property:  $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
- Distributive property:  $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
- Linearity property:  $a(\mathbf{u} \cdot \mathbf{v}) = (a\mathbf{u}) \cdot \mathbf{v}$
- Zero-vector property:  $\mathbf{0} \cdot \mathbf{v} = 0$
- The angle  $\theta$  between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$ :  $\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|}$ ;  $0 \leq \theta \leq \pi$  (p. 717)
- Two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  are orthogonal if and only if  $\mathbf{v} \cdot \mathbf{w} = 0$ . (p. 718)
- Direction angles  $\alpha, \beta, \gamma$  of a nonzero vector  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ : (p. 719)

$$\cos \alpha = \frac{v_1}{\sqrt{v_1^2 + v_2^2 + v_3^2}} = \frac{v_1}{\|\mathbf{v}\|}$$

$$\cos \beta = \frac{v_2}{\sqrt{v_1^2 + v_2^2 + v_3^2}} = \frac{v_2}{\|\mathbf{v}\|}$$

$$\cos \gamma = \frac{v_3}{\sqrt{v_1^2 + v_2^2 + v_3^2}} = \frac{v_3}{\|\mathbf{v}\|}$$

- For a vector  $\mathbf{v}$  in space:  $\mathbf{v} = \|\mathbf{v}\|[\cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}]$  (p. 719)
- Decomposition of a nonzero vector  $\mathbf{v}$ : (p. 720)

$$\text{Projection of } \mathbf{v} \text{ along } \mathbf{w} \text{ is } \mathbf{v}_1 = \text{proj}_{\mathbf{w}} \mathbf{v} = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{w}\|^2} \mathbf{w}$$

$$\text{The vector } \mathbf{v}_2 \text{ perpendicular to } \mathbf{w} \text{ is } \mathbf{v}_2 = \mathbf{v} - \mathbf{v}_1$$

## 10.5 The Cross Product

- Cross product: (p. 725)

If  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$  and  $\mathbf{w} = w_1\mathbf{i} + w_2\mathbf{j} + w_3\mathbf{k}$ , then  $\mathbf{v} \times \mathbf{w} = (v_2w_3 - v_3w_2)\mathbf{i} - (v_1w_3 - v_3w_1)\mathbf{j} + (v_1w_2 - v_2w_1)\mathbf{k}$ .

- Algebraic properties of the cross product: (p. 726)

If  $\mathbf{u}, \mathbf{v}$ , and  $\mathbf{w}$  are vectors in space and if  $a$  is a scalar, then

- $\mathbf{v} \times \mathbf{v} = \mathbf{0}$
- $\mathbf{v} \times \mathbf{w} = -(\mathbf{w} \times \mathbf{v})$
- $a(\mathbf{v} \times \mathbf{w}) = (a\mathbf{v}) \times \mathbf{w} = \mathbf{v} \times (a\mathbf{w})$
- $\mathbf{v} \times (\mathbf{w} + \mathbf{u}) = (\mathbf{v} \times \mathbf{w}) + (\mathbf{v} \times \mathbf{u})$
- $\|\mathbf{v} \times \mathbf{w}\|^2 = \|\mathbf{v}\|^2 \|\mathbf{w}\|^2 - (\mathbf{v} \cdot \mathbf{w})^2$

- Geometric properties of the cross product: (p. 727)

If  $\mathbf{v}$  and  $\mathbf{w}$  are nonzero vectors in space, then

- $\mathbf{v} \times \mathbf{w}$  is orthogonal to both  $\mathbf{v}$  and  $\mathbf{w}$ .
- $\|\mathbf{v} \times \mathbf{w}\| = \|\mathbf{v}\| \|\mathbf{w}\| \sin \theta$ , where  $\theta$  is the angle between  $\mathbf{v} \neq \mathbf{0}$  and  $\mathbf{w} \neq \mathbf{0}$ .
- $\|\mathbf{v} \times \mathbf{w}\|$  is the area of the parallelogram having  $\mathbf{v} \neq \mathbf{0}$  and  $\mathbf{w} \neq \mathbf{0}$  as adjacent sides.
- $\mathbf{v} \times \mathbf{w} = \mathbf{0}$  if and only if  $\mathbf{v}$  and  $\mathbf{w}$  are parallel vectors.

## 10.6 Equations of Lines and Planes in Space

**Lines:**

- Vector equation of a line:  $\mathbf{r} = \mathbf{r}_0 + t\mathbf{D}$  (p. 733)
- Parametric equations of a line:  $x = x_0 + at, y = y_0 + bt, z = z_0 + ct$  (p. 734)
- Symmetric equations of a line:  $\frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$  where  $abc \neq 0$ . (p. 735)

**Planes:**

- Vector equation of a plane:  $(\mathbf{r} - \mathbf{r}_0) \cdot \mathbf{N} = 0$ , where  $\mathbf{N}$  is normal to the plane. (p. 737)
- General equation of a plane:  $Ax + By + Cz = D$ , where at least one number  $A, B, C$  is not 0. (p. 738)
- Distance  $d$  from a point  $(x_0, y_0, z_0)$  to a plane  $Ax + By + Cz = D$ :

$$d = \frac{|Ax_0 + By_0 + Cz_0 - D|}{\sqrt{A^2 + B^2 + C^2}} \quad (\text{p. 740})$$

## 10.7 Quadric Surfaces

- Ellipsoid:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  (p. 744)
- Elliptic cone:  $z^2 = \frac{x^2}{a^2} + \frac{y^2}{b^2}$  (p. 745)
- Elliptic paraboloid:  $z = \frac{x^2}{a^2} + \frac{y^2}{b^2}$  (p. 745)
- Hyperbolic paraboloid:  $z = \frac{y^2}{b^2} - \frac{x^2}{a^2}$  (p. 746)
- Hyperboloid of one sheet:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$  (p. 747)
- Hyperboloid of two sheets:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$  (p. 747)
- Parabolic cylinder:  $x^2 = 4ay$  (p. 749)
- Elliptic cylinder:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  (p. 749)
- Hyperbolic cylinder:  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  (p. 749)

## OBJECTIVES

| Section | You should be able to ...                                                           | Example    | Review Exercises |
|---------|-------------------------------------------------------------------------------------|------------|------------------|
| 10.1    | 1 Locate points in space (p. 695)                                                   |            | 1, 2             |
|         | 2 Find the distance between two points in space (p. 696)                            | 1          | 5, 24            |
|         | 3 Find the equation of a sphere (p. 697)                                            | 2, 3       | 6, 7, 24         |

## REVIEW EXERCISES

- Opposite vertices of a rectangular box whose edges are parallel to the coordinate axes are  $(1, 0, 2)$  and  $(2, 3, 4)$ . List the coordinates of the other six vertices of the box.
- Describe in words the set of all points  $(x, y, z)$  that satisfy  $y = 3$ .
- The vector  $\mathbf{v}$  has initial point  $P_1 = (5, 0, -2)$  and terminal point  $P_2 = (7, 1, 3)$ .
  - Write the vector  $\mathbf{v}$  in terms of its components.
  - Write the vector  $\mathbf{v}$  in terms of standard basis vectors.
- Find the magnitude of the vector  $\mathbf{v} = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ .
- Find the distance between the points  $(1, 2, 3)$  and  $(7, 5, 1)$ .
- Write the equation of the sphere with center at the point  $(1, 2, 3)$  and radius 4.
- Find the radius and center of the sphere:  $x^2 + y^2 + z^2 - 4x + 8y = 5$ .
- If  $\mathbf{v} = \langle -2, -1, 3 \rangle$  and  $\mathbf{w} = \langle 5, 4, -2 \rangle$ , find  $3\mathbf{v} - 2\mathbf{w}$ .
- If  $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j} - \mathbf{k}$  and  $\mathbf{w} = -\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$ , find  $\|\mathbf{v} + \mathbf{w}\|$ .
- Find a unit vector in the direction of  $\mathbf{v} = 4\mathbf{i} + 12\mathbf{j} - 3\mathbf{k}$ .
- Find a vector  $\mathbf{v}$  in the plane with magnitude 25 if the angle between  $\mathbf{v}$  and  $\mathbf{i}$  is  $120^\circ$ .
- Find  $\mathbf{v}$  and  $\mathbf{w}$  if
 
$$\mathbf{w} - 3\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k} \quad \text{and} \quad 2\mathbf{w} + \mathbf{v} = \mathbf{i} + \mathbf{j}$$
- (a) Find the magnitude and direction cosines of the vector  $\mathbf{v} = 5\mathbf{i} + 8\mathbf{j} - 2\mathbf{k}$ .  
(b) Write  $\mathbf{v}$  in terms of its magnitude and direction cosines.
- Find the vector projection of  $\mathbf{v} = 3\mathbf{i} + \mathbf{j} - 2\mathbf{k}$  on  $\mathbf{w} = 5\mathbf{i} - \mathbf{j} + \mathbf{k}$ . Decompose  $\mathbf{v}$  into two vectors  $\mathbf{v}_1$  and  $\mathbf{v}_2$ , where  $\mathbf{v}_1$  is parallel to  $\mathbf{w}$  and  $\mathbf{v}_2$  is orthogonal to  $\mathbf{w}$ .
- Find the work done in moving an object along a vector  $\mathbf{u} = 3\mathbf{i} + 2\mathbf{j} - 5\mathbf{k}$  if the applied force is  $\mathbf{F} = 2\mathbf{i} - \mathbf{j} - \mathbf{k}$ . Use meters for distance and newtons for force.
- Three forces are applied to an object in mutually orthogonal directions: 12 units along the  $x$ -axis, 16 units along the  $y$ -axis, and 15 units along the  $z$ -axis. What is the resultant force?
- Find the angle between the vectors  $\mathbf{u} = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$  and  $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j} - \mathbf{k}$ .

18. Find the angle at the vertex  $A$  of the triangle  $ABC$  with vertices  $A = (1, 0, 1)$ ,  $B = (2, -1, 1)$ , and  $C = (-2, 1, 0)$ .

19. Find the distance between the parallel planes

$$p_1: x + y - z = 1$$

$$p_2: -2x - 2y + 2z = 2$$

20. A rigid body rotates with constant angular speed of  $\omega$  radians per second about a line through the origin and parallel to  $2\mathbf{i} + 3\mathbf{j} + 6\mathbf{k}$ . Find the speed of an object on this body at the instant it passes through the point  $(1, 2, 3)$ . Assume the distance is in meters.

21. Find the line perpendicular to the lines

$$l: x = 1 - t, \quad y = t, \quad z = 2t - 1$$

$$m: x = t + 1, \quad y = -t, \quad z = t - 1$$

22. Find the line containing the point  $(1, 2, 3)$  in the direction of  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} - 4\mathbf{k}$ .

23. Find the scalar  $a$  so that  $\mathbf{v} = 2\mathbf{i} - \mathbf{j} - 4\mathbf{k}$  and  $\mathbf{w} = a\mathbf{i} + a\mathbf{j} + 3\mathbf{k}$  are orthogonal.

24. Find an equation of the sphere with  $(2, 2, -3)$  and  $(-2, 6, 5)$  as endpoints of a diameter. Graph the sphere.

25. Find the line of intersection of the two planes  $p_1: x - y + z = 3$  and  $p_2: 2x + 2y - z = 1$ .

26. Find an equation of the plane with nonzero intercepts  $(a, 0, 0)$ ,  $(0, b, 0)$ ,  $(0, 0, c)$ .

27. Use the vectors in the figure to graph each of the following vectors:

(a)  $(2 + 3)\mathbf{v}$       (b)  $2(\mathbf{u} - \mathbf{w})$       (c)  $(\mathbf{u} + \mathbf{v}) + \mathbf{w}$

(d)  $\mathbf{v} + (-\mathbf{v})$       (e)  $\mathbf{u} - 3\mathbf{v}$

28. Determine whether the lines  $l_1$  and  $l_2$  intersect, are parallel, or are skew.

$$l_1: \frac{x+5}{6} = \frac{y-2}{3} = \frac{z+4}{7}$$

$$l_2: \frac{x+5}{6} = \frac{y+1}{3} = \frac{z-2}{7}$$

29. Find the general equation of the plane containing the point

$$(2, -1, 4) \text{ and normal to the line } \frac{x+3}{2} = \frac{y-3}{3} = z.$$

30. Determine whether the lines  $l_1$  and  $l_2$  intersect, are parallel, or are skew.

$$l_1: x = t + 1, \quad y = 3t, \quad z = t - 1$$

$$l_2: \frac{x+3}{2} = \frac{y-3}{3} = z$$

31. Find a line normal to the plane containing the lines

$$x - 2 = \frac{y+1}{2} = \frac{z-1}{2} \quad \text{and} \quad x + 1 = \frac{y+8}{3} = \frac{z}{-3}$$

at their point of intersection.

32. Find the line containing the points  $P_1 = (4, 0, 7)$  and  $P_2 = (5, 3, 6)$ .

In Problems 33–37:

(a) Identify each quadric surface.

(b) List its intercepts and traces.

**CAS** (c) Graph the quadric surface.

33.  $\frac{x^2}{4} - \frac{y^2}{9} = 1$

34.  $x^2 + y^2 - \frac{z^2}{4} = -1$

35.  $z = \frac{x^2}{4} - \frac{y^2}{9}$

36.  $z^2 = \frac{x^2}{4} + \frac{y^2}{9}$

37.  $\frac{x^2}{4} + \frac{y^2}{9} + z^2 = 1$

## CHAPTER 10 PROJECT

### The Hall Effect

While investigating the effects of magnets on electric current in 1879, E. H. Hall observed a phenomenon that is now used to measure the density of electric charge carriers in semiconductors. The so-called **Hall effect** describes the creation of a

voltage, or potential difference, on opposite sides of a conductor in the presence of an external magnetic field, created when an electric current flows through it. The magnetic field exerts a force on the moving carriers that tends to push them to one side of the conductor. The buildup of charges at the sides of the conductor balances the

magnetic influence and produces a voltage between the two sides of the conductor.

The geometry of this situation is based on the relationships among the initial velocity  $\mathbf{v}_0$  of the charges, the magnetic field  $\mathbf{B}$ , and the resulting magnetic force  $\mathbf{F}_m$  on the charges.

When an electric charge  $q$  moves in the presence of a magnetic field, it experiences a magnetic force given by  $\mathbf{F}_m = q\mathbf{v} \times \mathbf{B}$ . Note that because the magnetic force is proportional to the cross product of the velocity  $\mathbf{v}$  and the magnetic field  $\mathbf{B}$ , it must be orthogonal to each of these vectors. This relationship is illustrated in Figure 76.

Assuming  $q$  has a positive charge, the velocity  $\mathbf{v}$  is in the  $\mathbf{j}$  direction, and the magnetic field  $\mathbf{B}$  is in the  $\mathbf{k}$  direction, then the resulting force  $\mathbf{F}_m$  is in the  $\mathbf{i}$  direction.

- Given the velocity and magnetic field shown in Figure 76, in what direction would the magnetic force point if  $q$  has a negative charge?

Figure 76

As charges continue to flow into the region of the magnetic field, they are deflected toward the side of the conductor in the direction of the magnetic force and collect there. At the same time, the opposite side of the material can be thought of as being deficient in the amount of charge carriers. This creates a voltage, or potential difference, between the two sides. A consequence of this is that a static electric field is created within the conductor. In the example depicted in Figure 76, the electric field  $\mathbf{E}$  would point in the  $-\mathbf{i}$  direction, as positive charges collect on the side of the material in the direction of  $\mathbf{F}_m$ . See Figure 77. Note that the magnetic field is still present as charges continue to build up and make the electric field stronger and stronger.

Figure 77 The polarity resulting from positive charge carriers, as happens in many semiconductors.

You might ask, “Won’t this electric field just keep increasing as charges continue to flow through the conductor and are deflected by the magnetic field?” This would be true if not for a competing effect—the electric field itself. The charges also experience an electric force,  $\mathbf{F}_e$ , as the electric field  $\mathbf{E}$  is created and becomes stronger. The electric force on a charge in an electric field is given by the relationship  $\mathbf{F}_e = q\mathbf{E}$ . Note that the electric force on a positive charge would be in the same direction as the electric field and the directions of the magnetic and electric forces are opposed. Then as the electric field increases, subsequent charges moving into the material experience less and less of a net force, until the electric field becomes strong enough that subsequent charges experience no net force at all. When this happens, the potential difference across the conductor is established (by the electric field) and is measured. This potential difference is often referred to as the **Hall voltage** for the conductor.

- A stream of electrons, each with a charge  $q = -1.6 \times 10^{-19}\text{C}$ , have an initial velocity  $\mathbf{v}_0$  in meters per second (m/s) of  $\mathbf{v}_0 = (1.0 \times 10^{-4})\mathbf{i} + (2.0 \times 10^{-4})\mathbf{j} - (4.0 \times 10^{-4})\mathbf{k}$ . The charges move along the length of a semiconducting material and enter a region of magnetic field measured in teslas (T) with  $\mathbf{B} = 0.5\mathbf{i} + 1.0\mathbf{j} + 0.625\mathbf{k}$ . Find the magnitude of the initial velocity and the magnetic field.
- Find unit vectors in the direction of the velocity and the magnetic field.
- Verify that the velocity  $\mathbf{v}$  and the magnetic field  $\mathbf{B}$  are orthogonal, as required for the Hall effect.
- Find the magnetic force  $\mathbf{F}_m$  on the electrons as they enter the region of the magnetic field. The units of the magnetic force are newtons (N).
- The electric force  $\mathbf{F}_e$  will grow until it is finally equal in magnitude to the magnetic force  $\mathbf{F}_m$  but in the opposite direction. Write an expression for the final electric force. What are the units of the electric force?
- Find the electric field  $\mathbf{E}$  responsible for the electric force  $\mathbf{F}_e$  found in Problem 6. Verify that  $\mathbf{E}$  points in one of the two possible directions found in Problem 6. What are the units of the electric field?

### How to Design a Safe Road

The Innerbelt Curve is a stretch of road in downtown Cleveland that has been given the ominous nickname of “Deadman’s Curve.” For decades Ohio transportation department officials have struggled to find ways to help drivers safely negotiate the sharp 90-degree curve, which has a posted speed limit of 35 mph, as they connect from one 50 mph roadway to another. Improvements have included changing the speed limit, posting warning signs, introducing rumble strips to create more friction, and modifying the bank of the curve, but accidents are still common.

Though perhaps among the more famous, Cleveland’s Deadman’s Curve is hardly the only dangerous curve among the country’s interstates and highways. And while transportation officials and engineers can look at statistical evidence to identify places where accidents are abnormally frequent, engineers who are designing new exit ramps or roadways that curve around geographical features need to understand the forces that act on an automobile of a given size and moving at a given speed so that it can safely travel the road.

**CHAPTER 11 PROJECT** In the Chapter Project on page 807, we examine four different scenarios in which forces act on a vehicle to keep it on the road.

Until now, the domain and range of a function have both been subsets of real numbers. Such functions are referred to as *real-valued functions of a real variable* or, simply, as *real functions*. In this chapter, we discuss functions whose domains remain a subset of real numbers, but whose range consists of vectors in the plane or vectors in space. Such functions are called *vector-valued functions of a real variable* or, simply, *vector functions*.

Vector functions are particularly useful for describing the motion of a particle as it moves through space. As a result, vector functions have diverse applications from describing Kepler’s laws of planetary motion to modeling DNA to producing lifelike, animated films with computer graphics.

## 11.1 Vector Functions and Their Derivatives

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the domain of a vector function (p. 758)
- 2 Graph a vector function (p. 758)
- 3 Find the limit and determine the continuity of a vector function (p. 761)
- 4 Find the derivative of a vector function (p. 762)
- 5 Find the derivative of a vector function using derivative formulas (p. 763)

A vector function is denoted by  $\mathbf{r} = \mathbf{r}(t)$ , where  $t$  is a real number and  $\mathbf{r}$  is a vector. It is customary to use  $t$  as the independent variable, because in applications it often represents time.

### DEFINITION Vector Function

A **vector-valued function of a real variable**, or simply, a **vector function**,  $\mathbf{r} = \mathbf{r}(t)$ , is a function whose domain is a subset of the set of real numbers and whose range is a set of vectors.

For a vector function  $\mathbf{r} = \mathbf{r}(t)$  in the plane whose domain is the closed interval  $a \leq t \leq b$ , the components of  $\mathbf{r}$  are two real functions  $x = x(t)$ ,  $y = y(t)$ , each defined on the interval  $a \leq t \leq b$ . So,

$$\mathbf{r} = \mathbf{r}(t) = \langle x(t), y(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j}$$

For a vector function  $\mathbf{r} = \mathbf{r}(t)$  in space whose domain is the closed interval  $a \leq t \leq b$ , the components of  $\mathbf{r}$  are three real functions  $x = x(t)$ ,  $y = y(t)$ , and  $z = z(t)$ , each defined on the interval  $a \leq t \leq b$ . So,

$$\mathbf{r} = \mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$$

**NOTE** As with vectors and scalars, the symbol for a vector function is written using boldface roman type and the symbol for a real function is written using lightface italic type.

If no domain is specified for a vector function, it is assumed that the domain consists of all real numbers for which each of the component functions is defined.

### 1 Find the Domain of a Vector Function

#### EXAMPLE 1 Finding the Domain of a Vector Function

If  $\mathbf{r}(t) = (2t + 2)\mathbf{i} + \sqrt{t}\mathbf{j} - \ln(t + 3)\mathbf{k}$ , then the components of  $\mathbf{r} = \mathbf{r}(t)$  are

$$x(t) = 2t + 2 \quad y(t) = \sqrt{t} \quad z(t) = -\ln(t + 3)$$

Since no domain is specified, it is assumed that the domain consists of all real numbers  $t$  for which each of the component functions is defined. Since  $x = x(t)$  is defined for all real numbers,  $y = y(t)$  is defined for all real numbers  $t \geq 0$ , and  $z = z(t)$  is defined for all real numbers  $t > -3$ , the domain of the vector function  $\mathbf{r} = \mathbf{r}(t)$  is the intersection of these three sets, namely, the set of nonnegative real numbers,  $\{t | t \geq 0\}$ . ■

**NOW WORK** Problem 17.

### 2 Graph a Vector Function

**NEED TO REVIEW?** Parametric equations are discussed in Section 9.1, pp. 637–643.

In general, the graph of a vector function  $\mathbf{r} = \mathbf{r}(t)$  with domain  $a \leq t \leq b$  is the curve  $C$  in the plane or in space traced out by the tip of the vector  $\mathbf{r} = \mathbf{r}(t)$  as  $t$  varies over the interval  $a \leq t \leq b$ . The components of the vector function are the parametric equations of the curve. We refer to the curve  $C$ , shown in Figure 1, traced out by the tip of  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$ ,  $a \leq t \leq b$ , as a **plane curve**. The curve  $C$ , shown in Figure 2,

traced out by the tip of  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ ,  $a \leq t \leq b$ , is referred to as a **space curve**.

**DF** Figure 1 A plane curve  $C$ .

**Figure 2** A space curve  $C$ .

**DF** Figure 3  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$

**NOTE** From now on we will just say “the curve  $C$  is traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ ” rather than “traced out by the tip of the vector function.”

The curve  $C$  traced out by a vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , has a **direction**, or an **orientation**. We show the orientation of  $C$  by placing arrows on its graph in the direction the vector  $\mathbf{r} = \mathbf{r}(t)$  moves from  $t = a$  to  $t = b$ . See Figure 3.

### EXAMPLE 2 Graphing a Vector Function

Discuss the graph of the vector function

$$\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} \quad 0 \leq t \leq 2\pi$$

**Solution** The components of  $\mathbf{r} = \mathbf{r}(t)$  are the parametric equations

$$x = x(t) = \cos t \quad y = y(t) = \sin t \quad 0 \leq t \leq 2\pi$$

Since  $x^2 + y^2 = \cos^2 t + \sin^2 t = 1$ , the vector function  $\mathbf{r} = \mathbf{r}(t)$  traces out a circle with its center at the origin and radius 1. See Figure 4. The curve begins at  $\mathbf{r}(0) = \cos 0 \mathbf{i} + \sin 0 \mathbf{j} = \mathbf{i}$ , contains the vectors  $\mathbf{r}\left(\frac{\pi}{2}\right) = \cos \frac{\pi}{2} \mathbf{i} + \sin \frac{\pi}{2} \mathbf{j} = \mathbf{j}$ ,  $\mathbf{r}(\pi) = \cos \pi \mathbf{i} + \sin \pi \mathbf{j} = -\mathbf{i}$ , and  $\mathbf{r}\left(\frac{3\pi}{2}\right) = -\mathbf{j}$ . It ends at  $\mathbf{r}(2\pi) = \mathbf{i}$ , so the positive direction of the circle is counterclockwise. ■

The domain of the vector function in Example 2 is restricted to  $0 \leq t \leq 2\pi$ . If  $t$  were unrestricted, the domain would be all real numbers. The graph would look the same, as would its orientation. The graph would just keep repeating over intervals of length  $2\pi$ .

**NOW WORK** Problems 11 and 31.

### EXAMPLE 3 Graphing a Vector Function

Graph the curve  $C$  traced out by the vector function

$$\mathbf{r}(t) = (2 + 3t)\mathbf{i} + (3 - t)\mathbf{j} + 2t\mathbf{k}$$

**Solution** The components of  $\mathbf{r} = \mathbf{r}(t)$  are the parametric equations

$$x(t) = 2 + 3t \quad y(t) = 3 - t \quad z(t) = 2t$$

These are the parametric equations of a line in space containing the point  $(2, 3, 0)$  (corresponding to  $t = 0$ ) and in the direction of the vector  $3\mathbf{i} - \mathbf{j} + 2\mathbf{k}$ . Solving for  $t$ , we obtain the symmetric equations of this line

$$\frac{x - 2}{3} = \frac{y - 3}{-1} = \frac{z}{2}$$

Since  $\mathbf{r}(0) = 2\mathbf{i} + 3\mathbf{j}$  and  $\mathbf{r}(1) = 5\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$ , the positive direction of  $C$  is given by  $\mathbf{r}(1) - \mathbf{r}(0) = 3\mathbf{i} - \mathbf{j} + 2\mathbf{k}$ . See Figure 5. ■

**Figure 4**  $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$

**NEED TO REVIEW?** Parametric equations of a line are discussed in Section 10.6, pp. 734–736.

**Figure 5**  $\mathbf{r}(t) = (2 + 3t)\mathbf{i} + (3 - t)\mathbf{j} + 2t\mathbf{k}$

**EXAMPLE 4** Graphing a Vector Function

Graph the curve  $C$  traced out by the vector function

$$\mathbf{r}(t) = a \cos t \mathbf{i} + a \sin t \mathbf{j} + t \mathbf{k} \quad t \geq 0$$

where  $a$  is a positive constant.

**Solution** The parametric equations of the curve  $C$  are

$$x = x(t) = a \cos t \quad y = y(t) = a \sin t \quad z = z(t) = t$$

**NEED TO REVIEW?** Cylinders are discussed in Section 10.7, pp. 748–750.

Since  $x^2 + y^2 = a^2 \cos^2 t + a^2 \sin^2 t = a^2$ , for any real number  $t$ , any point  $(x, y, z)$  on the curve  $C$  will lie on the right circular cylinder  $x^2 + y^2 = a^2$ .

If  $t = 0$ , then  $\mathbf{r}(0) = a\mathbf{i}$  so the point  $(a, 0, 0)$  is on the curve. As  $t$  increases, the vector  $\mathbf{r} = \mathbf{r}(t)$  starts at  $(a, 0, 0)$  and winds up and around the circular cylinder, one revolution for every increase of  $2\pi$  in  $t$ . See Figure 6.

**Figure 6**  $\mathbf{r}(t) = a \cos t \mathbf{i} + a \sin t \mathbf{j} + t \mathbf{k}, t \geq 0$

The space curve shown in Figure 6 is a **circular helix** and may be viewed as a coiled spring, much like a Slinky<sup>®</sup>. One of the many occurrences of a helix in nature is in the model of deoxyribonucleic acid (DNA), which consists of a *double helix*, that is, one helix intertwined with another helix, as shown in Figure 7.

**Figure 7** Models of DNA's double helix.

**NOW WORK** Problems 37 and 43.

### 3 Find the Limit and Determine the Continuity of a Vector Function

We use the components of a vector function to define limits, continuity, and the derivative of a vector function.

#### DEFINITION Limit of a Vector Function

For a vector function  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$  in the plane

$$\lim_{t \rightarrow t_0} \mathbf{r}(t) = \left[ \lim_{t \rightarrow t_0} x(t) \right] \mathbf{i} + \left[ \lim_{t \rightarrow t_0} y(t) \right] \mathbf{j}$$

provided  $\lim_{t \rightarrow t_0} x(t)$  and  $\lim_{t \rightarrow t_0} y(t)$  both exist.

For a vector function  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$  in space

$$\lim_{t \rightarrow t_0} \mathbf{r}(t) = \left[ \lim_{t \rightarrow t_0} x(t) \right] \mathbf{i} + \left[ \lim_{t \rightarrow t_0} y(t) \right] \mathbf{j} + \left[ \lim_{t \rightarrow t_0} z(t) \right] \mathbf{k}$$

provided  $\lim_{t \rightarrow t_0} x(t)$ ,  $\lim_{t \rightarrow t_0} y(t)$ , and  $\lim_{t \rightarrow t_0} z(t)$  all exist.

For example,

$$\begin{aligned} \lim_{t \rightarrow \pi/2} [2 \cos t \mathbf{i} + 2 \sin(2t) \mathbf{j} + 5 \mathbf{k}] &= \left[ \lim_{t \rightarrow \pi/2} (2 \cos t) \right] \mathbf{i} + \left[ \lim_{t \rightarrow \pi/2} [2 \sin(2t)] \right] \mathbf{j} + \left[ \lim_{t \rightarrow \pi/2} 5 \right] \mathbf{k} \\ &= \left[ 2 \lim_{t \rightarrow \pi/2} \cos t \right] \mathbf{i} + \left[ 2 \lim_{t \rightarrow \pi/2} \sin(2t) \right] \mathbf{j} + 5 \mathbf{k} \\ &= 2(0) \mathbf{i} + 2(0) \mathbf{j} + 5 \mathbf{k} = 5 \mathbf{k} \end{aligned}$$

**NEED TO REVIEW?** Continuity of a real-valued function is discussed in Section 1.3, pp. 93–100.

The definition of continuity of a vector function at a number is almost identical to the definition for real functions. To determine if a vector function is continuous at a real number, we consider the continuity of its components.

#### Continuity of a Vector Function at a Number

A vector function  $\mathbf{r} = \mathbf{r}(t)$  is **continuous at a real number**  $t_0$  if:

- $\mathbf{r}(t_0)$  is defined.
- $\lim_{t \rightarrow t_0} \mathbf{r}(t)$  exists.
- $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{r}(t_0)$ .

For example, the vector function

$$\mathbf{r}(t) = t^2 \mathbf{i} + (1 + t) \mathbf{j} + \sin t \mathbf{k}$$

is continuous at 0 because

- $\mathbf{r}(0) = 0^2 \mathbf{i} + (1 + 0) \mathbf{j} + \sin 0 \mathbf{k} = \mathbf{j}$
- $\lim_{t \rightarrow 0} \mathbf{r}(t) = \lim_{t \rightarrow 0} [t^2 \mathbf{i} + (1 + t) \mathbf{j} + \sin t \mathbf{k}] = \left[ \lim_{t \rightarrow 0} t^2 \right] \mathbf{i} + \left[ \lim_{t \rightarrow 0} (1 + t) \right] \mathbf{j} + \left[ \lim_{t \rightarrow 0} \sin t \right] \mathbf{k} = (0) \mathbf{i} + (1) \mathbf{j} + (0) \mathbf{k} = \mathbf{j}$
- $\lim_{t \rightarrow 0} \mathbf{r}(t) = \mathbf{r}(0) = \mathbf{j}$

That is, a vector function is continuous at a real number  $t_0$  if, and only if, each of its component functions is continuous at  $t_0$ .

The definition of continuity on an interval for vector functions follows the pattern developed in Chapter 1 for real functions. That is,  $\mathbf{r} = \mathbf{r}(t)$  is continuous on an interval  $I$ , provided each of its components is continuous on  $I$ . For example, the vector function

$\mathbf{r}(t) = t^2\mathbf{i} + (1+t)\mathbf{j} + \sin t\mathbf{k}$  is continuous for  $-\infty < t < \infty$  since  $x(t) = t^2$ ,  $y(t) = 1+t$ , and  $z(t) = \sin t$  are continuous for all real numbers.

### NOW WORK Problem 49.

## 4 Find the Derivative of a Vector Function

The definition of a derivative for a vector function is very similar to the definition for a real function.

### DEFINITION Derivative of a Vector Function

The **derivative** of the vector function  $\mathbf{r} = \mathbf{r}(t)$ , denoted by  $\mathbf{r}'(t) = \frac{d\mathbf{r}}{dt}$ , is

$$\mathbf{r}'(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}$$

provided the limit exists. If the limit exists, then we say  $\mathbf{r}$  is **differentiable**.

The next theorem provides a simple method for differentiating a vector function.

### THEOREM Differentiating a Vector Function

If  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$  and if  $x = x(t)$  and  $y = y(t)$  are both differentiable real functions, then

$$\mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j}$$

If  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$  and if  $x = x(t)$ ,  $y = y(t)$ , and  $z = z(t)$  are each differentiable real functions, then

$$\mathbf{r}'(t) = x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}$$

**IN WORDS** To find the derivative of a vector function, differentiate each of its components.

We prove this theorem for a vector function in space.

**Proof** Use the definition of the derivative of a vector function.

$$\begin{aligned} \mathbf{r}'(t) &= \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h} \\ &= \lim_{h \rightarrow 0} \frac{[x(t+h) - x(t)]\mathbf{i} + [y(t+h) - y(t)]\mathbf{j} + [z(t+h) - z(t)]\mathbf{k}}{h} \\ &= \lim_{h \rightarrow 0} \left[ \frac{x(t+h) - x(t)}{h} \right] \mathbf{i} + \lim_{h \rightarrow 0} \left[ \frac{y(t+h) - y(t)}{h} \right] \mathbf{j} + \lim_{h \rightarrow 0} \left[ \frac{z(t+h) - z(t)}{h} \right] \mathbf{k} \\ &= x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k} \end{aligned}$$

In Leibniz notation, the derivative of a vector function  $\mathbf{r}$  has the form

$$\frac{d\mathbf{r}}{dt} = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} \quad \text{or} \quad \frac{d\mathbf{r}}{dt} = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} + \frac{dz}{dt}\mathbf{k}$$

### EXAMPLE 5 Finding the Derivative of a Vector Function

Find the derivative of each vector function.

(a)  $\mathbf{r}(t) = 2 \sin t\mathbf{i} + 3 \cos t\mathbf{j}$       (b)  $\mathbf{r}(t) = e^t\mathbf{i} + (1+t)\mathbf{j} + \sin t\mathbf{k}$

**Solution** (a) We find the derivative of each component. Since  $\frac{d}{dt}(2 \sin t) = 2 \cos t$  and  $\frac{d}{dt}(3 \cos t) = -3 \sin t$ ,

$$\frac{d\mathbf{r}}{dt} = \mathbf{r}'(t) = 2 \cos t\mathbf{i} - 3 \sin t\mathbf{j}$$

(b)  $\frac{d\mathbf{r}}{dt} = \mathbf{r}'(t) = \frac{d}{dt}e^t\mathbf{i} + \frac{d}{dt}(1+t)\mathbf{j} + \frac{d}{dt}\sin t\mathbf{k} = e^t\mathbf{i} + \mathbf{j} + \cos t\mathbf{k}$

## Higher-Order Derivatives

Since the derivative  $\mathbf{r}'$  is a vector function derived from the vector function  $\mathbf{r} = \mathbf{r}(t)$ , the derivative of  $\mathbf{r}'$  (if it exists) is also a function, called the **second derivative** of  $\mathbf{r}$ , and denoted by  $\mathbf{r}''$ . If the second derivative exists, then  $\mathbf{r}$  is called **twice differentiable**. Continuing in this fashion, we can find the **third derivative**  $\mathbf{r}'''$ , the **fourth derivative**  $\mathbf{r}^{(4)}$ , and so on, provided these derivatives exist. Collectively, these derivatives are called **higher-order derivatives** of the vector function  $\mathbf{r} = \mathbf{r}(t)$ .

### EXAMPLE 6 Finding $\mathbf{r}'$ and $\mathbf{r}''$ for a Vector Function

Find  $\mathbf{r}'(t)$  and  $\mathbf{r}''(t)$  for the vector function  $\mathbf{r}(t) = e^t \mathbf{i} + \ln t \mathbf{j} - \cos t \mathbf{k}$ .

**Solution**

$$\mathbf{r}'(t) = \frac{d}{dt} e^t \mathbf{i} + \frac{d}{dt} \ln t \mathbf{j} - \frac{d}{dt} \cos t \mathbf{k} = e^t \mathbf{i} + \frac{1}{t} \mathbf{j} + \sin t \mathbf{k}$$

$$\mathbf{r}''(t) = \frac{d}{dt} e^t \mathbf{i} + \frac{d}{dt} \frac{1}{t} \mathbf{j} + \frac{d}{dt} \sin t \mathbf{k} = e^t \mathbf{i} - \frac{1}{t^2} \mathbf{j} + \cos t \mathbf{k}$$

**NOW WORK** Problem 59.

## 5 Find the Derivative of a Vector Function Using Derivative Formulas

The derivative of a vector function  $\mathbf{r} = \mathbf{r}(t)$  is defined in much the same way as the derivative of a real function  $y = f(x)$ . For this reason, the sum and scalar multiplication formulas for vector functions are similar to the rules for real functions. However, for vector functions, there are formulas for the derivatives of the dot product and the cross product (in space). For vector functions, no formula analogous to the Quotient Rule exists.

### THEOREM Derivative Formulas

If the vector functions  $\mathbf{u} = \mathbf{u}(t)$  and  $\mathbf{v} = \mathbf{v}(t)$  are differentiable and the real function  $y = f(t)$  is differentiable, then

- **Sum formula:**

$$\frac{d}{dt} [\mathbf{u}(t) + \mathbf{v}(t)] = \frac{d}{dt} \mathbf{u}(t) + \frac{d}{dt} \mathbf{v}(t) = \mathbf{u}'(t) + \mathbf{v}'(t)$$

- **Scalar multiplication formula:**

$$\frac{d}{dt} [f(t)\mathbf{u}(t)] = \left[ \frac{d}{dt} f(t) \right] \mathbf{u}(t) + f(t) \left[ \frac{d}{dt} \mathbf{u}(t) \right] = f'(t)\mathbf{u}(t) + f(t)\mathbf{u}'(t)$$

- **Dot product formula:**

$$\frac{d}{dt} [\mathbf{u}(t) \cdot \mathbf{v}(t)] = [\mathbf{u}(t) \cdot \mathbf{v}(t)]' = \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t)$$

- **Cross product formula:**

$$\frac{d}{dt} [\mathbf{u}(t) \times \mathbf{v}(t)] = [\mathbf{u}(t) \times \mathbf{v}(t)]' = \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t)$$

where  $\mathbf{u}$  and  $\mathbf{v}$  are vector functions in space.

- **Chain rule:**

$$\frac{d}{dt} \mathbf{v}(f(t)) = \mathbf{v}'(f(t))f'(t)$$

The sum, scalar multiplication, and dot product formulas, and the Chain Rule hold for vector functions in the plane and in space. The cross product formula holds only for vectors in space. The proof for the scalar multiplication formula for a vector function in space is provided here. The proofs of the other four formulas are left as exercises. See Problems 99–102.

**Proof (Scalar Multiplication Formula)** Let  $\mathbf{u}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ . Then

$$f(t)\mathbf{u}(t) = [f(t)x(t)]\mathbf{i} + [f(t)y(t)]\mathbf{j} + [f(t)z(t)]\mathbf{k}$$

We use the Product Rule and differentiate each component.

$$\begin{aligned} [f(t)\mathbf{u}(t)]' &= [f(t)x(t)]'\mathbf{i} + [f(t)y(t)]'\mathbf{j} + [f(t)z(t)]'\mathbf{k} \\ &= [f(t)x'(t) + f'(t)x(t)]\mathbf{i} + [f(t)y'(t) + f'(t)y(t)]\mathbf{j} \\ &\quad + [f(t)z'(t) + f'(t)z(t)]\mathbf{k} \\ &= f'(t)[x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}] + f(t)[x'(t)\mathbf{i} + y'(t)\mathbf{j} + z'(t)\mathbf{k}] \\ &= f'(t)\mathbf{u}(t) + f(t)\mathbf{u}'(t) \end{aligned}$$

Notice that if  $f(t) = c$ , where  $c$  is a constant, and  $\mathbf{u} = \mathbf{u}(t)$  is a differentiable vector function, then

$$\frac{d}{dt}[c\mathbf{u}(t)] = c \left[ \frac{d}{dt}\mathbf{u}(t) \right] = c\mathbf{u}'(t)$$

### EXAMPLE 7 Finding the Derivative of a Cross Product

Find the derivative of  $\mathbf{u}(t) \times \mathbf{v}(t)$  if

$$\mathbf{u}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k} \quad \text{and} \quad \mathbf{v}(t) = t\mathbf{i} + \ln t\mathbf{j} + \mathbf{k}$$

**Solution** The derivatives of  $\mathbf{u}$  and  $\mathbf{v}$  are

$$\mathbf{u}'(t) = -\sin t\mathbf{i} + \cos t\mathbf{j} + \mathbf{k} \quad \text{and} \quad \mathbf{v}'(t) = \mathbf{i} + \frac{1}{t}\mathbf{j}$$

We use the cross product formula.

$$\begin{aligned} [\mathbf{u}(t) \times \mathbf{v}(t)]' &= \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t) \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\sin t & \cos t & 1 \\ t & \ln t & 1 \end{vmatrix} + \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos t & \sin t & t \\ 1 & \frac{1}{t} & 0 \end{vmatrix} \\ &= [(\cos t - \ln t)\mathbf{i} + (\sin t + t)\mathbf{j} - [(\sin t)(\ln t) + t \cos t]\mathbf{k}] \\ &\quad + \left[ -\mathbf{i} + t\mathbf{j} + \left( \frac{1}{t} \cos t - \sin t \right) \mathbf{k} \right] \\ &= (\cos t - \ln t - 1)\mathbf{i} + (\sin t + 2t)\mathbf{j} \\ &\quad + \left[ \frac{1}{t} \cos t - \sin t - (\sin t)(\ln t) - t \cos t \right] \mathbf{k} \end{aligned}$$

**CAUTION** Be careful when using the cross product formula. Since a cross product is not commutative, order is important.

### NOW WORK Problems 73 and 79.

We can also find the derivative of  $\mathbf{u} \times \mathbf{v}$  in Example 7 by first finding the cross product of vector functions  $\mathbf{u}$  and  $\mathbf{v}$  and then differentiating. Try it, and compare the two solutions.

## 11.1 Assess Your Understanding

### Concepts and Vocabulary

- The domain of  $\mathbf{r}(t) = (4t + 1)\mathbf{i} + \sqrt{4 - t}\mathbf{j} + \mathbf{k}$  is \_\_\_\_\_.
- True or False** A vector function is continuous at a real number  $t_0$  if at least one of its component functions is continuous at  $t_0$ .
- True or False** To find the derivative of a vector function  $\mathbf{r} = \mathbf{r}(t)$ , find the derivative of each of its component functions.
- True or False** The derivative of a dot product is a scalar function.
- True or False** If  $y = f(t)$  is a differentiable real (scalar) function and  $\mathbf{r} = \mathbf{r}(t)$  is a differentiable vector function, then  $\frac{d}{dt}[f(t)\mathbf{r}(t)] = f'(t)\frac{d}{dt}\mathbf{r}(t)$ .
- If  $\mathbf{u} = \mathbf{u}(t)$  and  $\mathbf{v} = \mathbf{v}(t)$  are vector functions in space that are differentiable, then  $\frac{d}{dt}(\mathbf{u} \times \mathbf{v}) =$  \_\_\_\_\_.

### Skill Building

In Problems 7–14, find the value of each vector function at  $t$ .

- $\mathbf{r}(t) = t^2\mathbf{i} - 2t\mathbf{j}$  at  $t = 1$
- $\mathbf{r}(t) = t^3\mathbf{i} + 2t\mathbf{j}$  at  $t = 2$
- $\mathbf{v}(t) = \sin t\mathbf{i} - \cos t\mathbf{j}$  at  $t = \frac{\pi}{4}$
- $\mathbf{v}(t) = \tan t\mathbf{i} + \cos(2t)\mathbf{j}$  at  $t = 0$
- $\mathbf{u}(t) = e^{2t}\mathbf{i} + t^2\mathbf{j} - 2\mathbf{k}$  at  $t = 0$
- $\mathbf{u}(t) = \ln t\mathbf{i} - \mathbf{j} + t^3\mathbf{k}$  at  $t = 1$
- $\mathbf{g}(t) = t\mathbf{i} - \cos\left(\frac{\pi t}{4}\right)\mathbf{j} + 2t\mathbf{k}$  at  $t = 4$
- $\mathbf{f}(t) = \sin\left(\frac{3\pi t}{4}\right)\mathbf{i} + 3\mathbf{j} - 3t^2\mathbf{k}$  at  $t = 1$

In Problems 15–22, find the domain of each vector function.

- $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + 2\mathbf{k}$
- $\mathbf{r}(t) = \cos(2t)\mathbf{i} + \sin t\mathbf{j} + 2t\mathbf{k}$
- $\mathbf{f}(t) = \sqrt{t}\mathbf{i} + t\mathbf{j} - \mathbf{k}$
- $\mathbf{r}(t) = t^2\mathbf{i} + \frac{1}{\sqrt{t}}\mathbf{j} - t\mathbf{k}$
- $\mathbf{u}(t) = \frac{(t^2 + 1)}{t}\mathbf{i} + 3t\mathbf{j} - \frac{2}{t}\mathbf{k}$
- $\mathbf{v}(t) = e^t\mathbf{i} + (5 + 3t)\mathbf{j} - \frac{2}{t}\mathbf{k}$
- $\mathbf{v}(t) = \ln t\mathbf{i} + (t + 1)\mathbf{j} + 4t\mathbf{k}$
- $\mathbf{v}(t) = \sqrt{t}\mathbf{i} + \ln t\mathbf{j} + t\mathbf{k}$

In Problems 23–36, graph the curve  $C$  traced out by each vector function and show its orientation.

- $\mathbf{r}(t) = 2t\mathbf{i} + t^2\mathbf{j}$ ,  $t \geq 0$
- $\mathbf{r}(t) = t^2\mathbf{i} - 4t\mathbf{j}$ ,  $t \leq 0$
- $\mathbf{r}(t) = t\mathbf{i}$ ,  $-1 \leq t \leq 1$
- $\mathbf{r}(t) = t\mathbf{j}$ ,  $-1 \leq t \leq 1$
- $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j}$
- $\mathbf{r}(t) = 3t\mathbf{i} + 2t\mathbf{j}$
- $\mathbf{r}(t) = 3t\mathbf{i} - 2t\mathbf{j}$
- $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$
- $\mathbf{r}(t) = \cos t\mathbf{i} - \sin t\mathbf{j}$ ,  $0 \leq t \leq \frac{\pi}{2}$
- $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$ ,  $0 \leq t \leq \frac{\pi}{2}$
- $\mathbf{r}(t) = \sin^2 t\mathbf{i} + \cos^2 t\mathbf{j}$ ,  $0 \leq t \leq \frac{\pi}{2}$

$$34. \mathbf{r}(t) = \sin^2 t\mathbf{i} - \cos^2 t\mathbf{j}, \quad 0 \leq t \leq \frac{\pi}{2}$$

$$35. \mathbf{r}(t) = \sin t\mathbf{i} + t^2\mathbf{j}, \quad 0 \leq t \leq 4\pi$$

$$36. \mathbf{r}(t) = \sin^3 t\mathbf{i} + \cos^3 t\mathbf{j}, \quad 0 \leq t \leq 2\pi$$

In Problems 37–40, match each vector function to its plane curve.

$$37. \mathbf{r}(t) = t^2\mathbf{i} + \cos t\mathbf{j}, \quad 0 \leq t \leq 2\pi$$

$$38. \mathbf{r}(t) = \cos t\mathbf{i} + t^2\mathbf{j}, \quad 0 \leq t \leq 2\pi$$

$$39. \mathbf{r}(t) = \sqrt{t}\mathbf{i} + \cos t\mathbf{j}, \quad 0 \leq t \leq 2\pi$$

$$40. \mathbf{r}(t) = \cos t\mathbf{i} - t\mathbf{j}, \quad 0 \leq t \leq 2\pi$$

(A)

(B)

(C)

(D)

**CAS** In Problems 41–48, graph the curve  $C$  traced out by each vector function.

$$41. \mathbf{r}(t) = (2t + 1)\mathbf{i} + \frac{t}{3}\mathbf{j} - (t + 1)\mathbf{k}$$

$$42. \mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} - (t + 1)\mathbf{k}$$

$$43. \mathbf{r}(t) = 2\cos t\mathbf{i} + t\mathbf{j} + 2\sin t\mathbf{k}, \quad -2\pi \leq t \leq 2\pi$$

$$44. \mathbf{r}(t) = \frac{t}{2}\mathbf{i} + 3\sin t\mathbf{j} + 2\cos t\mathbf{k}, \quad -2\pi \leq t \leq 2\pi$$

$$45. \mathbf{r}(t) = 4\cos t\mathbf{i} + \sin t\mathbf{j} + e^t\mathbf{k}, \quad -\pi \leq t \leq 2\pi$$

$$46. \mathbf{r}(t) = t\mathbf{i} + \sin t\mathbf{j} + e^t\mathbf{k}, \quad -5 \leq t \leq 5$$

$$47. \mathbf{r}(t) = 3\cos t\mathbf{i} + 3\sin t\mathbf{j} + \sin(2t)\mathbf{k}, \quad 0 \leq t \leq 2\pi$$

$$48. \mathbf{r}(t) = t\mathbf{i} + t\cos(3t)\mathbf{j} + t\sin(3t)\mathbf{k}, \quad 0 \leq t \leq 2\pi$$

In Problems 49–56, determine where each vector function is continuous.

$$49. \mathbf{r}(t) = t^2\mathbf{i} + \frac{2}{1 - t^2}\mathbf{j} + \sin t\mathbf{k}$$

$$50. \mathbf{r}(t) = \ln t\mathbf{i} + e^{-t}\mathbf{j}$$

51.  $\mathbf{r}(t) = \sec t \mathbf{i} - \cos t \mathbf{j}$

52.  $\mathbf{r}(t) = \sqrt{t+1} \mathbf{i} + \tan t \mathbf{j} - \frac{\sin t - 1}{t} \mathbf{k}$

53.  $\mathbf{r}(t) = \frac{t}{t+1} \mathbf{i} - t \mathbf{j}$

54.  $\mathbf{r}(t) = \frac{t}{t^2+1} \mathbf{i} + t \mathbf{j}$

55.  $\mathbf{r}(t) = \sin t \mathbf{i} - \tan t \mathbf{j} + \mathbf{k}$

56.  $\mathbf{r}(t) = \sec t \mathbf{i} + \csc t \mathbf{j} + \mathbf{k}$

In Problems 57–72, find  $\mathbf{r}'(t)$  and  $\mathbf{r}''(t)$ .

57.  $\mathbf{r}(t) = 4t^2 \mathbf{i} - 2t^3 \mathbf{j}$

58.  $\mathbf{r}(t) = 8t \mathbf{i} + 4t^3 \mathbf{j}$

59.  $\mathbf{r}(t) = 4\sqrt{t} \mathbf{i} + 2e^t \mathbf{j}$

60.  $\mathbf{r}(t) = e^{3t} \mathbf{i} + \sqrt[3]{t} \mathbf{j}$

61.  $\mathbf{r}(t) = \mathbf{i} + t \mathbf{j} + t^2 \mathbf{k}$

62.  $\mathbf{r}(t) = \mathbf{i} - \mathbf{j} + t \mathbf{k}$

63.  $\mathbf{r}(t) = t^2 \mathbf{i} + t^3 \mathbf{j} - t \mathbf{k}$

64.  $\mathbf{r}(t) = (1+t) \mathbf{i} - 3t^2 \mathbf{j} + t \mathbf{k}$

65.  $\mathbf{r}(t) = \sin^2 t \mathbf{i} - \cos^2 t \mathbf{j}$

66.  $\mathbf{r}(t) = \sin(2t) \mathbf{i} - \cos(2t) \mathbf{j}$

67.  $\mathbf{r}(t) = 5e^{t^2+t} \mathbf{i} - \ln e^{t^2+t} \mathbf{j}$

68.  $\mathbf{r}(t) = \sin(3t^3 - t) \mathbf{i} - \cos^2(3t^3 - t) \mathbf{j}$

69.  $\mathbf{r}(t) = e^t \cos t \mathbf{i} + e^t \sin t \mathbf{j} + t \mathbf{k}$

70.  $\mathbf{r}(t) = e^{-t} \cos t \mathbf{i} + e^{-t} \sin t \mathbf{j} - t \mathbf{k}$

71.  $\mathbf{r}(t) = (t - t^3) \mathbf{i} + (t + t^3) \mathbf{j} - t \mathbf{k}$

72.  $\mathbf{r}(t) = (t^2 - t) \mathbf{i} + (t^2 + t) \mathbf{j} + t \mathbf{k}$

In Problems 73–78, find  $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$ .

73.  $\mathbf{u}(t) = t^2 \mathbf{i} - t \mathbf{j}$  and  $\mathbf{v}(t) = t \mathbf{i} + t^2 \mathbf{j}$

74.  $\mathbf{u}(t) = t^3 \mathbf{i} + t \mathbf{j}$  and  $\mathbf{v}(t) = t \mathbf{i} - 2t \mathbf{j}$

75.  $\mathbf{u}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j}$  and  $\mathbf{v}(t) = t \mathbf{i} - t^2 \mathbf{j}$

76.  $\mathbf{u}(t) = t \mathbf{i} + 4\sqrt{t} \mathbf{j}$  and  $\mathbf{v}(t) = 2t \mathbf{i} - t^2 \mathbf{j}$

77.  $\mathbf{u}(t) = \sin(\omega t) \mathbf{i} + \cos(\omega t) \mathbf{j}$  and  $\mathbf{v}(t) = \mathbf{i} + \mathbf{j}$

78.  $\mathbf{u}(t) = \sin^2 t \mathbf{i} - \cos^2 t \mathbf{j}$  and  $\mathbf{v}(t) = \mathbf{i} - \mathbf{j}$

In Problems 79–82, find  $\frac{d}{dt}[\mathbf{u}(t) \cdot \mathbf{v}(t)]$  and  $\frac{d}{dt}[\mathbf{u}(t) \times \mathbf{v}(t)]$ .

79.  $\mathbf{u}(t) = 2t \mathbf{i} + t^2 \mathbf{j} - 5 \mathbf{k}$  and  $\mathbf{v}(t) = t^2 \mathbf{i} + 2t \mathbf{j} + \mathbf{k}$

80.  $\mathbf{u}(t) = t^3 \mathbf{i} - t^2 \mathbf{j} + t \mathbf{k}$  and  $\mathbf{v}(t) = t \mathbf{i} - t^2 \mathbf{j} + t^3 \mathbf{k}$

81.  $\mathbf{u}(t) = \cos(2t) \mathbf{i} + \sin(2t) \mathbf{j} + \mathbf{k}$  and  $\mathbf{v}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + \mathbf{k}$

82.  $\mathbf{u}(t) = e^{2t} \mathbf{i} + e^{-2t} \mathbf{j} + t \mathbf{k}$  and  $\mathbf{v}(t) = e^{-t} \mathbf{i} + e^{-2t} \mathbf{j} - t \mathbf{k}$

## Applications and Extensions

83. Given the vector function  $\mathbf{u}(t) = \cos(\omega t) \mathbf{i} + \sin(\omega t) \mathbf{j}$ ,

$$\text{find } \frac{d\mathbf{u}}{dt} \text{ and } \left\| \frac{d\mathbf{u}}{dt} \right\|.$$

84. Given the vector function  $\mathbf{v}(t) = t \mathbf{i} + t^2 \mathbf{j} + t^3 \mathbf{k}$ , find  $\frac{d^2 \mathbf{v}}{dt^2}$

$$\text{and } \left\| \frac{d^2 \mathbf{v}}{dt^2} \right\|.$$

85. For  $\mathbf{f}(t) = \sin t \mathbf{i} - \cos t \mathbf{j}$ , show that  $\mathbf{f}(t)$  and  $\mathbf{f}''(t)$  are parallel.

86. For  $\mathbf{f}(t) = e^{3t} \mathbf{i} + e^{-3t} \mathbf{j}$ , show that  $\mathbf{f}(t)$  and  $\mathbf{f}''(t)$  are parallel.

In Problems 87–94, a vector function  $\mathbf{r} = \mathbf{r}(t)$  defining a curve in the plane is given. Graph each curve, indicating its orientation. Include in the graph the vector  $\mathbf{r}(0)$  and  $\mathbf{r}'(0)$  so its initial point is at the terminal point of  $\mathbf{r}(0)$ .

87.  $\mathbf{r}(t) = t \mathbf{i} + t^2 \mathbf{j}$

88.  $\mathbf{r}(t) = 2t^2 \mathbf{i} - t \mathbf{j}$

89.  $\mathbf{r}(t) = t \mathbf{i} + e^t \mathbf{j}$

90.  $\mathbf{r}(t) = t \mathbf{i} + \ln(1+t) \mathbf{j}$

91.  $\mathbf{r}(t) = 3 \sin t \mathbf{i} - 3 \cos t \mathbf{j}$

92.  $\mathbf{r}(t) = 4 \sin t \mathbf{i} + 4 \cos t \mathbf{j}$

93.  $\mathbf{r}(t) = 2 \cos t \mathbf{i} - 3 \sin t \mathbf{j}$

94.  $\mathbf{r}(t) = -\cos t \mathbf{i} + 2 \sin t \mathbf{j}$

In Problems 95–98, the position of an object at time  $t$  is given.

(a) Eliminate the parameter  $t$  to find  $y$  as a function of  $x$ .

(b) Graph  $\mathbf{r} = \mathbf{r}(t)$  and indicate the orientation.

95.  $\mathbf{r}(t) = (1 - t^2) \mathbf{i} + t^2 \mathbf{j}$

96.  $\mathbf{r}(t) = t^2 \mathbf{i} + (4t^2 - t^4) \mathbf{j}$

97.  $\mathbf{r}(t) = \sin^2 t \mathbf{i} + \tan t \mathbf{j}, \quad 0 < t < \frac{\pi}{2}$

98.  $\mathbf{r}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j}$

**99. Proof of the Sum Formula** If the vector functions  $\mathbf{u} = \mathbf{u}(t)$  and  $\mathbf{v} = \mathbf{v}(t)$  are differentiable, show that

$$[\mathbf{u}(t) + \mathbf{v}(t)]' = \mathbf{u}'(t) + \mathbf{v}'(t)$$

**100. Proof of the Dot Product Formula** If the vector functions  $\mathbf{u} = \mathbf{u}(t)$  and  $\mathbf{v} = \mathbf{v}(t)$  are differentiable, show that

$$[\mathbf{u}(t) \cdot \mathbf{v}(t)]' = \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t)$$

**101. Proof of the Cross Product Formula** If the vector functions  $\mathbf{u} = \mathbf{u}(t)$  and  $\mathbf{v} = \mathbf{v}(t)$  in space are differentiable, show that

$$[\mathbf{u}(t) \times \mathbf{v}(t)]' = \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t)$$

**102. Proof of the Chain Rule** If the vector function  $\mathbf{v} = \mathbf{v}(t)$  is differentiable and the real function  $y = f(t)$  is differentiable, show that

$$\frac{d}{dt} \mathbf{v}(f(t)) = \mathbf{v}'(f(t)) f'(t)$$

**103.** The derivative of a cross product is not commutative. Give an example of two vector functions that demonstrate this fact.

**104.** Suppose the vector function  $\mathbf{r} = \mathbf{r}(t)$  is twice differentiable; show that  $[\mathbf{r}(t) \times \mathbf{r}'(t)]' = \mathbf{r}(t) \times \mathbf{r}''(t)$ .

**105.** Show that  $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{L}$  if and only if  $\lim_{t \rightarrow t_0} \|\mathbf{r}(t) - \mathbf{L}\| = 0$ .

**106.** If the vector function  $\mathbf{r} = \mathbf{r}(t)$  is differentiable, show that

$$\frac{d}{dt} \|\mathbf{r}(t)\| = \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|}. \text{ Use this result to show that } \|\mathbf{r}(t)\| \text{ is}$$

constant if and only if  $\mathbf{r}(t) \cdot \mathbf{r}'(t) = 0$  for all  $t$ .

## Challenge Problems

**107.** If the vector function  $\mathbf{r}$  is differentiable, show that

$$\frac{d}{dt} \frac{\mathbf{r}(t)}{\|\mathbf{r}(t)\|} = \frac{\mathbf{r}'(t)}{\|\mathbf{r}(t)\|} - \frac{\mathbf{r}(t) \cdot \mathbf{r}'(t)}{\|\mathbf{r}(t)\|^3} \mathbf{r}(t)$$

**108. (a)** Discuss the curve  $C$  traced out by the vector function  $\mathbf{r}(t) = e^t \sin t \mathbf{i} + e^t \cos t \mathbf{j} + e^t \mathbf{k}$ .

**(b)** Name the surface on which the curve  $C$  lies.

## 11.2 Unit Tangent and Principal Unit Normal Vectors; Arc Length

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Interpret the derivative of a vector function geometrically (p. 767)
- 2 Find the unit tangent vector and the principal unit normal vector of a smooth curve (p. 768)
- 3 Find the arc length of a curve traced out by a vector function (p. 770)

A vector function  $\mathbf{r} = \mathbf{r}(t)$  that is defined on a closed interval  $a \leq t \leq b$  traces out a curve as  $t$  varies over the interval. In this section, we analyze the curve geometrically by defining a *tangent vector* and a *normal vector* to the curve. We also express the arc length of a curve in terms of the unit tangent vector  $\mathbf{T}$ .

**RECALL** The terms *normal*, *perpendicular*, and *orthogonal* all mean “meet at right angles.”

### 1 Interpret the Derivative of a Vector Function Geometrically

Suppose a vector function  $\mathbf{r} = \mathbf{r}(t)$  is defined on an interval  $[a, b]$  and is differentiable on  $(a, b)$ . Then  $\mathbf{r} = \mathbf{r}(t)$  traces out a curve  $C$  as  $t$  varies over the interval. For a number  $t_0$ ,  $a < t_0 < b$ , there is a point  $P_0$  on  $C$  given by the vector  $\mathbf{r} = \mathbf{r}(t_0)$ . If  $h \neq 0$ , there is a point  $Q$  on  $C$  different from  $P_0$  given by the vector  $\mathbf{r}(t_0 + h)$ . The vector  $\frac{\mathbf{r}(t_0 + h) - \mathbf{r}(t_0)}{h}$  can be thought of as a secant vector in the direction from  $P_0$  to  $Q$ , as shown in Figure 8. Notice that whether  $h < 0$  or  $h > 0$ , the direction of the secant vectors follows the orientation of  $C$ .

**Figure 8** Secant vectors

As  $h \rightarrow 0$ , the vector in the direction from  $P_0$  to  $Q$  moves along the curve  $C$  toward  $P_0$ , getting closer and closer to the vector tangent to  $C$  at  $P_0$ , as shown in Figure 9. The direction of the tangent vector follows the orientation of  $C$ . But as  $h \rightarrow 0$ , the vector  $\frac{\mathbf{r}(t_0 + h) - \mathbf{r}(t_0)}{h}$  approaches the derivative  $\mathbf{r}'(t_0)$ . This leads to the following definition.

**DF** **Figure 9** Tangent vectors;  $\mathbf{r}'(t_0) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t_0 + h) - \mathbf{r}(t_0)}{h}$

**NOTE** There is no tangent vector defined if  $\mathbf{r}'(t_0) = \mathbf{0}$ .

**RECALL** The angle between two nonzero vectors  $\mathbf{v}$  and  $\mathbf{w}$  is determined by  $\cos \theta = \frac{\mathbf{v} \cdot \mathbf{w}}{\|\mathbf{v}\| \|\mathbf{w}\|}$ , where  $0 \leq \theta \leq \pi$ .

**Figure 10**  $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k}$ ,  $0 \leq t \leq 2\pi$

### DEFINITION Tangent Vector to a Curve $C$

Suppose  $\mathbf{r} = \mathbf{r}(t)$  is a vector function defined on the interval  $[a, b]$  and differentiable on the interval  $(a, b)$ . Let  $P_0$  be the point on the curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$  corresponding to  $t = t_0$ ,  $a < t_0 < b$ . If  $\mathbf{r}'(t_0) \neq \mathbf{0}$ , then the vector  $\mathbf{r}'(t_0)$  is a **tangent vector** to the curve at  $t_0$ . The line containing  $P_0$  in the direction of  $\mathbf{r}'(t_0)$  is the **tangent line** to the curve traced out by  $\mathbf{r} = \mathbf{r}(t)$  at  $t_0$ .

### Finding the Angle Between a Tangent Vector to a Helix and the Direction $\mathbf{k}$

#### EXAMPLE 1

Show that the acute angle between the tangent vector to the helix

$$\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k} \quad 0 \leq t \leq 2\pi$$

and the direction  $\mathbf{k}$  is  $\frac{\pi}{4}$  radian.

**Solution** A tangent vector at any point on the helix is given by

$$\mathbf{r}'(t) = -\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}$$

$$\text{Then } \|\mathbf{r}'(t)\| = \sqrt{(-\sin t)^2 + \cos^2 t + 1} = \sqrt{1 + 1} = \sqrt{2}.$$

The cosine of the acute angle  $\theta$  between  $\mathbf{r}'(t)$  and  $\mathbf{k}$  is

$$\cos \theta = \frac{\mathbf{r}'(t) \cdot \mathbf{k}}{\|\mathbf{r}'(t)\| \|\mathbf{k}\|} = \frac{1}{\sqrt{2}} = \frac{\sqrt{2}}{2} \quad \mathbf{r}'(t) \cdot \mathbf{k} = 1$$

So,  $\theta = \frac{\pi}{4}$  radian. See Figure 10. ■

**NOW WORK** Problems 9 and 15.

## 2 Find the Unit Tangent Vector and the Principal Unit Normal Vector of a Smooth Curve

We now state the definition of a smooth curve in terms of vector functions. You may wish to compare this definition with the one given in Section 9.2, p. 647.

### DEFINITION Smooth Curve

Let  $C$  denote a curve traced out by a vector function  $\mathbf{r} = \mathbf{r}(t)$  that is continuous for  $a \leq t \leq b$ . If the derivative  $\mathbf{r}'(t)$  exists and is continuous on the interval  $(a, b)$  and if  $\mathbf{r}'(t)$  is never  $\mathbf{0}$  on  $(a, b)$ , then  $C$  is called a **smooth curve**.

Since  $\mathbf{r}'(t)$  is never  $\mathbf{0}$  for a smooth curve, such curves will have tangent vectors at every point.

The *unit tangent vector* and the *unit normal vector* are important for analyzing the geometry of a curve (Section 11.3) and for describing motion along a curve (Section 11.4).

For a smooth curve  $C$  traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , the **unit tangent vector**  $\mathbf{T}(t)$  to  $C$  at  $t$  is

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$$

**EXAMPLE 2** Finding a Unit Tangent Vector to a Curve

Show that the unit tangent vector  $\mathbf{T}(t)$  to the circle of radius  $R$

$$\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j} \quad 0 \leq t \leq 2\pi$$

is everywhere orthogonal to  $\mathbf{r}(t)$ . Graph  $\mathbf{r} = \mathbf{r}(t)$  and  $\mathbf{T} = \mathbf{T}(t)$ .

**Solution** We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ :

$$\mathbf{r}'(t) = \frac{d}{dt}(R \cos t) \mathbf{i} + \frac{d}{dt}(R \sin t) \mathbf{j} = -R \sin t \mathbf{i} + R \cos t \mathbf{j}$$

$$\|\mathbf{r}'(t)\| = \sqrt{(-R \sin t)^2 + (R \cos t)^2} = R$$

Then the unit tangent vector is

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{-R \sin t \mathbf{i} + R \cos t \mathbf{j}}{R} = -\sin t \mathbf{i} + \cos t \mathbf{j}$$

To determine whether  $\mathbf{r}(t)$  is orthogonal to  $\mathbf{T}(t)$ , we find their dot product.

$$\mathbf{T}(t) \cdot \mathbf{r}(t) = (-\sin t \mathbf{i} + \cos t \mathbf{j}) \cdot (R \cos t \mathbf{i} + R \sin t \mathbf{j}) = -R \sin t \cos t + R \sin t \cos t = 0$$

for all  $t$ . That is,  $\mathbf{T}(t)$  is everywhere orthogonal to  $\mathbf{r}(t)$ , as shown in Figure 11. ■

**Figure 11**  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j}$

The following discussion leads to the definition of the *principal unit normal vector*.

Suppose a smooth curve  $C$  is traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$ . Then the unit tangent vector  $\mathbf{T}(t)$  is differentiable. Also, since  $\mathbf{T}(t)$  is a unit vector,

$$\mathbf{T}(t) \cdot \mathbf{T}(t) = 1 \quad \text{for all } t$$

If we differentiate this expression, we find

$$\frac{d}{dt}[\mathbf{T}(t) \cdot \mathbf{T}(t)] = \frac{d}{dt}(1) \quad \text{Differentiate both sides.}$$

$$\mathbf{T}'(t) \cdot \mathbf{T}(t) + \mathbf{T}(t) \cdot \mathbf{T}'(t) = 0 \quad \text{Use the dot product rule.}$$

$$\mathbf{T}(t) \cdot \mathbf{T}'(t) = 0 \quad \text{Simplify.}$$

We conclude that  $\mathbf{T}'(t)$  is a vector that is orthogonal to  $\mathbf{T}(t)$  at every point on the curve  $C$ .

In particular, the vector  $\frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$  is a unit vector that is orthogonal to  $\mathbf{T}(t)$  at every point on the curve  $C$ .

(a) There are two unit vectors orthogonal to  $\mathbf{T}$ .

(b) There are infinitely many vectors orthogonal to  $\mathbf{T}$ .

**Figure 12**

**DEFINITION** Principal Unit Normal Vector

For a smooth curve  $C$  traced out by a vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , that is twice differentiable for  $a < t < b$ , the **principal unit normal vector**  $\mathbf{N}(t)$  to  $C$  at  $t$  is

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$$

Notice that the unit normal vector  $\mathbf{N}$  is not defined if  $\mathbf{T}' = \mathbf{0}$ . So, for example, lines do not have well-defined unit normals.

If  $C$  is a plane curve, there are two unit vectors that are orthogonal to the unit tangent vector  $\mathbf{T}$ , as shown in Figure 12(a). If  $C$  is a curve in space, there are infinitely many unit vectors that are orthogonal to the unit tangent vector  $\mathbf{T}$ , as shown in Figure 12(b). The definition of the principal unit normal vector identifies exactly one of the orthogonal vectors and gives it a name.

**DF** Figure 13  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$

### EXAMPLE 3 Finding the Principal Unit Normal Vector

Find the principal unit normal vector  $\mathbf{N}(t)$  to the circle  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$ . (Refer to Example 2.) Graph  $\mathbf{r} = \mathbf{r}(t)$ , and show a unit tangent vector and a unit normal vector.

**Solution** From Example 2, the unit tangent vector  $\mathbf{T}(t)$  is

$$\mathbf{T}(t) = -\sin t \mathbf{i} + \cos t \mathbf{j}$$

Since  $\mathbf{T}'(t) = -\cos t \mathbf{i} - \sin t \mathbf{j}$ , the principal unit normal vector  $\mathbf{N}(t)$  is

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} = \frac{-\cos t \mathbf{i} - \sin t \mathbf{j}}{\sqrt{(-\cos t)^2 + (-\sin t)^2}} = -\cos t \mathbf{i} - \sin t \mathbf{j}$$

Since  $\mathbf{r}(t) = R(\cos t \mathbf{i} + \sin t \mathbf{j})$ , the vector  $\mathbf{N}(t)$  is parallel to  $-\mathbf{r}(t)$ . That is,  $\mathbf{N}(t)$  is a unit vector opposite in direction to the vector  $\mathbf{r}(t)$ , so  $\mathbf{N}$  is directed toward the center of the circle, as shown in Figure 13. ■

**NOW WORK** Problem 29.

### EXAMPLE 4 Finding the Principal Unit Normal Vector of a Helix

Show that the principal unit normal vector  $\mathbf{N}(t)$  of the helix

$$\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k}$$

is orthogonal to the  $z$ -axis.

**Solution** We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ .

$$\mathbf{r}'(t) = -\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k} \quad \|\mathbf{r}'(t)\| = \sqrt{(-\sin t)^2 + (\cos t)^2 + 1} = \sqrt{2}$$

$$\text{Then the unit tangent vector is } \mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{-\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}}{\sqrt{2}}.$$

Since

$$\mathbf{T}'(t) = \frac{-\cos t \mathbf{i} - \sin t \mathbf{j}}{\sqrt{2}} \quad \text{and} \quad \|\mathbf{T}'(t)\| = \sqrt{\left(-\frac{\cos t}{\sqrt{2}}\right)^2 + \left(-\frac{\sin t}{\sqrt{2}}\right)^2} = \frac{1}{\sqrt{2}}$$

we have

$$\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|} = -\cos t \mathbf{i} - \sin t \mathbf{j}$$

Since the direction of the  $z$ -axis is  $\mathbf{k}$ , it follows that  $\mathbf{N}(t) \cdot \mathbf{k} = 0$  for all  $t$ . So,  $\mathbf{N}(t)$  is always orthogonal to the  $z$ -axis, as shown in Figure 14. ■

**NOW WORK** Problem 37.

**Figure 14**  $\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k}$

## 3 Find the Arc Length of a Curve Traced Out by a Vector Function

A formula for the arc length of a smooth plane curve was derived in Chapter 9. The formula for the arc length of a smooth curve traced out by a vector function is given next.

### THEOREM Arc Length of a Vector Function

If a smooth curve  $C$  is traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , the **arc length**  $s$  along  $C$  from  $t = a$  to  $t = b$  is

$$s = \int_a^b \|\mathbf{r}'(t)\| dt$$

For a smooth plane curve  $C$ , traced out by

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} \quad a \leq t \leq b$$

we have

$$\mathbf{r}'(t) = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}$$

The arc length of  $C$  from  $a$  to  $b$  is given by

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \int_a^b \|\mathbf{r}'(t)\| dt$$

For a smooth space curve  $C$ , traced out by

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k} \quad a \leq t \leq b$$

we have

$$\mathbf{r}'(t) = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} + \frac{dz}{dt}\mathbf{k} \quad \text{and} \quad \|\mathbf{r}'(t)\| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2}$$

The arc length of  $C$  from  $a$  to  $b$  is given by

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} dt = \int_a^b \|\mathbf{r}'(t)\| dt$$

**NEED TO REVIEW?** The arc length of a smooth curve is discussed in Section 9.2, pp. 651–653.

**Figure 15**  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$

**Figure 16**  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j} + t \mathbf{k}$ ,  $0 \leq t \leq 2\pi$

### EXAMPLE 5 Finding the Arc Length of a Circle and a Helix

Find the arc length of:

- (a) The circle  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j}$  from  $t = 0$  to  $t = 2\pi$
- (b) The circular helix  $\mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j} + t \mathbf{k}$  from  $t = 0$  to  $t = 2\pi$

**Solution** (a) We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ :

$$\mathbf{r}'(t) = -R \sin t \mathbf{i} + R \cos t \mathbf{j} \quad \|\mathbf{r}'(t)\| = \sqrt{(-R \sin t)^2 + (R \cos t)^2} = R$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^{2\pi} R dt = [Rt]_0^{2\pi} = 2\pi R$$

which is the familiar formula for the circumference of a circle. See Figure 15.

(b) We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ .

$$\mathbf{r}'(t) = -R \sin t \mathbf{i} + R \cos t \mathbf{j} + \mathbf{k},$$

$$\|\mathbf{r}'(t)\| = \sqrt{(-R \sin t)^2 + (R \cos t)^2 + 1} = \sqrt{R^2 + 1}$$

Then

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^{2\pi} \sqrt{R^2 + 1} dt = [\sqrt{R^2 + 1} t]_0^{2\pi} = 2\pi \sqrt{R^2 + 1}$$

See Figure 16. ■

### NOW WORK Problem 51.

For most vector functions, finding arc length requires technology.

**Figure 17**  $\mathbf{r}(t) = 2 \cos t \mathbf{i} + 3 \sin t \mathbf{j}$ ,  
 $0 \leq t \leq \frac{\pi}{2}$

**Figure 18**

### **CAS** EXAMPLE 6 Using Technology to Find the Arc Length of an Ellipse

Use technology to find the arc length  $s$  of the ellipse shown in Figure 17 traced out by the vector function  $\mathbf{r}(t) = 2 \cos t \mathbf{i} + 3 \sin t \mathbf{j}$  from  $t = 0$  to  $t = \frac{\pi}{2}$ .

**Solution** We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ .

$$\mathbf{r}'(t) = -2 \sin t \mathbf{i} + 3 \cos t \mathbf{j} \quad \|\mathbf{r}'(t)\| = \sqrt{4 \sin^2 t + 9 \cos^2 t}$$

Now we use the formula for arc length.

$$s = \int_a^b \|\mathbf{r}'(t)\| dt = \int_0^{\pi/2} \sqrt{4 \sin^2 t + 9 \cos^2 t} dt$$

This is an integral that has no antiderivative in terms of elementary functions. To obtain a numerical approximation to the arc length, we use a CAS or a graphing utility.

When entering the integral in WolframAlpha, we find

$$\int_0^{\pi/2} \sqrt{4 \sin^2 t + 9 \cos^2 t} dt \approx 3.96636$$

If we use a TI-84 to find the value of this integral, we obtain the same result. The screen shot is given in Figure 18. ■

### **NOW WORK** Problem 55.

## 11.2 Assess Your Understanding

### Concepts and Vocabulary

- True or False** If a vector function  $\mathbf{r} = \mathbf{r}(t)$  is differentiable at  $t_0$ ,  $a < t_0 < b$ , and  $P_0$  is the point on the curve traced out by  $\mathbf{r} = \mathbf{r}(t)$  corresponding to  $t = t_0$ , then the tangent line to the curve at  $t_0$  contains the point  $P_0$  and has the direction  $\mathbf{r}'(t_0)$ .
- True or False** A curve traced out by a vector function  $\mathbf{r} = \mathbf{r}(t)$  is called a smooth curve on the interval  $[a, b]$  if  $\mathbf{r} = \mathbf{r}(t)$  is continuous on the interval  $[a, b]$ .
- True or False** If  $C$  is a smooth curve traced out by a vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , then  $\mathbf{T}(t) = \mathbf{r}'(t)$  is the unit tangent vector to  $C$  at  $t$ .
- True or False** If  $C$  is a smooth curve traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , and if  $\mathbf{T}$  is the unit tangent vector to  $C$ , then  $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$  is the principal unit normal vector to  $C$  at  $t$ .
- True or False** For a smooth space curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , the integral  $\int_a^b \|\mathbf{r}'(t)\| dt$  equals the arc length along  $C$  from  $t = a$  to  $t = b$ .
- True or False** For a smooth curve traced out by a twice differentiable vector function, the unit tangent vector is orthogonal to the principal unit normal vector.

### Skill Building

In Problems 7–14:

- Find the tangent vector to each curve at  $t$ .
- Graph the curve.
- Add the graph of the tangent vector to (b).

- $\mathbf{r}(t) = t\mathbf{i} - t^2\mathbf{j}$ ,  $t = 1$
- $\mathbf{r}(t) = t\mathbf{i} - t^3\mathbf{j}$ ,  $t = -1$
- $\mathbf{r}(t) = (t^2 + 1)\mathbf{i} + (1 - t)\mathbf{j}$ ,  $t = 1$
- $\mathbf{r}(t) = t^3\mathbf{i} + 3t\mathbf{j}$ ,  $t = 1$
- $\mathbf{r}(t) = 4t\mathbf{i} - \sqrt{t}\mathbf{j}$ ,  $t = 1$
- $\mathbf{r}(t) = \sqrt{t}\mathbf{i} + \frac{1}{2}t\mathbf{j}$ ,  $t = 4$
- $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j}$ ,  $t = 0$
- $\mathbf{r}(t) = e^{2t}\mathbf{i} + e^{-t}\mathbf{j}$ ,  $t = 0$

In Problems 15–22, find the tangent vector to each curve at  $t$ .

- $\mathbf{r}(t) = (1 - 3t)\mathbf{i} + 2t\mathbf{j} - (5 + t)\mathbf{k}$ ,  $t = 0$
- $\mathbf{r}(t) = (2 + t)\mathbf{i} + (2 - t)\mathbf{j} + 3t\mathbf{k}$ ,  $t = 0$
- $\mathbf{r}(t) = \cos(2t)\mathbf{i} + \sin(2t)\mathbf{j} - 5\mathbf{k}$ ,  $t = \frac{\pi}{4}$
- $\mathbf{r}(t) = 3\mathbf{i} + \cos t\mathbf{j} + \sin t\mathbf{k}$ ,  $t = \frac{\pi}{6}$

19.  $\mathbf{r}(t) = 2 \cos t \mathbf{i} + \mathbf{j} + 2 \sin t \mathbf{k}, \quad t = \frac{\pi}{6}$
20.  $\mathbf{r}(t) = 2 \cos(2t) \mathbf{i} + 2 \sin(2t) \mathbf{j} + 5 \mathbf{k}, \quad t = \frac{\pi}{2}$
21.  $\mathbf{r}(t) = e^t \cos t \mathbf{i} + e^t \sin t \mathbf{j} + e^t \mathbf{k}, \quad t = 0$
22.  $\mathbf{r}(t) = e^{-t} \cos t \mathbf{i} + e^{-t} \sin t \mathbf{j} - e^{-t} \mathbf{k}, \quad t = 0$

In Problems 23–26, draw the unit tangent vector  $\mathbf{T}$  and principal unit normal vector  $\mathbf{N}$  to  $\mathbf{C}$  at the points  $P$  and  $Q$ . Be sure to use the orientation of the curve. Assume the length of a unit vector is one inch.

In Problems 27–42, for each vector function  $\mathbf{r} = \mathbf{r}(t)$ , find the unit tangent vector  $\mathbf{T}$  and the principal unit normal vector  $\mathbf{N}$  at  $t$ .

27.  $\mathbf{r}(t) = t \mathbf{i} + t^2 \mathbf{j}, \quad t = 1$       28.  $\mathbf{r}(t) = t \mathbf{i} - t^3 \mathbf{j}, \quad t = -1$
29.  $\mathbf{r}(t) = (t^2 + 1) \mathbf{i} + (1 - t) \mathbf{j}, \quad t = 1$
30.  $\mathbf{r}(t) = t^3 \mathbf{i} + 3t \mathbf{j}, \quad t = 1$       31.  $\mathbf{r}(t) = \frac{2t}{t+1} \mathbf{i} - \frac{t^2}{t+1} \mathbf{j}, \quad t = 1$
32.  $\mathbf{r}(t) = \sqrt{t} \mathbf{i} + \frac{1}{2} t \mathbf{j}, \quad t = 4$       33.  $\mathbf{r}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j}, \quad t = 0$
34.  $\mathbf{r}(t) = e^{2t} \mathbf{i} + e^{-t} \mathbf{j}, \quad t = 0$
35.  $\mathbf{r}(t) = (1 - 3t) \mathbf{i} + 2t \mathbf{j} - (5 + t) \mathbf{k}, \quad t = 0$
36.  $\mathbf{r}(t) = (2 + t) \mathbf{i} + (2 - t) \mathbf{j} + 3t \mathbf{k}, \quad t = 0$
37.  $\mathbf{r}(t) = 2 \cos t \mathbf{i} + \mathbf{j} + 2 \sin t \mathbf{k}, \quad t = \frac{\pi}{6}$
38.  $\mathbf{r}(t) = 3 \mathbf{i} + \cos t \mathbf{j} + \sin t \mathbf{k}, \quad t = \frac{\pi}{6}$
39.  $\mathbf{r}(t) = \cos(2t) \mathbf{i} + \sin(2t) \mathbf{j} - 5 \mathbf{k}, \quad t = \frac{\pi}{4}$
40.  $\mathbf{r}(t) = 2 \cos(2t) \mathbf{i} + 2 \sin(2t) \mathbf{j} + 5 \mathbf{k}, \quad t = \frac{\pi}{2}$
41.  $\mathbf{r}(t) = e^t \cos t \mathbf{i} + e^t \sin t \mathbf{j} + e^t \mathbf{k}, \quad t = 0$
42.  $\mathbf{r}(t) = e^{-t} \cos t \mathbf{i} + e^{-t} \sin t \mathbf{j} - e^{-t} \mathbf{k}, \quad t = 0$

In Problems 43–54, find the arc length  $s$  of each vector function.

43.  $\mathbf{r}(t) = t \mathbf{i} + (t^{3/2} + 1) \mathbf{j}$  from  $t = 1$  to  $t = 8$
44.  $\mathbf{r}(t) = t \mathbf{i} + t^{3/2} \mathbf{j}$  from  $t = 0$  to  $t = 4$
45.  $\mathbf{r}(t) = 8t \mathbf{i} + \frac{t^6 + 2}{t^2} \mathbf{j}$  from  $t = 1$  to  $t = 2$
46.  $\mathbf{r}(t) = t \mathbf{i} + (1 - t^{2/3})^{3/2} \mathbf{j}$  from  $t = \frac{1}{8}$  to  $t = 1$
47.  $\mathbf{r}(t) = t \mathbf{i} + 2t \mathbf{j} + t \mathbf{k}$  from  $t = 0$  to  $t = 1$
48.  $\mathbf{r}(t) = 2t \mathbf{i} + t \mathbf{j} + 3t \mathbf{k}$  from  $t = 1$  to  $t = 3$
49.  $\mathbf{r}(t) = \sin(2t) \mathbf{i} + \cos(2t) \mathbf{j} + t \mathbf{k}$  from  $t = 0$  to  $t = \pi$
50.  $\mathbf{r}(t) = \sin t \mathbf{i} + \cos t \mathbf{j} + bt \mathbf{k}$  from  $t = 0$  to  $t = 2\pi$
51.  $\mathbf{r}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j} + \sqrt{2} t \mathbf{k}$  from  $t = 0$  to  $t = 1$
52.  $\mathbf{r}(t) = \cos^3 t \mathbf{i} + \sin^3 t \mathbf{j} + \mathbf{k}$  from  $t = 0$  to  $t = \frac{\pi}{2}$
53.  $\mathbf{r}(t) = e^t \cos t \mathbf{i} + e^t \sin t \mathbf{j} + e^t \mathbf{k}$  from  $t = 0$  to  $t = 2\pi$
54.  $\mathbf{r}(t) = t^2 \mathbf{i} - 2\sqrt{2} t \mathbf{j} + (t^2 - 1) \mathbf{k}$  from  $t = 0$  to  $t = 1$

In Problems 55–58,

- (a) Graph the curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .
- (b) Find the indicated arc length.

55.  $\mathbf{r}(t) = 3 \sin t \mathbf{i} - 4 \cos t \mathbf{j}$  from  $t = 0$  to  $t = \pi$
56.  $\mathbf{r}(t) = 5 \cos t \mathbf{i} + 3 \sin t \mathbf{j}$  from  $t = 0$  to  $t = \frac{\pi}{2}$
57.  $\mathbf{r}(t) = 2 \sin t \mathbf{i} + 4 \cos(2t) \mathbf{j}$  from  $t = 0$  to  $t = 2\pi$
58.  $\mathbf{r}(t) = 4 \sin(2t) \mathbf{i} - 6 \cos t \mathbf{j}$  from  $t = 0$  to  $t = \frac{\pi}{2}$

### Applications and Extensions

59. Find all the points on the curve traced out by  $\mathbf{r}(t) = t^2 \mathbf{i} + (t^2 - 1) \mathbf{j} - t \mathbf{k}$  at which  $\mathbf{r}(t)$  and its tangent vector are orthogonal.
60. Find the angle between the helix traced out by  $\mathbf{r}(t) = \cos t \mathbf{i} + t \mathbf{j} + \sin t \mathbf{k}$  and the  $y$ -axis.
61. The helix defined by  $\mathbf{r}(t) = 3 \sin t \mathbf{i} + 3 \cos t \mathbf{j} + 4t \mathbf{k}$  and the direction  $\mathbf{k}$  meet at a constant angle. Find the angle to the nearest degree.
62. The helix defined by  $\mathbf{r}(t) = 2 \cos t \mathbf{i} + 2 \sin t \mathbf{j} + t \mathbf{k}$  and the direction  $\mathbf{k}$  meet at a constant angle. Find the angle to the nearest degree.

In Problems 63–66, find the angle between the tangent vectors to the curves traced out by  $\mathbf{r}_1(t_1)$  and  $\mathbf{r}_2(t_2)$  at the point of intersection given.

63.  $\mathbf{r}_1(t_1) = t_1 \mathbf{i} + \sin(\pi t_1) \mathbf{j} + \mathbf{k}$  and  $\mathbf{r}_2(t_2) = \mathbf{i} + t_2 \mathbf{j} + (1 + t_2) \mathbf{k}$  at  $(1, 0, 1)$
64.  $\mathbf{r}_1(t_1) = \sin(2t_1) \mathbf{i} + \sin t_1 \mathbf{j} + t_1 \mathbf{k}$  and  $\mathbf{r}_2(t_2) = t_2^2 \mathbf{i} + t_2 \mathbf{j} + t_2^3 \mathbf{k}$  at  $(0, 0, 0)$
65.  $\mathbf{r}_1(t_1) = (e^{t_1} - 1) \mathbf{i} - \cos(\pi t_1) \mathbf{j} + t_1 \mathbf{k}$  and  $\mathbf{r}_2(t_2) = (1 - t_2) \mathbf{i} - \mathbf{j} + (t_2 - 1) \mathbf{k}$  at  $(0, -1, 0)$

66.  $\mathbf{r}_1(t_1) = t_1^2\mathbf{i} - (t_1 - 3)\mathbf{j} - (t_1 - 3)\mathbf{k}$  and  
 $\mathbf{r}_2(t_2) = (t_2^2 + 3)\mathbf{i} - (t_2 - 2)\mathbf{j} + t_2\mathbf{k}$  at  $(4, 1, 1)$

If  $\mathbf{r} = \mathbf{r}(t)$  is a vector function in space that is twice differentiable, then the cross product of the unit tangent vector and the principal unit normal vector,  $\mathbf{T} \times \mathbf{N}$ , defines a third unit vector  $\mathbf{B}(t)$ . This vector  $\mathbf{B}$ , called the binormal vector, is orthogonal to both the unit tangent vector  $\mathbf{T}$  and the principal unit normal vector  $\mathbf{N}$ , as shown in the figure.

In Problems 67–70, find the unit tangent vector  $\mathbf{T}$ , the principal unit normal vector  $\mathbf{N}$ , and the binormal vector  $\mathbf{B}$  to each vector function.

67.  $\mathbf{r}(t) = t^2\mathbf{i} - (t - 3)\mathbf{j} - (t - 3)\mathbf{k}$   
 68.  $\mathbf{r}(t) = (t + 5)\mathbf{i} - (t + 5)\mathbf{j} + t^2\mathbf{k}$   
 69.  $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k}$   
 70.  $\mathbf{r}(t) = 2 \sin t\mathbf{i} + 2 \cos t\mathbf{j} + 3t\mathbf{k}$
71. Suppose the vector function  $\mathbf{r} = \mathbf{r}(t)$  in space is differentiable and has a nonzero tangent vector at  $t_0$ . Find the direction cosines for the tangent vector at  $t_0$ .
72. Show that at any point, the tangent vectors to a helix  $\mathbf{r}(t) = a \cos t\mathbf{i} + a \sin t\mathbf{j} + bt\mathbf{k}$ , where  $a$  and  $b$  are real numbers, intersect the direction of the  $z$ -axis at a constant angle.

### Challenge Problems

73. Use Simpson's Rule with  $n = 4$  to approximate the length of the curve  $\mathbf{r}(t) = t^2\mathbf{i} + t^3\mathbf{j} + (2t + 3)\mathbf{k}$ ,  $0 \leq t \leq 2$ .
74. (a) Approximate the arc length of  $\mathbf{r}(t) = 3 \sin t\mathbf{i} - 4 \cos t\mathbf{j}$  from  $t = 0$  to  $t = \pi$  using Simpson's Rule with  $n = 4$ .  
 (b) Approximate the arc length of  $\mathbf{r}(t) = 3 \sin t\mathbf{i} - 4 \cos t\mathbf{j}$  from  $t = 0$  to  $t = \pi$  using the Trapezoidal Rule with  $n = 6$ .  
 (c) Compare the answers to (a) and (b) to the result given by technology (see Problem 55).
75. (a) Approximate the arc length of  $\mathbf{r}(t) = 2 \sin t\mathbf{i} + 4 \cos(2t)\mathbf{j}$  from  $t = 0$  to  $t = 2\pi$  using Simpson's Rule with  $n = 4$ .  
 (b) Approximate the arc length of  $\mathbf{r}(t) = 2 \sin t\mathbf{i} + 4 \cos(2t)\mathbf{j}$  from  $t = 0$  to  $t = 2\pi$  using the Trapezoidal Rule with  $n = 6$ .  
 (c) Compare the answers to (a) and (b) to the result given by technology (see Problem 57).
76. Approximate the length of the curve  $\mathbf{r}(t) = \frac{1}{3}t^3\mathbf{i} + (t - 1)\mathbf{j} + 2t\mathbf{k}$ ,  $0 \leq t \leq \frac{1}{2}$ , correct to three decimal places, by expanding the integrand in a power series.

## 11.3 Arc Length as Parameter; Curvature

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Determine whether the parameter used in a vector function is arc length (p. 775)
- 2 Find the curvature of a curve (p. 776)
- 3 Find the curvature of a space curve (p. 778)
- 4 Find the curvature of a plane curve given by  $y = f(x)$  (p. 779)
- 5 Find an osculating circle (p. 780)

In this section, we discuss geometric properties of curves.

We have seen that the same curve can be defined using different parametric equations. For example, the upper half of a unit circle can be given by

$$\mathbf{r}(t) = t\mathbf{i} + \sqrt{1 - t^2}\mathbf{j} \quad -1 \leq t \leq 1$$

where  $x(t) = t$  and  $y(t) = \sqrt{1 - t^2}$ . Here, the parameter  $t$  is the position on the  $x$ -axis.

This same curve can be given by

$$\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} \quad 0 \leq t \leq \pi$$

where  $x(t) = \cos t$  and  $y(t) = \sin t$ . Here, the parameter  $t$  is the angle between the positive  $x$ -axis and  $\mathbf{r} = \mathbf{r}(t)$ . Since the curve is the upper half of the unit circle, the arc length  $s$  subtended by the angle  $t$  is  $s = r\theta = t$ . That is, the parameter  $t$  equals the arc length along the circle.

Just as time is the preferred parameter for motion along a curve, arc length along a curve is the preferred parameter for discussing a curve's geometric properties—for several reasons.

First, the arc length of a curve is a natural consequence of the curve's shape. Further, arc length is independent of the representation of the curve. For example, the arc length of the semi-circle,  $x = 2t$ ,  $y = 2\sqrt{1-t^2}$ ,  $-1 \leq t \leq 1$ , is  $2\pi$ . The arc length of the same semi-circle,  $x = 2 \sin \theta$ ,  $y = 2 \cos \theta$ ,  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ , is also  $2\pi$ . No matter how the curve is defined, its arc length is the same.

## 1 Determine Whether the Parameter Used in a Vector Function Is Arc Length

So how do we determine whether the parameter of a curve represents arc length? And, if it doesn't, how can we change the parameter so it does represent arc length? The next result provides a means for determining whether the parameter of a vector function is arc length.

Let's examine the relationship between arc length  $s$  along a curve  $C$  and the parameter  $t$  used to define  $C$ . The arc length  $s$  of a smooth curve  $C$  traced out by a vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , from  $a$  to an arbitrary parameter value  $t$  in  $[a, b]$  is

$$s(t) = \int_a^t \|\mathbf{r}'(u)\| du \quad (1)$$

Then, by the Fundamental Theorem of Calculus,

$$\frac{ds}{dt} = \|\mathbf{r}'(t)\| \quad (2)$$

### THEOREM Criterion for Arc Length as Parameter

Suppose a smooth curve  $C$  is traced out by the vector function

$$\mathbf{r} = \mathbf{r}(t) \quad a \leq t \leq b$$

The parameter  $t$  is the arc length along  $C$  if and only if

$$\|\mathbf{r}'(t)\| = 1 \quad \text{for all } t$$

**Proof** We use equation (1). If  $\|\mathbf{r}'(t)\| = 1$  for all  $t$ , then the arc length  $s$  is

$$s(t) = \int_a^t du = t - a$$

That is, the parameter  $t$  is the arc length  $s$  measured along  $C$  from  $t = a$  to  $t = b$ . Notice that when  $t = a$ , the length  $s$  is zero, as expected.

Conversely, if the parameter  $t$  is arc length  $s$ , then, by differentiating (1), we obtain

$$\frac{ds}{dt} = 1 = \|\mathbf{r}'(t)\| \quad \text{for all } t \quad \blacksquare$$

### EXAMPLE 1 Determining Whether the Parameter Used in a Vector Function Is Arc Length

Determine whether the parameter used in each vector function is arc length.

(a)  $C_1: \mathbf{r}(t) = 2 \sin \frac{t}{2} \mathbf{i} + 2 \cos \frac{t}{2} \mathbf{j} \quad 0 \leq t \leq 2\pi$

(b)  $C_2: \mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k} \quad t \geq 0$

**Solution** (a) We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ .

$$\mathbf{r}'(t) = \cos \frac{t}{2} \mathbf{i} - \sin \frac{t}{2} \mathbf{j} \quad \|\mathbf{r}'(t)\| = \sqrt{\cos^2 \frac{t}{2} + \sin^2 \frac{t}{2}} = 1 \quad \text{for all } t$$

Since  $\|\mathbf{r}'(t)\| = 1$  for all  $t$ , the parameter  $t$  is arc length as measured along  $C_1$ .

(b) We begin by finding  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ .

$$\mathbf{r}'(t) = -\sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k} \quad \|\mathbf{r}'(t)\| = \sqrt{\sin^2 t + \cos^2 t + 1} = \sqrt{2}$$

Since  $\|\mathbf{r}'(t)\| \neq 1$  for all  $t$ , the parameter  $t$  does not measure arc length along  $C_2$ . ■

### NOW WORK Problem 13.

### EXAMPLE 2 Changing the Parameter to Arc Length

Represent the helix in Example 1(b).

$$\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} + t \mathbf{k} \quad t \geq 0$$

so the parameter is arc length.

**Solution** The arc length function  $s(t)$  along the curve  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , from  $t = a$  to an arbitrary  $t$  is given by the integral

$$s(t) = \int_a^t \|\mathbf{r}'(u)\| du$$

Since the graph of the helix starts at  $t = 0$ , and  $\|\mathbf{r}'(t)\| = \sqrt{2}$  for all  $t$  (Example 1(b)), we have

$$s(t) = \int_0^t \sqrt{2} du = \left[ \sqrt{2}u \right]_0^t = \sqrt{2}t$$

Then  $t = \frac{s}{\sqrt{2}}$ . The helix using arc length  $s$  as the parameter is expressed as

$$\mathbf{r}(s) = \cos \frac{s}{\sqrt{2}} \mathbf{i} + \sin \frac{s}{\sqrt{2}} \mathbf{j} + \frac{s}{\sqrt{2}} \mathbf{k} \quad s \geq 0$$

As Example 2 shows, to change the parameter  $t$  of a curve  $C$  traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , to arc length  $s$  requires finding the integral

$$s(t) = \int_a^t \|\mathbf{r}'(u)\| du$$

Since  $\|\mathbf{r}'(u)\|$  is continuous on  $(a, b)$  and  $\mathbf{r}'(t)$  is never zero on  $(a, b)$ , then  $s = s(t)$  exists for all  $t \geq a$ . Moreover,  $s'(t) = \|\mathbf{r}'(t)\| > 0$ , so  $s$  is increasing and has an inverse function. To find it, we need to solve  $s = s(t)$  for  $t$ . For most curves, finding the integral and solving for  $t$  is not possible. Regardless, for smooth curves, we know an arc length parameterization exists. In the discussion that follows, we make use of this fact and assume the curve is expressed using arc length as the parameter.

## 2 Find the Curvature of a Curve

A curve may change direction quickly at some points and slowly at others. For example, the curve in Figure 19 bends sharply at  $P$ , but at  $Q$  the curve bends only a little. *Curvature* is a measure of how sharply a curve bends, that is, curvature measures how much the direction of the curve is changing. For the curve in Figure 19, the curvature at  $P$  is greater than the curvature at  $Q$ .

The amount a curve changes direction at a point can be quantified using the unit tangent vector  $\mathbf{T}$  at the point. If we move a little away from  $Q$  and there is little or no change in the direction of  $\mathbf{T}$ , the curve has not bent much. If we move a little away from  $P$  and the direction of  $\mathbf{T}$  changes dramatically, the curve has bent a lot. The curvature of  $C$  at  $Q$  is less than the curvature at  $P$  because the tangent vectors near  $P$  have turned more than the tangent vectors near  $Q$ . We use the rate of change of the tangent vectors to measure curvature.

Figure 19

**DEFINITION** Curvature

Suppose a smooth curve  $C$  is traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(s)$ , where the parameter is the arc length  $s$  along  $C$ . The **curvature**  $\kappa = \kappa(s)$  at a point  $P$  on  $C$  is

$$\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\|$$

**NOTE**  $\kappa$  is the Greek letter kappa.

**IN WORDS** Curvature is measured by the magnitude of the rate of change of the unit tangent vector  $\mathbf{T}$  with respect to arc length.

In the next example, we find the curvature of a line. Since a line has constant direction, the tangent vectors never turn so the curvature of the line is 0.

**EXAMPLE 3** Finding the Curvature of a Line

Show that the curvature of a line is 0.

**Solution** For a line, the unit tangent vector  $\mathbf{T}$  is along the constant direction of the line, so  $\mathbf{T}$  is a constant and  $\frac{d\mathbf{T}}{ds} = \mathbf{0}$ . The curvature  $\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\|$  of a line is 0. ■

As we stated earlier, it is not easy to express a curve using arc length as the parameter. So, we seek expressions for the curvature  $\kappa$  that do not require the parameter to be arc length. Suppose  $\mathbf{T} = \mathbf{T}(t)$  is the unit tangent vector of a curve  $C$  traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ . If  $s$  is the arc length along  $C$ , then we can use the Chain Rule to obtain

$$\frac{d\mathbf{T}}{dt} = \frac{d\mathbf{T}}{ds} \frac{ds}{dt}$$

Since  $\frac{ds}{dt} = \|\mathbf{r}'(t)\| \neq 0$ , then

$$\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\| = \left\| \frac{\mathbf{T}'(t)}{\frac{ds}{dt}} \right\|$$

Since  $\frac{ds}{dt} = \|\mathbf{r}'(t)\|$ , we have the following expression for the curvature  $\kappa$  of a curve  $C$  in terms of any parameterization of  $C$ :

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} \quad (3)$$

The next example finds the curvature of a circle. Since a circle has a tangent line that turns uniformly, its curvature is a constant. What that constant is may surprise you.

**EXAMPLE 4** Finding the Curvature of a Circle

Find the curvature of a circle of radius  $R$ .

**Solution** For a circle of radius  $R$ ,

$$\mathbf{r} = \mathbf{r}(t) = R \cos t \mathbf{i} + R \sin t \mathbf{j} \quad 0 \leq t \leq 2\pi$$

Then we find  $\mathbf{r}'(t)$  and  $\|\mathbf{r}'(t)\|$ .

$$\mathbf{r}'(t) = -R \sin t \mathbf{i} + R \cos t \mathbf{j} \quad \|\mathbf{r}'(t)\| = \sqrt{R^2 \sin^2 t + R^2 \cos^2 t} = R$$

The unit tangent vector  $\mathbf{T}$  and its derivative  $\mathbf{T}'$  are

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|} = \frac{-R \sin t \mathbf{i} + R \cos t \mathbf{j}}{R} = -\sin t \mathbf{i} + \cos t \mathbf{j}$$

$$\mathbf{T}'(t) = -\cos t \mathbf{i} - \sin t \mathbf{j} \quad \|\mathbf{T}'(t)\| = 1$$

We use formula (3) to find the curvature  $\kappa$ .

$$\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|} = \frac{1}{R}$$

The curvature of a circle of radius  $R$  is the reciprocal of its radius. ■

**NOTE** The larger a circle, the smaller its curvature. As  $R \rightarrow \infty$ , then  $\kappa \rightarrow 0$ , and the circle will look more and more like a line.

### NOW WORK Problem 21.

## 3 Find the Curvature of a Space Curve

It is easier to find the curvature of a curve in space using the following formula rather than (3).

### THEOREM Curvature of a Space Curve

If a smooth curve  $C$  in space is traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$ , then its curvature  $\kappa$  is given by the formula

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} \quad (4)$$

**NEED TO REVIEW?** The cross product and its properties are discussed in Section 10.5, pp. 724–729.

**Proof** Since  $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$  and  $\|\mathbf{r}'(t)\| = \frac{ds}{dt}$  [from (2) on p. 775], then

$$\mathbf{r}'(t) = \|\mathbf{r}'(t)\| \mathbf{T}(t) = \frac{ds}{dt} \mathbf{T}(t) \quad (5)$$

Now we use the scalar multiplication formula to find  $\mathbf{r}''(t)$ .

$$\mathbf{r}''(t) = \frac{d}{dt} \mathbf{r}'(t) = \frac{d}{dt} \left( \frac{ds}{dt} \mathbf{T}(t) \right) = \frac{d^2s}{dt^2} \mathbf{T}(t) + \frac{ds}{dt} \mathbf{T}'(t) \quad (6)$$

Using (5) and (6), we get

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \frac{ds}{dt} \mathbf{T} \times \left( \frac{d^2s}{dt^2} \mathbf{T} + \frac{ds}{dt} \mathbf{T}' \right) = \frac{ds}{dt} \frac{d^2s}{dt^2} (\mathbf{T} \times \mathbf{T}) + \left( \frac{ds}{dt} \right)^2 (\mathbf{T} \times \mathbf{T}')$$

Since  $\mathbf{T} \times \mathbf{T} = \mathbf{0}$ , this reduces to

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \left( \frac{ds}{dt} \right)^2 (\mathbf{T} \times \mathbf{T}') \quad (7)$$

Since  $\mathbf{T}'$  is parallel to  $\mathbf{N}$  and  $\mathbf{T}$  is orthogonal to  $\mathbf{N}$ , it follows that  $\mathbf{T}$  and  $\mathbf{T}'$  are orthogonal. This means  $\|\mathbf{T} \times \mathbf{T}'\| = \|\mathbf{T}\| \|\mathbf{T}'\| \sin \frac{\pi}{2} = \|\mathbf{T}'\|$ , so

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \left( \frac{ds}{dt} \right)^2 \|\mathbf{T}'\|$$

Now we solve the above equation for  $\|\mathbf{T}'\|$  and use the fact that  $\frac{ds}{dt} = \|\mathbf{r}'(t)\|$ . Then

$$\|\mathbf{T}'\| = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^2} \quad (8)$$

From equation (3), the curvature  $\kappa$  is

$$\kappa = \frac{\|\mathbf{T}'\|}{\|\mathbf{r}'(t)\|} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$$

$\uparrow$   
(3)
 $\uparrow$   
(8)

■

**EXAMPLE 5** Finding the Curvature of a Space Curve

Find the curvature  $\kappa$  of the space curve  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$ .

**Solution** To use formula (4), we need to find  $\mathbf{r}'(t)$ ,  $\|\mathbf{r}'(t)\|$ ,  $\mathbf{r}''(t)$ ,  $\mathbf{r}'(t) \times \mathbf{r}''(t)$ , and  $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$ .

$$\mathbf{r}'(t) = \mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k} \quad \|\mathbf{r}'(t)\| = \sqrt{1 + 4t^2 + 9t^4}$$

$$\mathbf{r}''(t) = 2\mathbf{j} + 6t\mathbf{k}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2t & 3t^2 \\ 0 & 2 & 6t \end{vmatrix} = 6t^2\mathbf{i} - 6t\mathbf{j} + 2\mathbf{k}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = \sqrt{36t^4 + 36t^2 + 4} = 2\sqrt{9t^4 + 9t^2 + 1}$$

Now we use formula (4). The curvature  $\kappa$  is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{2\sqrt{9t^4 + 9t^2 + 1}}{(1 + 4t^2 + 9t^4)^{3/2}}$$

**NOW WORK** Problem 31.**4 Find the Curvature of a Plane Curve Given by  $y = f(x)$** 

The curvature formula  $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$  for a space curve can be used to find the curvature of a plane curve given by a twice differentiable function  $y = f(x)$ . We use  $x$  as the parameter and define the plane curve  $y = f(x)$  using the vector equation

$$\mathbf{r} = \mathbf{r}(x) = x\mathbf{i} + f(x)\mathbf{j} + 0\mathbf{k}$$

Notice that a  $\mathbf{k}$ -component of 0 is used. Then

$$\mathbf{r}'(x) = \mathbf{i} + f'(x)\mathbf{j} \quad \|\mathbf{r}'(x)\| = \sqrt{1 + [f'(x)]^2}$$

$$\mathbf{r}''(x) = f''(x)\mathbf{j}$$

$$\mathbf{r}'(x) \times \mathbf{r}''(x) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & f'(x) & 0 \\ 0 & f''(x) & 0 \end{vmatrix} = f''(x)\mathbf{k}$$

Now we use formula (4).

$$\kappa = \frac{\|\mathbf{r}'(x) \times \mathbf{r}''(x)\|}{\|\mathbf{r}'(x)\|^3} = \frac{|f''(x)|}{(1 + [f'(x)]^2)^{3/2}} \quad (9)$$

**EXAMPLE 6** Finding the Curvature of Plane Curves

- Find an equation of the tangent line to the graph of the parabola  $f(x) = \frac{1}{4}x^2$  at the point  $(2, 1)$ .
- What is the curvature of the graph of  $f$  at the point  $(2, 1)$ ?
- Find an equation of the tangent line to the graph of  $g(x) = \frac{x^3 + 4}{12}$  at the point  $(2, 1)$ .
- What is the curvature of the graph of  $g$  at the point  $(2, 1)$ ?
- Graph both curves and their tangent lines.

**Solution (a)**  $f(x) = \frac{1}{4}x^2$ ;  $f'(x) = \frac{1}{2}x$ . An equation of the tangent line to the graph of  $f$  at the point  $(2, 1)$  is

$$\begin{aligned}y - 1 &= 1 \cdot (x - 2) & f'(2) &= 1 \\y &= x - 1\end{aligned}$$

**(b)**  $f''(x) = \frac{1}{2}$ ;  $f'(2) = 1$ ;  $f''(2) = \frac{1}{2}$ . We use formula (9) and evaluate  $\kappa$  at  $x = 2$ .

$$\kappa = \frac{|f''(2)|}{(1 + [f'(2)]^2)^{3/2}} = \frac{\frac{1}{2}}{(1 + 1)^{3/2}} = \frac{1}{2 \cdot 2\sqrt{2}} = \frac{1}{4\sqrt{2}} \approx 0.177$$

**(c)**  $g(x) = \frac{x^3 + 4}{12}$ ;  $g'(x) = \frac{3x^2}{12} = \frac{x^2}{4}$ . An equation of the tangent line to the graph of  $g$  at the point  $(2, 1)$  is

$$\begin{aligned}y - 1 &= 1 \cdot (x - 2) & g'(2) &= 1 \\y &= x - 1\end{aligned}$$

**(d)**  $g''(x) = \frac{x}{2}$ ;  $g'(2) = 1$ ;  $g''(2) = 1$ . The curvature  $\kappa$  at the point  $(2, 1)$  is

$$\kappa = \frac{|g''(2)|}{(1 + [g'(2)]^2)^{3/2}} = \frac{1}{(1 + 1)^{3/2}} = \frac{1}{2\sqrt{2}} \approx 0.354$$

**(e)** The functions  $f$  and  $g$  are graphed in Figure 20. Both graphs have the same tangent line at  $(2, 1)$ , but the tangent line to the graph of  $y = \frac{1}{4}x^2$  at  $(2, 1)$  turns more slowly ( $\kappa \approx 0.177$ ) than the tangent line to the graph of  $y = \frac{x^3 + 4}{12}$  at  $(2, 1)$  ( $\kappa \approx 0.354$ ). ■

Figure 20

### NOW WORK Problem 39.

## 5 Find an Osculating Circle

Provided the curvature  $\kappa \neq 0$ , each point  $P$  on a smooth curve  $C$  traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$  can be associated with a circle, called the **osculating circle** of  $C$  at  $P$ . The osculating circle of  $C$  at  $P$  has the following properties:

- The osculating circle contains the point  $P$ .
- The tangent line to  $C$  at  $P$  and the tangent line to the osculating circle at  $P$  are the same.
- The radius  $\rho$  of the osculating circle is  $\rho = \frac{1}{\kappa}$ , where  $\kappa$  is the curvature of  $C$  at  $P$ .  
That is, the osculating circle and the curve  $C$  have the same curvature at  $P$ .
- The center of the osculating circle lies on a line in the direction of the principal unit normal  $\mathbf{N}$  to  $C$  at the point  $P$ .

Figure 21 illustrates these properties.

The osculating circle of a curve  $C$  is sometimes called the **circle of curvature**. Its radius  $\rho = \frac{1}{\kappa}$  is called the **radius of curvature**, and its center is called the **center of curvature**.

Figure 21 Osculating circle

**NOTE** The term *osculating* means "kissing."

**NOTE** The osculating circle at a point  $P$  is the limiting circle that results from the circle containing three points  $P$ ,  $Q$ , and  $R$  on the curve  $C$  as the points  $Q$  and  $R$  are made to approach point  $P$ .

Since the osculating circle and the curve share a common tangent at each point and have the same curvature at each point, sometimes the osculating circle is used to approximate the curve  $C$ . See Figure 22.

DF Figure 22

### EXAMPLE 7 Finding an Osculating Circle for an Ellipse

Find the radius of the osculating circle of the ellipse traced out by the vector function

$$\mathbf{r}(t) = 3 \sin t \mathbf{i} + 4 \cos t \mathbf{j} \quad 0 \leq t \leq 2\pi$$

- (a) At  $t = 0$       (b) At  $t = \frac{\pi}{2}$

**Solution** To find the radius of the osculating circle, we need to find the curvature  $\kappa$ . We treat the ellipse as a curve in space with a  $\mathbf{k}$  component of 0 and find  $\mathbf{r}'(t)$ ,  $\|\mathbf{r}'(t)\|$ ,  $\mathbf{r}''(t)$ ,  $\mathbf{r}'(t) \times \mathbf{r}''(t)$ , and  $\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|$ .

$$\mathbf{r}'(t) = 3 \cos t \mathbf{i} - 4 \sin t \mathbf{j} + 0 \mathbf{k} \quad \|\mathbf{r}'(t)\| = \sqrt{9 \cos^2 t + 16 \sin^2 t}$$

$$\mathbf{r}''(t) = -3 \sin t \mathbf{i} - 4 \cos t \mathbf{j} + 0 \mathbf{k}$$

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 \cos t & -4 \sin t & 0 \\ -3 \sin t & -4 \cos t & 0 \end{vmatrix} = (-12 \cos^2 t - 12 \sin^2 t) \mathbf{k} = -12 \mathbf{k}$$

$$\|\mathbf{r}'(t) \times \mathbf{r}''(t)\| = 12$$

Using formula (4), the curvature  $\kappa$  of  $C$  is

$$\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{12}{(9 \cos^2 t + 16 \sin^2 t)^{3/2}}$$

The radius  $\rho$  of the osculating circle is

$$\rho = \frac{1}{\kappa} = \frac{(9 \cos^2 t + 16 \sin^2 t)^{3/2}}{12}$$

- (a) At  $t = 0$ , the curvature of  $C$  is  $\kappa = \frac{4}{9}$ , so the radius of the osculating circle is  $\rho = \frac{9}{4}$ .

- (b) At  $t = \frac{\pi}{2}$ , the curvature of  $C$  is  $\kappa = \frac{3}{16}$ , so the radius of the osculating circle is  $\rho = \frac{16}{3}$ . ■

Figures 23(a) and 23(b) illustrate the graph of the ellipse and the osculating circles at the points  $P = (0, 4)$  and  $P = (3, 0)$  on the ellipse.

Figure 23  $\mathbf{r}(t) = 3 \sin t \mathbf{i} + 4 \cos t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$

**NOW WORK** Problem 57.

## 11.3 Assess Your Understanding

### Concepts and Vocabulary

- Multiple Choice** If a smooth curve  $C$  is traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , then the parameter  $t$  is the arc length if and only if [(a)  $\|\mathbf{r}(t)\| = 1$ , (b)  $\|\mathbf{r}'(t)\| = 0$ , (c)  $\|\mathbf{r}''(t)\| = 1$ , (d)  $\|\mathbf{r}'(t)\| = 1$ ] for all  $t$ .
- True or False** The curvature  $\kappa$  of a straight line equals the slope of the line.
- True or False** The curvature  $\kappa$  of a circle equals the radius of the circle.
- True or False** The curvature  $\kappa$  of a twice differentiable smooth curve  $C$  equals the magnitude of the rate of change of the unit tangent vector  $\mathbf{T}$  with respect to arc length.
- True or False** The curvature  $\kappa$  of a twice differentiable smooth curve  $C: \mathbf{r} = \mathbf{r}(t)$  is  $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$ .
- The curvature of a twice differentiable function  $y = f(x)$  is  $\kappa =$  \_\_\_\_\_.
- The curvature of the circle  $x^2 + (y - 2)^2 = 9$  is  $\kappa =$  \_\_\_\_\_.
- True or False** The radius  $\rho$  of the osculating circle at a point  $P$  of a smooth curve  $C$  equals  $\kappa$ , provided  $\kappa \neq 0$ .

### Skill Building

In Problems 9–18, determine whether the parameter used for each curve is the arc length along the curve.

- $\mathbf{r}(t) = 4 \cos t \mathbf{i} - 4 \sin t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$
- $\mathbf{r}(t) = \sin 3t \mathbf{i} + \cos 3t \mathbf{j}$ ,  $0 \leq t \leq 2\pi$

- $\mathbf{r}(t) = t^2 \mathbf{i} + t \mathbf{j}$ ,  $0 \leq t \leq 4$
- $\mathbf{r}(t) = t \mathbf{i} + t^3 \mathbf{j}$ ,  $0 \leq t \leq 2$
- $\mathbf{r}(t) = (2t + 1) \mathbf{i} + (3t - 2) \mathbf{j}$ ,  $0 \leq t \leq 5$
- $\mathbf{r}(t) = \mathbf{i} + t \mathbf{j}$ ,  $0 \leq t \leq 1$
- $\mathbf{r}(t) = \left(\frac{2}{\sqrt{13}}t + 1\right) \mathbf{i} + \left(\frac{3}{\sqrt{13}}t - 2\right) \mathbf{j}$ ,  $0 \leq t \leq 5\sqrt{13}$
- $\mathbf{r}(t) = \mathbf{i} + t^2 \mathbf{j}$ ,  $0 \leq t \leq 1$
- $\mathbf{r}(t) = \sin t \mathbf{i} + \cos t \mathbf{j} + t \mathbf{k}$
- $\mathbf{r}(t) = a \sin t \mathbf{i} + a \cos t \mathbf{j} + \sqrt{1 - a^2} t \mathbf{k}$

In Problems 19 and 20, rank the curvature of each curve at points  $P$ ,  $Q$ , and  $R$  from greatest to least.

19.

20.

In Problems 21–26, find the curvature  $\kappa$  of each plane curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .

- $\mathbf{r}(t) = t^2 \mathbf{i} + \frac{2}{t} \mathbf{j}$
- $\mathbf{r}(t) = 2t \mathbf{i} + t^3 \mathbf{j}$
- $\mathbf{r}(t) = 2 \sin t \mathbf{i} + 2 \cos t \mathbf{j}$
- $\mathbf{r}(t) = \cos t \mathbf{i} + 2 \sin t \mathbf{j}$
- $\mathbf{r}(t) = (3t - t^3) \mathbf{i} + 3t^2 \mathbf{j}$
- $\mathbf{r}(t) = (3t - t^3) \mathbf{i} + (3t + t^3) \mathbf{j}$

In Problems 27–34, find the curvature  $\kappa$  of each space curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .

27.  $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + t\mathbf{k}$

28.  $\mathbf{r}(t) = 2t\mathbf{i} + t\mathbf{j} + 3t\mathbf{k}$

29.  $\mathbf{r}(t) = \sin(2t)\mathbf{i} + \cos(2t)\mathbf{j} + t\mathbf{k}$

30.  $\mathbf{r}(t) = \sin t\mathbf{i} + \cos t\mathbf{j} + bt\mathbf{k}$

31.  $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j} + \sqrt{2}t\mathbf{k}$

32.  $\mathbf{r}(t) = e^t\mathbf{i} + e^{2t}\mathbf{j} + e^{-t}\mathbf{k}$

33.  $\mathbf{r}(t) = \cos^3 t\mathbf{i} + \sin^3 t\mathbf{j} + \mathbf{k}$

34.  $\mathbf{r}(t) = 4\cos^3 t\mathbf{i} + 3\mathbf{j} + 4\sin^3 t\mathbf{k}$

In Problems 35–44, find the curvature  $\kappa$  of the graph of each function at the indicated point.

35.  $y = x^2$  at  $(1, 1)$

36.  $y = 2x - x^2$  at  $(1, 1)$

37.  $y = x^2 - x^3$  at  $(1, 0)$

38.  $y = x^{-3/2}$  at  $(1, 1)$

39.  $y = \sqrt{x}$  at  $(2, \sqrt{2})$

40.  $y = \frac{1}{\sqrt{x}}$  at  $(1, 1)$

41.  $4x^2 + 9y^2 = 36$  at  $(0, 2)$

42.  $y = \sec x - 1$  at  $(\frac{\pi}{4}, \sqrt{2} - 1)$

43.  $y = e^x$  at  $(0, 1)$

44.  $y = \ln(x + 1)$  at  $(2, \ln 3)$

In Problems 45–52, find the radius of the osculating circle at the indicated point.

45.  $y = x^3 - 6x$  at  $(1, -5)$

46.  $y = \frac{1}{x^2}$  at  $(-1, 1)$

47.  $y = \sin x$  at  $(\frac{\pi}{2}, 1)$

48.  $y = e^{-x}$  at  $(0, 1)$

49.  $x^2 + xy + y^2 = 3$  at  $(1, 1)$

50.  $y^2 - y + x = 0$  at  $(0, 0)$

51.  $y = \ln(\sec x)$  at  $(\frac{\pi}{4}, \ln \sqrt{2})$

52.  $y = \cosh x$  at  $(0, 1)$

In Problems 53–62, find the radius of the osculating circle at the point corresponding to  $t$  on the curve  $C$  traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .

53.  $\mathbf{r}(t) = 3t^2\mathbf{i} + (3t - t^3)\mathbf{j}$ ,  $t = 1$

54.  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$ ,  $t = 1$

55.  $\mathbf{r}(t) = \sin t\mathbf{i} + \cos(2t)\mathbf{j}$ ,  $t = \frac{\pi}{4}$

56.  $\mathbf{r}(t) = \sin t\mathbf{i} + \cos t\mathbf{j} + bt\mathbf{k}$ ,  $b > 0$ ,  $t = \frac{\pi}{4}$

57.  $\mathbf{r}(t) = \sin(2t)\mathbf{i} + \cos(2t)\mathbf{j} + t\mathbf{k}$ ,  $t = \frac{\pi}{4}$

58.  $\mathbf{r}(t) = \cos^3 t\mathbf{i} + \sin^3 t\mathbf{j} + \mathbf{k}$ ,  $t = \frac{\pi}{3}$

59.  $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j} + \sqrt{2}t\mathbf{k}$ ,  $t = 0$

60.  $\mathbf{r}(t) = a(3t - t^3)\mathbf{i} + 3at^2\mathbf{j} + a(3t + t^3)\mathbf{k}$ ,  $a > 0$ ,  $t = 1$

61.  $\mathbf{r}(t) = 4a\cos^3 t\mathbf{i} + 4a\sin^3 t\mathbf{j} + 3a\cos(2t)\mathbf{k}$ ,  $a > 0$ ,  $t = \frac{\pi}{4}$

62.  $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + \sqrt{1 - 5t^2}\mathbf{k}$ ,  $-\frac{\sqrt{5}}{5} < t < \frac{\sqrt{5}}{5}$ ,  $t = 0$

### Applications and Extensions

63. **Radius of Curvature** Show that the radius of curvature of the parabola  $y = ax^2 + bx + c$  is a maximum at its vertex.

64. **Radius of Curvature** Show that the radii of curvature at the ends of the axes of the ellipse  $b^2x^2 + a^2y^2 = a^2b^2$  are  $\frac{b^2}{a}$  and  $\frac{a^2}{b}$ ,  $a > 0$ ,  $b > 0$ .

65. **Maximum Curvature** Find the point on the curve  $y = \ln x$  at which the curvature is maximum.

66. **Maximum Curvature** Find the point on the curve  $y = e^x$  at which the curvature is maximum.

67. **Maximum Curvature** Find the point(s) on the curve  $y = \frac{1}{3}x^3$  at which the curvature is maximum.

68. **Maximum Curvature** Find the point(s) on the curve  $y = \sin x$  at which the curvature is maximum.

69. **Maximum Curvature** Find  $\alpha > 0$  so that  $\mathbf{r}(t) = \alpha \cos t\mathbf{i} + \alpha \sin t\mathbf{j} + t\mathbf{k}$  has maximum curvature.

70. **Curvature of a Plane Curve** What is the curvature at a point of inflection of a plane curve?

71. **Curvature of a Catenary** Show that the curvature of the catenary  $y = a \cosh \frac{x}{a}$ ,  $a > 0$ , at any point  $(x, y)$  is  $\frac{a}{y^2}$ .

72. **Curvature of a Cissoid** Find the curvature of the cissoid  $y^2(2 - x) = x^3$  at the point  $(1, 1)$ . See the figure.

73. **Curvature of a Cycloid** Find the curvature of the cycloid  $x(\theta) = \theta - \sin \theta$  and  $y(\theta) = 1 - \cos \theta$  at the highest point of an arch. See the figure.

74. (a) Find the curvature of the curve  $\mathbf{r}(t) = (1 - t^3)\mathbf{i} + t^2\mathbf{j}$ .

(b) Graph  $\mathbf{r} = \mathbf{r}(t)$ . Where is the curvature undefined? Do you see any geometric reason for this?

75. **Curvature of a Spiral** Find the curvature of the spiral  $\mathbf{r}(t) = e^{-t} \cos t\mathbf{i} + e^{-t} \sin t\mathbf{j}$  shown in the figure. How does the curvature behave when  $t \rightarrow \infty$ ? Do you see any geometric reason for this?

**76. Curvature** Find the curvature  $\kappa$  of the curve

$$\mathbf{r}(t) = 2a \cos t \mathbf{i} + 2a \sin t \mathbf{j} + bt^2 \mathbf{k}, \quad a > 0, b > 0.$$

**77. Curvature** Show that the curvature of an ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ,  $a > b$ , is a maximum at the points  $(\pm a, 0)$  and is a minimum at the points  $(0, \pm b)$ .

**Source:** Contributed by the students at the University of Missouri.

**78. Curvature** Show that the circular helix

$$\mathbf{r}(t) = a \cos t \mathbf{i} + a \sin t \mathbf{j} + t \mathbf{k} \text{ has constant curvature.}$$

**Source:** Contributed by the students at the University of Missouri.

**79.** Write a vector equation for the curve  $C$  traced out by

$\mathbf{r}(t) = 2t \mathbf{i} + (2t - 1) \mathbf{j} + t \mathbf{k}$ ,  $0 \leq t \leq 2$ , using arc length  $s$  as the parameter. [Hint: For each  $t$ ,  $0 \leq t \leq 2$ , calculate the length  $s(t)$  of the curve from  $0$  to  $t$ .]

**80.** Compare the solutions of Problems 13 and 15. Then show how to change the parameter  $t$  of the line  $\mathbf{r}(t) = (at + b) \mathbf{i} + (ct + d) \mathbf{j}$ , where either  $a \neq 0$  or  $c \neq 0$ , to one that is arc length as measured along the line.**81.** Suppose a smooth curve  $C$  is traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ . If the curvature  $\kappa \neq 0$  at a point  $P$  on  $C$ , show that the position vector  $\mathbf{C}$  of the center of the osculating circle at  $P$  is given by

$$\mathbf{C}(t) = \mathbf{r}(t) + \rho \mathbf{N}(t)$$

where  $\mathbf{N}$  is the principal unit normal vector to  $C$  at  $P$ , and  $\rho = \frac{1}{\kappa}$ .

**82.** Use the result of Problem 81 to find the center and radius of the osculating circle for the helix  $\mathbf{r}(t) = a \sin t \mathbf{i} + a \cos t \mathbf{j} + a^2 t \mathbf{k}$ ,  $a > 0$ ;

(a) at  $t = \frac{\pi}{2}$ .      (b) at  $t = \pi$ .

Use the following discussion for Problems 83–87. Suppose  $C$  is a smooth curve traced out by the twice differentiable vector function  $\mathbf{r} = \mathbf{r}(s)$ ,  $a \leq s \leq b$ , where  $s$  is arc length as measured along  $C$ . Define the **binormal vector**  $\mathbf{B}$  of  $C$  as  $\mathbf{B}(s) = \mathbf{T}(s) \times \mathbf{N}(s)$ .

**83.** Show that the three vectors  $\mathbf{T}$ ,  $\mathbf{N}$ , and  $\mathbf{B}$  form a collection of mutually orthogonal unit vectors at each point on  $C$ .**84.** Show that  $\frac{d\mathbf{T}}{ds} = \kappa(s) \mathbf{N}(s)$ .**85.** Show that  $\frac{d\mathbf{B}}{ds}$  is orthogonal to both  $\mathbf{B}(s)$  and  $\mathbf{T}(s)$ .**86.** If the **torsion**  $\tau(s)$  of  $C$  is defined by the equation  $\frac{d\mathbf{B}}{ds} = -\tau \mathbf{N}$ , show that  $\frac{d\mathbf{N}}{ds} = \tau \mathbf{B} - \kappa \mathbf{T}$ .**87.** Find  $\kappa$ ,  $\mathbf{T}$ ,  $\mathbf{N}$ , and  $\mathbf{B}$  for  $\mathbf{r}(s) = \frac{1}{\sqrt{2}} [\sin s \mathbf{i} + \cos s \mathbf{j} + s \mathbf{k}]$ .**Challenge Problems****88. Curvature of a Polar Curve** Show that the formula for the curvature of a polar curve  $r = f(\theta)$  is

$$\kappa = \frac{\left| r^2 + 2 \left( \frac{dr}{d\theta} \right)^2 - r \left( \frac{d^2r}{d\theta^2} \right) \right|}{\left[ r^2 + \left( \frac{dr}{d\theta} \right)^2 \right]^{3/2}}$$

In Problems 89–94, use the result of Problem 88 to find the curvature of each polar curve.

**89.**  $r = 2 \cos(2\theta)$  at  $\theta = \frac{\pi}{12}$       **90.**  $r = e^{a\theta}$  at  $\theta = \frac{\pi}{2}$ ,  $a > 0$

**91.**  $r = a\theta$  at  $\theta = 1$  and  $a > 0$       **92.**  $r = 1 - \cos \theta$  at  $\theta = 0$

**93.**  $r = 3 - 2 \sin \theta$  at  $\theta = \frac{\pi}{6}$       **94.**  $r = 2 + 3 \cos \theta$  at  $\theta = \frac{\pi}{3}$

**95.** Use the figure below to show that the coordinates  $(h, k)$  of the center of curvature of  $y = f(x)$  are

$$h = x - \rho \sin \phi \quad k = y + \rho \cos \phi$$

where  $\rho$  is the radius of curvature. Show that

$$\sin \phi = \frac{y'}{\sqrt{1 + (y')^2}} \quad \text{and} \quad \cos \phi = \frac{1}{\sqrt{1 + (y')^2}}$$

so

$$h = x - \frac{y' [1 + (y')^2]}{y''} \quad \text{and} \quad k = y + \frac{1 + (y')^2}{y''}$$

In Problems 96–100, use the result obtained in Problem 95 to find the center of curvature of each function.

**96.**  $y = x^2$  at  $x = 1$       **97.**  $y = \sin x$  at  $x = \frac{\pi}{2}$

**98.**  $y = \frac{x}{x+1}$  at  $(0, 0)$       **99.**  $x^3 + y^3 = 4xy$  at  $(2, 2)$

**100.**  $xy = 4$  at  $x = 2$

**101.** As a point  $P$  moves along a curve  $C$ , the center of curvature corresponding to  $P$  traces out a curve  $C_1$  called the **evolute** of  $C$ ; conversely,  $C$  is the **involute** of  $C_1$ . Show that parametric equations of the evolute of  $y = \frac{1}{2}x^2$  are  $h = -x^3$ ,  $k = \frac{3}{2}x^2 + 1$ .

Then eliminate the parameter  $x$  to obtain

$$h^2 = \frac{8}{27} (k - 1)^3$$

**102.** Refer to Problem 101. Find parametric equations and a rectangular equation for the evolute of  $\mathbf{r}(t) = a \cos t \mathbf{i} + b \sin t \mathbf{j}$ ,  $a > 0, b > 0, 0 \leq t \leq 2\pi$ .

## 11.4 Motion Along a Curve

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the velocity, acceleration, and speed of a moving particle (p. 785)
- 2 Express the acceleration vector using tangential and normal components (p. 788)

An important physical application of vector functions and their derivatives is the study of moving objects. If we think of the mass of an object as being concentrated at the object's center of gravity, then the object can be thought of as a particle, and it can be represented as a point on a graph. As the particle moves through space, its coordinates  $x$ ,  $y$ , and  $z$  are each functions of time  $t$ , and its position at time  $t$  is given by the vector function:

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$$

### 1 Find the Velocity, Acceleration, and Speed of a Moving Particle

Using the vector function  $\mathbf{r} = \mathbf{r}(t)$  of a particle's position, we can find the particle's velocity, acceleration, and speed at any time  $t$ .

#### DEFINITION Velocity; Acceleration; Speed

The **velocity**, **acceleration**, and **speed** of a particle whose motion is along a smooth curve traced out by the twice differentiable vector function  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ ,  $a \leq t \leq b$ , are defined as

|                     |                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Velocity</b>     | $\mathbf{v}(t) = \mathbf{r}'(t) = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} + \frac{dz}{dt}\mathbf{k}$                                      |
| <b>Acceleration</b> | $\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d^2x}{dt^2}\mathbf{i} + \frac{d^2y}{dt^2}\mathbf{j} + \frac{d^2z}{dt^2}\mathbf{k}$                         |
| <b>Speed</b>        | $v(t) = \ \mathbf{v}(t)\  = \ \mathbf{r}'(t)\  = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2}$ |

For plane curves, the definitions are similar. See Figure 24.

#### EXAMPLE 1 Finding Velocity, Acceleration, and Speed

Find the velocity  $\mathbf{v}$ , acceleration  $\mathbf{a}$ , and speed  $v$  of a particle that is moving along:

- (a) the plane curve  $\mathbf{r}(t) = \left(\frac{1}{2}t^2 + t\right)\mathbf{i} + t^3\mathbf{j}$  from  $t = 0$  to  $t = 2$ .
- (b) the space curve  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$  from  $t = 0$  to  $t = 2$ .

For each curve, graph the motion of the particle and the vectors  $\mathbf{v}(1)$  and  $\mathbf{a}(1)$ .

**Solution** (a) The velocity, acceleration, and speed are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}\left(\frac{1}{2}t^2 + t\right)\mathbf{i} + \frac{d}{dt}t^3\mathbf{j} = (t+1)\mathbf{i} + 3t^2\mathbf{j}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}(t+1)\mathbf{i} + \frac{d}{dt}3t^2\mathbf{j} = \mathbf{i} + 6t\mathbf{j}$$

$$v(t) = \|\mathbf{v}(t)\| = \sqrt{(t+1)^2 + (3t^2)^2} = \sqrt{9t^4 + t^2 + 2t + 1}$$

At  $t = 1$ , the velocity is  $\mathbf{v}(1) = \mathbf{r}'(1) = 2\mathbf{i} + 3\mathbf{j}$  and the acceleration is  $\mathbf{a}(1) = \mathbf{r}''(1) = \mathbf{i} + 6\mathbf{j}$ . Figure 25 illustrates the graph of  $\mathbf{r} = \mathbf{r}(t)$ ,  $\mathbf{v}(1)$ , and  $\mathbf{a}(1)$ .

**Figure 24**  $\mathbf{v} = \mathbf{r}'(t) = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j}$

$$v = \|\mathbf{v}\| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2}$$

**NOTE** Since  $\mathbf{v}(t) = \mathbf{r}'(t)$ , the velocity vector is directed along the tangent vector.

**Figure 25**  $\mathbf{r}(t) = \left(\frac{1}{2}t^2 + t\right)\mathbf{i} + t^3\mathbf{j}$ ,  $0 \leq t \leq 2$

Figure 26  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$ ,  $0 \leq t \leq 2$

(b) The velocity, acceleration, and speed of the particle are

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}t\mathbf{i} + \frac{d}{dt}t^2\mathbf{j} + \frac{d}{dt}t^3\mathbf{k} = \mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt}\mathbf{r}'(t) = \frac{d}{dt}\mathbf{i} + \frac{d}{dt}(2t)\mathbf{j} + \frac{d}{dt}(3t^2)\mathbf{k} = 2\mathbf{j} + 6t\mathbf{k}$$

$$v(t) = \|\mathbf{v}(t)\| = \sqrt{1^2 + (2t)^2 + (3t^2)^2} = \sqrt{1 + 4t^2 + 9t^4}$$

At  $t = 1$ , the velocity is  $\mathbf{v}(1) = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$  and the acceleration is  $\mathbf{a}(1) = 2\mathbf{j} + 6\mathbf{k}$ . See Figure 26. ■

**NOW WORK** Problems 7 and 11.

### Finding the Force Acting on a Particle Moving Along an Ellipse

#### EXAMPLE 2

The position of a particle of mass  $m$  that is moving along an ellipse with a constant angular speed  $\omega$  is given by the vector function

$$\mathbf{r}(t) = A \cos(\omega t)\mathbf{i} + B \sin(\omega t)\mathbf{j} \quad 0 \leq t \leq 2\pi$$

Find the force  $\mathbf{F}$  acting on the particle at any time  $t$ . Graph  $\mathbf{r} = \mathbf{r}(t)$  and  $\mathbf{F} = \mathbf{F}(t)$ .

**Solution** To find the force  $\mathbf{F}$ , we use Newton's Second Law of Motion,  $\mathbf{F} = m\mathbf{a}$ . We begin by finding the acceleration  $\mathbf{a}$  of the particle.

$$\mathbf{r}(t) = A \cos(\omega t)\mathbf{i} + B \sin(\omega t)\mathbf{j}$$

$$\mathbf{v}(t) = \mathbf{r}'(t) = -A\omega \sin(\omega t)\mathbf{i} + B\omega \cos(\omega t)\mathbf{j}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = -A\omega^2 \cos(\omega t)\mathbf{i} - B\omega^2 \sin(\omega t)\mathbf{j} = -\omega^2 \mathbf{r}(t)$$

Then, by Newton's Law,

$$\mathbf{F}(t) = m\mathbf{a}(t) = -m\omega^2 \mathbf{r}(t)$$

The direction of the force vector  $\mathbf{F}$  is opposite to that of the vector  $\mathbf{r}$  at any time  $t$ , as shown in Figure 27. ■

**NOW WORK** Problem 23(a).

### Finding the Position, Velocity, and Acceleration of a Particle Moving Along a Circle

#### EXAMPLE 3

- Find the position  $\mathbf{r} = \mathbf{r}(t)$  of a particle that moves counterclockwise along a circle of radius  $R$  with a constant speed  $v_0$ .
- Find the velocity and acceleration of the particle.
- Find the magnitude of the acceleration.

**Solution** For convenience, we place the circle of radius  $R$  in the  $xy$ -plane, with its center at the origin, and assume that at time  $t = 0$  the particle is on the positive  $x$ -axis.

(a) The particle is moving counterclockwise along the circle, as shown in Figure 28. If  $\theta(t)$  is the angle between the positive  $x$ -axis and the position vector of the particle  $\mathbf{r} = \mathbf{r}(t)$ , then the vector  $\mathbf{r} = \mathbf{r}(t)$  is

$$\mathbf{r}(t) = R \cos[\theta(t)]\mathbf{i} + R \sin[\theta(t)]\mathbf{j} \quad (1)$$

Figure 27  $\mathbf{F}(t) = -m\omega^2 \mathbf{r}(t)$

**NOTE** The force  $\mathbf{F}$  acting on the particle in Example 2 is directed toward the center of the ellipse at a time  $t$ . Because of this, it is called a **centripetal** (center-seeking) **force**.

Figure 28

Notice that  $\mathbf{r}(0) = R\mathbf{i}$ , as required. Also for the motion to be counterclockwise, the function  $\theta = \theta(t)$  must be increasing.

(b) The velocity  $\mathbf{v}$  of the particle is

$$\mathbf{v}(t) = \frac{d\mathbf{r}}{dt} = -R \sin[\theta(t)] \frac{d\theta}{dt} \mathbf{i} + R \cos[\theta(t)] \frac{d\theta}{dt} \mathbf{j} \quad \text{Use the Chain Rule.}$$

and the speed  $v$  of the particle is

$$\begin{aligned} v(t) = \|\mathbf{v}(t)\| &= \sqrt{R^2 \sin^2[\theta(t)] \left(\frac{d\theta}{dt}\right)^2 + R^2 \cos^2[\theta(t)] \left(\frac{d\theta}{dt}\right)^2} \\ &= \sqrt{R^2 \left(\frac{d\theta}{dt}\right)^2} = R \left| \frac{d\theta}{dt} \right| \end{aligned}$$

Since we know the speed is constant,  $v(t) = v_0$ . Also, since the function  $\theta = \theta(t)$  is increasing,  $\frac{d\theta}{dt} > 0$ . As a result,

$$\begin{aligned} v_0 &= R \frac{d\theta}{dt} \\ \frac{d\theta}{dt} &= \frac{v_0}{R} \end{aligned}$$

Since  $\frac{d\theta}{dt}$  is the rate at which the angle  $\theta$  is changing, the quantity  $\frac{v_0}{R}$  is the angular speed  $\omega$  of the particle. That is,

$$\frac{d\theta}{dt} = \omega$$

We solve this differential equation, using  $\theta(0) = 0$  as the initial condition.

$$d\theta = \omega dt$$

$$\theta(t) = \omega t + k$$

$$\theta(0) = k = 0$$

So,  $\theta(t) = \omega t$ . Now substitute  $\theta(t) = \omega t$  into the vector function  $\mathbf{r} = \mathbf{r}(t)$  [statement (1)] to obtain

$$\mathbf{r}(t) = R \cos(\omega t) \mathbf{i} + R \sin(\omega t) \mathbf{j}$$

Then the velocity  $\mathbf{v}$  and acceleration  $\mathbf{a}$  of the particle are

$$\mathbf{v} = \mathbf{v}(t) = -R\omega \sin(\omega t) \mathbf{i} + R\omega \cos(\omega t) \mathbf{j}$$

$$\begin{aligned} \mathbf{a} = \mathbf{a}(t) &= -R\omega^2 \cos(\omega t) \mathbf{i} - R\omega^2 \sin(\omega t) \mathbf{j} = -\omega^2 [R \cos(\omega t) \mathbf{i} + R \sin(\omega t) \mathbf{j}] \\ &= -\omega^2 \mathbf{r}(t) \end{aligned}$$

(c) Since  $\omega = \frac{v_0}{R}$ , the magnitude of the acceleration is

$$\|\mathbf{a}(t)\| = \omega^2 \|\mathbf{r}(t)\| = \omega^2 R = \frac{v_0^2}{R} \quad (2)$$

### NOW WORK Problem 23(b).

Observe that although the speed of the particle in Example 3 is constant, its velocity  $\mathbf{v}$  is not. Furthermore, the direction of the acceleration is opposite that of the vector  $\mathbf{r}$  and is directed toward the center of the circle. By Newton's Second Law of Motion,  $\mathbf{F} = m\mathbf{a}$ , so the force vector  $\mathbf{F}$  is another example of a centripetal force.

**NOTE** Near-Earth orbits are above 100 miles (out of Earth's atmosphere) up to an altitude of approximately 15,000 miles.

#### EXAMPLE 4 Finding the Speed Required for a Near-Earth Circular Orbit

Find the speed required to maintain a satellite in a near-Earth circular orbit. (The gravitational attraction of other bodies is ignored.)

**Solution** Let  $R$  be the distance of a satellite from the center of Earth. Then from (2), the magnitude of the acceleration of the satellite whose motion is circular is

$$\|\mathbf{a}(t)\| = \frac{v_0^2}{R}$$

For the satellite to remain in orbit, the magnitude of the acceleration  $\|\mathbf{a}(t)\|$  of the satellite at any time  $t$  must equal  $g$ , the acceleration due to gravity for Earth. As a result,

$$\begin{aligned}\frac{v_0^2}{R} &= g \\ v_0 &= \sqrt{gR}\end{aligned}$$

The speed  $v_0$  required to maintain a near-Earth circular orbit is

$$v_0 = \sqrt{gR}$$

where  $R$  is the distance of the satellite from the center of Earth and  $g$  is the acceleration due to gravity. ■

For example, the speed required of a communications satellite whose circular orbit must be 4500 mi from the center of Earth is

$$v_0 = \sqrt{(79,036)(4500)} \approx 18,859 \text{ mi/h}$$

**NOTE** The acceleration due to gravity at near-Earth orbits is somewhat less than  $g \approx 32.2 \text{ ft/s}^2 \approx 79,036 \text{ mi/h}^2$ , the acceleration due to gravity at Earth's surface.

#### NOW WORK Problem 63.

#### EXAMPLE 5 Finding the Frictional Force Necessary to Prevent Skidding

A motorcycle with a mass of 150 kg is driven at a constant speed of 120 km/h on a circular track whose radius is 100 m. To keep the motorcycle from skidding, what frictional force must be exerted by the track on the tires?

**Solution** By Newton's Second Law of Motion, the force  $\mathbf{F}$  required to keep an object of mass  $m$  traveling along a curve traced out by  $\mathbf{r} = \mathbf{r}(t)$  is  $\mathbf{F} = m\mathbf{a}$ . The magnitude of the frictional force exerted by the tires must therefore equal

$$\|\mathbf{F}\| = m\|\mathbf{a}\|$$

In this example, the motion is circular. So, using (2), we have

$$\|\mathbf{F}\| = m \left( \frac{v_0^2}{R} \right) = 150 \text{ kg} \left[ \frac{(120 \text{ km/h})^2}{100 \text{ m}} \right] \underset{\substack{\uparrow \\ 1 \text{ h} = 3600 \text{ s}}}{=} (150)(144) \left( \frac{1000^2}{3600^2} \right) \frac{\text{kg} \cdot \text{m}}{\text{s}^2} \approx 1667 \text{ N}$$

The track must exert a force of magnitude 1667 N or greater to prevent skidding. ■

**NOTE** The SI unit of force is the newton (N):  $\text{N} = \frac{\text{kg} \cdot \text{m}}{\text{s}^2}$ .

#### NOW WORK Problem 53.

## 2 Express the Acceleration Vector Using Tangential and Normal Components

To continue our investigation of the motion of a particle, we show that the acceleration vector  $\mathbf{a}$  lies in the plane determined by the unit tangent vector  $\mathbf{T}$  and the principal unit normal vector  $\mathbf{N}$ .

**RECALL** The unit tangent vector is

$$\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}.$$

Consider a particle whose motion is along a smooth curve  $C$  traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$ . The velocity vector  $\mathbf{v}(t) = \mathbf{r}'(t)$  can be expressed in terms of the unit tangent vector  $\mathbf{T}(t)$  of  $C$  as follows:

$$\mathbf{v}(t) = \mathbf{r}'(t) = \|\mathbf{r}'(t)\|\mathbf{T}(t) = \|\mathbf{v}(t)\|\mathbf{T}(t) = v(t)\mathbf{T}(t) \quad (3)$$

where  $v(t) = \|\mathbf{v}(t)\|$  is the speed of the particle.

By differentiating  $\mathbf{v} = \mathbf{v}(t)$ , we obtain the acceleration vector  $\mathbf{a} = \mathbf{a}(t)$ .

$$\mathbf{a} = \mathbf{a}(t) = \frac{d}{dt}\mathbf{v}(t) = \frac{d}{dt}[v(t)\mathbf{T}(t)] = v'(t)\mathbf{T}(t) + v(t)\mathbf{T}'(t)$$

Since  $\mathbf{T}'(t) = \|\mathbf{T}'(t)\|\mathbf{N}(t)$ ,  $\mathbf{a}(t)$  can be written as

$$\mathbf{a}(t) = v'(t)\mathbf{T}(t) + v(t)\|\mathbf{T}'(t)\|\mathbf{N}(t) \quad (4)$$

Recall that the curvature  $\kappa$  of a curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$  can be expressed as  $\kappa = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|}$ , so

$$\|\mathbf{T}'(t)\| = \|\mathbf{r}'(t)\|\kappa = v(t)\kappa \quad (5)$$

Combining (4) and (5), we have

$$\mathbf{a}(t) = v'(t)\mathbf{T}(t) + [v(t)]^2\kappa\mathbf{N}(t)$$

### THEOREM The Acceleration Vector Expressed Using T and N

The acceleration vector  $\mathbf{a} = \mathbf{a}(t)$  of a particle moving along a smooth curve  $C$  traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$  lies in the plane formed by the unit tangent vector  $\mathbf{T}(t)$  and the principal unit normal vector  $\mathbf{N}(t)$  to  $C$ . Moreover,

$$\mathbf{a}(t) = v'(t)\mathbf{T}(t) + [v(t)]^2\kappa\mathbf{N}(t) \quad (6)$$

where  $v(t)$  is the speed of the particle and  $\kappa$  is the curvature of the curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ .

**DF** Figure 29  $\mathbf{a}(t) = v'(t)\mathbf{T}(t) + [v(t)]^2\kappa\mathbf{N}(t)$

See Figure 29.

The acceleration vector

$$\mathbf{a}(t) = \underbrace{v'(t)}_{\text{tangential component}} \mathbf{T}(t) + \underbrace{[v(t)]^2\kappa}_{\text{normal component}} \mathbf{N}(t)$$

has a **tangential component**, denoted by  $a_T$ , and a **normal component**, denoted by  $a_N$ , namely

$$a_T = v'(t) = \frac{dv}{dt} \quad a_N = [v(t)]^2\kappa$$

Then the acceleration vector can be written as

$$\mathbf{a}(t) = a_T\mathbf{T}(t) + a_N\mathbf{N}(t)$$

Physically,  $a_T$  gives the amount of acceleration in the direction of the tangent  $\mathbf{T}$ , and  $a_N$  gives the amount of acceleration in the direction of the normal  $\mathbf{N}$ . For example, if the motion has constant speed [so  $v'(t) = 0$ ], then the acceleration occurs in the direction of the normal and has no tangential component. In this case, the force  $\mathbf{F}$  causing the motion is also in the direction of the normal ( $\mathbf{F} = m\mathbf{a}$ ).

### Finding the Tangential and Normal Components of Acceleration for an Elliptical Path

**EXAMPLE 6** Find the tangential component  $a_T$  and normal component  $a_N$  of the acceleration of a particle moving along the ellipse

$$\mathbf{r}(t) = 3 \sin t \mathbf{i} + 4 \cos t \mathbf{j} \quad 0 \leq t \leq 2\pi$$

Graph the ellipse, showing  $\mathbf{a} = \mathbf{a}(t)$ ,  $a_T$ , and  $a_N$  when  $t = 0$ ,  $\frac{\pi}{4}$ , and  $\frac{\pi}{2}$ .

**Solution** We begin by finding the velocity, speed, and acceleration of the particle.

$$\mathbf{v}(t) = \mathbf{r}'(t) = 3 \cos t \mathbf{i} - 4 \sin t \mathbf{j}$$

$$v(t) = \|\mathbf{v}(t)\| = \sqrt{(3 \cos t)^2 + (-4 \sin t)^2} = \sqrt{9 \cos^2 t + 16 \sin^2 t}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = -3 \sin t \mathbf{i} - 4 \cos t \mathbf{j}$$

The tangential component of the acceleration is

$$\begin{aligned} a_T = v'(t) &= \frac{d}{dt} \sqrt{9 \cos^2 t + 16 \sin^2 t} \\ &= \frac{1}{2} (9 \cos^2 t + 16 \sin^2 t)^{-1/2} [18 \cos t (-\sin t) + 32 \sin t (\cos t)] \\ &= \frac{7 \sin t \cos t}{\sqrt{9 \cos^2 t + 16 \sin^2 t}} \end{aligned}$$

To find the normal component of the acceleration, we need to find the curvature  $\kappa$  of  $\mathbf{r} = \mathbf{r}(t)$ .

$$\begin{aligned} \kappa &= \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 \cos t & -4 \sin t & 0 \\ -3 \sin t & -4 \cos t & 0 \end{vmatrix}}{(9 \cos^2 t + 16 \sin^2 t)^{3/2}} = \frac{|-12 \cos^2 t - 12 \sin^2 t|}{(9 \cos^2 t + 16 \sin^2 t)^{3/2}} \\ &= \frac{12}{(9 \cos^2 t + 16 \sin^2 t)^{3/2}} \end{aligned}$$

Then

$$a_N = v^2(t) \kappa = (9 \cos^2 t + 16 \sin^2 t) \frac{12}{(9 \cos^2 t + 16 \sin^2 t)^{3/2}} = \frac{12}{\sqrt{9 \cos^2 t + 16 \sin^2 t}}$$

The motion of the particle on the ellipse starts at  $\mathbf{r}(0) = 4\mathbf{j}$ . As  $t$  increases,  $x(t) = 3 \sin t$  increases and  $y(t) = 4 \cos t$  decreases, so the motion of the particle is clockwise.

At  $t = 0$ ,

$$\mathbf{a}(0) = -3(0)\mathbf{i} - 4(1)\mathbf{j} = -4\mathbf{j} \quad a_T = \frac{7(0)(1)}{3} = 0 \quad a_N = \frac{12}{3} = 4$$

$$\text{At } t = \frac{\pi}{4}, \mathbf{r}\left(\frac{\pi}{4}\right) = \frac{3\sqrt{2}}{2}\mathbf{i} + 2\sqrt{2}\mathbf{j}, \text{ and}$$

$$\mathbf{a}\left(\frac{\pi}{4}\right) = -\frac{3\sqrt{2}}{2}\mathbf{i} - 2\sqrt{2}\mathbf{j} \quad a_T = \frac{7\sqrt{2}}{10} \quad a_N = \frac{12\sqrt{2}}{5}$$

$$\text{At } t = \frac{\pi}{2}, \mathbf{r}\left(\frac{\pi}{2}\right) = 3\mathbf{i} + 4(0)\mathbf{j} = 3\mathbf{i}, \text{ and}$$

$$\mathbf{a}\left(\frac{\pi}{2}\right) = -3(1)\mathbf{i} - 4(0)\mathbf{j} = -3\mathbf{i} \quad a_T = 0 \quad a_N = \frac{12}{4} = 3$$

See Figure 30. ■

Figure 30  $\mathbf{r}(t) = 3 \sin t \mathbf{i} + 4 \cos t \mathbf{j}$

**NOW WORK** Problem 27.

### EXAMPLE 7 Analyzing the Acceleration of a Car

A car on the ramp of a multistory parking garage travels along a curve traced out by  $\mathbf{r}(t) = 10 \cos t \mathbf{i} + 10 \sin t \mathbf{j} + 3t \mathbf{k}$ , where  $t$  is the time in hours and distance is in miles. Find the tangential component  $a_T$  and normal component  $a_N$  of the acceleration of the car. What are the magnitude and direction of the force on the driver?

**Solution** We begin by finding the velocity  $\mathbf{v}$ , speed  $v$ , and acceleration  $\mathbf{a}$  of the car.

$$\mathbf{v}(t) = \mathbf{r}'(t) = \frac{d}{dt}(10 \cos t) \mathbf{i} + \frac{d}{dt}(10 \sin t) \mathbf{j} + \frac{d}{dt}(3t) \mathbf{k} = -10 \sin t \mathbf{i} + 10 \cos t \mathbf{j} + 3 \mathbf{k}$$

$$v(t) = \|\mathbf{v}(t)\| = \|\mathbf{r}'(t)\| = \sqrt{(-10 \sin t)^2 + (10 \cos t)^2 + 9} = \sqrt{109} \approx 10.440 \text{ mi/h}$$

$$\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d}{dt} \mathbf{v}(t) = -10 \cos t \mathbf{i} - 10 \sin t \mathbf{j}$$

Since the speed is constant, the tangential component of acceleration  $a_T$  is

$$a_T = \frac{dv}{dt} = 0$$

The normal component of acceleration  $a_N$  is

$$a_N = v^2 \kappa = v^2 \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\underbrace{\|\mathbf{r}'(t)\|}_{v = \sqrt{109}}^3} = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\sqrt{109}}$$

Since,

$$\mathbf{r}'(t) \times \mathbf{r}''(t) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -10 \sin t & 10 \cos t & 3 \\ -10 \cos t & -10 \sin t & 0 \end{vmatrix} = 30 \sin t \mathbf{i} - 30 \cos t \mathbf{j} + 100 \mathbf{k}$$

the normal component is

$$\begin{aligned} a_N &= \frac{\|30 \sin t \mathbf{i} - 30 \cos t \mathbf{j} + 100 \mathbf{k}\|}{\sqrt{109}} = \frac{\sqrt{900 \sin^2 t + 900 \cos^2 t + 10000}}{\sqrt{109}} \\ &= \frac{\sqrt{10900}}{\sqrt{109}} = 10 \end{aligned}$$

As the car travels on the ramp at a constant speed, the force

$$\mathbf{F} = m\mathbf{a} = ma_N \mathbf{N} = 10m\mathbf{N}$$

pulls the car and driver toward the center of the ramp, with a magnitude about 10 times the mass of the car. ■

### NOW WORK Problem 69.

### Application: The UVW-Axes in Orbital Mechanics

A spacecraft in orbit about Earth follows a curve in space, which is modeled as the graph of a vector function of time  $t$ . The spacecraft carries a gyroscope whose three axes remain fixed in direction throughout time and are aligned with the  $\mathbf{i}$ ,  $\mathbf{j}$ ,  $\mathbf{k}$  unit vectors of the  $xyz$ -coordinate system. The  $xyz$ -coordinate system has its origin at the center of Earth, providing the same basic frame of reference for both Earth-bound observers and the spacecraft. See Figure 31.

Suppose the position of the spacecraft is given by the vector function

$$\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$$

Then the velocity vector  $\mathbf{v} = \mathbf{v}(t)$  is tangent to the orbit:  $\mathbf{v}(t) = \mathbf{r}'(t)$ .

Figure 31

Figure 32

If Earth is taken to have all its mass concentrated at the center, then the laws of Kepler and Newton tell us that any orbit remains in a *fixed plane* containing the center. Furthermore, a closed orbit describes an ellipse (or circle) in that plane with Earth's center at *one of the foci*.

The UVW system of axes is an orthogonal set of unit vectors  $\mathbf{i}_U(t)$ ,  $\mathbf{i}_V(t)$ ,  $\mathbf{i}_W(t)$  that are “attached” to the spacecraft's orbit at each point. This set of vectors is particularly useful in manned spacecraft, since it corresponds to the axes of *yaw*, *roll*, and *pitch* customarily used in airplanes flying over the surface of Earth. These time-dependant unit vectors are defined as

$$\mathbf{i}_U = \frac{\mathbf{r}}{\|\mathbf{r}\|}, \quad \mathbf{i}_W = \frac{\mathbf{r} \times \mathbf{v}}{\|\mathbf{r} \times \mathbf{v}\|}, \quad \mathbf{i}_V = \mathbf{i}_W \times \mathbf{i}_U \quad (7)$$

Notice that  $\mathbf{i}_U(t)$  lies in the orbit plane and points radially *outward*. Since both  $\mathbf{r}$  and  $\mathbf{v}$  are vectors in the orbit plane and  $\mathbf{r} \times \mathbf{v}$  is orthogonal to both  $\mathbf{r}$  and  $\mathbf{v}$ , the vector  $\mathbf{i}_W(t)$  is *normal* to the orbit plane. The vector  $\mathbf{i}_V(t)$  completes the set of axes and lies in the orbit plane. See Figure 32.

### EXAMPLE 8 Finding the UVW-Axes of an Orbit

A satellite in a circular orbit intersects the  $x$ -axis and is inclined to the  $xy$ -plane at an angle of  $30^\circ$ . Suppose the orbit has a radius  $a$ , and the motion has angular speed  $\omega$ . Then the position of the satellite at time  $t$  is

$$\mathbf{r}(t) = a \left( \cos(\omega t) \mathbf{i} + \frac{\sqrt{3}}{2} \sin(\omega t) \mathbf{j} + \frac{1}{2} \sin(\omega t) \mathbf{k} \right)$$

The velocity vector  $\mathbf{v}$  is

$$\mathbf{v}(t) = \mathbf{r}'(t) = a\omega \left( -\sin(\omega t) \mathbf{i} + \frac{\sqrt{3}}{2} \cos(\omega t) \mathbf{j} + \frac{1}{2} \cos(\omega t) \mathbf{k} \right)$$

In this case, using (7), the UVW system of axes is

$$\begin{aligned} \mathbf{i}_U &= \cos(\omega t) \mathbf{i} + \frac{\sqrt{3}}{2} \sin(\omega t) \mathbf{j} + \frac{1}{2} \sin(\omega t) \mathbf{k} & \mathbf{i}_U &= \frac{\mathbf{r}}{\|\mathbf{r}\|} \\ \mathbf{i}_W &= -\frac{1}{2} \mathbf{j} + \frac{\sqrt{3}}{2} \mathbf{k} & \mathbf{i}_W &= \frac{\mathbf{r} \times \mathbf{v}}{\|\mathbf{r} \times \mathbf{v}\|} \\ \mathbf{i}_V &= -\sin(\omega t) \mathbf{i} + \frac{\sqrt{3}}{2} \cos(\omega t) \mathbf{j} + \frac{1}{2} \cos(\omega t) \mathbf{k} & \mathbf{i}_V &= \mathbf{i}_W \times \mathbf{i}_U \end{aligned}$$

The directions of the onboard gyroscope axes UVW are now expressed in terms of  $\mathbf{i}$ ,  $\mathbf{j}$ , and  $\mathbf{k}$ . ■

## 11.4 Assess Your Understanding

### Concepts and Vocabulary

- True or False** If a twice differentiable vector function  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$  represents the position of a particle moving along a smooth curve, then the velocity vector is  $\mathbf{v}(t) = \mathbf{r}'(t)$  and the acceleration vector is  $\mathbf{a}(t) = \mathbf{r}''(t)$ .
- True or False** If a particle moving along a smooth curve traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$  travels at a constant speed, then the acceleration of the particle is directed along the unit tangent vector  $\mathbf{T}$ .
- True or False** The acceleration vector  $\mathbf{a} = \mathbf{a}(t)$  of a particle moving along a smooth curve traced out by a twice differentiable vector function  $\mathbf{r} = \mathbf{r}(t)$  can be written as the sum of two orthogonal vectors: one vector in the direction of the velocity and the other vector perpendicular to the direction of the velocity.
- When the acceleration vector  $\mathbf{a}(t)$  of a particle moving along a smooth curve is written as  $\mathbf{a}(t) = v'(t)\mathbf{T}(t) + [v(t)]^2 \kappa \mathbf{N}(t)$ , then  $a_T = v'(t)$  is called the \_\_\_\_\_ component and  $a_N = [v(t)]^2 \kappa$  is called the \_\_\_\_\_ component of the acceleration vector  $\mathbf{a}$ .

## Skill Building

In Problems 5–10:

- (a) Find the velocity, acceleration, and speed of a particle whose motion is along the plane curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .  
 (b) For each curve, graph the motion of the particle and the vectors  $\mathbf{v}(0)$  and  $\mathbf{a}(0)$ .

5.  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$       6.  $\mathbf{r}(t) = t\mathbf{i} - t^3\mathbf{j}$

7.  $\mathbf{r}(t) = (t^2 + 1)\mathbf{i} + (1 - t)\mathbf{j}$       8.  $\mathbf{r}(t) = t^3\mathbf{i} + 3t\mathbf{j}$

9.  $\mathbf{r}(t) = 4t\mathbf{i} - t^3\mathbf{j}$       10.  $\mathbf{r}(t) = t^3\mathbf{i} + \frac{1}{2}t\mathbf{j}$

In Problems 11–16, find the velocity, acceleration, and speed of a particle whose motion is along the space curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .

11.  $\mathbf{r}(t) = t^2\mathbf{i} + t\mathbf{j} - 3t^3\mathbf{k}$       12.  $\mathbf{r}(t) = (t + 1)\mathbf{i} + 6t\mathbf{j} + t^2\mathbf{k}$

13.  $\mathbf{r}(t) = \sqrt{16 - t^2}\mathbf{i} + t^2\mathbf{j} + t\mathbf{k}$       14.  $\mathbf{r}(t) = \frac{1}{t^2}\mathbf{i} + \frac{t+1}{t^2}\mathbf{j} + t\mathbf{k}$

15.  $\mathbf{r}(t) = 2\cos t\mathbf{i} + \sin t\mathbf{j} + t\mathbf{k}$

16.  $\mathbf{r}(t) = t\mathbf{i} + \sin(4t)\mathbf{j} + \cos(4t)\mathbf{k}$

In Problems 17 and 18:

- (a) Find the velocity, acceleration, and speed of a particle whose motion is along the space curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .  
 (b) Evaluate  $\mathbf{v}(t)$ ,  $\mathbf{a}(t)$ , and  $v(t)$  at the given  $t$ .

- CAS** (c) Graph the space curve traced out by  $\mathbf{r} = \mathbf{r}(t)$ . On the same screen graph the velocity vector and acceleration vector at the given value of  $t$ .

17.  $\mathbf{r}(t) = \sin t\mathbf{i} + \cos t\mathbf{j} + \sin(2t)\mathbf{k}, \quad t = \frac{\pi}{2}$

18.  $\mathbf{r}(t) = \sin t\mathbf{i} + \cos t\mathbf{j} + \sqrt{t}\mathbf{k}, \quad t = \pi$

In Problems 19–26, a particle of mass  $m$  is moving along the curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .

- (a) Find the force acting on the particle at any time  $t$ .  
 (b) Find the magnitude of the acceleration of the particle.

19.  $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j}$       20.  $\mathbf{r}(t) = e^{2t}\mathbf{i} + e^{-t}\mathbf{j}$

21.  $\mathbf{r}(t) = t\mathbf{i} + e^t\mathbf{j}$       22.  $\mathbf{r}(t) = t\mathbf{i} + \ln(1 + t)\mathbf{j}$

23.  $\mathbf{r}(t) = 3\sin(2t)\mathbf{i} + 3\cos(2t)\mathbf{j}$       24.  $\mathbf{r}(t) = 4\sin t\mathbf{i} - 4\cos t\mathbf{j}$

25.  $\mathbf{r}(t) = 2\cos t\mathbf{i} - 3\sin t\mathbf{j}$       26.  $\mathbf{r}(t) = -\cos(3t)\mathbf{i} + 2\sin(3t)\mathbf{j}$

In Problems 27–44:

- (a) Find the velocity, acceleration, and speed of a particle traveling along the curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .  
 (b) Find the tangential and normal components of the acceleration.

27.  $\mathbf{r}(t) = 2t\mathbf{i} + (t + 1)\mathbf{j}$       28.  $\mathbf{r}(t) = (1 - 3t)\mathbf{i} + 2t\mathbf{j}$

29.  $\mathbf{r}(t) = e^t\mathbf{i} + e^{2t}\mathbf{j}$       30.  $\mathbf{r}(t) = e^{-t}\mathbf{i} + e^{-2t}\mathbf{j}$

31.  $\mathbf{r}(t) = 2\sin t\mathbf{i} + \cos t\mathbf{j}$       32.  $\mathbf{r}(t) = 2\cos t\mathbf{i} + 3\sin t\mathbf{j}$

33.  $\mathbf{r}(t) = (1 - 3t)\mathbf{i} + 2t\mathbf{j} - (5 + t)\mathbf{k}$

34.  $\mathbf{r}(t) = (2 + t)\mathbf{i} + (2 - t)\mathbf{j} + 3t\mathbf{k}$

35.  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$

36.  $\mathbf{r}(t) = \frac{t^2}{t+1}\mathbf{i} + \frac{1}{t+1}\mathbf{j} + \frac{t}{t+1}\mathbf{k}$

37.  $\mathbf{r}(t) = 3\mathbf{i} + \cos t\mathbf{j} + \sin t\mathbf{k}$

38.  $\mathbf{r}(t) = t\mathbf{i} + \sin t\mathbf{j} + \cos t\mathbf{k}$

39.  $\mathbf{r}(t) = \ln t\mathbf{i} + \sqrt{t}\mathbf{j} + t^{3/2}\mathbf{k}; \quad t > 0$

40.  $\mathbf{r}(t) = \cos(2t)\mathbf{i} + \sin(2t)\mathbf{j} - 5\mathbf{k}$

41.  $\mathbf{r}(t) = e^t \cos t\mathbf{i} + e^t \sin t\mathbf{j} + e^t\mathbf{k}$

42.  $\mathbf{r}(t) = e^{-t} \cos t\mathbf{i} + e^{-t} \sin t\mathbf{j} - e^{-t}\mathbf{k}$

43.  $\mathbf{r}(t) = a \cos t\mathbf{i} + b \sin t\mathbf{j} + ct\mathbf{k}; \quad a > 0, b > 0, c > 0$

44.  $\mathbf{r}(t) = \cosh t\mathbf{i} + \sinh t\mathbf{j} + t\mathbf{k}$

## Applications and Extensions

45. **Velocity and Acceleration** Find the velocity and acceleration of a particle moving on the cycloid

$$\mathbf{r}(t) = [\pi t - \sin(\pi t)]\mathbf{i} + [1 - \cos(\pi t)]\mathbf{j}$$

## 46. Velocity and Acceleration

- (a) Find the velocity and acceleration of a particle moving on the parabola  $\mathbf{r}(t) = (t^2 - 2t)\mathbf{i} + t\mathbf{j}$ .  
 (b) At what time  $t$  is the speed of the particle 0?

47. **Acceleration** A particle moves along the path  $y = 3x^2 - x^3$  with the horizontal component of the velocity equal to  $\frac{1}{3}$ . Find the acceleration at the points where the velocity  $\mathbf{v}$  is horizontal. Graph the motion and indicate  $\mathbf{v}$  and  $\mathbf{a}$  at these points.

48. Show that if the speed of a particle along a curve is constant, then the velocity and acceleration vectors are orthogonal.

49. If a particle moves along the graph of  $y = f(x)$ , show that  $a_N = 0$  at a point of inflection of the graph.

50. Suppose that the vector function  $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j}$  gives the position of a particle at time  $t$ .

- (a) Show that the force on the particle is directed away from the origin.  
 (b) What is the minimum speed of the particle and where does it occur?  
 (c) Find the tangential and normal components of the acceleration at the point found in (b).  
 (d) The answers to (c) are  $a_T = 0$  and  $a_N = \mathbf{a}(t) = \sqrt{2}$ . How could these have been predicted?

51. A particle moves along the graph  $y = \frac{1}{2}x^2$  with constant speed  $v_0 = 2$ . Find  $a_T$  and  $a_N$  in terms of  $x$  alone at a general point  $\left(x, \frac{1}{2}x^2\right)$  on the graph.

52. If the motion of a particle is along the curve traced out by  $\mathbf{r}(t) = \alpha \cosh t\mathbf{i} + \beta \sinh t\mathbf{j}$ , where  $\alpha > 0$  and  $\beta > 0$ , show that the force acting on the particle is in the direction of  $\mathbf{r} = \mathbf{r}(t)$ .

**53. Centripetal Force** Refer to Example 5.

- (a) If the speed of the motorcycle is increased by 10%, by how much does the frictional force on the tires need to increase to keep the motorcycle moving along the same path?
- (b) If the radius of the circular track is halved, how much more slowly should the motorcycle be driven so the frictional force doesn't change?

**54. Frictional Force** A race car with mass 1000 kg is driven at a constant speed of 200 km/h around a circular track whose radius is 75 m. What frictional force must be exerted by the track on the tires to keep the car from skidding?

**55. Particle Collider** The Large Hadron Collider (LHC), buried 100 m beneath Earth's surface, is located near Geneva, Switzerland, and spans the border between France and Switzerland. The LHC is 26,659 m in circumference and, at full power, protons travel at a speed of 299,792,455.3 m/s (99.9999991% the speed of light) around the circle. Find the magnitude of force necessary to keep a proton of mass  $m$  moving at this speed.

*Source:* <http://public.web.cern.ch>.

**56. Particle Collider** At the Fermi National Accelerator Laboratory in Batavia, Illinois, protons were accelerated along a circular route with radius 1 km. Find the magnitude of the force necessary to give a proton of mass  $m$  a constant speed of 280,000 km/s.

**57. Magnitude of a Force** Find the maximum magnitude of the force acting on a particle of mass  $m$  whose motion is along the curve  $\mathbf{r}(t) = 4 \cos t \mathbf{i} - 2 \cos(2t) \mathbf{j}$ .

**58. Curvature of the Path of a Golf Ball** A golf ball is hit with an initial speed  $v_0$  at an angle  $\theta$  to the horizontal and travels on a smooth curve traced out by the vector function

$$\mathbf{r} = \mathbf{r}(t) = (v_0 \cos \theta)t \mathbf{i} + \left[ (v_0 \sin \theta)t - \frac{1}{2}gt^2 \right] \mathbf{j},$$

where  $g = 9.8 \text{ m/s}^2$  and  $0 \leq \theta \leq \frac{\pi}{2}$ .

- (a) At the highest point in the ball's trajectory, find the curvature of its path.
- (b) At the highest point in its trajectory, express the ball's acceleration vector using tangential and normal components. Are these components physically reasonable? Explain why.

**59. Velocity** A particle moves on the circle  $x^2 + y^2 = 1$  so that at time  $t \geq 0$  the position is given by the vector

$$\mathbf{r}(t) = \frac{1-t^2}{1+t^2} \mathbf{i} + \frac{2t}{1+t^2} \mathbf{j}$$

- (a) Find the velocity vector.
- (b) Is the particle ever at rest? Justify your answer.
- (c) Give the coordinates of the point that the particle approaches as  $t$  increases without bound.

**60. Velocity** The position of a particle at time  $t \geq 0$  is given by  $\mathbf{r}(t) = e^{-t} \cos t \mathbf{i} + e^{-t} \sin t \mathbf{j}$ .

- (a) Show that the path of the particle is part of the spiral  $r = e^{-\theta}$  (in polar coordinates).

- (b) Graph the path of the particle and indicate its direction of travel.
- (c) Show that the angle between the vector  $\mathbf{r}$  and velocity vector  $\mathbf{v}$  is always  $135^\circ$ .

**61. Oscillating Motion** Suppose a particle moves along the curve traced out by  $\mathbf{r}(t) = 4 \cos t \mathbf{i} - 2 \cos(2t) \mathbf{j}$ .

- (a) Show that the particle oscillates on an arc of a parabola.
- (b) Graph the path.
- (c) Find the acceleration  $\mathbf{a}$  at points of zero velocity.

**62.** If  $\mathbf{r}'(t) = \mathbf{b} \times \mathbf{r}(t)$  for all  $t$ , where  $\mathbf{b}$  is a constant vector, show that the acceleration  $\mathbf{a}(t)$  is perpendicular to  $\mathbf{b}$  and that the speed is constant.

**63. Mars Orbit** NASA's *Odyssey* orbiter has a new mission to relay directly back to Earth. The UHF telemetry taken by *Curiosity*, which landed on Mars on August 6, 2012. *Odyssey* is in a 'near-Mars' orbit at a height of 400 km above its surface. Find the speed of the *Odyssey* if the acceleration due to gravity on Mars is  $3.71 \text{ m/s}^2$  and Mars' radius is 3390 km.

**64. Physics** The power expended by a force  $\mathbf{F}(t)$  acting on an object of mass  $m$  with velocity  $\mathbf{v}(t)$  is the dot product

$$\text{Power} = \mathbf{F}(t) \cdot \mathbf{v}(t)$$

The kinetic energy of an object of mass  $m$  and velocity  $\mathbf{v}(t)$  equals one-half the product of its mass times the square of its speed:

$$\text{Kinetic energy} = \frac{1}{2}m\|\mathbf{v}(t)\|^2$$

Show that the power of an object equals the rate of change of its kinetic energy with respect to time.

**65. Momentum** In classical mechanics, the momentum  $\mathbf{p}(t)$  of an object of mass  $m$  at time  $t$  is defined as  $\mathbf{p}(t) = m\mathbf{v}(t)$ , where  $\mathbf{v}(t)$  is the velocity of the object at time  $t$ . Show that force equals the rate of change of momentum with respect to time.

**66. Angular Momentum** The torque  $\boldsymbol{\tau}$  (Greek letter *tau*) produced by a force  $\mathbf{F}(t)$  acting on an object whose position at time  $t$  is  $\mathbf{r}(t)$  is defined as  $\boldsymbol{\tau}(t) = \mathbf{r}(t) \times \mathbf{F}(t)$ . Torque measures the twist imparted on the object by the force. See the figure below. The angular momentum  $\mathbf{L}$  of an object of mass  $m$  and velocity  $\mathbf{v}(t)$  whose position at time  $t$  is  $\mathbf{r}(t)$  is  $\mathbf{L}(t) = \mathbf{r}(t) \times m\mathbf{v}(t)$ . Show that the rate of change of angular momentum with respect to time equals the torque.

**67. Central Fields of Force** A central field of force  $\mathbf{F}(t)$  is one whose direction is parallel to that of the position  $\mathbf{r} = \mathbf{r}(t)$  of the object it acts upon; that is,  $\mathbf{F}(t) = u(t)\mathbf{r}(t)$ , where  $u(t)$  is a scalar function. Show that a central field of force produces zero torque.

**68. Hydrogen Atom** The Bohr model of an atom views it as a miniature solar system, with negative electrons in circular orbits around the positive nucleus. A hydrogen atom consists of a single electron in orbit around a single proton. The electric force  $F_{\text{elec}}$  that the proton of charge  $e = 1.60 \times 10^{-19} \text{ C}$  exerts on the electron,

also of charge  $e = 1.60 \times 10^{-19} \text{ C}$ , is  $F_{\text{elec}} = \frac{ke^2}{r^2}$ , where  $r$  is the distance in meters between the nucleus and the electron and  $k = 9.0 \times 10^9 \text{ N} \cdot \text{m}^2/\text{C}$  is a constant. Apply Newton's Second Law of Motion to the electron in a hydrogen atom and show that

its speed is  $v = \sqrt{\frac{ke^2}{mr}}$ , where  $m = 9.11 \times 10^{-31} \text{ kg}$  is the mass of the electron.

**69. Analyzing Forces** Use the formula

$$\mathbf{F} = m\mathbf{a} = m \frac{dv}{dt} \mathbf{T} + mv^2 \kappa \mathbf{N}$$

to discuss the forces on a passenger in a car.

- What force corresponds to the push against the seat experienced by the passenger when the accelerator is depressed?
- What force corresponds to the push against the door experienced by the passenger when the car is going around a curve?
- How does this second force vary with the curvature of the road?
- How does it vary with the speed of the car?

**70. Analyzing Motion** Suppose  $\mathbf{r} = \mathbf{r}(t)$  gives the position of a particle at time  $t$ . If the normal component of acceleration equals 0 at any time  $t$ , explain why the motion of the particle must be in a straight line.

**71.** Suppose the position of a particle in space is given by the vector function  $\mathbf{r} = \mathbf{r}(t)$ . Show that if  $\mathbf{r} = \mathbf{r}(t)$  lies on a sphere, then the tangent vector is always orthogonal to  $\mathbf{r} = \mathbf{r}(t)$ .

### Challenge Problems

**72. Coriolis Acceleration** A particle moves on a disk from the center directly toward the edge. See the figure. The disk has radius 1 and is revolving in the counterclockwise direction at a constant angular speed  $\omega$ , so the position of a point on the edge of the disk is given by  $\mathbf{R}(t) = \cos(\omega t)\mathbf{i} + \sin(\omega t)\mathbf{j}$ . Suppose the position of the particle at time  $t$  is  $\mathbf{r}(t) = t\mathbf{R}(t)$ .

- (a) Show that the velocity  $\mathbf{v}$  of the particle is

$$\mathbf{v} = \cos(\omega t)\mathbf{i} + \sin(\omega t)\mathbf{j} + t\mathbf{v}_d$$

where  $\mathbf{v}_d = \mathbf{R}'(t)$  is the velocity of the rotating disk.

- (b) Also show that the acceleration  $\mathbf{a}$  of the particle is

$$\mathbf{a} = 2\mathbf{v}_d + t\mathbf{a}_d$$

where  $\mathbf{a}_d = \mathbf{R}''(t)$  is the acceleration of the rotating disk. The extra term  $2\mathbf{v}_d$  is called the **Coriolis acceleration**, which results from the interaction of the rotation of the disk and the motion of the particle on the disk.

**73. Coriolis Acceleration** Refer to Problem 72.

- (a) Find the velocity and acceleration of a particle revolving on a rotating disk according to

$$\mathbf{r}(t) = t^2 \cos(\omega t)\mathbf{i} + t^2 \sin(\omega t)\mathbf{j}$$

- (b) What is the Coriolis acceleration?

**74.** Suppose a curve  $C$  is traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ . Find two nonparallel vectors that are orthogonal to  $\mathbf{T}(t)$  other than the principal unit normal vector. Assume  $\mathbf{T}(t) \neq \mathbf{0}$  and  $\mathbf{N}(t) \neq \mathbf{0}$ .

**75.** Let  $\mathbf{u}_r = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$  and  $\mathbf{u}_\theta = -\sin \theta \mathbf{i} + \cos \theta \mathbf{j}$ .

- Show that  $\mathbf{u}_r$  and  $\mathbf{u}_\theta$  are unit orthogonal vectors.
- Show that  $\frac{d\mathbf{u}_r}{d\theta} = \mathbf{u}_\theta$  and  $\frac{d\mathbf{u}_\theta}{d\theta} = -\mathbf{u}_r$ .
- Suppose that  $\mathbf{r}(t)$  is the position vector of a plane curve and that the tip of  $\mathbf{r}(t)$  has polar coordinates  $(r(t), \theta(t))$ . Show that  $\mathbf{r}(t) = \|\mathbf{r}(t)\|\mathbf{u}_r = r(t)\mathbf{u}_r(t)$ .
- Use the Chain Rule to show that

$$\mathbf{v}(t) = \frac{dr}{dt}\mathbf{u}_r + r \frac{d\theta}{dt}\mathbf{u}_\theta = r'\mathbf{u}_r + r\theta'\mathbf{u}_\theta$$

- (e) Show that  $\mathbf{a}(t) = [r'' - r(\theta')^2]\mathbf{u}_r + [r\theta'' + 2r'\theta']\mathbf{u}_\theta$ .

**76.** Express the velocity  $\mathbf{v}$  and acceleration  $\mathbf{a}$  in terms of  $\mathbf{u}_r$  and  $\mathbf{u}_\theta$  for a motion along the polar curve  $r = 2 + \cos t$ , where  $\theta = 2t$ .

**77.** Find polar coordinate equations for  $\mathbf{r}(t) = e^{2t} \cos t \mathbf{i} + e^{2t} \sin t \mathbf{j}$  and express the velocity  $\mathbf{v}$  and acceleration  $\mathbf{a}$  in terms of  $\mathbf{u}_r$  and  $\mathbf{u}_\theta$ .

**78. (a)** Show that if  $\mathbf{r}'(t) \cdot \mathbf{r}(t) = 0$  for all  $t$ , then the motion  $\mathbf{r}(t)$  is on the surface of a sphere centered at the origin.

- (b) What can be said about a motion for which  $\mathbf{r}''(t) \cdot \mathbf{r}'(t) = 0$  for all  $t$ ?

- (c) What can be said about a motion for which  $\mathbf{r}'(t) \times \mathbf{r}(t) = \mathbf{0}$  for all  $t$ ?

## 11.5 Integrals of Vector Functions; Projectile Motion

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Integrate vector functions (p. 796)
- 2 Solve projectile motion problems (p. 797)

Up to now we have been given the position function  $\mathbf{r} = \mathbf{r}(t)$  of a moving particle, and we have used it to find the particle's velocity, speed, and acceleration. But in motion problems involving a force applied to an object, we often only know the mass  $m$  of the object and the force vector  $\mathbf{F}$  that is applied to it. By using Newton's Second Law of Motion,  $\mathbf{F} = m\mathbf{a}$ , we can find  $\mathbf{a}$ . But to find the motion of the particle, we also need its velocity  $\mathbf{v}$  and its position  $\mathbf{r}$ . Since  $\mathbf{a} = \frac{d\mathbf{v}}{dt}$  and  $\mathbf{v} = \frac{d\mathbf{r}}{dt}$ , we can find  $\mathbf{v}$  and then  $\mathbf{r}$  by integrating.

### 1 Integrate Vector Functions

The **integral of a vector function**  $\mathbf{r} = \mathbf{r}(t)$  is found by integrating each component individually. That is, if  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ , then

$$\int \mathbf{r}(t) dt = \left[ \int x(t) dt \right] \mathbf{i} + \left[ \int y(t) dt \right] \mathbf{j} + \left[ \int z(t) dt \right] \mathbf{k}$$

When integrating a vector function, we must insert a constant of integration into every component. For example,

$$\begin{aligned} \int (\sin t \mathbf{i} + \cos t \mathbf{j} + 2\mathbf{k}) dt &= \left( \int \sin t dt \right) \mathbf{i} + \left( \int \cos t dt \right) \mathbf{j} + \left( \int 2 dt \right) \mathbf{k} \\ &= (-\cos t + c_1) \mathbf{i} + (\sin t + c_2) \mathbf{j} + (2t + c_3) \mathbf{k} \end{aligned}$$

Then using the properties of vector addition, we get

$$\begin{aligned} \int (\sin t \mathbf{i} + \cos t \mathbf{j} + 2\mathbf{k}) dt &= -\cos t \mathbf{i} + \sin t \mathbf{j} + 2t \mathbf{k} + c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k} \\ &= -\cos t \mathbf{i} + \sin t \mathbf{j} + 2t \mathbf{k} + \mathbf{c} \end{aligned}$$

where  $\mathbf{c} = c_1 \mathbf{i} + c_2 \mathbf{j} + c_3 \mathbf{k}$ .

**NOW WORK** Problem 3.

### EXAMPLE 1 Solving a Vector Differential Equation

Solve the vector differential equation  $\mathbf{r}'(t) = 2t\mathbf{i} + e^t\mathbf{j} + e^{-t}\mathbf{k}$  with the initial condition  $\mathbf{r}(0) = \mathbf{i} - \mathbf{j} + \mathbf{k}$ .

**Solution** The general solution to the differential equation is

$$\begin{aligned} \mathbf{r}(t) &= \int \mathbf{r}'(t) dt = \int (2t\mathbf{i} + e^t\mathbf{j} + e^{-t}\mathbf{k}) dt \\ &= \left( \int 2t dt \right) \mathbf{i} + \left( \int e^t dt \right) \mathbf{j} + \left( \int e^{-t} dt \right) \mathbf{k} \\ &= (t^2 + c_1) \mathbf{i} + (e^t + c_2) \mathbf{j} + (-e^{-t} + c_3) \mathbf{k} \end{aligned}$$

Now we use the initial condition  $\mathbf{r}(0) = \mathbf{i} - \mathbf{j} + \mathbf{k}$ .

$$\mathbf{r}(0) = c_1 \mathbf{i} + (1 + c_2) \mathbf{j} + (-1 + c_3) \mathbf{k} = \mathbf{i} - \mathbf{j} + \mathbf{k}$$

from which we find

$$\begin{array}{rcl} c_1 = 1 & 1 + c_2 = -1 & -1 + c_3 = 1 \\ & c_2 = -2 & c_3 = 2 \end{array}$$

The vector function  $\mathbf{r} = \mathbf{r}(t)$  is

$$\mathbf{r}(t) = (t^2 + 1)\mathbf{i} + (e^t - 2)\mathbf{j} + (2 - e^{-t})\mathbf{k}$$

**NOW WORK** Problem 13.

## 2 Solve Projectile Motion Problems

From Newton's Second Law of Motion,  $\mathbf{F}(t) = m\mathbf{a}(t)$ . Once we know the force  $\mathbf{F}(t)$  acting on a particle of mass  $m$ , the acceleration vector  $\mathbf{a}(t)$  is determined. The velocity vector  $\mathbf{v}(t)$  is the integral of  $\mathbf{a}(t)$ . That is,

$$\mathbf{v}(t) = \int \mathbf{a}(t) dt$$

From this we can find the velocity and speed of the particle, provided an initial condition\* on  $\mathbf{v}(t)$  is given. Furthermore, since

$$\mathbf{r}(t) = \int \mathbf{v}(t) dt$$

we can find the path of the particle if we know an initial condition on  $\mathbf{r}(t)$ .

### EXAMPLE 2 Finding the Velocity and Position of a Particle

Find the velocity vector and position vector of a particle if its acceleration is given by  $\mathbf{a}(t) = -9.8\mathbf{j} \text{ m/s}^2$ ,  $\mathbf{v}(0) = 9.8\mathbf{j} \text{ m/s}$ , and  $\mathbf{r}(0) = \mathbf{0} \text{ m}$  for  $0 \leq t \leq 2$ .

**Solution** The velocity vector  $\mathbf{v}(t)$  is

$$\mathbf{v}(t) = \int \mathbf{a}(t) dt = \left( \int -9.8 dt \right) \mathbf{j} = c_1 \mathbf{i} + (-9.8t + c_2) \mathbf{j}$$

Since  $\mathbf{v}(0) = 9.8\mathbf{j}$ , then  $c_1 = 0$  and  $c_2 = 9.8$ , and the velocity vector is

$$\mathbf{v}(t) = (-9.8t + 9.8) \mathbf{j}$$

The position vector of the particle is given by

$$\mathbf{r}(t) = \int \mathbf{v}(t) dt = \left[ \int (-9.8t + 9.8) dt \right] \mathbf{j} = d_1 \mathbf{i} + (-4.9t^2 + 9.8t + d_2) \mathbf{j}$$

Since  $\mathbf{r}(0) = \mathbf{0}$ , then  $d_1 = 0$  and  $d_2 = 0$ , and the position of the particle is given by

$$\mathbf{r}(t) = (-4.9t^2 + 9.8t) \mathbf{j}$$

**NOW WORK** Problem 19.

Example 2 is a special case of the projectile problem: Find the path of a projectile fired at an angle  $\theta$  to the horizontal with initial speed  $v_0$ , assuming that the only force acting on the projectile is gravity. We are interested in knowing the maximum height of the projectile, how far it travels, and how long it is in the air. To simplify the analysis, we choose to start the motion at the origin, so  $\mathbf{r}(0) = \mathbf{0}$ . The initial velocity vector  $\mathbf{v}(0)$  has magnitude  $v_0$  and is directed at an inclination  $\theta$  to the horizontal axis, so  $\mathbf{v}(0) = v_0(\cos \theta \mathbf{i} + \sin \theta \mathbf{j}) = (v_0 \cos \theta) \mathbf{i} + (v_0 \sin \theta) \mathbf{j}$ .

In Figure 33,  $\mathbf{r} = \mathbf{r}(t)$  represents the position of the projectile after time  $t$  and  $\mathbf{v} = \mathbf{v}(t)$  is the velocity vector. We assume the only force acting on the projectile is

**DF** Figure 33

\*Sometimes a condition may be imposed other than an initial condition.

**NOTE** This is called the **flat Earth approximation**. It is a good approximation for short-range missiles. We also ignore air resistance here.

$\mathbf{F} = -mg\mathbf{j}$ , where  $g$  is the acceleration due to gravity\* and  $m$  is the mass of the projectile. From Newton's Second Law of Motion, the acceleration  $\mathbf{a}(t)$  of the projectile obeys

$$m\mathbf{a}(t) = -mg\mathbf{j}$$

$$\mathbf{a}(t) = -g\mathbf{j}$$

Integrating both sides with respect to  $t$  gives

$$\mathbf{v}(t) = \int \mathbf{a}(t) dt = \left( \int -g dt \right) \mathbf{j} = -gt\mathbf{j} + \mathbf{c}$$

where  $\mathbf{c}$  is a constant vector. When  $t = 0$ ,  $\mathbf{v}(0) = v_0 \cos \theta \mathbf{i} + v_0 \sin \theta \mathbf{j} = \mathbf{c}$ . So, the velocity vector of the projectile is

$$\mathbf{v}(t) = v_0 \cos \theta \mathbf{i} + (v_0 \sin \theta - gt)\mathbf{j}$$

The position of the projectile is given by

$$\mathbf{r}(t) = \int \mathbf{v}(t) dt = (v_0 \cos \theta)t\mathbf{i} + \left[ (v_0 \sin \theta)t - \frac{1}{2}gt^2 \right] \mathbf{j} + \mathbf{d}$$

where  $\mathbf{d}$  is a constant vector. When  $t = 0$ , the position of the projectile is at the origin,  $\mathbf{r}(0) = \mathbf{0}$ , so  $\mathbf{d} = \mathbf{0}$ . The position of the projectile at time  $t$  is

$$\mathbf{r}(t) = (v_0 \cos \theta)t\mathbf{i} + \left[ (v_0 \sin \theta)t - \frac{1}{2}gt^2 \right] \mathbf{j}$$

The parametric equations of the motion of the projectile are

$$x = (v_0 \cos \theta)t \quad \text{and} \quad y = -\frac{1}{2}gt^2 + (v_0 \sin \theta)t$$

We use  $t = \frac{x}{v_0 \cos \theta}$  to eliminate  $t$  from these equations. Then the rectangular equation of the motion is

$$y = -\frac{g}{2v_0^2 \cos^2 \theta} x^2 + x \tan \theta$$

which is the equation of a parabola. See Figure 34.

We are interested in knowing how far the projectile travels horizontally, how long it is in the air, and its maximum height.

The  $x$ -intercepts of the parabola are found by letting  $y = 0$ . As a result, the  $x$ -intercepts are

$$x = 0 \quad \text{and} \quad x = \frac{2v_0^2 \cos^2 \theta \tan \theta}{g} = \frac{v_0^2 \sin(2\theta)}{g}$$

The number  $\frac{v_0^2 \sin(2\theta)}{g}$ , called the **range** of the projectile, tells us the horizontal distance

the projectile travels. In Problem 39, you are asked to show that an inclination of  $\theta = \frac{\pi}{4}$  gives the maximum range.

Figure 34

\*In SI units,  $g \approx 9.8 \text{ m/s}^2$ ; in U.S. customary units  $g \approx 32 \text{ ft/s}^2$ .

The projectile hits the ground when  $y = 0$  and  $t > 0$ . We use the parametric equation of the motion for  $y$ , let  $y = 0$ , and solve for  $t$ .

$$y = -\frac{1}{2}gt^2 + (v_0 \sin \theta)t$$

$$0 = -\frac{1}{2}gt^2 + (v_0 \sin \theta)t$$

$$\frac{1}{2}gt = v_0 \sin \theta$$

$$t = \frac{2v_0 \sin \theta}{g}$$

The projectile is in the air for  $\frac{2v_0 \sin \theta}{g}$  seconds.

The projectile reaches its maximum height when  $\frac{dy}{dt} = -gt + v_0 \sin \theta = 0$ . The maximum height is reached at  $t = \frac{v_0 \sin \theta}{g}$  seconds. The maximum height is

$$y = -\frac{1}{2}g \left( \frac{v_0^2 \sin^2 \theta}{g^2} \right) + (v_0 \sin \theta) \left( \frac{v_0 \sin \theta}{g} \right) = \frac{v_0^2 \sin^2 \theta}{2g}$$

The formulas for the range of a projectile and its maximum height derived here are valid only for the initial conditions specified by  $\mathbf{r}(0) = \mathbf{0}$  and  $\mathbf{v}(0) = v_0 \cos \theta \mathbf{i} + v_0 \sin \theta \mathbf{j}$ . If different initial conditions are given, the range and maximum height of the projectile will be different. In such instances, merely follow the same pattern of solution, adjusting where needed for different initial conditions.

### NOW WORK Problem 25.

## 11.5 Assess Your Understanding

### Concepts and Vocabulary

- True or False** To integrate a vector function  $\mathbf{r} = \mathbf{r}(t)$ , integrate each component individually.
- True or False** When integrating a vector function  $\mathbf{r} = \mathbf{r}(t)$ , there is no need to add a constant of integration.

### Skill Building

In Problems 3–10, find each integral.

- $\int (\sin t \mathbf{i} - \cos t \mathbf{j} + t \mathbf{k}) dt$
- $\int (\cos t \mathbf{i} + \sin t \mathbf{j} - \mathbf{k}) dt$
- $\int (t^2 \mathbf{i} - t \mathbf{j} + e^t \mathbf{k}) dt$
- $\int (e^t \mathbf{i} - \sqrt{t} \mathbf{j} + t^2 \mathbf{k}) dt$
- $\int (\ln t \mathbf{i} - t \ln t \mathbf{j} - 2\mathbf{k}) dt$
- $\int \left( \mathbf{i} + \ln t \mathbf{j} + \frac{1}{t} \mathbf{k} \right) dt$
- $\int [(t-2)\mathbf{i} - (t-2)^2 \mathbf{j} + \mathbf{k}] dt$
- $\int [(3t+1)\mathbf{i} + (3t+1)^2 \mathbf{j} + (3t+1)^{-1} \mathbf{k}] dt$

In Problems 11–16, solve each vector differential equation with the given condition.

- $\mathbf{r}'(t) = e^t \mathbf{i} - \ln t \mathbf{j} + 2t \mathbf{k}, \quad \mathbf{r}(1) = \mathbf{j} + \mathbf{k}$
- $\mathbf{r}'(t) = t \mathbf{i} + e^{-t} \mathbf{j} - \frac{1}{t} \mathbf{k}, \quad \mathbf{r}(1) = \mathbf{i} - \mathbf{j} + 2\mathbf{k}$
- $\mathbf{r}'(t) = 2 \sin t \mathbf{i} + \cos t \mathbf{j} + \mathbf{k}, \quad \mathbf{r}(0) = \mathbf{i} - \mathbf{j}$
- $\mathbf{r}'(t) = \cos(2t) \mathbf{i} + \sin(2t) \mathbf{j} + 2\mathbf{k}, \quad \mathbf{r}(0) = \mathbf{i} + \mathbf{k}$
- $\mathbf{r}'(t) = t^{-1} \mathbf{i} + t \mathbf{j} + t^2 \mathbf{k}, \quad \mathbf{r}(1) = \mathbf{i} + \mathbf{j} + \mathbf{k}$
- $\mathbf{r}'(t) = t^3 \mathbf{i} + \frac{1}{t+1} \mathbf{j} + \mathbf{k}, \quad \mathbf{r}(0) = \mathbf{i} + \mathbf{j} + \mathbf{k}$

In Problems 17–24, find the velocity, speed, and position of a particle having the given acceleration, initial velocity, and initial position.

- $\mathbf{a}(t) = -32\mathbf{k}, \quad \mathbf{v}(0) = \mathbf{0}, \quad \mathbf{r}(0) = \mathbf{0}$
- $\mathbf{a}(t) = -32\mathbf{k}, \quad \mathbf{v}(0) = \mathbf{i} + \mathbf{j}, \quad \mathbf{r}(0) = \mathbf{0}$
- $\mathbf{a}(t) = \cos t \mathbf{i} + \sin t \mathbf{j}, \quad \mathbf{v}(0) = \mathbf{i}, \quad \mathbf{r}(0) = \mathbf{j}$
- $\mathbf{a}(t) = \cos t \mathbf{i} + \sin t \mathbf{j}, \quad \mathbf{v}(0) = \mathbf{j}, \quad \mathbf{r}(0) = \mathbf{i}$
- $\mathbf{a}(t) = -9.8\mathbf{k}, \quad \mathbf{v}(0) = \mathbf{i}, \quad \mathbf{r}(0) = 5\mathbf{k}$

22.  $\mathbf{a}(t) = -9.8\mathbf{k}$ ,  $\mathbf{v}(0) = \mathbf{i} + \mathbf{j}$ ,  $\mathbf{r}(0) = 2\mathbf{i}$
23.  $\mathbf{a}(t) = e^{-t}\mathbf{i} + \mathbf{j}$ ,  $\mathbf{v}(0) = \mathbf{i} + \mathbf{j}$ ,  $\mathbf{r}(0) = \mathbf{i} - \mathbf{j}$
24.  $\mathbf{a}(t) = t^2\mathbf{i} - e^{-t}\mathbf{k}$ ,  $\mathbf{v}(0) = \mathbf{i} - \mathbf{j}$ ,  $\mathbf{r}(0) = \mathbf{k}$

## Applications and Extensions

In Problems 25–30, assume  $g = 9.8 \text{ m/s}^2$ .

25. **Projectile Motion** A projectile is fired at an angle of  $30^\circ$  to the horizontal with an initial speed of 520 m/s. What are its range, the time of flight, and the greatest height reached?

26. **Projectile Motion** A projectile is fired with an initial speed of 200 m/s at an inclination of  $60^\circ$  to the horizontal. What are its range, the time of flight, and the greatest height reached?

27. **Projectile Motion** A projectile is fired with an initial speed of 100 m/s at an inclination of  $\tan^{-1}\left(\frac{5}{12}\right)$  to the horizontal.

- (a) Find parametric equations of the path of the projectile.
- (b) Find the range.
- (c) How long is the projectile in the air?

- (d) Graph the trajectory of the projectile.

28. **Projectile Motion** A projectile is fired with an initial speed of 120 m/s at an inclination of  $\tan^{-1}\left(\frac{3}{4}\right)$  to the horizontal.

- (a) Find parametric equations of the path of the projectile.
- (b) Find the range.
- (c) How long is the projectile in the air?

- (d) Graph the trajectory of the projectile.

29. **Projectile Motion** A projectile is fired up a hill that makes a  $30^\circ$  angle to the horizontal. Suppose the projectile is fired at an angle of inclination of  $45^\circ$  to the horizontal with an initial speed of 100 ft/s. See the figure.

- (a) How far up the hill does the projectile land?
- (b) How long is the projectile in the air?

30. **Projectile Motion** A projectile is propelled horizontally at a height of 3 m above the ground in order to hit a target 1 m high that is 30 m away. See the figure below. What should the initial velocity  $\mathbf{v}_0$  of the projectile be?

31. A force whose magnitude is 5 N and whose direction is along the positive  $x$ -axis is continuously applied to a projectile of mass  $m = 1 \text{ kg}$ . At  $t = 0 \text{ s}$ , the position of the object is the origin and its velocity is 3 m/s in the direction of the positive  $y$ -axis.

- (a) Find the velocity and speed of the projectile after  $t$  seconds.
- (b) Find the position after the force has been applied for  $t$  seconds.
- (c) How long is the projectile in the air?
- (d) Describe the path of the projectile.

32. An object of mass  $m$  is propelled from the point  $(1, 2)$  with initial velocity  $\mathbf{v}_0 = 3\mathbf{i} + 4\mathbf{j}$ . Thereafter, it is subjected only to the force  $\mathbf{F} = \frac{m}{\sqrt{2}}(-\mathbf{i} - \mathbf{j})$ . Find the vector equation for the position of the object at any time  $t > 0$ .

33. **Projectile Motion: Basketball** In a Metro Conference basketball game on January 21, 1980, between Florida State University and Virginia Tech, a record was set. Les Henson, who is 6 ft 6 in. tall, made a basket from  $89\frac{1}{4}$  ft down court to win the game for Virginia Tech by a score of 79 to 77. Assuming he released the ball at a height of 6 ft 6 in. and threw it at an angle of  $45^\circ$  (to maximize distance), with what initial velocity was the ball tossed? See the figure. (Assume  $g = 32 \text{ ft/s}^2$ .)

34. **Projectile Motion: Airplanes** A plane is flying at an elevation of 4.0 km with a constant horizontal speed of 400 km/h toward a point directly above its target  $T$ . See the figure. At what angle of sight  $\alpha$  should a package be released in order to strike the target? (Hint:  $g \approx 127,008 \text{ km/h}^2$ .)

35. **Projectile Motion: Baseball** A baseball is hit at an angle of  $45^\circ$  to the horizontal from an initial height of 3 ft. If the ball just clears the vines in front of the bleachers in Wrigley Field, which are 10 ft high and a distance of 400 ft from home plate, what was the initial speed of the ball? How long did it take the ball to reach the vines?
36. **Projectile Motion: Baseball** An outfielder throws a baseball at an angle of  $45^\circ$  to the horizontal from an initial height of 6 ft. Suppose he can throw the ball with an initial velocity of 100 ft/s.
- (a) What is the furthest the outfielder can be from home plate to ensure that the ball reaches home plate on the fly?
- (b) How long is the ball in flight?
- (c) Use (a) and (b) to determine how fast a player must run to get from third base to home plate on a fly ball and beat the throw to score a run. (Hint: It is 90 ft from third base to home plate.)

**37. Projectile Motion: Football** In a field goal attempt on a flat field, a football is kicked at an angle of  $30^\circ$  to the horizontal with an initial speed of 65 ft/s.

- What horizontal distance does the football travel while it is in the air?
- To score a field goal, the ball must clear the cross bar of the goal post, which is 10 ft above the ground. What is the furthest from the goal post the kick can originate and score a field goal?

**38. Projectile Motion: Skeet Shooting** A gun, lifted at an angle  $\theta_0$  to the horizontal, is aimed at an elevated target  $T$ , which is released the moment the gun is fired. See the figure. No matter what the initial speed  $v_0$  of the bullet is, show that it will always hit the falling target.

**39. (a)** Show that the maximum range of the projectile with position

$$\text{vector } \mathbf{r}(t) = (v_0 \cos \theta)t\mathbf{i} + \left[ (v_0 \sin \theta)t - \frac{1}{2}gt^2 \right]\mathbf{j} \text{ occurs}$$

$$\text{when } \theta = \frac{\pi}{4}.$$

**(b)** Show that the maximum range is  $\frac{v_0^2}{g}$ .

**40.** Show that the speed of the projectile whose position vector is given by  $\mathbf{r}(t) = (v_0 \cos \theta)t\mathbf{i} + \left[ -\frac{1}{2}gt^2 + (v_0 \sin \theta)t \right]\mathbf{j}$  is least when the projectile is at its highest point.

**41.** Show that a particle subject to no outside forces is either stationary or moves with constant speed along a straight line.

**42.** Show that if  $\mathbf{r}'(t) = \mathbf{0}$  for all  $t$  on some interval  $I$ , then  $\mathbf{r}(t) = \mathbf{c}$ , a constant vector, for all  $t$  in  $I$ .

**43.** Show that if  $\mathbf{f}'(t) = \mathbf{g}'(t)$  for all  $t$  in some interval  $I$ , then  $\mathbf{f}(t) = \mathbf{g}(t) + \mathbf{c}$  for all  $t$  in  $I$ .

### Challenge Problems

**44.** If  $\mathbf{c}$  is a constant vector and  $\mathbf{r} = \mathbf{r}(t)$  is continuous on a closed interval  $[a, b]$ , show that

$$\int_a^b [\mathbf{c} \cdot \mathbf{r}(t)] dt = \mathbf{c} \cdot \int_a^b \mathbf{r}(t) dt$$

**45.** Use the result of Problem 44 to show that

$$\left\| \int_a^b \mathbf{r}(t) dt \right\| \leq \int_a^b \|\mathbf{r}(t)\| dt$$

[Hint: Set  $\mathbf{c} = \int_a^b \mathbf{r}(t) dt$  and find  $\|\mathbf{c}\|^2$ .]

**46.** If  $\mathbf{c}$  is a constant vector and  $\mathbf{r}(t)$  is continuous on a closed interval  $[a, b]$ , prove that

$$\int_a^b [\mathbf{c} \times \mathbf{r}(t)] dt = \mathbf{c} \times \int_a^b \mathbf{r}(t) dt$$

## 11.6 Application: Kepler's Laws of Planetary Motion

**OBJECTIVES** When you finish this section, you should be able to:

**1** Discuss Kepler's Laws of Planetary Motion (p. 801)

**DF** Figure 35

### 1 Discuss Kepler's Laws of Planetary Motion

In the sixteenth century, Nicolaus Copernicus (1473–1543) proposed the **Heliocentric Theory of Planetary Motion**. He postulated that the planets travel in circular orbits with the Sun at the center. This theory agreed better with observation than the earlier **Geocentric Theory**, which claimed the Sun, moon, and planets travel in circular paths around Earth.

However, Copernicus' theory did not explain some observable facts. Early in the seventeenth century, Johannes Kepler (1571–1630) used the data of the Danish astronomer Tycho Brahe (1546–1601) to state three Laws of Planetary Motion.

- The orbit of each planet is an ellipse with the Sun at a focus [postulated in (1609)]. See Figure 35.
- A line joining the Sun to a planet sweeps out equal areas in equal times (1609). See Figure 36 on page 802.
- The square of the period of revolution of a planet is proportional to the cube of the length of the semimajor axis of the planet's elliptical orbit (1619).

Figure 36  $A_1 = A_2$ ;  $t_1 = t_2$ 

Figure 37

Although Kepler's Laws of Planetary Motion fit Brahe's observations, the theory could not be proved until Newton used calculus to explain the motion of planetary bodies. Here, we derive the first two of Kepler's laws using Newton's ideas and vector calculus. The proof of Kepler's third law for circular orbits is left as an exercise. See Problem 5.

Position a coordinate system with the Sun at the origin and let  $\mathbf{r} = \mathbf{r}(t)$  denote the position of a planet in orbit about the Sun, as shown in Figure 37. Then  $\mathbf{r}$  is subject to two laws:

$$\text{Newton's Second Law of Motion:} \quad \mathbf{F} = m\mathbf{a}(t) = m\mathbf{r}''(t)$$

$$\text{Newton's Law of Universal Gravitation:} \quad \mathbf{F} = -\frac{GmM}{\|\mathbf{r}\|^2} \frac{\mathbf{r}}{\|\mathbf{r}\|}$$

where  $m$  is the mass of the planet,  $M$  is the mass of the Sun,  $G$  is the gravitational constant and  $\|\mathbf{r}\|$  is the distance between the Sun and the planet.

Newton's Second Law of Motion states that the force acting on an object is proportional to the acceleration of the object, its mass being the constant of proportionality. Newton's Law of Universal Gravitation states that the force  $\mathbf{F}$  of attraction between two objects of mass  $m$  and  $M$  is inversely proportional to the square of the distance between the objects and is directed along the line joining them. Here, the

gravitational constant  $G \approx 6.67 \times 10^{-11} \frac{\text{N} \cdot \text{m}^2}{\text{kg}^2}$  is the constant of proportionality.

From Newton's two laws, we find

$$\mathbf{r}''(t) = -\frac{GM}{\|\mathbf{r}\|^3} \mathbf{r}$$

If  $\mathbf{v} = \mathbf{v}(t)$  is the velocity of a planet, then  $\mathbf{a}(t) = \frac{d\mathbf{v}}{dt} = \mathbf{r}''(t)$ , so

$$\frac{d\mathbf{v}}{dt} = -\frac{GM}{\|\mathbf{r}\|^3} \mathbf{r} \quad (1)$$

This shows that  $\frac{d\mathbf{v}}{dt}$  and  $\mathbf{r}$  are parallel, so

$$\mathbf{r} \times \frac{d\mathbf{v}}{dt} = \mathbf{0}$$

Now we differentiate  $\mathbf{r} \times \mathbf{v}$ .

$$\frac{d}{dt}(\mathbf{r} \times \mathbf{v}) = \left( \frac{d\mathbf{r}}{dt} \times \mathbf{v} \right) + \left( \mathbf{r} \times \frac{d\mathbf{v}}{dt} \right) = (\mathbf{v} \times \mathbf{v}) + \mathbf{0} = \mathbf{0}$$

$\frac{d\mathbf{r}}{dt} = \mathbf{v}$

This means  $\mathbf{r} \times \mathbf{v}$  is a constant vector, which we denote by  $\mathbf{D}$ . That is,

$$\mathbf{r} \times \mathbf{v} = \mathbf{D} \quad (2)$$

This fact implies that the motion of a planet lies in a plane.

We now prove Kepler's second law. A little later we prove Kepler's first law. As Figure 38 illustrates, if  $A$  is the area swept out by the vector  $\mathbf{r}$  in time  $t$ , then the area  $\Delta A$  that is swept out in time  $\Delta t$  can be approximated by a triangle. Since  $\|\mathbf{r} \times \Delta \mathbf{r}\|$  is the area of a parallelogram with sides  $\mathbf{r}$  and  $\Delta \mathbf{r}$ , the area of the triangle is  $\frac{1}{2}$  the area of the parallelogram. That is,

$$\Delta A \approx \frac{1}{2} \|\mathbf{r} \times \Delta \mathbf{r}\|$$

and

$$\frac{\Delta A}{\Delta t} \approx \frac{1}{2} \left\| \mathbf{r} \times \frac{\Delta \mathbf{r}}{\Delta t} \right\|$$

**NEED TO REVIEW?** Properties of the cross product are discussed in Section 10.5, pp. 726–729.

Figure 38  $\Delta A \approx \frac{1}{2} \|\mathbf{r} \times \Delta \mathbf{r}\|$

Figure 39

As  $\Delta t$  approaches 0, then  $\frac{\Delta A}{\Delta t} \rightarrow \frac{dA}{dt}$  and  $\frac{\Delta \mathbf{r}}{\Delta t} \rightarrow \frac{d\mathbf{r}}{dt}$ . So,

$$\frac{dA}{dt} = \frac{1}{2} \left\| \mathbf{r} \times \frac{d\mathbf{r}}{dt} \right\| = \frac{1}{2} \left\| \mathbf{r} \times \mathbf{v} \right\| = \frac{1}{2} \left\| \mathbf{D} \right\|$$

$\uparrow$   $\frac{d\mathbf{r}}{dt} = \mathbf{v}$        $\uparrow$  By (2)

That is,  $\frac{dA}{dt}$  is constant. This proves Kepler's second law. See Figure 39.

### THEOREM Kepler's Second Law of Planetary Motion

The speed of a planet varies so that the line joining the Sun to the planet sweeps out equal areas in equal times.

To obtain Kepler's first law, we use equation (1),  $\frac{d\mathbf{v}}{dt} = -\frac{GM}{\|\mathbf{r}\|^3} \mathbf{r}$ , and equation (2),  $\mathbf{r} \times \mathbf{v} = \mathbf{D}$ . We seek an expression for  $\frac{d\mathbf{v}}{dt} \times \mathbf{D}$ .

$$\frac{d\mathbf{v}}{dt} \times \mathbf{D} = -\frac{GM}{\|\mathbf{r}\|^3} \mathbf{r} \times (\mathbf{r} \times \mathbf{v}) = -\frac{GM}{\|\mathbf{r}\|^3} [(\mathbf{r} \cdot \mathbf{v})\mathbf{r} - (\mathbf{r} \cdot \mathbf{r})\mathbf{v}] \quad (3)$$

$\uparrow$   
Triple Cross Product

Now we differentiate the dot product  $\mathbf{r} \cdot \mathbf{r}$ .

$$\frac{d}{dt}(\mathbf{r} \cdot \mathbf{r}) = \frac{d\mathbf{r}}{dt} \cdot \mathbf{r} + \mathbf{r} \cdot \frac{d\mathbf{r}}{dt} = 2\mathbf{r} \cdot \frac{d\mathbf{r}}{dt} = 2\mathbf{r} \cdot \mathbf{v} \quad (4)$$

$\uparrow$   
 $\frac{d\mathbf{r}}{dt} = \mathbf{v}$

Since  $\mathbf{r} \cdot \mathbf{r} = \|\mathbf{r}\|^2$ , the following is also true:

$$\frac{d}{dt}(\mathbf{r} \cdot \mathbf{r}) = \frac{d}{dt} \|\mathbf{r}\|^2 = 2\|\mathbf{r}\| \frac{d}{dt} \|\mathbf{r}\| \quad (5)$$

Based on (4) and (5), we have

$$2\mathbf{r} \cdot \mathbf{v} = 2\|\mathbf{r}\| \frac{d}{dt} \|\mathbf{r}\|$$

$$\mathbf{r} \cdot \mathbf{v} = \|\mathbf{r}\| \frac{d}{dt} \|\mathbf{r}\|$$

We substitute this result in (3). Then

$$\begin{aligned} \frac{d\mathbf{v}}{dt} \times \mathbf{D} &= -\frac{GM}{\|\mathbf{r}\|^3} [(\mathbf{r} \cdot \mathbf{v})\mathbf{r} - (\mathbf{r} \cdot \mathbf{r})\mathbf{v}] = -\frac{GM}{\|\mathbf{r}\|^3} \left[ \|\mathbf{r}\| \left( \frac{d}{dt} \|\mathbf{r}\| \right) \mathbf{r} - \|\mathbf{r}\|^2 \mathbf{v} \right] \\ &= GM \left( \frac{\mathbf{v}}{\|\mathbf{r}\|} - \frac{\mathbf{r}}{\|\mathbf{r}\|^2} \frac{d}{dt} \|\mathbf{r}\| \right) \end{aligned}$$

But,

$$\frac{d}{dt} \frac{\mathbf{r}}{\|\mathbf{r}\|} = \frac{\frac{d\mathbf{r}}{dt}}{\|\mathbf{r}\|} - \frac{\mathbf{r}}{\|\mathbf{r}\|^2} \frac{d}{dt} \|\mathbf{r}\| = \frac{\mathbf{v}}{\|\mathbf{r}\|} - \frac{\mathbf{r}}{\|\mathbf{r}\|^2} \frac{d}{dt} \|\mathbf{r}\|$$

As a result, we can write

$$\frac{d\mathbf{v}}{dt} \times \mathbf{D} = GM \left( \frac{d}{dt} \frac{\mathbf{r}}{\|\mathbf{r}\|} \right)$$

Since  $\mathbf{D}$  is a constant vector, we can integrate both sides and obtain

$$\mathbf{v} \times \mathbf{D} = GM \frac{\mathbf{r}}{\|\mathbf{r}\|} + \mathbf{H}$$

where  $\mathbf{H}$  is a constant vector.

**NOTE** The Triple Vector Product is discussed in Section 10.5, Problems 68 and 69, p. 732.

To find  $\|\mathbf{r}\|$ , we first find the dot product  $\mathbf{r} \cdot (\mathbf{v} \times \mathbf{D})$ :

$$\mathbf{r} \cdot (\mathbf{v} \times \mathbf{D}) = \mathbf{r} \cdot \left( GM \frac{\mathbf{r}}{\|\mathbf{r}\|} + \mathbf{H} \right) = GM \|\mathbf{r}\| + \mathbf{r} \cdot \mathbf{H}$$

But  $\mathbf{A} \cdot (\mathbf{B} \times \mathbf{C}) = (\mathbf{A} \times \mathbf{B}) \cdot \mathbf{C}$ , so

$$(\mathbf{r} \times \mathbf{v}) \cdot \mathbf{D} = GM \|\mathbf{r}\| + \mathbf{r} \cdot \mathbf{H}$$

Since  $\mathbf{r} \times \mathbf{v} = \mathbf{D}$ , we have

$$\|\mathbf{D}\|^2 = GM \|\mathbf{r}\| + \mathbf{r} \cdot \mathbf{H}$$

If  $\theta$  is the angle between  $\mathbf{r}$  and  $\mathbf{H}$ , then  $\cos \theta = \frac{\mathbf{r} \cdot \mathbf{H}}{\|\mathbf{r}\| \|\mathbf{H}\|}$ , so

$$\|\mathbf{D}\|^2 = GM \|\mathbf{r}\| + \|\mathbf{r}\| \|\mathbf{H}\| \cos \theta$$

Now we solve for  $\|\mathbf{r}\|$ :

$$\|\mathbf{r}\| = \frac{\|\mathbf{D}\|^2}{GM + \|\mathbf{H}\| \cos \theta} = \frac{\|\mathbf{D}\|^2}{GM} \left( \frac{1}{1 + e \cos \theta} \right)$$

where  $e = \frac{\|\mathbf{H}\|}{GM}$ . This is the polar equation of a conic with a focus at the origin, the Sun.

It is a hyperbola if  $e > 1$ , a parabola if  $e = 1$ , or an ellipse if  $e < 1$ . Since the planets have closed orbits, the only possibility is an ellipse, resulting in Kepler's First Law of Planetary Motion:

### THEOREM Kepler's First Law of Planetary Motion

The orbit of each planet is an ellipse with the Sun at a focus.

**NEED TO REVIEW?** The polar equations of conics are discussed in Section 9.7, pp. 684–687.

## 11.6 Assess Your Understanding

### Applications and Extensions

- Exoplanets** As a result of NASA's Kepler mission, astronomers have discovered hundreds of planetary systems beyond our own. In one such planetary system, the planet GJ 667Cc has a circular orbit of radius  $1.8 \times 10^{10}$  m that takes 28.1 days to revolve about its central star GJ 667C.

Suppose another planet in circular orbit about central star GJ 667C is discovered. If this second planet is twice as far from the central star as planet GJ 667Cc, how many days would it take for the second planet to orbit the central star?

**Source:** <http://www.kepler.nasa.gov>.

- Satellites of Jupiter** The giant planet Jupiter has many satellites. The four largest satellites were discovered by Galileo in 1609. One of them, Io, is the most volcanically active body in the solar system. It is 422,000 km from Jupiter and takes 1.77 days for each orbit. Another satellite, Europa, probably has an ocean (and life?) beneath its icy surface. It is 671,000 km from Jupiter. A third satellite, Ganymede, is larger than the planet Mercury and takes 7.16 days for each orbit. Assuming the orbits of each of these satellites is circular,

- How long does it take Europa to orbit Jupiter?
- How far is Ganymede from Jupiter?

- Equation (2) on p. 802 states that  $\mathbf{r} \times \mathbf{v}$  is a constant. Explain why this means the motion of the planet lies in a plane.
- Explain why  $\frac{dA}{dt}$  equal to a constant results in the statement given for Kepler's second law.

### Challenge Problems

#### 5. Kepler's Third Law

- Prove Kepler's Third Law of Planetary Motion for orbits that are circular.
- Use the result from (a) to calculate the mass of the Sun. (Hint: Earth is  $1.5 \times 10^{11}$  m from the Sun, and the gravitational constant is  $G = 6.67 \times 10^{-11} \text{ N} \cdot \text{m}^2/\text{kg}^2$ .)

- From the equation  $\|\mathbf{r}\| = \frac{\|\mathbf{D}\|^2}{GM + \|\mathbf{H}\| \cos \theta} = \frac{\|\mathbf{D}\|^2}{GM} \left( \frac{1}{1 + e \cos \theta} \right)$ , deduce the following:

$$\text{Length of the semimajor axis} = \frac{\|\mathbf{D}\|^2}{GM} \left( \frac{1}{1 - e^2} \right)$$

$$\text{Length of the semiminor axis} = \frac{\|\mathbf{D}\|^2}{GM} \left( \frac{1}{\sqrt{1 - e^2}} \right)$$

$$\text{Area of the ellipse} = \frac{\pi \|\mathbf{D}\|^4}{G^2 M^2} \left[ \frac{1}{(1 - e^2)^{3/2}} \right]$$

7. (a) For a particle moving under the influence of a central field of force directed toward the origin, show that  $r\theta'' + 2r'\theta' = 0$ .
- (b) Multiply the equation in part (a) by  $r$  and integrate to obtain  $r^2\theta' = c$ , where  $c$  is a constant.
- (c) Using the expression for area in polar coordinates, deduce Kepler's second law for any central field of force.

## Chapter Review

### THINGS TO KNOW

#### 11.1 Vector Functions and Their Derivatives

- The vector function  $\mathbf{r} = \mathbf{r}(t) = \langle x(t), y(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j}$ ,  $a \leq t \leq b$ , traces out a **plane curve**. (p. 758)
- The vector function  $\mathbf{r} = \mathbf{r}(t) = \langle x(t), y(t), z(t) \rangle = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ ,  $a \leq t \leq b$ , traces out a **space curve**. (p. 759)
- Limit of a vector function (p. 761)
- A vector function  $\mathbf{r} = \mathbf{r}(t)$  is **continuous at a real number**  $t_0$  if:
  - $\mathbf{r}(t_0)$  is defined
  - $\lim_{t \rightarrow t_0} \mathbf{r}(t)$  exists
  - $\lim_{t \rightarrow t_0} \mathbf{r}(t) = \mathbf{r}(t_0)$  (p. 761)
- The **derivative** of the vector function  $\mathbf{r} = \mathbf{r}(t)$  is
 
$$\mathbf{r}'(t) = \lim_{h \rightarrow 0} \frac{\mathbf{r}(t+h) - \mathbf{r}(t)}{h}, \text{ provided the limit exists. (p. 762)}$$

#### Derivative formulas: (p. 763)

- Sum formula:
 
$$\frac{d}{dt} [\mathbf{u}(t) + \mathbf{v}(t)] = \frac{d}{dt} \mathbf{u}(t) + \frac{d}{dt} \mathbf{v}(t) = \mathbf{u}'(t) + \mathbf{v}'(t)$$
- Scalar multiplication formula:  $\frac{d}{dt} [f(t)\mathbf{u}(t)] =$ 

$$\left[ \frac{d}{dt} f(t) \right] \mathbf{u}(t) + f(t) \left[ \frac{d}{dt} \mathbf{u}(t) \right] = f'(t)\mathbf{u}(t) + f(t)\mathbf{u}'(t)$$
- Dot product formula:
 
$$\frac{d}{dt} [\mathbf{u}(t) \cdot \mathbf{v}(t)] = [\mathbf{u}(t) \cdot \mathbf{v}(t)]' = \mathbf{u}'(t) \cdot \mathbf{v}(t) + \mathbf{u}(t) \cdot \mathbf{v}'(t)$$
- Cross product formula:
 
$$\frac{d}{dt} [\mathbf{u}(t) \times \mathbf{v}(t)] = [\mathbf{u}(t) \times \mathbf{v}(t)]' = \mathbf{u}'(t) \times \mathbf{v}(t) + \mathbf{u}(t) \times \mathbf{v}'(t)$$
- Chain Rule:
 
$$\frac{d}{dt} \mathbf{v}(f(t)) = \mathbf{v}'(f(t)) \cdot f'(t)$$

#### 11.2 Unit Tangent and Principal Unit Normal Vectors; Arc Length

- Tangent vector to a curve (p. 768)
- Smooth curve (p. 768)
- Unit tangent vector:  $\mathbf{T}(t) = \frac{\mathbf{r}'(t)}{\|\mathbf{r}'(t)\|}$  (p. 768)
- Principal unit normal vector:  $\mathbf{N}(t) = \frac{\mathbf{T}'(t)}{\|\mathbf{T}'(t)\|}$  (p. 769)
- Arc length  $s$  of a vector function:  $s = \int_a^b \|\mathbf{r}'(t)\| dt$  (p. 770)

#### 11.3 Arc Length as Parameter; Curvature

- Parameter  $t$  is arc length if and only if  $\|\mathbf{r}'(t)\| = 1$ . (p. 775)

- Curvature of a curve:  $\kappa = \left\| \frac{d\mathbf{T}}{ds} \right\| = \frac{\|\mathbf{T}'(t)\|}{\|\mathbf{r}'(t)\|}$ , where the parameter  $s$  is arc length. (p. 777)
- Curvature of a space curve:  $\kappa = \frac{\|\mathbf{r}'(t) \times \mathbf{r}''(t)\|}{\|\mathbf{r}'(t)\|^3}$  (p. 778)
- Curvature of a plane curve given by  $y = f(x)$ :
 
$$\kappa = \frac{|y''|}{[1 + (y')^2]^{3/2}} \text{ (p. 779)}$$

#### Properties of an osculating circle (p. 780)

- The osculating circle contains a point  $P$  on a curve  $C$ .
- The tangent line to  $C$  at  $P$  and the tangent line to the osculating circle at  $P$  are the same.
- The radius  $\rho$  of the osculating circle is  $\rho = \frac{1}{\kappa}$ , where  $\kappa \neq 0$  is the curvature of the curve  $C$ .
- The center of the osculating circle lies on the line in the direction of the principal unit normal vector  $\mathbf{N}$  to  $C$  at  $P$ .

#### 11.4 Motion Along a Curve

- Position:  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$  (p. 785)
- Velocity:  $\mathbf{v}(t) = \mathbf{r}'(t) = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} + \frac{dz}{dt}\mathbf{k}$  (p. 785)
- Acceleration:  $\mathbf{a}(t) = \mathbf{r}''(t) = \frac{d^2x}{dt^2}\mathbf{i} + \frac{d^2y}{dt^2}\mathbf{j} + \frac{d^2z}{dt^2}\mathbf{k}$  (p. 785)
- Speed:  $v(t) = \|\mathbf{v}(t)\| = \|\mathbf{r}'(t)\|$  (p. 785)
- Tangential and normal components of an acceleration vector:  $\mathbf{a}(t) = a_T\mathbf{T}(t) + a_N\mathbf{N}(t)$ , where
 
$$a_T = v'(t) = \frac{dv}{dt} \quad \text{and} \quad a_N = [v(t)]^2 \kappa \text{ (p. 789)}$$

#### 11.5 Integrals of Vector Functions; Projectile Motion

- If  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ , then
 
$$\int \mathbf{r}(t) dt = \left[ \int x(t) dt \right] \mathbf{i} + \left[ \int y(t) dt \right] \mathbf{j} + \left[ \int z(t) dt \right] \mathbf{k}$$
 (p. 796)
- Projectile motion (p. 797)

#### 11.6 Kepler's Laws of Planetary Motion

- The orbit of each planet is an ellipse with the Sun at a focus. (p. 801)
- A line joining the Sun to a planet sweeps out equal areas in equal times. (p. 801)
- The square of the period of revolution of a planet is proportional to the cube of the length of the semimajor axis of the planet's elliptical orbit. (p. 801)

## OBJECTIVES

| Section | You should be able to ...                                                                      | Example | Review Exercises |
|---------|------------------------------------------------------------------------------------------------|---------|------------------|
| 11.1    | 1 Find the domain of a vector function (p. 758)                                                | 1       | 1–4(a)           |
|         | 2 Graph a vector function (p. 758)                                                             | 2–4     | 1–4(b)           |
|         | 3 Find the limit and determine the continuity of a vector function (p. 761)                    |         | 5–7              |
|         | 4 Find the derivative of a vector function (p. 762)                                            | 5, 6    | 1–4(c), 8, 9     |
|         | 5 Find the derivative of a vector function using derivative formulas (p. 763)                  | 7       | 10, 11           |
| 11.2    | 1 Interpret the derivative of a vector function geometrically (p. 767)                         | 1       | 12–14(a), 15     |
|         | 2 Find the unit tangent vector and the principal unit normal vector of a smooth curve (p. 768) | 2–4     | 12–14(b), (c)    |
|         | 3 Find the arc length of a curve traced out by a vector function (p. 770)                      | 5, 6    | 16–18            |
| 11.3    | 1 Determine whether the parameter used in a vector function is arc length (p. 775)             | 1, 2    | 19, 20           |
|         | 2 Find the curvature of a curve (p. 776)                                                       | 3, 4    | 21, 30           |
|         | 3 Find the curvature of a space curve (p. 778)                                                 | 5       | 22, 23           |
|         | 4 Find the curvature of a plane curve given by $y = f(x)$ (p. 779)                             | 6       | 24, 25, 29       |
|         | 5 Find an osculating circle (p. 780)                                                           | 7       | 26–28            |
| 11.4    | 1 Find the velocity, acceleration, and speed of a moving particle (p. 785)                     | 1–5     | 31–34(a), 35, 36 |
|         | 2 Express an acceleration vector using tangential and normal components (p. 788)               | 6–8     | 31–34(b)         |
| 11.5    | 1 Integrate vector functions (p. 796)                                                          | 1       | 37–42            |
|         | 2 Solve projectile motion problems (p. 797)                                                    | 2       | 43               |

## REVIEW EXERCISES

In Problems 1–4, for each vector function  $\mathbf{r} = \mathbf{r}(t)$

- (a) Find the domain.  
 (b) Graph the curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ , indicating its orientation.  
 (c) Find the value of  $\mathbf{r}'(t)$  at the given number  $t$ .

- $\mathbf{r}(t) = t^2\mathbf{i} + 3t\mathbf{j}, \quad t = 2$
- $\mathbf{r}(t) = 3\cos t\mathbf{i} + \sin t\mathbf{j}, \quad 0 \leq t \leq \pi, \quad t = \frac{\pi}{3}$
- $\mathbf{r}(t) = t\mathbf{i} + 2\cos t\mathbf{j} + 2\sin t\mathbf{k}, \quad t = 0$
- $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} - 2\mathbf{k}, \quad t = 1$
- Find  $\lim_{t \rightarrow 3} \left[ (t-3)\mathbf{i} + \frac{t^2-3t}{t^2-9}\mathbf{j} - \frac{4}{t}\mathbf{k} \right]$ .

In Problems 6 and 7, determine if the vector function is continuous at each number in the given interval. Identify any numbers where  $\mathbf{r} = \mathbf{r}(t)$  is discontinuous.

- $\mathbf{r}(t) = \frac{t}{t-2}\mathbf{i} + \sin t\mathbf{j}, \quad \text{interval } (0, 2\pi)$
- $\mathbf{r}(t) = \frac{t}{t+1}\mathbf{i} + \sqrt{t-1}\mathbf{j} + 3t\mathbf{k}, \quad \text{interval } [1, 3]$

In Problems 8 and 9, find  $\mathbf{r}'(t)$  and  $\mathbf{r}''(t)$ .

- $\mathbf{r}(t) = 3t\mathbf{i} - \ln t\mathbf{j} + 2e^t\mathbf{k}$
- $\mathbf{r}(t) = 2\cos t\mathbf{i} + 3\cos t\mathbf{j} + t\mathbf{k}$

In Problems 10 and 11, find  $[\mathbf{f}(t) \cdot \mathbf{g}(t)]'$  and  $[\mathbf{f}(t) \times \mathbf{g}(t)]'$ .

- $\mathbf{f}(t) = t\mathbf{i} - \frac{t}{2}\mathbf{j} + \mathbf{k} \quad \text{and} \quad \mathbf{g}(t) = \sqrt{1-t}\mathbf{i} + t^3\mathbf{j} + 2(t+1)\mathbf{k}$
- $\mathbf{f}(t) = t\mathbf{i} + \cos(2t)\mathbf{j} - 5\mathbf{k} \quad \text{and} \quad \mathbf{g}(t) = 2t\mathbf{i} + \cos t\mathbf{j} + \sin t\mathbf{k}$

In Problems 12–14, for each curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ :

- (a) Find a tangent vector to each curve  $C$  at  $t = 0$ .  
 (b) Find the unit tangent vector  $\mathbf{T}$  at  $t = 0$ .  
 (c) Find the principal unit normal vector  $\mathbf{N}$  at  $t = 0$ .

12.  $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j} + \mathbf{k}$

13.  $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + \sqrt{1-5t^2}\mathbf{k}, \quad \frac{-\sqrt{5}}{5} < t < \frac{\sqrt{5}}{5}$

14.  $\mathbf{r}(t) = e^t \sin t\mathbf{i} + e^t \cos t\mathbf{j} + e^t\mathbf{k}$

15. Find the angle between the helix traced out by  $\mathbf{r}(t) = \sin t\mathbf{i} + 3t\mathbf{j} + \cos t\mathbf{k}$  and the direction  $\mathbf{j}$ .

In Problems 16–18, find the arc length of each vector function.

- $\mathbf{r}(t) = \cos^3 t\mathbf{i} + \sin^3 t\mathbf{j}$  from  $t = 0$  to  $t = 2\pi$
- $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + \sqrt{1-5t^2}\mathbf{k}$  from  $t = 0$  to  $t = \frac{1}{4}$
- $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j} + \frac{t}{5}\mathbf{k}$  from  $t = 0$  to  $t = 2\pi$

In Problems 19 and 20, determine whether the parameter is arc length.

- $\mathbf{r}(t) = 3t\mathbf{i} + 4t\mathbf{j} + (5t+1)\mathbf{k}$
- $\mathbf{r}(t) = 3\cos t\mathbf{i} + 3\sin t\mathbf{j} + 8t\mathbf{k}$

In Problems 21–23, find the curvature  $\kappa = \kappa(t)$  of the curve  $C$  traced out by each vector function  $\mathbf{r} = \mathbf{r}(t)$ .

- $\mathbf{r}(t) = 4\cos t\mathbf{i} - 4\sin t\mathbf{j}$
- $\mathbf{r}(t) = t\mathbf{i} + \cos t\mathbf{j} + \sin t\mathbf{k}$
- $\mathbf{r}(t) = e^t\mathbf{i} + 4t\mathbf{j} + 5e^{-t}\mathbf{k}$
- Find the curvature of the graph of  $y = x^3 - 4$  at the point  $(1, -3)$ .
- Find the curvature of the graph of  $y = 4e^{-2x}$  at the point  $(0, 4)$ .

In Problems 26–28, find the radius of the osculating circle at the point corresponding to  $t$  on the curve  $C$  traced out by each vector function.

- $\mathbf{r}(t) = (1-t^2)\mathbf{i} + e^{-t}\mathbf{j}, \quad t = 0$
- $\mathbf{r}(t) = \cos^2 t\mathbf{i} + \sin^2 t\mathbf{j}, \quad t = \frac{\pi}{3}$
- $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + \sqrt{1-t^2}\mathbf{k}, \quad -1 < t < 1, \quad t = 0$
- Find the curvature of the curve  $y = \sqrt[3]{x}, x > 0$ .

30. Find the minimum curvature of the curve  $C$  traced out by the vector function  $\mathbf{r}(t) = \cos^3 t \mathbf{i} + \sin^3 t \mathbf{j}$ .

In Problems 31–34:

- (a) Find the velocity  $\mathbf{v}$ , acceleration  $\mathbf{a}$ , and speed  $v$  of a particle traveling along the curve traced out by the vector function  $\mathbf{r} = \mathbf{r}(t)$ .
- (b) Find the tangential and normal components of the acceleration.
31.  $\mathbf{r}(t) = 2 \cos t \mathbf{i} + \sin t \mathbf{j}$       32.  $\mathbf{r}(t) = e^t \sin t \mathbf{i} + e^{-t} \mathbf{j}$
33.  $\mathbf{r}(t) = e^t \mathbf{i} + e^{-t} \mathbf{j} + \mathbf{k}$       34.  $\mathbf{r}(t) = e^t \sin t \mathbf{i} + e^t \cos t \mathbf{j} + e^t \mathbf{k}$
35. Find the velocity and acceleration of a particle moving on the cycloid  $\mathbf{r}(t) = [\pi t - \sin(\pi t)] \mathbf{i} + [1 - \cos(\pi t)] \mathbf{j}$ .
36. (a) Find the velocity and acceleration of a particle moving on the parabola  $\mathbf{r}(t) = (t^2 - 2t) \mathbf{i} + t \mathbf{j}$ .

(b) At what time  $t$  is the speed of the particle 0?

In Problems 37 and 38, find each integral.

37.  $\int [(t^2 - 2) \mathbf{i} - (t - 2)^2 \mathbf{j} + e^{2t} \mathbf{k}] dt$

38.  $\int \left( \cos \frac{t}{2} \mathbf{i} + \sin^2 \left( \frac{t}{2} \right) \mathbf{j} + 3t \mathbf{k} \right) dt$

In Problems 39–41, solve each vector differential equation with the given boundary condition.

39.  $\mathbf{r}'(t) = e^{2t} \mathbf{i} + \ln t \mathbf{j} + 2e^t \mathbf{k}$ ,  $\mathbf{r}(1) = \mathbf{j} + \mathbf{k}$
40.  $\mathbf{r}'(t) = \sin t \cos t \mathbf{i} + \tan t \sec t \mathbf{j} + t \mathbf{k}$ ,  $\mathbf{r}(0) = \mathbf{i} + \mathbf{k}$
41.  $\frac{d\mathbf{r}}{dt} = \cos t \mathbf{i} - \sin t \mathbf{j} + \frac{t}{2} \mathbf{k}$ ,  $\mathbf{r}(0) = \mathbf{i}$
42. Find the speed, velocity, and position at time  $t$  for a particle whose acceleration at time  $t$  is given by  $\mathbf{a}(t) = \tan t \sec t \mathbf{i} + \cos t \mathbf{j}$ . Assume that the initial velocity and position are  $\mathbf{0}$ .
43. **Projectile Motion** A projectile is fired with a speed of 500 m/s at an inclination of  $45^\circ$  to the horizontal from a point 30 m above level ground. Find the point where the projectile strikes the ground.
44. State Kepler's three laws of Planetary Motion. Explain each law in your own words.

## CHAPTER 11 PROJECT

### How to Design a Safe Road

When a car moves around a corner, we often feel ourselves being pulled outward. This “pull” is due to inertia, the tendency to move along straight-line paths. Without some sort of centripetal (center-seeking) force, a passenger would move in a tangent line to the

circle while the car turned underneath. It is the frictional force exerted by the road on the tires that keeps the car from sliding off the road, and it is a combination of forces between a passenger and the seat/seatbelt which pushes the passenger into a circular path.

In this project we examine the forces acting on a moving vehicle under three different scenarios involving exiting from one road to another, and a fourth involving the forces affecting a vehicle during a high speed turn.

They are:

- Exiting from one road to another road that are perpendicular along a flat circular ramp.
- Exiting from one road to another road that are perpendicular along a flat circular ramp that is angled (banked) at an angle to the horizontal.
- Exiting from one road to another road that is approximately 28 ft above the first along an inclined, banked ramp.
- Traveling along a rural highway as the road curves.

1. Suppose a car weighing 3800 lb is traveling at a constant speed of 30 mi/h.

- (a) What is the speed of the car in ft/s?
- (b) What is the mass  $m$  of the car? (Hint: weight  $w = mg$ , where  $g = 32 \text{ ft/s}^2$ .)

Suppose the car exits from one road to another on a flat circular ramp of radius 100 ft given by the vector equation

$$\mathbf{r} = \mathbf{r}(t) = 100 \sin(\omega t) \mathbf{i} + 100 \cos(\omega t) \mathbf{j} \quad 0 \leq t \leq \frac{\pi}{2\omega} \quad (1)$$

where  $\omega$  is the angular speed of the car.

2. Graph  $\mathbf{r} = \mathbf{r}(t)$ . Explain how the vector function  $\mathbf{r} = \mathbf{r}(t)$  models a circular ramp connecting two roads that intersect at a right angle.
3. (a) Find  $\omega$ .
- (b) Find the velocity vector  $\mathbf{v} = \mathbf{v}(t)$ .
- (c) Find the acceleration vector  $\mathbf{a} = \mathbf{a}(t)$ .
4. What is the magnitude of the frictional force required to keep the car from sliding on the ramp?

Now suppose the circular exit ramp leading from one road to the other is banked. That is, the ramp is pitched at an angle  $\theta$  to the horizontal. This banking helps push the car into a circular path, much as friction did in the scenario where the road was flat. We wish to find the angle  $\theta$  so that the car will travel in a circular path even on a very slick (frictionless) road. Since, in practice, the road will not be frictionless, the angle of banking is often less than  $\theta$ .

We wish to find  $\theta$  so that there is no lateral centripetal force. In doing so, we ignore the frictional force exerted on the tires so that, in practice, the angle used could be smaller than  $\theta$ .

5. Suppose the same 3800 lb car, traveling at a constant speed of 30 mi/h, exits from one road to another on a banked, circular ramp of radius 100 ft, (Equation (1)), that is pitched at an angle  $\theta$ ,  $0 < \theta < \frac{\pi}{2}$ , to the horizontal.
- (a) If  $\mathbf{n}$  is the normal force vector exerted by the car as it moves along the ramp, show that the weight of the car is  $\mathbf{n} \cos \theta$  and the centripetal force is  $\mathbf{F} = \mathbf{n} \sin \theta$ . (Hint: Draw a force diagram.)
- (b) Find the magnitude of  $\mathbf{F}$ . [Hint: Use  $\mathbf{F} = m\mathbf{a}$  and the results found in Problems 4 and 5.]
- (c) Use the results of (a) and (b) to find  $\sin \theta$  and  $\cos \theta$ .
- (d) Find  $\tan \theta$ , and solve for  $\theta$ .

6. Suppose a road with an E-W direction passes under a second road with a N-S direction, and the N-S road is 28.27 ft higher than the E-W road. You are driving East and want to head North. An inclined, banked exit ramp from the lower road to the higher road can be modeled by the vector equation

$$\mathbf{r} = \mathbf{r}(t) = 100 \sin(\omega t)\mathbf{i} + 100 \cos(\omega t)\mathbf{j} + 6\omega t\mathbf{k} \quad (2)$$

$$0 \leq t \leq \frac{3\pi}{2\omega}$$

Graph  $\mathbf{r} = \mathbf{r}(t)$  and explain how the graph satisfies the conditions required of the ramp.

7. Find the angle  $\theta$  to bank the exit ramp so that a 3800 lb car travelling at a constant speed of 30 mi/h will travel in a circular path of constant radius. Explain your answer mathematically.

The discussion above can also be used to answer the following questions.

8. A rural highway has a posted speed of 65 mi/h. At a certain point the highway curves and follows a flat circular path of radius 1000 ft given by

$$\mathbf{r} = \mathbf{r}(t) = 1000 \sin(\omega t)\mathbf{i} + 1000 \cos(\omega t)\mathbf{j}$$

Suppose the road is banked at an angle of  $10^\circ$ . What speed limit should be set so that a car weighing 3800 lb would travel in a circular path of constant radius even if the road became slick? Express your answer in mi/h.

9. Repeat Problem 8 for a vehicle weighing 10,000 lb. Explain why the answer makes sense.
10. Narrowing the width of a lane from 12 ft to 11 ft increases the likelihood of an accident at approximately the same rate as decreasing the banking angle by  $1^\circ$ . Repeat Problem 8 if the banking angle is  $9^\circ$ . Explain how this might influence the choice of a banking angle vs. an increase in lane width.
11. Describe the role of the curvature of the road used for an exit ramp. Assume the speed of the vehicle is constant.

### Searching for Exoplanets

In 1992 the first planet outside our solar system was discovered by astronomers. Such planets, called **extrasolar planets** or **exoplanets**, are of great interest to astronomers in the search for potential extraterrestrial life forms. The first exoplanets discovered were large planets similar in size to Jupiter and Neptune. Larger planets are easier to detect but less likely to have an atmosphere hospitable for life. Since the light reflected by a planet is much fainter than the light emitted from the star it revolves around, most exoplanets cannot be observed directly. Instead, exoplanets are discovered through the use of indirect methods such as radial velocity or the Doppler method. A star with a planet will move in a small orbit in response to the planet's gravity. This creates a slight fluctuation in the radial velocity, the speed at which the star moves toward or away from earth. Due to the Doppler effect, these fluctuations can be measured, indicating the existence of an exoplanet.

In certain cases the exoplanet passes between Earth and the star once every orbit. This is called a **transit**. Since the planet is cooler than the star, the transit causes the star's brightness to decrease slightly while it is in front of the star. With very careful observations, this decrease in brightness can be recorded, even by amateur astronomers. The transit method has also been used from space by NASA's Kepler satellite to identify more than 3000 candidate exoplanets.

**CHAPTER 12 PROJECT** In the Chapter 12 Project on p. 861, we examine the transit method for discovering exoplanets and investigate the main source of error when it is used with telescopes on the ground.

In Chapter 1, we discussed finding the limit of a function  $y = f(x)$ , a function of one variable, and investigated where such a function is continuous. In Chapters 2 and 3, we defined the derivative of a function  $y = f(x)$ , investigated properties of derivatives, and developed methods for finding derivatives that eliminated the need to actively use the definition. In this chapter, we extend these concepts to functions of more than one variable. Instead of a derivative, we define *partial derivatives* of such functions. And instead of a single chain rule, we discover functions of more than one variable have a variety of chain rules.

## 12.1 Functions of Two or More Variables and Their Graphs

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Work with functions of two or three variables (p. 810)
- 2 Graph functions of two variables (p. 812)
- 3 Graph level curves (p. 812)
- 4 Describe level surfaces (p. 815)

### 1 Work with Functions of Two or Three Variables

Many applications of the physical sciences, biology, the social sciences, business and economics, and even sports require functions of two or more variables. For example, the monthly cost of using a netbook depends on the megabytes of data used domestically, the number of kilobytes of data sent to or received from Canada, and the number of kilobytes of data used outside the United States and Canada. The cost is a *function of three variables*. For another example, the volume  $V = \pi R^2 h$  of water stored in a cylindrical tank depends on both the height  $h$  of the water and the radius  $R$  of the tank. The volume  $V$  is a *function of two variables*,  $R$  and  $h$ . In function notation,

$$V = f(R, h) = \pi R^2 h$$

So, if  $R = 10$  centimeters (cm) and  $h = 3$  cm, then the volume of water in the tank is  $V = f(10, 3) = \pi(10^2)(3) = 300\pi$  cubic centimeters ( $\text{cm}^3$ ).

**Figure 1**  $D$  is the domain of  $f$ ;  $z = f(x, y)$  is in the range of  $f$ .

#### DEFINITION Function of Two Variables

Let  $D$  be a nonempty subset of the  $xy$ -plane. A **function  $f$  of two variables**  $x$  and  $y$  is a rule that associates with each point  $(x, y)$  of  $D$  a unique real number  $z = f(x, y)$ .

The function  $z = f(x, y)$  has two **independent variables**  $x$  and  $y$ , and one **dependent variable**  $z$ . The **domain**  $D$  of the function  $f$  is the set of points in the  $xy$ -plane for which the function is defined. The **range** of  $f$  is the set of real numbers  $z = f(x, y)$ , where  $(x, y)$  is in  $D$ . Figure 1 illustrates how the point  $(x, y)$  is mapped to the number  $z = f(x, y)$ .

#### EXAMPLE 1 Evaluating a Function of Two Variables

Let  $f(x, y) = \sqrt{x} + x\sqrt{y}$ . Find:

- (a)  $f(1, 4)$    (b)  $f(a^2, 9b^2)$ ,  $a > 0$ ,  $b > 0$    (c)  $f(x + \Delta x, y)$    (d)  $f(x, y + \Delta y)$

**Solution** (a)  $f(1, 4) = \sqrt{1} + 1\sqrt{4} = 1 + 2 = 3$

$$x = 1; y = 4.$$

(b)  $f(a^2, 9b^2) = \sqrt{a^2} + a^2\sqrt{9b^2} = a + 3a^2b$

$$x = a^2; y = 9b^2; a > 0; b > 0.$$

(c)  $f(x + \Delta x, y) = \sqrt{x + \Delta x} + (x + \Delta x)\sqrt{y}$

(d)  $f(x, y + \Delta y) = \sqrt{x} + x\sqrt{y + \Delta y}$  ■

#### NOW WORK Problem 7.

#### DEFINITION Function of Three Variables

Let  $D$  be a nonempty set of points in space. A **function  $f$  of three variables**  $x$ ,  $y$ , and  $z$  is a rule that associates with each point  $(x, y, z)$  of  $D$  a unique real number  $w = f(x, y, z)$ .

**Figure 2**  $D$  is the domain of  $f$ ;  $w$  is the value of  $f(x, y, z)$ .

The function  $w = f(x, y, z)$  has *three* independent variables  $x$ ,  $y$ , and  $z$  and one dependent variable  $w$ . The domain  $D$  of the function  $f$  is the set of points in space for which the function is defined, and the range of  $f$  is the set of real numbers  $w = f(x, y, z)$  for points  $(x, y, z)$  in  $D$ . See Figure 2.

Functions of  $n$  variables, where  $n$  is a positive integer, are defined similarly. A **function**  $f$  of  $n$  variables  $x_1, x_2, \dots, x_n$  is a rule that associates a unique real number  $z = f(x_1, x_2, \dots, x_n)$  with each point  $(x_1, x_2, \dots, x_n)$  in a nonempty subset  $D$  of  $n$ -dimensional space. Here,  $z$  is the dependent variable and  $x_1, x_2, \dots, x_n$  are the  $n$  independent variables.

Collectively, functions of two or more variables are referred to as **functions of several variables**. As with functions of a single variable, a function of several variables is usually given by a formula, and unless the domain is specified, the domain is the largest set of points for which the dependent variable is a real number.

Functions of several variables are expressed **explicitly** when they are in the form

$$z = f(x, y) \quad w = g(x, y, z) \quad z = h(x_1, x_2, \dots, x_n)$$

or **implicitly** when they are in the form

$$F(x, y, z) = 0 \quad G(x, y, z, w) = 0 \quad H(x_1, x_2, \dots, x_n, z) = 0$$

### EXAMPLE 2 Finding the Domain of a Function of Two Variables

Find the domain of each of the following functions. Then graph the domain.

(a)  $z = f(x, y) = \sqrt{16 - x^2 - y^2}$       (b)  $z = f(x, y) = \ln(y^2 - 4x)$

**Solution** (a) Since the expression under the radical must be nonnegative, the domain of  $f$  consists of all points in the plane for which

$$\begin{aligned} 16 - x^2 - y^2 &\geq 0 \\ x^2 + y^2 &\leq 16 \end{aligned}$$

The domain is all the points inside and on the circle  $x^2 + y^2 = 16$ . The shaded portion of Figure 3 illustrates the domain.

(b) Since the logarithmic function is defined for only positive numbers, the domain of  $f$  is the set of points  $(x, y)$  for which  $y^2 - 4x > 0$  or  $y^2 > 4x$ . To graph the domain, we start with the parabola  $y^2 = 4x$ , and use a dashed curve to indicate that the parabola is not part of the domain. The parabola  $y^2 = 4x$  divides the plane into two sets of points: those for which  $y^2 < 4x$  and those for which  $y^2 > 4x$ . To find which points are in the domain, choose any point not on the parabola  $y^2 = 4x$  and determine whether it satisfies the inequality. For example, the point  $(2, 0)$  is not in the domain, since  $0^2 < (4)(2)$ . The set of points for which  $y^2 > 4x$ , the domain of  $f$ , is shaded in Figure 4. ■

**Figure 3** The domain of  $f(x, y) = \sqrt{16 - x^2 - y^2}$ .

**Figure 4** The domain of  $f(x, y) = \ln(y^2 - 4x)$ .

**NOW WORK** Problems 13 and 17.

Figure 5  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2 - 1}$ .

### EXAMPLE 3 Finding the Domain of a Function of Three Variables

Find the domain of the function  $w = f(x, y, z) = \sqrt{x^2 + y^2 + z^2 - 1}$  and graph the domain.

**Solution** Since the expression under the radical must be nonnegative, the domain of  $f$  consists of all points for which  $x^2 + y^2 + z^2 - 1 \geq 0$ . The domain is the set of all points on and outside of the unit sphere  $x^2 + y^2 + z^2 = 1$ ; that is, the set  $\{(x, y, z) \mid x^2 + y^2 + z^2 \geq 1\}$ . See Figure 5. ■

**NOW WORK** Problem 25.

## 2 Graph Functions of Two Variables

The graph of a function  $z = f(x, y)$  of two variables is called a **surface** and consists of all points  $(x, y, z)$  for which  $z = f(x, y)$ , and  $(x, y)$  is in the domain of  $f$ . We use the graphing techniques introduced in Chapter 10 to graph functions of two variables.

### EXAMPLE 4 Graphing a Function of Two Variables

Graph each function:

- (a)  $z = f(x, y) = 1 - x - y$       (b)  $z = f(x, y) = x^2 + 4y^2$   
 (c)  $z = f(x, y) = \sqrt{x^2 + y^2}$

**NEED TO REVIEW?** Planes in space are discussed in Section 10.6, pp. 737–740.

**NEED TO REVIEW?** Quadric surfaces are discussed in Section 10.7, pp. 744–751.

**Solution** (a) The graph of the equation  $z = 1 - x - y$ , or  $x + y + z = 1$ , is a plane. The intercepts are the points  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$ . See Figure 6.

(b) The graph of the equation  $z = x^2 + 4y^2$  is an elliptic paraboloid whose vertex is at the origin. See Figure 7.

(c) The equation  $z = f(x, y) = \sqrt{x^2 + y^2}$  is equivalent to  $z^2 = x^2 + y^2$ , where  $z \geq 0$ . The graph of the equation is part of a circular cone whose vertex is at the origin. Since  $z \geq 0$ , the graph of  $f$  is the upper nappe of the cone. See Figure 8.

Figure 6  $z = f(x, y) = 1 - x - y$

Figure 7  $z = f(x, y) = x^2 + 4y^2$

Figure 8  $z = f(x, y) = \sqrt{x^2 + y^2}$

**NOW WORK** Problems 29, 33, and 37.

## 3 Graph Level Curves

The graph of a function  $f$  of two variables is usually difficult to draw by hand. In practice, such as in *topography*, the surface  $z = f(x, y)$  is conveyed by drawing properly labeled curves for fixed values of  $z$ . These curves are called **contour lines** and each contour line corresponds to the intersection of the surface  $z = f(x, y)$  and a plane  $z = c$ , where  $c$  is a constant.

**NOTE** A contour line is equivalent to a trace used to describe a quadric surface in Chapter 10. Recall that a trace is the intersection of a surface with a coordinate plane or a plane parallel to a coordinate plane.

**Figure 9** Level curve of  $z = f(x, y)$  at  $z = c$ .

For example, suppose the surface is a mountain whose height is measured in meters, and  $z = 0$  represents sea level. Then by walking along the contour line  $z = 500$ , we would be walking on a level path 500 m above sea level.

When a contour line is projected onto the  $xy$ -plane, the resulting graph is called a **level curve**. See Figure 9.

In a topographical map, a series of level curves are drawn, each representing a contour line of height (or depth)  $c$ . For example, to represent a hilly terrain, a topographer draws level curves corresponding to contour lines for various heights measured at equal intervals, say, every 100 m. When the level curves are close to each other, the terrain is steep; when they are further apart, the terrain is flatter. See Figure 10.

**Figure 10** Menan Buttes, ID. Contour intervals are shown for each 100-ft change in altitude. The north crater is about 100 ft deep, and the south crater is about 150 ft deep.

So by reversing the process, we can visualize a surface by mentally raising each level curve to its corresponding height  $z$  and viewing the resulting contour lines. Figure 11 shows this process. Figure 11(a) is a U.S. geological survey topographic map of Devil's Tower, a monolith in Wyoming. Observe how the level curves are close together, indicating that the surface is steep on all sides. Figure 11(b) shows the contour lines drawn on the monolith. Figure 11(c) is a photograph of Devil's Tower.

**Figure 11**

**IN WORDS** The prefix *iso-* is Greek meaning “same.”

Level curves are used by meteorologists to indicate points at which barometric pressure is fixed (*isobars*), to illustrate places at which wind speed remains constant (*isolines*), and to show temperature bands (*isotherms*).

Figure 12

**EXAMPLE 5** Graphing Level Curves

Graph the level curves of the function  $z = f(x, y) = x^2 + 4y^2 + 1$  for  $c = 1, 2, 5$ , and 17.

**Solution** Here, we recognize the graph of  $f$  to be an elliptic paraboloid, as shown in Figure 12. Since  $z \geq 1$ , the level curves of  $f$  consist of the graphs of  $x^2 + 4y^2 = c - 1$ ,  $c \geq 1$ . Figure 13(a) shows the elliptic paraboloid and a level curve

$$x^2 + 4y^2 + 1 = c \quad c > 1$$

Figure 13(b) shows the elliptic paraboloid  $z = x^2 + 4y^2 + 1$  with several contour lines marked. The level curves for  $c = 1$  [the point  $(0, 0)$ ],  $c = 2$ ,  $c = 5$ , and  $c = 17$  are then graphed in Figure 13(c). Notice that the level curves are concentric ellipses. You should be able to see how the elliptic paraboloid evolves from the collection of its level curves.

DF Figure 13

**NOW WORK** Problem 39.**EXAMPLE 6** Graphing Level Curves

Graph the level curves of the function  $z = f(x, y) = e^{x^2+y^2}$  for  $c = 1, e, e^4$ , and  $e^{16}$ .

**Solution** Because  $x^2 + y^2 \geq 0$ , it follows that  $z \geq e^0 = 1$ . The level curves satisfy the equation  $e^{x^2+y^2} = c$  or  $x^2 + y^2 = \ln c$ , where  $c \geq 1$ . For  $c = 1$ , the level curve is the point  $(0, 0)$ . If  $c > 1$ , the level curves are concentric circles. Figure 14 illustrates several level curves of  $f$ . A graph of the surface  $z = e^{x^2+y^2}$  is given in Figure 15. Do you see how the graph evolved from the collection of its level curves?

Figure 14 Level curves of  $z = e^{x^2+y^2}$ .Figure 15 The surface  $z = e^{x^2+y^2}$ .**NOW WORK** Problem 43.

## 4 Describe Level Surfaces

The graph of a function  $w = f(x, y, z)$  of three variables consists of all points  $(x, y, z, w)$  for which  $w = f(x, y, z)$  and  $(x, y, z)$  is in the domain of  $f$ . We cannot draw the graph of a function of three variables because it requires four dimensions. But we can visualize the graph by examining its **level surfaces**, that is, the surfaces obtained by letting  $w$  equal a constant.

Figure 16 Level surfaces  $x^2 + y^2 + z^2 = c$ .

Figure 17

### EXAMPLE 7 Describing Level Surfaces

Describe the level surfaces of the function  $w = f(x, y, z) = x^2 + y^2 + z^2$ .

**Solution** Since  $w \geq 0$ , the level surfaces are the graphs of

$$x^2 + y^2 + z^2 = c \quad c \geq 0$$

These are concentric spheres if  $c > 0$  and the origin if  $c = 0$ . See Figure 16. ■

**NOW WORK** Problem 47.

### EXAMPLE 8 Describing Level Surfaces

Describe the level surfaces of the function  $w = f(x, y, z) = 2x + 3y + z$ .

**Solution** The level surfaces are the graphs of

$$2x + 3y + z = c$$

This is a collection of parallel planes, each plane having the vector  $\mathbf{N} = 2\mathbf{i} + 3\mathbf{j} + \mathbf{k}$  as normal. See Figure 17. ■

**NOW WORK** Problem 49.

## 12.1 Assess Your Understanding

### Concepts and Vocabulary

- For the function  $z = f(x, y) = \sqrt{16 - x^2 - y^2}$ ,  $f(2, 3) = \underline{\hspace{2cm}}$ .
- True or False** The domain of a function of two variables is a nonempty set of points  $(x, y)$  in the  $xy$ -plane.
- For a function  $w = f(x, y, z)$ , the independent variable(s) is(are)  $\underline{\hspace{2cm}}$  and the dependent variable(s) is(are)  $\underline{\hspace{2cm}}$ .
- True or False** A level curve of the graph of  $z = f(x, y)$  is the set of points in the  $xy$ -plane for which  $f(x, y) = c$ .

### Skill Building

In Problems 5–10, evaluate each function.

- $f(x, y) = 3x + 2y + xy$ 
  - $f(0, 1)$
  - $f(2, 1)$
  - $f(x + \Delta x, y)$
  - $f(x, y + \Delta y)$
- $f(x, y) = x^2y + x + 1$ 
  - $f(0, 1)$
  - $f(2, 1)$
  - $f(x + \Delta x, y)$
  - $f(x, y + \Delta y)$

7.  $f(x, y) = \sqrt{xy} + x$

- $f(0, 1)$
- $f(a^2, t^2); a > 0, t > 0$
- $f(x + \Delta x, y)$
- $f(x, y + \Delta y)$

8.  $f(x, y) = e^{x+y}$

- $f(1, -1)$
- $f(x + \Delta x, y)$
- $f(x, y + \Delta y)$

9.  $F(x, y, z) = \frac{3xy + z}{x^2 + y^2 + z^2}$

- $F(0, 0, 1)$
- $F(0, 1, 0)$
- $F(\sin t, \cos t, 0)$

10.  $F(x, y, z) = \frac{xyz}{x^2 + y^2 + z^2}$

- $F(1, -1, 1)$
- $F(a, a, a), a \neq 0$
- $F(\sin t, \cos t, a)$

11.  $f(x, y) = 3xy - x^2$ , where  $x = x(t) = \sqrt{t}$  and  $y = y(t) = t^2$ . Find:

- $f(x(0), y(0))$
- $f(x(1), y(1))$
- $f(x(4), y(4))$

12.  $f(x, y) = x^2 + xy + y^2$ , where  $x = x(t) = t$  and  $y = y(t) = t^2$ . Find:

- $f(x(0), y(0))$
- $f(x(1), y(1))$
- $f(x(2), y(2))$

In Problems 13–24, find the domain of each function and graph the domain. Use a solid curve to indicate that the domain includes the boundary and a dashed curve to indicate that the domain excludes the boundary.

13.  $f(x, y) = \frac{\sqrt{x}}{\sqrt{y}}$       14.  $f(x, y) = \sqrt{x}\sqrt{y}$   
 15.  $f(x, y) = \sqrt{xy}$       16.  $f(x, y) = \frac{xy}{x^2 + y^2}$   
 17.  $f(x, y) = e^x \sin y$       18.  $f(x, y) = \frac{\ln x}{\ln y}$   
 19.  $f(x, y) = \sqrt{\frac{x^2 + y^2}{x^2 - y^2}}$       20.  $f(x, y) = \sqrt{\frac{x^2 + y^2}{xy}}$   
 21.  $f(x, y) = \frac{5}{\sqrt{2y + x^2}}$       22.  $f(x, y) = \ln(x^2 - y^2)$   
 23.  $f(x, y) = \frac{y}{\sqrt{9 - x^2 - y^2}}$       24.  $f(x, y) = \tan^{-1}(x^2 + y^2)$

In Problems 25–28, find the domain of each function.

25.  $f(x, y, z) = \frac{x^2 + y^2}{z^2}$       26.  $f(x, y, z) = e^z \ln(x^2 + y^2)$   
 27.  $f(x, y, z) = \frac{z \sin x}{\cos y}$       28.  $f(x, y, z) = \frac{xyz}{\sqrt{x^2 + y^2 + z^2}}$

In Problems 29–38, graph each surface.

29.  $z = f(x, y) = 3 - x - y$       30.  $z = f(x, y) = 2 + x - y$   
 31.  $z = f(x, y) = x^2 + y^2$       32.  $z = f(x, y) = x^2 - y^2$   
 33.  $z = f(x, y) = \sqrt{4 - x^2 - y^2}$   
 34.  $z = f(x, y) = \sqrt{x^2 + y^2 - 4}$   
 35.  $z = f(x, y) = \sin y$       36.  $z = f(x, y) = \cos x$   
 37.  $z = f(x, y) = 4 - x^2 - y^2$   
 38.  $z = f(x, y) = x^2 + y^2 - 4$

In Problems 39–46, for each function

(a) Graph the level curves corresponding to the given values of  $c$ .

**CAS** (b) Use a CAS to graph the surface.

39.  $z = f(x, y) = x^2 - y^2$  at  $c = 0, 1, 4, 9$   
 40.  $z = f(x, y) = 2x^2 + y^2$  at  $c = 0, 1, 4, 9$   
 41.  $z = f(x, y) = \sqrt{9 - x^2 - y^2}$  at  $c = 0, 1, 3$   
 42.  $z = f(x, y) = \sqrt{x^2 + y^2 - 4}$  at  $c = 0, 1, 4, 9$   
 43.  $z = f(x, y) = x^2 - 2y$  at  $c = -4, -1, 0, 1, 4$   
 44.  $z = f(x, y) = y^2 - x$  at  $c = -4, -1, 0, 1, 4$   
 45.  $z = f(x, y) = x + \sin y$  at  $c = 0, 2, 4, 8$   
 46.  $z = f(x, y) = y - \ln x$  at  $c = 1, 2, 4$

In Problems 47–52:

(a) Describe in words the level surfaces of each function  $f$ .

**CAS** (b) Graph a level surface.

(c) Does the graph match your verbal description?

47.  $w = f(x, y, z) = x^2 + z^2$

48.  $w = f(x, y, z) = x^2 + y^2$

49.  $w = f(x, y, z) = z - 2x - 2y$

50.  $w = f(x, y, z) = x + y - z$

51.  $w = f(x, y, z) = 4 - x^2 - y^2$

52.  $w = f(x, y, z) = z$

### Applications and Extensions

In Problems 53–58, match each surface to its corresponding level curves shown in (A)–(F).

53.  $z = f(x, y) = 2x - y - 2$

54.  $z = f(x, y) = x + y - 3$

55.  $z = f(x, y) = 4x^2 + y^2$

56.  $z = f(x, y) = \sqrt{\frac{x^2}{4^2} + \frac{y^2}{4^2}}$

57.  $z = f(x, y) = \frac{x^2}{2^2} - \frac{y^2}{1^2}$

58.  $z = f(x, y) = \frac{xy(x^2 - y^2)}{x^2 + y^2}$

(A)

(B)

**59. Weather Maps** A contour map of the temperatures in °F of the western United States made on a given day in December 2011 is shown. The level curves are called **isotherms**.

- Estimate the temperature at the Four Corners, the point where Utah, Colorado, Arizona, and New Mexico meet.
- Describe the change in temperature as you move south from the Four Corners.
- Describe the direction you would travel if you were at the Four Corners and wanted to move as quickly as possible to the next warmer temperature zone. Comment on how your path intersects the isotherm.
- A weather front is moving in if the isotherms are close together. Do you think a front is approaching the Four Corners? From what direction? Explain.

**60. Climbing a Mountain**

A topographical map of Mount Washington in New Hampshire is shown. Suppose a climber is at the base of the mountain and wants to climb to the summit. If she can begin at point A, B, C, or D, and climb straight up the mountain,

- At which point should she start to climb so the distance climbed is a minimum?
- At which point is the climb initially the steepest?

- Suppose someone is on any level curve of the mountain. Describe how he would walk so that no change in altitude occurs.
- Comment on how the paths in (a)–(c) intersect the contour lines.

**61. Social Science** In psychology, the intelligence quotient (IQ)

is measured by  $IQ = f(M, C) = 100 \frac{M}{C}$ , where  $M$  is a person's mental age and  $C$  is the person's chronological or actual age,  $0 < C \leq 16$ .

- Find the IQ of a 12-year-old child whose mental age is 10.
- Find the IQ of a 10-year-old child whose mental age is 12.
- If a 10-year-old girl has an IQ of 139, what is her mental age? Round answers to the nearest integer.

**62. Mobile Data Cost** One version of the AT&T DataConnect Pass plan for tablets has a monthly cost (in dollars) of

$C(x, y, z) = 35.00 + 0.1x + 0.015y + 0.0195z$ , where  $x$  is the number of megabytes (mb) used domestically in excess of 200,  $y$  is the number of kilobytes (kb) of data sent to or received from Canada, and  $z$  is the number of kilobytes of data used outside the United States and Canada. Find the total monthly bill (in dollars) for 210 mb domestic, 250 kb Canadian, and 15 kb international usage.

(Source: AT&T Wireless.)

**63. Baseball** A pitcher's earned run average is calculated using the

function  $A(N, I) = 9 \left( \frac{N}{I} \right)$ , where  $N$  is the total number of earned runs given up in  $I$  innings pitched. Find:

- $A(3, 4)$
- $A(6, 3)$
- $A(2, 9)$
- $A(3, 18)$

**64. Field Goal Percentages in the NBA** In the National Basketball Association (NBA), the adjusted field goal percentage is modeled

by the function  $f(x, y, s) = \frac{x + 1.5y}{s}$ , where  $x$  is the number of two-point field goals made,  $y$  is the number of three-point field goals made, and  $s$  is the total of all field goals attempted.

- During the 2013 season, DeAndre Jordan of the Los Angeles Clippers led the league in field goal shooting. He made 234 out of 488 two-point attempts and no three-point attempts. Find his adjusted field goal percentage.
- During the 2013 season, Gordon Hayward of the Utah Jazz led the league in three-point shooting. He made 234 out of 527 two-point attempts and 234 out of 246 three-point attempts. Find his adjusted field goal percentage.

**65. Meteorology** The apparent temperature (in degrees Fahrenheit) is measured by the heat index  $H$  according to the formula

$$H = H(t, r) = -42.379 + 2.04901523t + 10.1333127r - 0.22475541tr - 0.00683783t^2 - 0.05481717r^2 + 0.00122874t^2r + 0.00085282t^2r^2 - 0.00000199t^2r^2$$

where  $H$  = the heat index,  $t$  = the air temperature, and  $r$  = the percent relative humidity (for example,  $r = 75$  when the relative humidity is 75%).

- What is the heat index when the air temperature is 95° and the relative humidity is 50%?

- (b) If the air temperature is  $97^\circ$ , what is the lowest relative humidity that will result in a heat index of  $105^\circ$ ?

**Source:** Weather Information Center; 4WX.com.

- 66. Economics** The production function for a toy manufacturer is given by the equation  $Q(L, M) = 400L^{0.3}M^{0.7}$ , where  $Q$  is the output in units,  $L$  is the labor in hours, and  $M$  is the number of machine hours. Find:

(a)  $Q(19, 21)$                       (b)  $Q(21, 20)$

- 67. Rectangular Box** Write the equation for the surface area  $S$  of an open box as a function of its length  $x$ , width  $y$ , and depth  $z$ .

- 68. Cost Function** The cost  $C$  of the bottom and top of a cylindrical tank is \$300 per square meter and the cost of the sides is \$500 per square meter. Find a function that models the total cost of constructing such a tank as a function of the radius  $R$  and height  $h$ , both in meters.

- 69. Cost Function** Find a function that models the total cost  $C$  of constructing an open rectangular box if the cost per square centimeter of the material to be used for the bottom is \$4, for two of the opposite sides is \$3, and for the remaining pair of opposite sides is \$2.

- 70. Cost Function** Repeat Problem 69 for a closed rectangular box that has a top made of material costing \$5 per square centimeter.

- 71. Electrical Potential** The formula

$$V(x, y) = \frac{9}{\sqrt{4 - (x^2 + y^2)}}$$

gives the electrical potential  $V$  (in volts) at a point  $(x, y)$  in the  $xy$ -plane. Draw the equipotential curves (level curves) for  $V = 18, 9$ , and  $6$  volts. Describe the surface  $z = V(x, y)$ .

- 72. Temperature** The temperature  $T$  in degrees Celsius at any point  $(x, y)$  of a flat plate in the  $xy$ -plane, is  $T = 60 - 2x^2 - 3y^2$ . Draw the isothermal curves (level curves) for  $T = 60^\circ\text{C}, 54^\circ\text{C}, 48^\circ\text{C}, 6^\circ\text{C}, 0^\circ\text{C}$ . Describe the surface  $z = T(x, y)$ .

- 73. Electric Field** The strength  $E$  of an electric field at a point  $(x, y, z)$  resulting from an infinitely long charged wire lying along the  $x$ -axis is

$$E(x, y, z) = \frac{3}{\sqrt{y^2 + z^2}}$$

Describe the level surfaces of  $E$ .

- 74. Gravitation** The magnitude  $F$  of the force of attraction between two objects, one located at the origin and the other at the point  $(x, y, z) \neq (0, 0, 0)$ , of masses  $m$  and  $M$  is given by

$$F = \frac{GmM}{x^2 + y^2 + z^2}$$

where  $G = 6.67 \times 10^{-11} \text{ N m}^2/\text{kg}^2$  is the gravitational constant. Describe the level surfaces of  $F$ .

- 75. Thermodynamics** The Ideal Gas Law,  $PV = nRT$ , is used to describe the relationship among the pressure  $P$ , volume  $V$ , and temperature  $T$  of an ideal gas, where  $n$  is the number of moles of gas and  $R$  is the universal gas constant. Describe the level curves for each of the following thermodynamic processes on an ideal gas:

- (a) An isothermal process, that is, a process in which the temperature  $T$  is held constant

- (b) An isobaric process, that is, a process in which the pressure  $P$  is held constant

- (c) An isochoric process, that is, a process in which the volume  $V$  is held constant

- 76. Electrostatics** The electrostatic potential  $V$  (in volts) from a point charge  $Q$  at the origin is given by

$$V = \frac{kQ}{\sqrt{x^2 + y^2 + z^2}}$$

where  $k$  is a constant.

- (a) Describe the level surfaces of  $V$ . In electronics these are called the equipotential surfaces.

- (b) What happens as the potential  $V$  gets close to 0?

- 77. Magnetism** The magnitude of the magnetic field  $B$  produced by a very long wire carrying a current  $I$  along the  $z$ -axis is given by

$$B = \frac{\mu_0 I}{2\pi\sqrt{x^2 + y^2}}, \text{ where } \mu_0 \text{ is a constant.}$$

- (a) Describe the level surfaces for  $B$ .

(Hint: Notice that the field is independent of  $z$ .)

- (b) What happens as the magnitude of  $B$  increases?

- 78. Orbit of a Satellite** The gravitational potential energy  $U$  of a

$$\text{satellite in orbit around Earth is } U = -\frac{GM_{\text{Earth}}m_{\text{satellite}}}{\sqrt{x^2 + y^2 + z^2}},$$

where the origin is placed at the center of Earth and  $G$  is the universal gravitation constant.

- (a) Describe the level surfaces for  $U$ .

- (b) What happens as the gravitational potential energy gets close to 0?

- CAS 79. (a)** Graph the surface  $z = f(x, y) = 5e^{-(x^2 + y^2)}$ .

- (b) Experiment by changing the perspectives and plotting options until a clear picture of the graph is obtained.

- (c) Change the style of the graph to show contour lines.

- (d) Plot the level curves  $f(x, y) = c$   $c = 1, 2, 3, 4$ .

- (e) Explain how the curves obtained in (d) relate to the graph from (a).

- 80. (a)** Find the curve of intersection of the surfaces

$$x^2 + y^2 + z^2 = 4 \text{ and } z = \frac{1}{3}(x^2 + y^2) \text{ above the } xy\text{-plane.}$$

- CAS (b)** Graph the surfaces from (a).

- (c) Does the graph support the result from (a)?

- 81. Level Curves** On the same set of axes, graph the level curves of  $f(x, y) = x^2 - y^2$  and  $g(x, y) = xy$ . Use  $c = \pm 1, \pm 2, \pm 3$  for both  $f$  and  $g$ .

- 82. Orthogonal Curves** Show that at each point  $P_0 \neq (0, 0)$ , the level curve of  $f(x, y) = x^2 - y^2$  through  $P_0$  is perpendicular to the level curve of  $g(x, y) = xy$  through  $P_0$ . The two families of level curves are said to be **orthogonal**.

### Challenge Problem

- 83.** Describe the set of points  $(x, y, z)$  satisfying the conditions  $x^2 + y^2 + z^2 < 1$  and  $x^2 + y^2 < z^2$ , where  $z > 0$ .

## 12.2 Limits and Continuity

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Define the limit of a function of several variables (p. 819)
- 2 Find a limit using properties of limits (p. 821)
- 3 Examine when limits exist (p. 822)
- 4 Determine whether a function is continuous (p. 824)

In Chapters 1 and 2, we saw the importance of the limit of a function of one variable in determining continuity and defining and finding the derivative. Limits of functions of several variables play a similar role.

### 1 Define the Limit of a Function of Several Variables

We begin by reviewing the definition of a limit (Chapter 1, pp. 76 and 132).

Let  $f$  be a function of one variable defined everywhere in an open interval containing  $c$ , except possibly at  $c$ . Then the **limit of  $f(x)$  as  $x$  approaches  $c$  is  $L$** , written

$$\lim_{x \rightarrow c} f(x) = L$$

if for any number  $\varepsilon > 0$ , there is a number  $\delta > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta \quad \text{then} \quad |f(x) - L| < \varepsilon$$

Figure 18

In this definition, the phrase “whenever  $0 < |x - c| < \delta$ ” means “for all  $x$ ,  $x \neq c$ , within a distance  $\delta$  of  $c$ ,” and “ $|f(x) - L| < \varepsilon$ ” means “the corresponding value of  $f$  is within a distance  $\varepsilon$  of  $L$ .” See Figure 18.

The definition of a limit for functions of two or more variables is similar, but requires additional terminology.

(a) Disk of radius  $\delta$  centered at  $P_0$ .

(b) Ball of radius  $\delta$  centered at  $P_0$ .

Figure 19

**NOTE** On a real line, a  $\delta$ -neighborhood of a number  $P_0$  is an open interval with  $P_0$  as midpoint.

#### DEFINITION $\delta$ -Neighborhood; Disk; Ball

Let  $P_0$  be a point in the plane or in space. A  $\delta$ -neighborhood of  $P_0$  consists of all the points  $P$  that lie within a distance  $\delta$  of  $P_0$ . That is, a  $\delta$ -neighborhood consists of all points  $P$  for which  $d(P, P_0) < \delta$ , where  $d(P, P_0)$  is the distance from  $P$  to  $P_0$ .

- In the plane, a  $\delta$ -neighborhood of  $P_0$  is called a **disk of radius  $\delta$  centered at  $P_0$** .
- In space, a  $\delta$ -neighborhood of  $P_0$  is called a **ball of radius  $\delta$  centered at  $P_0$** .

See Figure 19.

With these definitions, we are ready to define the limit of a function of several variables.

#### DEFINITION Limit of a Function of Two Variables

Let  $f$  be a function of two variables defined at each point in some disk centered at  $(x_0, y_0)$ , except possibly at  $(x_0, y_0)$ . Then the **limit of  $f(x, y)$  as  $(x, y)$  approaches  $(x_0, y_0)$  is  $L$**  if, for any given number  $\varepsilon > 0$ , there is a number  $\delta > 0$ , so that

$$\text{whenever } 0 < \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta \quad \text{then} \quad |f(x, y) - L| < \varepsilon$$

Then we say, “The limit exists”, and write

$$\lim_{(x, y) \rightarrow (x_0, y_0)} f(x, y) = L$$

Figure 20 illustrates the definition.

**DF Figure 20**  $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = L$  means that for any  $\varepsilon > 0$ , there is a  $\delta > 0$ , so that whenever  $(x,y) \neq (x_0,y_0)$  is within  $\delta$  of  $(x_0,y_0)$ , then  $z = f(x,y)$  is within  $\varepsilon$  of  $L$ .

### DEFINITION Limit of a Function of Three Variables

Let  $f$  be a function of three variables defined at each point in some ball centered at  $(x_0, y_0, z_0)$ , except possibly at  $(x_0, y_0, z_0)$ . Then the **limit of  $f(x, y, z)$  as  $(x, y, z)$  approaches  $(x_0, y_0, z_0)$  is  $L$**  if, for any given number  $\varepsilon > 0$ , there is a number  $\delta > 0$ , so that

$$\text{whenever } 0 < \sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2} < \delta \quad \text{then } |f(x, y, z) - L| < \varepsilon$$

Then we say, “The limit exists”, and write

$$\lim_{(x,y,z) \rightarrow (x_0,y_0,z_0)} f(x,y,z) = L$$

The definition states that if you decide how close you want  $f$  to be to  $L$ , that is, if you choose  $\varepsilon$ , you can find a number  $\delta$  so that whenever the point  $(x, y, z)$  is within a distance  $\delta$  of  $(x_0, y_0, z_0)$ , then  $f$  is within a distance  $\varepsilon$  of  $L$ . See Figure 21.

**DF Figure 21**  $\lim_{(x,y,z) \rightarrow (x_0,y_0,z_0)} f(x,y,z) = L$  means that for any  $\varepsilon > 0$ , there is a  $\delta > 0$ , so that whenever  $(x, y, z) \neq (x_0, y_0, z_0)$  is within  $\delta$  of  $(x_0, y_0, z_0)$ , then  $w = f(x, y, z)$  is within  $\varepsilon$  of  $L$ .

Notice the similarity of the definitions for the limit of a function of one variable, two variables, and three variables. In fact, limits of functions of more than three variables are defined similarly, as follows. Suppose  $f(P)$  is a function of one or more variables defined at each point  $P$  in some neighborhood of  $P_0$ , except possibly at  $P_0$ . Then

$$\lim_{P \rightarrow P_0} f(P) = L$$

if, for any given number  $\varepsilon > 0$ , there is a number  $\delta > 0$ , so that

$$\text{whenever } 0 < d(P, P_0) < \delta \quad \text{then} \quad |f(P) - L| < \varepsilon$$

## 2 Find a Limit Using Properties of Limits

The algebra of limits for functions of one variable extends to that for functions of several variables. We state the algebraic properties of limits of functions of two variables without proof. These properties are also true for functions of three or more variables.

### THEOREM Algebraic Properties of Limits (Two Variables)

Let  $f$  and  $g$  be functions of two variables for which

$$\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = L \quad \text{and} \quad \lim_{(x,y) \rightarrow (x_0,y_0)} g(x,y) = M$$

where  $L$  and  $M$  are two real numbers.

- **Limit of a sum:**

$$\begin{aligned} \lim_{(x,y) \rightarrow (x_0,y_0)} [f(x,y) + g(x,y)] &= \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) + \lim_{(x,y) \rightarrow (x_0,y_0)} g(x,y) \\ &= L + M \end{aligned}$$

- **Limit of a difference:**

$$\begin{aligned} \lim_{(x,y) \rightarrow (x_0,y_0)} [f(x,y) - g(x,y)] &= \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) - \lim_{(x,y) \rightarrow (x_0,y_0)} g(x,y) \\ &= L - M \end{aligned}$$

- **Limit of a constant times a function:** If  $k$  is any real number, then

$$\lim_{(x,y) \rightarrow (x_0,y_0)} [k f(x,y)] = k \left[ \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) \right] = kL$$

- **Limit of a product:**

$$\begin{aligned} \lim_{(x,y) \rightarrow (x_0,y_0)} [f(x,y)g(x,y)] &= \left[ \lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) \right] \left[ \lim_{(x,y) \rightarrow (x_0,y_0)} g(x,y) \right] \\ &= LM \end{aligned}$$

- **Limit of a quotient:** If  $\lim_{(x,y) \rightarrow (x_0,y_0)} g(x,y) = M \neq 0$ ,

$$\lim_{(x,y) \rightarrow (x_0,y_0)} \frac{f(x,y)}{g(x,y)} = \frac{\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y)}{\lim_{(x,y) \rightarrow (x_0,y_0)} g(x,y)} = \frac{L}{M}$$

- **Limit of a constant:** If  $c$  is a constant,

$$\lim_{(x,y) \rightarrow (x_0,y_0)} c = c$$

- **Limit of a function of a single variable:** If  $f(x,y) = h(x)$ , then

$$\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = \lim_{x \rightarrow x_0} h(x)$$

If  $f(x,y) = g(y)$ , then

$$\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) = \lim_{y \rightarrow y_0} g(y)$$

**EXAMPLE 1** Using Properties of Limits to Find a Limit

Find each limit:

(a)  $\lim_{(x,y) \rightarrow (1,2)} (3x^2 + 2xy + y^2)$

(b)  $\lim_{(x,y) \rightarrow (1,2)} \frac{xy}{x^2 + y^2}$

(c)  $\lim_{(x,y) \rightarrow (3,-1)} \frac{x^2 + 2xy - 3y^2}{x^2 + 9y^2}$

**Solution (a)**

$$\begin{aligned}
 \lim_{(x,y) \rightarrow (1,2)} (3x^2 + 2xy + y^2) &= \lim_{(x,y) \rightarrow (1,2)} (3x^2) + \lim_{(x,y) \rightarrow (1,2)} (2xy) + \lim_{(x,y) \rightarrow (1,2)} y^2 \\
 &= 3 \lim_{x \rightarrow 1} x^2 + \left( \lim_{(x,y) \rightarrow (1,2)} (2x) \right) \left( \lim_{(x,y) \rightarrow (1,2)} y \right) + \lim_{y \rightarrow 2} y^2 \\
 &= 3 + 2 \left( \lim_{x \rightarrow 1} x \right) \left( \lim_{y \rightarrow 2} y \right) + 4 = 3 + 2 \cdot 1 \cdot 2 + 4 = 11
 \end{aligned}$$

(b) Since  $\lim_{(x,y) \rightarrow (1,2)} (x^2 + y^2) = \lim_{x \rightarrow 1} x^2 + \lim_{y \rightarrow 2} y^2 = 5 \neq 0$ , we use the limit of a quotient:

$$\lim_{(x,y) \rightarrow (1,2)} \frac{xy}{x^2 + y^2} = \frac{\lim_{(x,y) \rightarrow (1,2)} (xy)}{\lim_{(x,y) \rightarrow (1,2)} (x^2 + y^2)} = \frac{\left( \lim_{x \rightarrow 1} x \right) \left( \lim_{y \rightarrow 2} y \right)}{\lim_{x \rightarrow 1} x^2 + \lim_{y \rightarrow 2} y^2} = \frac{1 \cdot 2}{1 + 4} = \frac{2}{5}$$

(c) Look at the denominator. Since  $\lim_{(x,y) \rightarrow (3,-1)} (x^2 + 9y^2) = 18$ , we can use the limit of a quotient property. Then

$$\begin{aligned}
 \lim_{(x,y) \rightarrow (3,-1)} \frac{x^2 + 2xy - 3y^2}{x^2 + 9y^2} &= \frac{\lim_{(x,y) \rightarrow (3,-1)} (x^2 + 2xy - 3y^2)}{\lim_{(x,y) \rightarrow (3,-1)} (x^2 + 9y^2)} \\
 &= \frac{\lim_{x \rightarrow 3} x^2 + 2 \left( \lim_{x \rightarrow 3} x \right) \left( \lim_{y \rightarrow -1} y \right) - 3 \lim_{y \rightarrow -1} y^2}{18} \\
 &= \frac{9 + 2(3)(-1) - 3(1)}{18} = 0
 \end{aligned}$$

**NOW WORK** Problems 9 and 21.(a) Two ways to approach  $x_0$ (b) Infinitely many ways to approach  $P_0$ **Figure 22****3 Examine When Limits Exist**

The limit of a function  $f$  of single variable exists only if the left-hand limit equals the right-hand limit. That is,  $\lim_{x \rightarrow c} f(x)$  exists if the limit is the same no matter how the number  $c$  is approached. For a single variable, there are only two ways to approach  $c$ : from the left or from the right. See Figure 22(a). When  $z = f(x, y)$  is a function of two variables, however, there are infinitely many ways to approach a point  $P_0$ , namely along any curve that passes through  $P_0$ . See Figure 22(b). So, for  $\lim_{(x,y) \rightarrow (x_0, y_0)} f(x, y)$  to exist, it is necessary that the same limit be obtained no matter what curve  $C$  containing  $P_0$  is used. Put another way, if two different curves that contain  $(x_0, y_0)$  result in different limits, then  $\lim_{(x,y) \rightarrow (x_0, y_0)} f(x, y)$  does not exist.

**THEOREM**

If  $\lim_{P \rightarrow P_0} f(P)$  is computed along two different curves containing  $P_0$  and if two different answers are obtained, then  $\lim_{P \rightarrow P_0} f(P)$  does not exist.

**EXAMPLE 2** Showing That a Limit Does Not Exist

Show that  $\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2 + y^2}$  does not exist.

**Solution** Look at the denominator. Since  $\lim_{(x,y) \rightarrow (0,0)} (x^2 + y^2) = 0$ , we cannot use the limit of a quotient to investigate the limit. We investigate the limit using two curves that contain  $(0, 0)$ , say,  $y = 2x$  and  $y = -x$ .

First we investigate the limit using the line  $y = 2x$ . Then

$$\text{Using } y = 2x: \quad \lim_{(x,y) \rightarrow (0,0)} \frac{x(2x)}{x^2 + (2x)^2} = \lim_{x \rightarrow 0} \frac{2x^2}{x^2 + 4x^2} = \lim_{x \rightarrow 0} \frac{2x^2}{5x^2} = \frac{2}{5}$$

Now we investigate the limit using the line  $y = -x$ .

$$\text{Using } y = -x: \quad \lim_{(x,y) \rightarrow (0,0)} \frac{x(-x)}{x^2 + (-x)^2} = \lim_{x \rightarrow 0} \frac{-x^2}{x^2 + x^2} = \lim_{x \rightarrow 0} \frac{-x^2}{2x^2} = -\frac{1}{2}$$

Since two different answers are obtained, the limit does not exist. ■

Figure 23 shows the graph of  $f(x, y) = \frac{xy}{x^2 + y^2}$ .

**DF** Figure 23  $f(x, y) = \frac{xy}{x^2 + y^2}$

**CAUTION** Even if the same limit is obtained along two curves that contain  $P_0$  (or three, or even several hundred curves), we cannot conclude that the limit of the function exists. For instance, in Example 2, using the curves  $y = 2x$  and  $y = \frac{1}{2}x$  would both result in the same value for the limit, but we have shown the limit does not exist.

**EXAMPLE 3** Showing That a Limit Does Not Exist

Show that  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2}$  does not exist.

**Solution** We investigate the limit using curves that contain  $(0, 0)$ . Based on our experience with the function in Example 2, we can simultaneously test all nonvertical lines that contain  $(0, 0)$  by using  $y = mx$ . Then

$$\text{Using } y = mx: \quad \lim_{(x,y) \rightarrow (0,0)} \frac{x^2(mx)}{x^4 + (mx)^2} = \lim_{x \rightarrow 0} \frac{mx^3}{x^4 + m^2x^2} = \lim_{x \rightarrow 0} \frac{mx}{x^2 + m^2} = 0$$

Along every nonvertical line containing the point  $(0, 0)$ , the limit is 0. But this does not

mean that  $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^4 + y^2}$  is 0. Suppose we use the curve  $y = x^2$ . Then

$$\text{Using } y = x^2: \quad \lim_{(x,y) \rightarrow (0,0)} \frac{x^4}{x^4 + x^4} = \lim_{x \rightarrow 0} \frac{x^4}{2x^4} = \frac{1}{2}$$

Since two different curves that contain  $(0, 0)$  result in different values for the limit, the limit does not exist. ■

The graph of  $f(x, y) = \frac{x^2 y}{x^4 + y^2}$  is shown in Figure 24.

In Example 3, the limit failed to exist even though along all nonvertical lines the limit equals 0. We will see that this kind of behavior makes multivariable calculus different from single-variable calculus.

**Figure 24**  $f(x, y) = \frac{x^2 y}{x^4 + y^2}$

**NOW WORK** Problem 33.

How do we know a limit exists? The next example shows how to use the  $\epsilon$ - $\delta$  definition of a limit to prove that a limit exists.

**EXAMPLE 4** Showing That a Limit Exists

Use the  $\varepsilon$ - $\delta$  definition of a limit to show that  $\lim_{(x,y) \rightarrow (0,0)} \frac{2xy^2}{x^2 + y^2} = 0$ .

**Solution** Given a number  $\varepsilon > 0$ , we seek a number  $\delta > 0$ , so that

$$\text{whenever } 0 < \sqrt{(x-0)^2 + (y-0)^2} < \delta \quad \text{then} \quad \left| \frac{2xy^2}{x^2 + y^2} - 0 \right| < \varepsilon$$

That is,

$$\text{whenever } 0 < \sqrt{x^2 + y^2} < \delta \quad \text{then} \quad \left| \frac{2xy^2}{x^2 + y^2} \right| < \varepsilon$$

We need to find a connection between  $\frac{2xy^2}{x^2 + y^2}$  and  $\sqrt{x^2 + y^2}$ . We begin with the observation that since  $x^2 \geq 0$ ,

$$y^2 \leq x^2 + y^2$$

So, for all points  $(x, y)$  not equal to  $(0, 0)$ , we have

$$\frac{y^2}{x^2 + y^2} \leq 1 \quad \text{Divide both sides by } x^2 + y^2.$$

Now

$$\left| \frac{2xy^2}{x^2 + y^2} \right| = \frac{2|x|y^2}{x^2 + y^2} = 2|x| \cdot \frac{y^2}{x^2 + y^2} \leq 2|x| \cdot 1 = 2\sqrt{x^2} \leq 2\sqrt{x^2 + y^2}$$

Given  $\varepsilon > 0$ , we choose  $\delta \leq \frac{\varepsilon}{2}$ . Then whenever  $0 < \sqrt{x^2 + y^2} < \delta$ , we have

$$\left| \frac{2xy^2}{x^2 + y^2} \right| \leq 2\sqrt{x^2 + y^2} < 2\delta \leq \varepsilon$$

That is,

$$\lim_{(x,y) \rightarrow (0,0)} \left| \frac{2xy^2}{x^2 + y^2} \right| = 0$$

**Figure 25**  $f(x, y) = \frac{2xy^2}{x^2 + y^2}$

Figure 25 shows the graph of  $f(x, y) = \frac{2xy^2}{x^2 + y^2}$ .

**NOW WORK** Problem 63.

As Example 4 illustrates, showing a limit exists using the  $\varepsilon$ - $\delta$  definition can be challenging. For most of our work, we will not be required to show that limits exist in this way. We will instead find limits using various properties of functions, such as continuity.

**4 Determine Whether a Function Is Continuous**

When investigating continuity for a function of one variable in Chapter 1, we began by defining what it means for a function  $f$  to be continuous at a number  $c$ , where  $f$  is defined on an open interval containing  $c$ . Then we extended the definition to include continuity on intervals: open, closed, or neither, and finally continuity on the domain of  $f$ .

For functions of two or three variables, we begin by defining continuity at a point in the plane or in space. But first, we need some preliminary definitions.

**NEED TO REVIEW?** Continuity for functions of one variable is discussed in Section 1.3, pp. 93–100.

**DEFINITION Interior Point; Boundary Point; Open Set; Closed Set**

Let  $S$  be a set of points in the plane or in space.

- A point  $P_0$  is called an **interior point** of  $S$  if there is a  $\delta$ -neighborhood of  $P_0$  that lies entirely in  $S$ .
- A point  $P_0$  is called a **boundary point** of  $S$  if every  $\delta$ -neighborhood of  $P_0$  contains points both in  $S$  and not in  $S$ . A boundary point of  $S$  may be in  $S$  or not in  $S$ .
- A set  $S$  is called an **open set** if every point of  $S$  is an interior point.
- A set  $S$  is called a **closed set** if it contains all its boundary points.
- A set  $S$  that contains some, but not all, of its boundary points is neither open nor closed.

Figure 26(a) shows an interior point  $P_0$  in the set  $S$ . In Figure 26(b), the point  $P_0$  is a boundary point of  $S$ . Figure 27 shows an open set (a), a closed set (b), and a set that is neither open nor closed (c).

Figure 26

Figure 27

**NOTE** You may find it helpful to compare the definition given here with the one on p. 93 in Chapter 1.

**DEFINITION Continuity at a Point  $P_0$** 

Let  $f$  be a function whose domain  $D$  is some subset of points in the plane, and let  $P_0$  be an interior point of  $D$ . Then  $f$  is **continuous** at  $P_0$  if the following two conditions are met:

- $\lim_{P \rightarrow P_0} f(P)$  exists
- $\lim_{P \rightarrow P_0} f(P) = f(P_0)$

If either one of the two conditions is not met, then we say that  $f$  is **discontinuous** at the point  $P_0$ .

If  $P_0$  is a boundary point of the domain  $D$  of  $f$ , then  $f$  is continuous at  $P_0$ , provided  $\lim_{P \rightarrow P_0} f(P) = f(P_0)$  is taken to mean that given any  $\varepsilon > 0$ , there is a  $\delta > 0$ , so that whenever  $P$  is in the domain of  $f$  and  $d(P, P_0) < \delta$ , then  $|f(P) - f(P_0)| < \varepsilon$ .

### DEFINITION Continuity on a Domain

A function  $f$  is **continuous on its domain** if it is continuous at every point in its domain. Such functions are referred to as **continuous functions**.

We use limit properties and information about continuous functions of one variable to obtain information about functions of two variables. For example, two important properties of continuous functions (of one or more variables) are:

- The sum, difference, product, or composition of two continuous functions is continuous.
- The quotient of two functions that are continuous at a point  $P_0$  is also continuous at  $P_0$ , provided the denominator is not 0 at  $P_0$ .

Let's see how we use these properties. The function  $f(x, y) = ax^n y^m$ , where  $n$  and  $m$  are nonnegative integers and  $a$  is a constant, is continuous at every point  $(x, y)$  in the plane. This follows since

$$\begin{aligned}\lim_{(x,y) \rightarrow (x_0,y_0)} f(x,y) &= \lim_{(x,y) \rightarrow (x_0,y_0)} (ax^n y^m) = \left[ \lim_{(x,y) \rightarrow (x_0,y_0)} (ax^n) \right] \left[ \lim_{(x,y) \rightarrow (x_0,y_0)} y^m \right] \\ &= a \left[ \lim_{x \rightarrow x_0} x^n \right] \left[ \lim_{y \rightarrow y_0} y^m \right] = ax_0^n y_0^m\end{aligned}$$

(a)  $f(x, y) = 3xy^2 - 5xy + 4x^3y$

(b)  $R(x, y) = \frac{x^2y - 2xy}{xy - 1}$

Figure 28

Because a polynomial in two variables is a sum of functions of the form  $ax^n y^m$ , where  $n$  and  $m$  are nonnegative integers and  $a$  is a constant, it follows that polynomials in two variables are continuous at every point  $(x, y)$  in the plane. Further, rational functions, quotients of polynomials, are continuous on their domains, all points in the plane except those at which the denominator is 0.

### EXAMPLE 5 Determining Where a Function Is Continuous

Determine where the following functions are continuous:

(a)  $f(x, y) = 3xy^2 - 5xy + 4x^3y$       (b)  $R(x, y) = \frac{x^2y - 2xy}{xy - 1}$

**Solution** (a) Since  $f$  is a polynomial function, it is continuous on its domain, every point  $(x, y)$  in the plane, as shown in Figure 28(a).

(b)  $R$  is a rational function and is continuous on its domain, all points  $(x, y)$  in the plane, except those for which  $xy = 1$ . The graph of  $R$  will have no points on the cylinder  $xy = 1$ , as shown in Figure 28(b). ■

### NOW WORK Problems 37 and 39.

Another property of a continuous function is:

- The composite of a continuous function of one variable  $z = f(t)$  and a continuous function of two variables  $t = g(x, y)$  is continuous on its domain.

**EXAMPLE 6** Determining Where a Function Is Continuous

- (a) The function  $z = e^t$  is continuous for all  $t$ , and the function  $t = x^2 + y^2$  is continuous on its domain (all points in the plane), so the composite  $z = e^{x^2+y^2}$  is continuous on its domain (all points in the plane), as shown in Figure 29(a).
- (b) The sine function  $z = \sin t$  is continuous for all  $t$ , and the function  $t = e^{x^2+y^2}$  is continuous for all points  $(x, y)$  in the plane, so the composite  $z = \sin e^{x^2+y^2}$  is continuous for all points  $(x, y)$  in the plane, as shown in Figure 29(b).
- (c) The function  $z = \ln t$  is continuous for all  $t > 0$ , and the function  $t = \frac{y}{x}$  is continuous for all  $x \neq 0$ . The composite function  $z = \ln \frac{y}{x}$  is continuous for all  $(x, y)$  for which  $x > 0, y > 0$  or  $x < 0, y < 0$ . The graph of  $z$  has no points for which  $x \geq 0, y \leq 0$  or  $x \leq 0, y \geq 0$ , as shown in Figure 29(c).

**Figure 29****NOW WORK** Problem 43.

Finding limits of continuous functions can be done by substitution:

- If  $z = f(x, y)$  is continuous at the point  $(x_0, y_0)$ , then

$$\lim_{(x,y) \rightarrow (x_0,y_0)} f(x, y) = f(x_0, y_0)$$

**EXAMPLE 7** Finding Limits

- (a)  $\lim_{(x,y) \rightarrow (0,0)} e^{x^2+y^2} = e^{0+0} = 1$   
↑  
Example 6(a)
- (b)  $\lim_{(x,y) \rightarrow (\sqrt{\pi}, 0)} \sin e^{x^2+y^2} = \sin e^\pi$   
↑  
Example 6(b)
- (c)  $\lim_{(x,y) \rightarrow (e, 1)} \ln \frac{y}{x} = \ln \frac{1}{e} = \ln e^{-1} = -1$   
↑  
Example 6(c)

**NOW WORK** Problem 53.

## 12.2 Assess Your Understanding

## Concepts and Vocabulary

- Multiple Choice** The set of all points  $P$  for which the distance  $d(P, P_0) < \delta$  is called [(a) a  $\delta$  position, (b) an  $\varepsilon$ -value, (c) a  $\delta$ -neighborhood] of  $P_0$ .
- $\lim_{(x,y) \rightarrow (1,8)} (2y) = \underline{\hspace{2cm}}$ .
- True or False** One way to show that  $\lim_{(x,y) \rightarrow (0,0)} f(x) = L$  is to find two lines  $y = m_1x$  and  $y = m_2x$  for which  $\lim_{(x,y) \rightarrow (0,0)} f(x) = L$ .
- True or False** In order for the limit of a function  $f$  to exist at a point  $P_0$ , the limit of  $f$  must be the same along every curve in the domain of  $f$  that contains  $P_0$ .
- Multiple Choice** A point  $P_0$  is [(a) an interior, (b) an exterior, (c) a boundary, (d) an isolated] point of  $S$  if every  $\delta$ -neighborhood of  $P_0$  contains points both in  $S$  and not in  $S$ .
- Multiple Choice** If every point of  $S$  is an interior point, then  $S$  is [(a) an open, (b) a closed, (c) an interior] set.
- True or False** If two functions  $f$  and  $g$  are both continuous at the point  $P_0$ , then the quotient  $\frac{g}{f}$  is also continuous at  $P_0$ .
- $\lim_{(x,y) \rightarrow (0,0)} e^{x^2+y^2} = \underline{\hspace{2cm}}$ .

## Skill Building

In Problems 9–24, use algebraic properties of limits of two variables (p. 821) to find each limit.

- $\lim_{(x,y) \rightarrow (1,2)} (x^2 + xy - y^2 + 8)$
- $\lim_{(x,y) \rightarrow (-1,3)} (x^2y + y^2 - 3xy - 2)$
- $\lim_{(x,y,z) \rightarrow (1,-1,2)} (3x^2y + y^2z)$
- $\lim_{(x,y,z) \rightarrow (0,1,-1)} (x^2 - y^2z^2)$
- $\lim_{(x,y) \rightarrow (\pi/2, \pi)} (\sin x \cos y)$
- $\lim_{(x,y) \rightarrow (2,e)} (x^2y \ln y)$
- $\lim_{(x,y) \rightarrow (1,5)} \frac{4x - xy + 4}{4y - y^2}$
- $\lim_{(x,y) \rightarrow (2,2)} \frac{x^2 + 2xy + y^2 - 9}{x + y - 3}$
- $\lim_{(x,y) \rightarrow (\pi, 0)} \frac{\cos x \cos y}{x}$
- $\lim_{(x,y) \rightarrow (\pi, \pi)} \frac{\cos y(1 - \cos x)}{xy}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{e^x - 4}{e^y}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{e^x \cos y - \cos y}{e^y}$
- $\lim_{(x,y) \rightarrow (2,1)} \frac{x^2 + xy - 6y^2}{x^2 + 4y^2}$
- $\lim_{(x,y) \rightarrow (0,-2)} \frac{y^2 + xy + 4y + e^x}{xy - y + 2x - e^x}$
- $\lim_{(x,y) \rightarrow (2,0)} \frac{x^2y + x}{x^3y + 3xy^2 - 8}$
- $\lim_{(x,y) \rightarrow (0,1)} \frac{x^3 - 4x^2y + 2}{xy + 4}$

In Problems 25–32, find each limit by approaching  $(0, 0)$  along:

- The  $x$ -axis.
- The  $y$ -axis.
- The line  $y = x$ .
- The line  $y = 3x$ .
- The parabola  $y = x^2$ .

Can you conclude anything?

- $\lim_{(x,y) \rightarrow (0,0)} \frac{3xy}{2x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{2xy}{x^2 + 3y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{xy^2}{x^2 + y^3}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{3x^2y^2}{x^4 + y^4}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 + xy}{x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{2x^2y}{3x^3 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{2x^2y}{3x^3 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2}{x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{(x - y)^2}{x^2 + y^2}$

In Problems 33–36, show that the limit does not exist.

- $\lim_{(x,y) \rightarrow (0,0)} \frac{2x^2 + y^2}{x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{2xy}{x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{x^4 - y^2}{x^2 + y^2}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 + y^4}{x^2 + y^2}$

In Problems 37–48, determine where each function is continuous.

- $f(x, y) = 3x^2y - 4x^2y^2 + 10xy^2 - 9$
- $f(x, y) = x^3 + 2x^2y + xy^2 - 4y^3$
- $f(x, y) = \frac{x^2 - y^2}{x - y}$
- $f(x, y) = \frac{2x^2y + xy^2}{1 - xy}$
- $f(x, y) = e^{x^2 - y^2}$
- $f(x, y) = \ln(x^2 + y^2)$
- $f(x, y) = \sin(x^2 - y)$
- $f(x, y) = \cos \sqrt{x^2 - y}$
- $f(x, y) = \sin(x + y) \cos(x - y)$
- $f(x, y) = e^x \sin(xy)$
- $f(x, y) = \frac{x + 3xy^2}{e^{x^2 - y^2}}$
- $f(x, y) = \frac{x + 3xy^2}{\ln(x^2 + y^2)}$

In Problems 49–58, find each limit.

- $\lim_{(x,y) \rightarrow (1,0)} \frac{x^2 - y^2}{x - y}$
- $\lim_{(x,y) \rightarrow (0,0)} \frac{2x^2y + xy^2}{1 - xy}$
- $\lim_{(x,y) \rightarrow (1,1)} e^{x^2 - y^2}$
- $\lim_{(x,y) \rightarrow (0,e)} \ln(x^2 + y^2)$
- $\lim_{(x,y) \rightarrow (\pi/2, \pi)} [\sin(x + y) \cos(x - y)]$
- $\lim_{(x,y) \rightarrow (0, \pi/2)} e^x \sin(xy)$
- $\lim_{(x,y) \rightarrow (\pi, 0)} \frac{e^{x^2 + y^2} \cos x^2}{\cos y^2}$

$$56. \lim_{(x,y) \rightarrow (\pi/2, 4)} \frac{e^{x^2 y}}{\cos(2x)}$$

$$57. \lim_{(x,y) \rightarrow (0,0)} \tan^{-1} \left( \frac{e^{x+y}}{y^2 + 1} \right)$$

$$67. f(x, y) = \frac{2x^2 + y^2}{x^2 + y^2}$$

$$68. f(x, y) = \frac{x^4 - y^2}{x^2 + y^2}$$

$$58. \lim_{(x,y) \rightarrow (\pi, 0)} \tan^{-1}[\cos(x + y)]$$

$$69. f(x, y) = \begin{cases} \frac{3xy}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$$

$$70. f(x, y) = \begin{cases} \frac{\sin(xy)}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 1 & \text{if } (x, y) = (0, 0) \end{cases}$$

$$71. f(x, y) = \begin{cases} \frac{\sin(x^2 + y^2)}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 1 & \text{if } (x, y) = (0, 0) \end{cases}$$

$$72. f(x, y) = \begin{cases} \frac{\sin(x^2 - y^2)}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 1 & \text{if } (x, y) = (0, 0) \end{cases}$$

### Applications and Extensions

In Problems 59–62, find  $\lim_{(x,y,z) \rightarrow (0,0,0)} \frac{2yz}{x^4 + y^2 + z^2}$  along the indicated curves.

$$59. \text{ the line } x = t, y = t, z = t$$

$$60. \text{ the line } x = 2t, y = 3t, z = 4t$$

$$61. \text{ the curve } x = t, y = t^2, z = t^2$$

$$62. \text{ the line } x = at, y = bt, z = ct, \quad a^2 + b^2 + c^2 > 0$$

In Problems 63 and 64, use the  $\varepsilon$ - $\delta$  definition of a limit to prove each limit statement.

$$63. \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^2 + y^2} = 0$$

$$64. \lim_{(x,y) \rightarrow (0,0)} \frac{\sin(x^2 + y^2)}{x^2 + y^2} = 1$$

In Problems 65–72,

(a) Determine whether each function  $f$  is continuous at  $(0, 0)$ .

(b) If  $f$  is discontinuous at  $(0, 0)$ , is it possible to define  $f(0, 0)$  so that  $f$  would be continuous at  $(0, 0)$ ?

(c) If the answer to (b) is yes, how should  $f(0, 0)$  be defined?

$$65. f(x, y) = \frac{xy^2}{x^2 + y^2}$$

$$66. f(x, y) = \frac{x^2 y}{x^2 + y^2}$$

### Challenge Problems

In Problems 73–76, find each limit by converting to polar coordinates.

$$73. \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y}{x^2 + y^2}$$

$$74. \lim_{(x,y) \rightarrow (0,0)} \frac{xy^2}{x^2 + y^2}$$

$$75. \lim_{(x,y) \rightarrow (0,0)} \frac{\cos(x^2 + y^2)}{x^2 + y^2}$$

$$76. \lim_{(x,y) \rightarrow (0,0)} \frac{\sin(x^2 + y^2)}{x^2 + y^2}$$

$$77. \text{ Find } \lim_{(x,y) \rightarrow (0,0)} f(x, y), \text{ if } f(x, y) = \frac{x^3 - 4x^2 y + 4xy^2 + 5x - 10y}{x - 2y}.$$

## 12.3 Partial Derivatives

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the partial derivatives of a function of two variables (p. 829)
- 2 Interpret partial derivatives as the slope of a tangent line (p. 831)
- 3 Interpret partial derivatives as a rate of change (p. 832)
- 4 Find second-order partial derivatives (p. 834)
- 5 Find the partial derivatives of a function of  $n$  variables (p. 836)

### 1 Find the Partial Derivatives of a Function of Two Variables

Suppose  $z = f(x, y)$  is a function of two variables  $x$  and  $y$ . If  $y_0$  is a constant, then the function  $z = f(x, y) = f(x, y_0)$  is a function of the single variable  $x$ . If  $z = f(x, y_0)$  is differentiable at  $x = x_0$ , then the derivative of the function  $f(x, y_0)$  at  $x_0$  is called the *partial derivative of  $f$  with respect to  $x$  at  $(x_0, y_0)$*  and is denoted by  $f_x(x_0, y_0)$ .

Similarly, if  $x_0$  is a constant, then  $z = f(x_0, y)$  is a function of the single variable  $y$ . If  $z = f(x_0, y)$  is differentiable at  $y = y_0$ , then its derivative is called the *partial derivative of  $f$  with respect to  $y$  at  $(x_0, y_0)$*  and is denoted by  $f_y(x_0, y_0)$ .

**DEFINITION Partial Derivatives**

Let  $z = f(x, y)$  be a function of two variables, and let  $(x, y)$  be any interior point\* of the domain of  $f$ . The **first-order partial derivative of  $f$  with respect to  $x$**  and the **first-order partial derivative of  $f$  with respect to  $y$**  are functions  $f_x$  and  $f_y$  defined by

$$\begin{aligned} f_x(x, y) &= \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x, y) - f(x, y)}{\Delta x} \\ f_y(x, y) &= \lim_{\Delta y \rightarrow 0} \frac{f(x, y + \Delta y) - f(x, y)}{\Delta y} \end{aligned}$$

provided these limits exist.

**NEED TO REVIEW?** The definition of the derivative is discussed in Section 2.2, p. 154.

**IN WORDS** We find the partial derivative of  $f$  with respect to  $x$  by differentiating  $f$  with respect to  $x$  while treating  $y$  as if it were a constant.

We find the partial derivative of  $f$  with respect to  $y$  by differentiating  $f$  with respect to  $y$  while treating  $x$  as if it were a constant.

Observe the similarity between the definitions of partial derivatives above and the definition of a derivative as the limit of a difference quotient given in Chapter 2. Namely, if  $y = f(x)$ , then  $f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$ . In  $f_x(x, y)$ , the increment  $\Delta x$  applies to  $x$ , while  $y$  is treated as a constant, and in  $f_y(x, y)$ , the increment  $\Delta y$  applies to  $y$ , while  $x$  is treated as a constant.

Just as the derivative of a function  $y = f(x)$  is itself a function, the partial derivatives  $f_x$  and  $f_y$  of a function  $z = f(x, y)$  are functions, generally of two variables.

The Sum, Difference, Product, and Quotient Rules used for finding the derivative of a function  $f$  of one variable also are used to find partial derivatives.

**Finding the Partial Derivatives of a Function of Two Variables****EXAMPLE 1**

For each function  $z = f(x, y)$ , find  $f_x(x, y)$  and  $f_y(x, y)$ .

(a)  $f(x, y) = 3x^2y + 2x - 3y$       (b)  $f(x, y) = x \sin y + y \sin x$

**Solution** (a) To find  $f_x(x, y)$ , treat  $y$  as a constant in  $f(x, y) = 3x^2y + 2x - 3y$  and differentiate with respect to  $x$ . The result is

$$f_x(x, y) = 6xy + 2$$

To find  $f_y(x, y)$ , treat  $x$  as a constant and differentiate with respect to  $y$ . The result is

$$f_y(x, y) = 3x^2 - 3$$

(b) For  $f(x, y) = x \sin y + y \sin x$ , we have

$$\begin{aligned} f_x(x, y) &= \sin y + y \cos x & f_y(x, y) &= x \cos y + \sin x \\ &\uparrow & &\uparrow \\ &\text{Treat } y \text{ as a constant} & &\text{Treat } x \text{ as a constant} \end{aligned}$$

**NOW WORK Problem 13.****Finding the Partial Derivatives of a Function at a Point  $(x_0, y_0)$** **EXAMPLE 2**

For  $f(x, y) = x \sin y + y \sin x$ , find  $f_x\left(\frac{\pi}{3}, \frac{\pi}{6}\right)$  and  $f_y\left(\frac{\pi}{3}, \frac{\pi}{6}\right)$ .

**Solution** We use the results from Example 1(b):

$$\begin{aligned} f_x(x, y) &= \sin y + y \cos x \\ f_x\left(\frac{\pi}{3}, \frac{\pi}{6}\right) &= \sin \frac{\pi}{6} + \frac{\pi}{6} \cos \frac{\pi}{3} = \frac{1}{2} + \frac{\pi}{6} \left(\frac{1}{2}\right) = \frac{6 + \pi}{12} \end{aligned}$$

\*Although partial derivatives may be defined at boundary points of the domain of  $f$ , they are more difficult to handle and are not discussed in this book.

$$f_y(x, y) = x \cos y + \sin x$$

$$f_y\left(\frac{\pi}{3}, \frac{\pi}{6}\right) = \frac{\pi}{3} \cos \frac{\pi}{6} + \sin \frac{\pi}{3} = \frac{\pi}{3} \left(\frac{\sqrt{3}}{2}\right) + \frac{\sqrt{3}}{2} = \frac{(\pi + 3)\sqrt{3}}{6}$$

### Another Notation

Another notation used for the partial derivatives of a function  $z = f(x, y)$  is

$$f_x(x, y) = \frac{\partial f}{\partial x} = \frac{\partial z}{\partial x} \quad \text{and} \quad f_y(x, y) = \frac{\partial f}{\partial y} = \frac{\partial z}{\partial y}$$

The symbols  $\frac{\partial}{\partial x}$  and  $\frac{\partial}{\partial y}$  are read as “the partial with respect to  $x$ ” and “the partial with respect to  $y$ ,” respectively. They denote operations on a function to obtain the partial derivatives with respect to  $x$  in the case of  $\frac{\partial}{\partial x}$  and with respect to  $y$  in the case of  $\frac{\partial}{\partial y}$ .

For example,  $\frac{\partial}{\partial x}(e^x \cos y) = e^x \cos y$  and  $\frac{\partial}{\partial y}(e^x \cos y) = -e^x \sin y$ .

**Figure 30**  $f_x(x_0, y_0)$  is the slope of the tangent line to the curve  $z = f(x, y_0)$  at  $(x_0, y_0, z_0)$ .

**DF Figure 31**  $f_y(x_0, y_0)$  is the slope of the tangent line to the curve  $z = f(x_0, y)$  at  $(x_0, y_0, z_0)$ .

### NOW WORK Problem 17.

## 2 Interpret Partial Derivatives as the Slope of a Tangent Line

Suppose  $z = f(x, y)$  is a function of two variables for which both  $f_x(x, y)$  and  $f_y(x, y)$  exist. When we find  $f_x(x, y)$ , the variable  $y$  is held fixed, say, at  $y = y_0$ , and  $f$  is differentiated with respect to  $x$ . Holding  $y$  fixed at  $y_0$  is equivalent to intersecting the surface  $z = f(x, y)$  with the plane  $y = y_0$ . This intersection is the curve  $z = f(x, y_0)$  shown in Figure 30. Since  $f_x(x, y_0)$  is the derivative of the function  $z = f(x, y_0)$  of one variable, then  $f_x(x, y_0)$  is the slope of the tangent line to the curve  $z = f(x, y_0)$ .

Similarly, Figure 31 shows that  $f_y(x_0, y)$  is the slope of the tangent line to the curve  $z = f(x_0, y)$ , the curve of intersection of the plane  $x = x_0$  and the surface  $z = f(x, y)$ .

### THEOREM Slope of a Tangent Line

The partial derivative  $f_x(x_0, y_0)$  equals the **slope of the tangent line** to the curve of intersection of the surface  $z = f(x, y)$  and the plane  $y = y_0$  at the point  $(x_0, y_0, f(x_0, y_0))$  on the surface  $z = f(x, y)$ .

The partial derivative  $f_y(x_0, y_0)$  equals the **slope of the tangent line** to the curve of intersection of the surface  $z = f(x, y)$  and the plane  $x = x_0$  at the point  $(x_0, y_0, f(x_0, y_0))$  on the surface  $z = f(x, y)$ .

### EXAMPLE 3 Finding an Equation of a Tangent Line

Find an equation of the tangent line to the curve of intersection of the surface  $z = f(x, y) = 16 - x^2 - y^2$ :

- (a) With the plane  $y = 2$  at the point  $(1, 2, 11)$
- (b) With the plane  $x = 1$  at the point  $(1, 2, 11)$

**Solution** (a) The slope of the tangent line to the curve of intersection of  $z = 16 - x^2 - y^2$  and the plane  $y = 2$  at any point is  $f_x(x, 2) = -2x$ . At the point  $(1, 2, 11)$ , the slope is  $f_x(1, 2) = -2(1) = -2$ . This tangent line lies on the plane  $y = 2$ . Symmetric equations of the tangent line are

$$z - 11 = \frac{x - 1}{-1/2} \quad y = 2$$

(b) The slope of the tangent line to the curve of intersection of  $z = 16 - x^2 - y^2$  and the plane  $x = 1$  at any point is  $f_y(1, y) = -2y$ . At the point  $(1, 2, 11)$ , the slope is

**NEED TO REVIEW?** Symmetric equations of a line in space are discussed in Section 10.6, pp. 734–735.

Figure 32

$f_y(1, 2) = -2(2) = -4$ . This tangent line lies on the plane  $x = 1$ . Symmetric equations of the tangent line are

$$z - 11 = \frac{y - 2}{-1/4} \quad x = 1$$

Figure 32 illustrates these solutions.

### NOW WORK Problem 41.

## 3 Interpret Partial Derivatives as a Rate of Change

The definition of the partial derivatives of  $z = f(x, y)$  is a generalization of the definition of the derivative of a function of one variable. It is not surprising, therefore, to see similarities in the interpretations. For example,  $f_x(x, y)$  equals the rate of change of  $f$  in the direction of the positive  $x$ -axis (while  $y$  is held fixed), as shown in Figure 33.

Figure 33

Similarly,  $f_y(x, y)$  equals the rate of change of  $f$  in the direction of the positive  $y$ -axis ( $x$  is held fixed), as shown in Figure 34.

Figure 34

**NOTE** In Chapter 13, we discuss rates of change in any direction.

### EXAMPLE 4 Finding the Rate of Change of Temperature

The temperature  $T$  (in degrees Celsius) of a metal plate, located in the  $xy$ -plane, at any point  $(x, y)$  is given by  $T = T(x, y) = 24(x^2 + y^2)^2$ .

- Find the rate of change of  $T$  in the direction of the positive  $x$ -axis at the point  $(1, -2)$ .
- Find the rate of change of  $T$  in the direction of the positive  $y$ -axis at the point  $(1, -2)$ .

**Solution** (a) The rate of change of temperature in the direction of the positive  $x$ -axis is given by

$$T_x(x, y) = 2(24)(x^2 + y^2)(2x) = 96x(x^2 + y^2)$$

At the point  $(1, -2)$ ,  $T_x(1, -2) = 96(1)(5) = 480$ . This means that as one moves in a horizontal direction to the right away from the point  $(1, -2)$ , the temperature of the plate increases at the rate of  $480^\circ\text{C}$  per unit of distance.

(b) The rate of change of temperature in the direction of the positive  $y$ -axis is given by

$$T_y(x, y) = 2(24)(x^2 + y^2)(2y) = 96y(x^2 + y^2)$$

At the point  $(1, -2)$ ,  $T_y(1, -2) = 96(-2)(5) = -960$ . This means that as one moves in a vertical direction up from the point  $(1, -2)$ , the temperature of the plate decreases at the rate of  $960^\circ\text{C}$  per unit of distance. ■

### NOW WORK Problem 45.

### EXAMPLE 5 Finding Rates of Change

See Figure 35.

The area  $A$  of a triangle with sides  $a$  and  $b$  and included angle  $\theta$  is given by

$$A = \frac{1}{2}ab \sin \theta$$

Figure 35

- Find the rate of change of  $A$  with respect to  $a$  when  $b$  and  $\theta$  are held fixed.
- Find the rate of change of  $A$  with respect to  $b$  when  $a$  and  $\theta$  are held fixed.
- Find the rate of change of  $A$  with respect to  $\theta$  when  $a$  and  $b$  are held fixed.
- Evaluate each of the above if  $a = 20$ ,  $b = 30$ , and  $\theta = \frac{\pi}{6}$ .
- Interpret the results found in (d).

**Solution** (a)  $\frac{\partial A}{\partial a} = \frac{1}{2}b \sin \theta$       (b)  $\frac{\partial A}{\partial b} = \frac{1}{2}a \sin \theta$       (c)  $\frac{\partial A}{\partial \theta} = \frac{1}{2}ab \cos \theta$

(d) When  $a = 20$ ,  $b = 30$ , and  $\theta = \frac{\pi}{6}$ , then

$$\frac{\partial A}{\partial a} = \frac{1}{2}(30) \left( \sin \frac{\pi}{6} \right) = \frac{15}{2}$$

$$\frac{\partial A}{\partial b} = \frac{1}{2}(20) \left( \sin \frac{\pi}{6} \right) = 5$$

$$\frac{\partial A}{\partial \theta} = \frac{1}{2}(20)(30) \cos \frac{\pi}{6} = 150\sqrt{3}$$

(e) Each partial derivative equals the rate of change of area with respect to  $a$ ,  $b$ , or  $\theta$ . The relative size of each rate of change tells us that the area will increase most rapidly when  $a$  and  $b$  are fixed and  $\theta$  varies. The area increases the least when  $a$  and  $\theta$  are fixed and  $b$  varies. ■

**ORIGINS** Charles Wiggins Cobb (1875–1949) and Paul H. Douglas (1892–1976) were American scholars who studied the growth of the U.S. economy from 1899 to 1922. They produced a simple model, known as the Cobb–Douglas model, in which production output is a function of the amount of labor used and the amount of capital invested. Later, while Cobb continued to publish in mathematics (he obtained a PhD from the University of Michigan) and in economics, Douglas went into politics and represented Illinois in the U.S. Senate from 1949 to 1966.

In business and economics, analysts are often interested in the rate of change of a process, called the **marginal** process. For example, if the amount  $z$  of a good produced depends on the quantities of the  $x$  and  $y$  components used, then the **production function**  $z = f(x, y)$  gives the amount of **output** for the amounts  $x$  and  $y$  of **input** used. The **marginal productivity** of  $z$  with respect to an input  $x$  is  $f_x$  and the marginal productivity of  $z$  with respect to an input  $y$  is  $f_y$ .

### EXAMPLE 6 Finding Marginal Productivity: The Cobb–Douglas Model

In 1928 the mathematician Charles Cobb and the economist Paul Douglas empirically (from data) derived a production model for the manufacturing sector of the U.S. economy for the period 1899–1922. Using the model  $P = aK^bL^{1-b}$ , where  $P$  is manufacturing productivity,  $K$  is capital input, and  $L$  is labor input, and multiple regression techniques,

Cobb and Douglas determined that manufacturing productivity was represented by the function

$$P = 1.014651K^{0.254124}L^{0.745876} \approx 1.01K^{0.25}L^{0.75}$$

- (a) Find the marginal productivity of manufacturing output with respect to capital input. Interpret the result.
- (b) Find the marginal productivity of manufacturing output with respect to labor input. Interpret the result.

**Solution** (a) The marginal productivity of manufacturing output with respect to capital input  $K$  is

$$\frac{\partial P}{\partial K} \approx 1.01(0.25K^{-0.75})L^{0.75} = 0.2525 \left(\frac{L}{K}\right)^{0.75}$$

For every unit increase in capital input, there is an increase of  $0.2525 \left(\frac{L}{K}\right)^{0.75}$  units in manufacturing productivity.

(b) The marginal productivity of manufacturing output with respect to labor input  $L$  is

$$\frac{\partial P}{\partial L} \approx 1.01K^{0.25}(0.75L^{-0.25}) = 0.7575 \left(\frac{K}{L}\right)^{0.25}$$

For every unit increase in labor input, there is an increase of  $0.7575 \left(\frac{K}{L}\right)^{0.25}$  units in manufacturing productivity. ■

Marginal productivity is usually positive. That is, as the amount of one input increases (with the other input held constant), the output also increases. However, as the input of one component increases, the output usually increases at a decreasing rate until the point is reached where there is no further increase in output. This is called the **law of eventually diminishing marginal productivity**.

#### **NOW WORK** Problem 49.

## 4 Find Second-Order Partial Derivatives

If the first-order partial derivatives of a function  $z = f(x, y)$  of two variables exist, and if it is possible to differentiate each of these with respect to  $x$  or  $y$ , the result is four **second-order partial derivatives**. They are

|                                                                                                                                                                 |                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $f_{xx}(x, y) = \frac{\partial}{\partial x} f_x(x, y) = \frac{\partial}{\partial x} \frac{\partial z}{\partial x} = \frac{\partial^2 z}{\partial x^2}$          | $f_{xy}(x, y) = \frac{\partial}{\partial y} f_x(x, y) = \frac{\partial}{\partial y} \frac{\partial z}{\partial x} = \frac{\partial^2 z}{\partial y \partial x}$ |
| $f_{yx}(x, y) = \frac{\partial}{\partial x} f_y(x, y) = \frac{\partial}{\partial x} \frac{\partial z}{\partial y} = \frac{\partial^2 z}{\partial x \partial y}$ | $f_{yy}(x, y) = \frac{\partial}{\partial y} f_y(x, y) = \frac{\partial}{\partial y} \frac{\partial z}{\partial y} = \frac{\partial^2 z}{\partial y^2}$          |

The two second-order partial derivatives

$$\frac{\partial^2 z}{\partial x \partial y} = f_{yx}(x, y) \quad \text{and} \quad \frac{\partial^2 z}{\partial y \partial x} = f_{xy}(x, y)$$

are called **mixed partials**.

**CAUTION** Notice the differences in the two mixed partial derivatives. To find  $\frac{\partial^2 z}{\partial x \partial y} = f_{yx}$ , first differentiate  $f$  with respect to  $y$  and then differentiate  $f_y$  with

respect to  $x$ , in that order. On the other hand, to find  $\frac{\partial^2 z}{\partial y \partial x} = f_{xy}$ , first differentiate  $f$  with respect to  $x$  and then differentiate  $f_x$  with respect to  $y$ .

### EXAMPLE 7 Finding Second-Order Partial Derivatives

Find the four second-order partial derivatives of  $z = f(x, y) = x \ln y + ye^x$ .

**Solution** We begin by finding the first-order partial derivatives  $f_x(x, y)$  and  $f_y(x, y)$ .

$$f_x(x, y) = \ln y + ye^x \quad f_y(x, y) = \frac{x}{y} + e^x$$

Then the second-order partial derivatives are

$$\begin{aligned} f_{xx}(x, y) &= \frac{\partial}{\partial x} f_x(x, y) = \frac{\partial}{\partial x} (\ln y + ye^x) = ye^x & f_{xy}(x, y) &= \frac{\partial}{\partial y} f_x(x, y) = \frac{\partial}{\partial y} (\ln y + ye^x) = \frac{1}{y} + e^x \\ f_{yx}(x, y) &= \frac{\partial}{\partial x} f_y(x, y) = \frac{\partial}{\partial x} \left( \frac{x}{y} + e^x \right) = \frac{1}{y} + e^x & f_{yy}(x, y) &= \frac{\partial}{\partial y} f_y(x, y) = \frac{\partial}{\partial y} \left( \frac{x}{y} + e^x \right) = -\frac{x}{y^2} \end{aligned}$$

**ORIGINS** Alexis Claude Clairaut (1713–1765) was home schooled by his father, a respected mathematician. As a result, Clairaut completed algebra when he was 9, produced his first scholarly paper at age 13, and was the youngest person admitted to the Paris Academy of Sciences. When he was about 30, Clairaut began to study the three-body problem—seeking a solution to the motion of three masses that attract each other according to Newton's Law. He applied this theory to the orbit of Halley's comet, and was able to predict the return of the comet to within weeks.

Notice in Example 7 that the mixed partials  $f_{xy}$  and  $f_{yx}$  are equal. As it turns out, the mixed partials are equal for most functions we encounter. The next result gives conditions for the mixed partials to be equal.

### NOW WORK Problem 23.

### THEOREM Equality of Mixed Partial (Clairaut's Theorem)

Let  $z = f(x, y)$  be a function of two variables whose domain is the set  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$ . If the partial derivatives  $f_x$ ,  $f_y$ ,  $f_{xy}$ , and  $f_{yx}$  exist at each point of some disk centered at  $(x_0, y_0)$ , and if  $f_{xy}$  and  $f_{yx}$  are continuous at  $(x_0, y_0)$ , then  $f_{xy}(x_0, y_0) = f_{yx}(x_0, y_0)$ .

A proof of Clairaut's Theorem may be found in most advanced calculus texts. For an example of a function for which the mixed partials are not equal, see Problem 75 or 76.

### Continuity and Partial Derivatives

In Chapter 2, we proved the important result that if a function  $f$  of one variable has a derivative at  $c$ , then  $f$  is continuous at  $c$ . This property is not necessarily true for a function  $f$  of several variables. That is, if a function  $f$  of several variables has partial derivatives at a point  $P_0$ , the function  $f$  may fail to be continuous at  $P_0$ .

### EXAMPLE 8 Showing That a Function of Two Variables Having Partial Derivatives Is Not Continuous

Show that the function

$$f(x, y) = \begin{cases} \frac{xy}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$$

has partial derivatives at  $(0, 0)$ , but is not continuous at that point.

**Solution** We use the definition to find the partial derivatives of  $f$  at  $(0, 0)$ .

$$f_x(0, 0) = \lim_{\Delta x \rightarrow 0} \frac{f(0 + \Delta x, 0) - f(0, 0)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{f(\Delta x, 0)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{0}{\Delta x} = \lim_{\Delta x \rightarrow 0} 0 = 0$$

$\uparrow$   
 $f(0, 0) = 0$        $f(\Delta x, 0) = \frac{\Delta x \cdot 0}{(\Delta x)^2} = 0$

$$f_y(0, 0) = \lim_{\Delta y \rightarrow 0} \frac{f(0, 0 + \Delta y) - f(0, 0)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \frac{f(0, \Delta y)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \frac{0}{\Delta y} = \lim_{\Delta y \rightarrow 0} 0 = 0$$

$\uparrow$   
 $f(0, 0) = 0$        $f(0, \Delta y) = \frac{0 \cdot \Delta y}{(\Delta y)^2} = 0$

The partial derivatives  $f_x(0, 0)$  and  $f_y(0, 0)$  both exist.

But  $\lim_{(x,y) \rightarrow (0,0)} \frac{xy}{x^2 + y^2}$  does not exist. (See Example 2 from Section 12.2.) As a result,  $f$  is not continuous at  $(0, 0)$ . ■

**NOW WORK** Problem 35.

## 5 Find the Partial Derivatives of a Function of $n$ Variables

The idea of partial differentiation can be extended to functions of three or more variables. If  $w = f(x, y, z)$  is a function of three variables, there will be three first-order partial derivatives:

- The partial derivative of  $w$  with respect to  $x$  is  $\frac{\partial w}{\partial x} = f_x(x, y, z)$ .
- The partial derivative of  $w$  with respect to  $y$  is  $\frac{\partial w}{\partial y} = f_y(x, y, z)$ .
- The partial derivative of  $w$  with respect to  $z$  is  $\frac{\partial w}{\partial z} = f_z(x, y, z)$ .

Each partial derivative is found by differentiating with respect to the indicated variable, while treating the other two variables as constants.

The function  $f_x$  equals the rate of change of  $w$  with respect to  $x$ ; the function  $f_y$  equals the rate of change of  $w$  with respect to  $y$ ; and the function  $f_z$  equals the rate of change of  $w$  with respect to  $z$ .

### EXAMPLE 9 Finding the Partial Derivatives of a Function of Three Variables

If  $w = f(x, y, z) = 5x^2yz^3$ , then

$$f_x(x, y, z) = 10xyz^3 \quad f_y(x, y, z) = 5x^2z^3 \quad f_z(x, y, z) = 15x^2yz^2 \quad \blacksquare$$

**NOW WORK** Problem 27.

Higher-order partial derivatives of a function  $w = f(x, y, z)$  of three variables are defined in a similar way to those of a function of two variables. For example,

$$f_{zy} = \frac{\partial}{\partial y} \left( \frac{\partial w}{\partial z} \right) = \frac{\partial^2 w}{\partial y \partial z} \quad \text{and} \quad f_{xz} = \frac{\partial}{\partial z} \left( \frac{\partial w}{\partial x} \right) = \frac{\partial^2 w}{\partial z \partial x}$$

As in the case of functions of two variables, for most functions  $w = f(x, y, z)$ , the mixed partials have the property that  $f_{xy} = f_{yx}$  and  $f_{xz} = f_{zx}$  and  $f_{yz} = f_{zy}$ .

If  $z = f(x_1, x_2, \dots, x_n)$  is a function of  $n$  variables, there are  $n$  partial derivatives of  $f$ . The partial derivative of  $f$  with respect to  $x_1$ ,  $\frac{\partial f}{\partial x_1}$ , is found by differentiating  $f$  with respect to  $x_1$ , while treating the remaining variables as constants. The other partial derivatives  $\frac{\partial f}{\partial x_2}, \frac{\partial f}{\partial x_3}, \dots, \frac{\partial f}{\partial x_n}$  are defined similarly.

### EXAMPLE 10 Finding the Partial Derivatives of a Function of $n$ Variables

If  $z = f(x_1, x_2, \dots, x_n) = x_1^2 + x_2^2 + \dots + x_n^2$ , then

$$\frac{\partial f}{\partial x_1} = 2x_1 \quad \frac{\partial f}{\partial x_2} = 2x_2 \quad \dots \quad \frac{\partial f}{\partial x_n} = 2x_n$$

Collectively, these partial derivatives can be written as

$$\frac{\partial f}{\partial x_i} = 2x_i \quad \text{where } i = 1, 2, \dots, n$$

## 12.3 Assess Your Understanding

### Concepts and Vocabulary

- True or False** To find the partial derivative  $f_y(x, y)$ , differentiate  $f$  with respect to  $y$  while treating  $x$  as if it were a constant.
- Multiple Choice** The partial derivative  $f_x(x_0, y_0)$  equals the slope of the tangent line to the curve of intersection of the surface  $z = f(x, y)$  and the plane [(a)  $x = x_0$ , (b)  $y = y_0$ , (c)  $z = z_0$ , (d)  $x + y + z = 0$ ] at the point  $(x_0, y_0, f(x_0, y_0))$  on the surface.
- True or False**  $f_x(x, y)$  equals the rate of change of  $f$  in the direction of the positive  $x$ -axis.
- The two second-order partial derivatives  $\frac{\partial^2 z}{\partial x \partial y}$  and  $\frac{\partial^2 z}{\partial y \partial x}$  are called \_\_\_\_\_ partials.
- True or False** If  $f(x, y) = x \cos y$ , then  $f_x(x, y) = f_y(x, y)$ .
- For a function  $w = f(x, y, z)$  of three variables, to find the partial derivative  $f_y(x, y, z)$ , treat the variables \_\_\_\_\_ and \_\_\_\_\_ as constants, and differentiate  $f$  with respect to \_\_\_\_\_.

In Problems 15–20, find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$ .

- $z = f(x, y) = \tan^{-1} \frac{y}{x}$
- $z = f(x, y) = \sin^2(2xy)$
- $z = f(x, y) = \sin(e^{x^2y})$
- $z = f(x, y) = \sin[\ln(x^2 + y^2)]$
- $z = f(x, y) = e^{(x^2+y^2)^{1.2}}$
- $z = f(x, y) = \ln \sqrt{x^2 + y^2}$

In Problems 21–26, find the second-order partial derivatives  $f_{xx}$ ,  $f_{xy}$ ,  $f_{yx}$ , and  $f_{yy}$ . Check to verify that  $f_{xy} = f_{yx}$ .

- $f(x, y) = 6x^2 - 8xy + 9y^2$
- $f(x, y) = (2x + 3y)(3x - 2y)$
- $f(x, y) = \ln(x^3 + y^2)$
- $f(x, y) = e^{2x+3y}$
- $f(x, y) = \cos(x^2y^3)$
- $f(x, y) = \sin^2(xy)$

In Problems 27–34, find  $f_x(x, y, z)$ ,  $f_y(x, y, z)$ , and  $f_z(x, y, z)$ .

- $f(x, y, z) = xy + yz + xz$
- $f(x, y, z) = xe^y + ye^z + ze^x$
- $f(x, y, z) = xy \sin z - yz \sin x$
- $f(x, y, z) = \frac{1}{\sqrt{x^2 + y^2 + z^2}}$
- $f(x, y, z) = z \tan^{-1} \frac{y}{x}$
- $f(x, y, z) = \tan^{-1} \frac{xy}{z}$

### Skill Building

In Problems 7–14, find  $f_x(x, y)$  and  $f_y(x, y)$ .

- $f(x, y) = x^2y + 6y^2$
- $f(x, y) = 3x^2 + 6xy^3$
- $f(x, y) = \frac{x-y}{x+y}$
- $f(x, y) = \frac{x+y}{y^2}$
- $f(x, y) = e^y \cos x + e^x \sin y$
- $f(x, y) = x^2 \cos y + y^2 \sin x$
- $f(x, y) = x^2e^{xy}$
- $f(x, y) = \cos(x^2y^3)$

33.  $f(x, y, z) = \sin[\ln(x^2 + y^2 + z^2)]$

34.  $f(x, y, z) = e^{x^2+y^2} \ln z$

In Problems 35 and 36, use the definition of a partial derivative to find  $f_x(0, 0)$  and  $f_y(0, 0)$ .

35.  $f(x, y) = \begin{cases} \frac{x^3 + y^3}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$

36.  $f(x, y) = \begin{cases} \frac{x^2 y^2}{x^2 + 4y^3} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$

In Problems 37–42, find symmetric equations of the tangent line to the curve of intersection of each surface with the given plane at the indicated point.

37.  $z = x^2 + y^2$  and  $y = 2$  at  $(1, 2, 5)$

38.  $z = x^2 - y^2$  and  $x = 3$  at  $(3, 1, 8)$

39.  $z = \sqrt{1 - x^2 - y^2}$  and  $x = 0$  at  $(0, \frac{1}{2}, \frac{\sqrt{3}}{2})$

40.  $z = \sqrt{16 - x^2 - y^2}$  and  $y = 2$  at  $(\sqrt{3}, 2, 3)$

41.  $z = \sqrt{x^2 + y^2}$  and  $x = 4$  at  $(4, 2, 2\sqrt{5})$

42.  $z = e^x \ln y$  and  $y = e$  at  $(0, e, 1)$

43. Find the rate of change of  $z = \ln \sqrt{x^2 + y^2}$  at  $(3, 4, \ln 5)$ ,

(a) In the direction of the positive  $x$ -axis.

(b) In the direction of the positive  $y$ -axis.

44. Find the rate of change of  $z = e^y \sin x$  at  $(\frac{\pi}{3}, 0, \frac{\sqrt{3}}{2})$ ,

(a) In the direction of the positive  $x$ -axis.

(b) In the direction of the positive  $y$ -axis.

## Applications and Extensions

45. **Temperature Distribution** The temperature distribution  $T$  (in degrees Celsius) of a heated plate at a point  $(x, y)$  in the  $xy$ -plane is modeled by

$$T = T(x, y) = \left( \frac{100}{\ln 2} \right) \ln(x^2 + y^2) \quad 1 \leq x^2 + y^2 \leq 9$$

(a) Show that  $T = 0^\circ\text{C}$  on the circle  $x^2 + y^2 = 1$ , and  $T = 200^\circ\text{C}$  on the circle  $x^2 + y^2 = 9$ .

(b) Find the rate of change of  $T$  in the direction of the positive  $x$ -axis at the point  $(1, 2)$  and at the point  $(2, 1)$ . Describe the rate of change.

(c) Find the rate of change of  $T$  in the direction of the positive  $y$ -axis at the point  $(2, 0)$  and at the point  $(0, 2)$ . Describe the rate of change.

46. **Temperature Distribution** The temperature distribution (in degrees Celsius) of a heated plate at a point  $(x, y)$  in the  $xy$ -plane is modeled by  $T = T(x, y) = \frac{100}{\sqrt{x^2 + y^2}}$ ,  $1 \leq x^2 + y^2 \leq 9$ .

(a) Show that  $T = 100^\circ\text{C}$  on the circle  $x^2 + y^2 = 1$ , and  $T = 50^\circ\text{C}$  on the circle  $x^2 + y^2 = 9$ .

(b) Find the rate of change of  $T$  in the direction of the positive  $x$ -axis at the point  $(1, 0)$  and at the point  $(0, 1)$ . Describe the rate of change.

(c) Find the rate of change of  $T$  in the direction of the positive  $y$ -axis at the point  $(2, 0)$  and at the point  $(0, 2)$ . Describe the rate of change.

47. **Thermodynamics** The Ideal Gas Law  $PV = nrT$  is used to describe the relationship between pressure  $P$ , volume  $V$ , and temperature  $T$  of a confined gas, where  $n$  is the number of moles of the gas and  $r$  is the universal gas constant. Show that

$$\frac{\partial V}{\partial T} \cdot \frac{\partial T}{\partial P} \cdot \frac{\partial P}{\partial V} = -1$$

48. **Thermodynamics** The volume  $V$  of a fixed amount of gas varies directly with the temperature  $T$  and inversely with the pressure  $P$ . That is,  $V = k \frac{T}{P}$ , where  $k > 0$  is a constant.

(a) Find  $\frac{\partial V}{\partial T}$  and  $\frac{\partial V}{\partial P}$ .

(b) Show that  $T \frac{\partial V}{\partial T} + P \frac{\partial V}{\partial P} = 0$ .

49. **Economics** The data used to develop the **Cobb–Douglas productivity model** included capital input  $K$  and labor input  $L$  for each year during the period 1899–1922. Using the model  $P = aK^b L^{1-b}$  and multiple regression techniques, Cobb and Douglas determined that manufacturing productivity was represented by the function

$$P = 1.014651 K^{0.254124} L^{0.745876} \approx 1.01 K^{0.25} L^{0.75}$$

(a) Find the marginal productivity with respect to capital input and the marginal productivity with respect to labor input in 1900 when  $K = 107$  and  $L = 105$ .

(b) Find the marginal productivity with respect to capital input and the marginal productivity with respect to labor input in 1920 when  $K = 407$  and  $L = 193$ .

(c) Compare the answers. What do you conclude about the change in manufacturing productivity in the United States during the 20-year period?

50. **Economics** The function

$$z = f(x, y, r) = \frac{1 + (1 - x)y}{1 + r} - 1$$

describes the net gain or loss of money invested, where  $x$  = annual marginal tax rate,  $y$  = annual effective yield on an investment, and  $r$  = annual inflation rate.

(a) Find the annual net gain or loss if money is invested at an effective yield of 4% when the marginal tax rate is 25% and the inflation rate is 5%; that is, find  $f(0.25, 0.04, 0.05)$ .

(b) Find the rate of change of gain (or loss) of money with respect to the marginal tax rate when the effective yield is 4% and the inflation rate is 5%.

(c) Find the rate of change of gain (or loss) of money with respect to the effective yield when the marginal tax rate is 25% and the inflation rate is 5%.

- (d) Find the rate of change of gain (or loss) of money with respect to the inflation rate when the marginal tax rate is 25% and the effective yield is 4%.

- 51. Economics** Let  $w = 2x^{1/2}y^{1/3}z^{1/6}$  be a production function that depends on three inputs:  $x$ ,  $y$ , and  $z$ . Find the marginal productivity with respect to  $x$ , the marginal productivity with respect to  $y$ , and the marginal productivity with respect to  $z$ .
- 52. Speed of Sound** The speed  $v$  of sound in a gas depends on the pressure  $p$  and density  $d$  of the gas and is modeled by the formula  $v(p, d) = k\sqrt{\frac{p}{d}}$ , where  $k$  is some constant. Find the rate of change of speed with respect to  $p$  and with respect to  $d$ .

- 53. Vibrating Strings** Suppose a vibrating string is governed by the equation  $f(x, t) = 2\cos(5t)\sin x$ , where  $x$  is the horizontal distance of a point on the string,  $t$  is time, and  $f(x, t)$  is the displacement. Show that  $\frac{\partial^2 f}{\partial t^2} = 25\frac{\partial^2 f}{\partial x^2}$  at all points  $(x, t)$ .

- 54. Temperature Distribution** Suppose a thin metal rod extends along the  $x$ -axis from  $x = 0$  to  $x = 20$ , and for each  $x$ , where  $0 \leq x \leq 20$ , the temperature  $T$  of the rod at time  $t \geq 0$  and position  $x$  is  $T(t, x) = 40e^{-\lambda t} \sin \frac{\pi x}{20}$ , where  $\lambda > 0$  is a constant.

- (a) Show that  $T_t = -\lambda T$ ,  $T_{xx} = -\frac{\pi^2}{400}T$ , and  $T_t = \frac{1}{k^2}T_{xx}$  for some  $k$ .

- (b) Graph the initial temperature distribution,  $y = T(0, x)$ , where  $0 \leq x \leq 20$ .

- 55.** Find  $\frac{\partial x}{\partial r}$ ,  $\frac{\partial x}{\partial \theta}$ ,  $\frac{\partial y}{\partial r}$ , and  $\frac{\partial y}{\partial \theta}$  if  $x = r \cos \theta$  and  $y = r \sin \theta$ .

- 56.** Find  $\frac{\partial r}{\partial x}$ ,  $\frac{\partial \theta}{\partial x}$ ,  $\frac{\partial r}{\partial y}$ , and  $\frac{\partial \theta}{\partial y}$  if  $r = \sqrt{x^2 + y^2}$  and  $\theta = \tan^{-1} \frac{y}{x}$ ,  $x \neq 0$ .

- CAS 57. (a)** Graph  $f(x, y) = \frac{1}{2}x^2 + \frac{1}{3}y^2$  and the plane  $y = 1$ .

- (b) Find symmetric equations of the tangent line to the curve of intersection of the surface and the plane at the point  $\left(2, 1, \frac{7}{3}\right)$ .

- CAS 58. (a)** Graph  $f(x, y) = \frac{5}{\sqrt{x^2 + y^2 + 1}}$  and the plane  $x = 1$ .

- (b) Find symmetric equations of the tangent line to the curve of intersection of the surface and the plane at the point  $\left(1, -2, \frac{5\sqrt{6}}{6}\right)$ .

- 59.** Show that  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$  and  $\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$  for  $u = e^x \cos y$  and  $v = e^x \sin y$ .

- 60.** Show that  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$  and  $\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$  for  $u = \ln \sqrt{x^2 + y^2}$  and  $v = \tan^{-1} \frac{y}{x}$ .

- 61.** If  $u = x^2 + 4y^2$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 2u$ .

- 62.** If  $u = xy^2$ , show that  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = 3u$ .

- 63.** If  $w = x^2 + y^2 - 3yz$ , show that  $x \frac{\partial w}{\partial x} + y \frac{\partial w}{\partial y} + z \frac{\partial w}{\partial z} = 2w$ .

- 64.** If  $w = \frac{xz + y^2}{yz}$ , show that  $x \frac{\partial w}{\partial x} + y \frac{\partial w}{\partial y} + z \frac{\partial w}{\partial z} = 0$ .

- 65.** If  $z = \cos(x + y) + \cos(x - y)$ , show that  $\frac{\partial^2 z}{\partial x^2} - \frac{\partial^2 z}{\partial y^2} = 0$ .

- 66.** If  $z = \sin(x - y) + \ln(x + y)$ , show that  $\frac{\partial^2 z}{\partial x^2} = \frac{\partial^2 z}{\partial y^2}$ .

- 67.** Show that  $u = e^{-\alpha^2 t} \sin(\alpha x)$  satisfies the equation  $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$  for all values of the constant  $\alpha$ .

**Laplace's Equation** A function  $z = f(x, y)$  that obeys the partial differential equation  $\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = 0$  is called a **harmonic function**.\*

In Problems 68–71, show that each function is a harmonic function.

- 68.**  $z = \ln \sqrt{x^2 + y^2}$       **69.**  $z = e^{ax} \sin(ay)$

- 70.**  $z = \tan^{-1} \frac{y}{x}$       **71.**  $z = e^{ax} \cos(ay)$

- 72. Harmonic Functions** Suppose  $u(x, y)$  and  $v(x, y)$  have continuous second-order partial derivatives,  $u_x = v_y$  and  $u_y = -v_x$ . Show that  $u$  and  $v$  are harmonic functions.

- 73. Harmonic Functions** If  $u = z \tan^{-1} \frac{x}{y}$ , show that

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0$$

- 74. Harmonic Functions** Show that  $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2}$  satisfies the three-dimensional Laplace equation

$$f_{xx} + f_{yy} + f_{zz} = 0$$

- 75.** Let  $f(x, y) = \begin{cases} \frac{xy^3}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$ .

- (a) Find  $f_x$  and  $f_y$ . [Hint:  $f_x$  and  $f_y$ , where  $(x, y) \neq (0, 0)$ , can be found using derivative formulas. To find  $f_x(0, 0)$  and  $f_y(0, 0)$ , use the definition of a partial derivative.]

- (b) Show that  $f_{xy}(0, 0) \neq f_{yx}(0, 0)$ .

- 76.** Let  $f(x, y) = \begin{cases} \frac{xy(x^2 - y^2)}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$ .

Show that:

- (a)  $f_x(0, y) = -y$       (b)  $f_y(x, 0) = x$

- (c)  $f_{xy}(0, 0) = -1$       (d)  $f_{yx}(0, 0) = 1$

- 77.** If you are told that  $f$  is a function of two variables whose partial derivatives are  $f_x(x, y) = 3x - y$  and  $f_y(x, y) = x - 3y$ , should you believe it? Explain.

\*Laplace's equation is important in many applications including fluid dynamics, heat, elasticity, and electricity.

78. Show that there is no function  $z = f(x, y)$  for which  $f_x(x, y) = 2x - y$  and  $f_y(x, y) = x - 2y$ .

79. Use the definition of a partial derivative to show that the function  $z = \sqrt{x^2 + y^2}$  does not have partial derivatives at  $(0, 0)$ . By discussing the graph of the function, give a geometric reason why this should be so.

80. If  $z = f(x, y) = 4x^2 + 9y^2 - 12$ , interpret  $f_x\left(1, -\frac{1}{3}\right)$  and

$f_y\left(1, -\frac{1}{3}\right)$  geometrically.

81. Show that  $xf_x + yf_y + zf_z = 0$  for  $f(x, y, z) = e^{x/y} + e^{y/z} + e^{z/x}$ .

82. Find  $a$  in terms of  $b$  and  $c$  so that  $f(t, x, y) = e^{at} \sin(bx) \cos(cy)$  satisfies  $f_t = f_{xx} + f_{yy}$ .

83. **Wave Equation** Show that  $f(x, t) = \cos(x + ct)$  satisfies the one-dimensional wave equation  $f_{tt} = c^2 f_{xx}$ , where  $c$  is a constant.

84. Find  $f_x$  and  $f_y$  if  $f(x, y) = \int_x^y \ln(\cos \sqrt{t}) dt$ .

85. Find  $\frac{\partial a}{\partial b}$ ,  $\frac{\partial a}{\partial c}$ , and  $\frac{\partial a}{\partial A}$  for the Law of Cosines:  
 $a^2 = b^2 + c^2 - 2bc \cos A$ .

86. If  $x = r \cos \theta$  and  $y = r \sin \theta$ , show that

$$\begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} = r \quad \text{and} \quad \begin{vmatrix} \frac{\partial r}{\partial x} & \frac{\partial r}{\partial y} \\ \frac{\partial \theta}{\partial x} & \frac{\partial \theta}{\partial y} \end{vmatrix} = \frac{1}{r}$$

### Challenge Problems

In Problems 87 and 88, find  $f_x$  and  $f_y$ .

87.  $f(x, y) = x^y$

88.  $f(x, y) = x^{2x+3y}$

In Problems 89–92, find  $f_x$ ,  $f_y$ , and  $f_z$ .

89.  $f(x, y, z) = x^{y+z}$

90.  $f(x, y, z) = x^{yz}$

91.  $f(x, y, z) = (x + y)^z$

92.  $f(x, y, z) = (xy)^z$

93. Find  $f_x$  and  $f_y$  at  $(0, 0)$  if

$$f(x, y) = \begin{cases} e^{-1/(x^2+y^2)} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$$

94. Find  $f_x$ ,  $f_y$ ,  $f_{xx}$ ,  $f_{yy}$ , and  $f_{xy}$  for  $f(x, y) = (xy)^{xy}$ . What is the domain of  $f$ ?

95. Show that the following function has first partial derivatives at all points in the plane:

$$f(x, y) = \begin{cases} \frac{x^3 - y^3}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$$

96. **Laplace's Equation in Polar Coordinates** Show that the function  $f(r, \theta) = r^n \sin(n\theta)$  satisfies the Laplace equation

$$f_{rr} + \frac{1}{r} f_r + \frac{1}{r^2} f_{\theta\theta} = 0$$

97. Let  $u = r^m \cos(m\theta)$ . Show that

$$\frac{\partial^2 u}{\partial r^2} + \frac{1}{r^2} \left( \frac{\partial^2 u}{\partial \theta^2} \right) + \frac{1}{r} \left( \frac{\partial u}{\partial r} \right) = 0 \quad \text{for all } m.$$

98. (a) Find symmetric equations of the tangent lines at  $(x_0, y_0, f(x_0, y_0))$  to the curve of intersection of  $z = f(x, y)$  and  $y = y_0$ , and the curve of intersection of  $z = f(x, y)$  and  $x = x_0$ .

(b) Write an equation of the plane determined by these two lines.

(c) What is the geometric relationship of this plane to the surface  $z = f(x, y)$ ?

99. Consider two coordinate systems as given in the figure.

(a) Let  $f(x, y) = 3x^2 + 4y^3$ . Find  $f_x(1, 6)$  and  $f_y(1, 6)$ .

(b) Let  $(a, b)$  be the  $x'y'$ -coordinates of  $(1, 6)$ . Let  $\tilde{f}(x', y') = f(x, y)$ . Find  $\tilde{f}_{x'}(a, b)$  and  $\tilde{f}_{y'}(a, b)$ .

## 12.4 Differentiability and the Differential

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the change in  $z = f(x, y)$  (p. 841)
- 2 Show that a function of two variables is differentiable (p. 841)
- 3 Use the differential  $dz$  to approximate a change in  $z$  (p. 844)
- 4 Find the differential of a function of three or more variables (p. 846)

For a function  $y = f(x)$  of a single variable, we said that when  $f$  has a derivative, then  $f$  is differentiable. We also defined the differential of  $y$  in terms of its derivative as  $dy = f'(x) dx$ , where  $dx = \Delta x$ . For functions of more than one variable, the situation is a little more involved. We begin by defining what it means for a function  $z = f(x, y)$  to be *differentiable*, which involves the change  $\Delta z$  in  $z$ . Then under suitable conditions on  $z$ , we will define  $dz$ , the differential of  $z$ .

Figure 36

## 1 Find the Change in $z = f(x, y)$

If  $y = f(x)$  is a function of one variable, then the change  $\Delta y$  in  $y$  from  $x_0$  to  $x_0 + \Delta x$  is

$$\Delta y = f(x_0 + \Delta x) - f(x_0)$$

There is a similar definition for a function  $z = f(x, y)$  of two variables.

### DEFINITION Change in $z = f(x, y)$

Let  $z = f(x, y)$  be a function of two variables with domain  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$ , and let  $\Delta x$  and  $\Delta y$  represent changes in  $x$  and in  $y$ , respectively. If  $\Delta x$  and  $\Delta y$  are chosen so that the point  $(x_0 + \Delta x, y_0 + \Delta y)$  is also in  $D$ , then the **change in  $z$** , denoted by  $\Delta z$ , is defined as

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$$

See Figure 36.

### EXAMPLE 1 Finding the Change in $z$

- (a) Find the change  $\Delta z$  in  $z = f(x, y) = x^2y - 1$  from  $(x_0, y_0)$  to  $(x_0 + \Delta x, y_0 + \Delta y)$ .  
 (b) Use the answer to calculate the change in  $z$  from  $(1, 2)$  to  $(1.1, 1.9)$ .

**Solution** (a)  $\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$   
 $= [(x_0 + \Delta x)^2(y_0 + \Delta y) - 1] - [x_0^2y_0 - 1]$

(b) Let  $(x_0, y_0) = (1, 2)$  and  $(x_0 + \Delta x, y_0 + \Delta y) = (1.1, 1.9)$ . Then

$$\Delta z = [(1.1)^2(1.9) - 1] - [(1)^2(2) - 1] = 0.299$$

### NOW WORK Problem 7.

**NEED TO REVIEW?** The differentials  $dx$  and  $dy$  of a function  $y = f(x)$  of one variable are discussed in Section 3.4, pp. 230–232.

## 2 Show That a Function of Two Variables Is Differentiable

Before defining the differentiability of a function of two variables, let's reexamine the differential  $dy$  of a function  $y = f(x)$  of a single variable. For a differentiable function  $y = f(x)$  of one variable, the differentials  $dx = \Delta x$  and  $dy = f'(x) dx = f'(x) \Delta x$  can be used to approximate  $\Delta y = f(x_0 + \Delta x) - f(x_0)$ . That is,

$$dy \approx \Delta y = f(x_0 + \Delta x) - f(x_0)$$

provided  $\Delta x$  is close to 0.

If the error in using  $dy$  to approximate  $\Delta y$  is  $\eta \Delta x$ , then

$$\Delta y - dy = \eta \Delta x$$

$$\Delta y = f'(x_0) \Delta x + \eta \Delta x \quad dy = f'(x_0) \Delta x \quad (1)$$

where  $\eta$  is a function of  $\Delta x$  for which  $\lim_{\Delta x \rightarrow 0} \eta = 0$ .

Figure 37 gives a geometric interpretation of equation (1). From Figure 37, we can see that  $\eta \Delta x \rightarrow 0$  as  $\Delta x \rightarrow 0$ . But Figure 37 does not show something else suggested by equation (1), namely that  $\eta \rightarrow 0$  as  $\Delta x \rightarrow 0$ . Do you see why? From (1),  $\frac{\Delta y}{\Delta x} = f'(x_0) + \eta$ . Since  $f$  is differentiable,  $\lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = f'(x_0)$ . This means  $\lim_{\Delta x \rightarrow 0} \eta$  must be 0.

The discussion above provides background for the definition of differentiability of a function of two variables.

**NOTE**  $\eta$  is the Greek letter eta.

DF Figure 37

**DEFINITION** Differentiability of  $z = f(x, y)$  at  $(x_0, y_0)$ 

Let  $z = f(x, y)$  be a function of two variables whose domain is  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$  and let  $\Delta x$  and  $\Delta y$  be chosen so that the point  $(x_0 + \Delta x, y_0 + \Delta y)$  is also in  $D$ . If the change  $\Delta z$  from  $(x_0, y_0)$  to  $(x_0 + \Delta x, y_0 + \Delta y)$  can be expressed in the form

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \eta_1\Delta x + \eta_2\Delta y \quad (2)$$

where both  $\eta_1$  and  $\eta_2$  are functions of  $\Delta x$  and  $\Delta y$  for which

$$\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_1 = 0 \quad \text{and} \quad \lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_2 = 0 \quad (3)$$

then  $z = f(x, y)$  is said to be **differentiable at the point**  $(x_0, y_0)$ .

If the domain  $D$  of a function  $z = f(x, y)$  is an open set and if  $z = f(x, y)$  is differentiable at every point of  $D$ , then we say  $f$  is **differentiable on  $D$** .

**EXAMPLE 2** Showing That a Function of Two Variables Is Differentiable

Show that  $z = f(x, y) = x^2y - 1$  is differentiable.

**Solution** The domain of  $f$  is the  $xy$ -plane and the partial derivatives of  $f$  are

$$f_x(x, y) = 2xy \quad \text{and} \quad f_y(x, y) = x^2$$

We find the change  $\Delta z$  in  $z$  and express it in the form of (2).

$$\begin{aligned} \Delta z &= [(x + \Delta x)^2(y + \Delta y) - 1] - [x^2y - 1] \\ &= [x^2 + 2x\Delta x + (\Delta x)^2](y + \Delta y) - x^2y \\ &= x^2\Delta y + 2xy\Delta x + 2x\Delta x\Delta y + y(\Delta x)^2 + (\Delta x)^2\Delta y \\ &= \underbrace{(2xy)}_{f_x(x, y)} \Delta x + \underbrace{(x^2)}_{f_y(x, y)} \Delta y + \underbrace{[y\Delta x]}_{\eta_1} \Delta x + \underbrace{[2x\Delta x + (\Delta x)^2]}_{\eta_2} \Delta y \\ &= f_x(x, y)\Delta x + f_y(x, y)\Delta y + \eta_1\Delta x + \eta_2\Delta y \end{aligned}$$

**NOTE** There are other ways to choose  $\eta_1$  and  $\eta_2$  so that equations (2) and (3) are satisfied.

Equation (2) is satisfied. It remains to show that equation (3) is satisfied.

$$\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_1 = \lim_{\Delta x \rightarrow 0} (y\Delta x) = 0 \quad \text{and} \quad \lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_2 = \lim_{\Delta x \rightarrow 0} [2x\Delta x + (\Delta x)^2] = 0$$

So,  $z = f(x, y)$  is differentiable on its domain. ■

**NOW WORK** Problem 29.

Although not every function  $z = f(x, y)$  is differentiable, there are conditions on a function  $z = f(x, y)$  that will guarantee it is differentiable.

**THEOREM** Continuous Partial Derivatives Are Sufficient for Differentiability

Let  $z = f(x, y)$  be a function of two variables whose domain is  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$ . If the partial derivatives  $f_x$  and  $f_y$  exist at each point of some disk centered at  $(x_0, y_0)$ , and if  $f_x$  and  $f_y$  are each continuous at  $(x_0, y_0)$ , then  $f$  is differentiable at  $(x_0, y_0)$ .

The proof of this result is given in Appendix B.

Now we are ready to define the differential  $dz$  of a function  $z = f(x, y)$ .

**DEFINITION** Differential  $dz$  of  $z = f(x, y)$ 

Let  $z = f(x, y)$  be a function of two variables whose domain is  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$  and let  $\Delta x$  and  $\Delta y$  be chosen so that the point  $(x_0 + \Delta x, y_0 + \Delta y)$  is also in  $D$ . If  $f$  is differentiable at the point  $(x_0, y_0)$ , then the **differentials**  $dx$  and  $dy$  are defined as

$$dx = \Delta x \quad \text{and} \quad dy = \Delta y$$

The **differential**  $dz$ , also called the **total differential** of  $z = f(x, y)$  at  $(x_0, y_0)$ , is defined as

$$dz = f_x(x_0, y_0) dx + f_y(x_0, y_0) dy$$

**EXAMPLE 3** Finding the Differential  $dz$  of  $z = f(x, y)$ 

Find the differential  $dz$  of each function:

(a)  $f(x, y) = e^x \cos y$       (b)  $f(x, y) = \frac{\ln x}{y}$

**Solution** (a)  $f$  is defined everywhere in the  $xy$ -plane. The partial derivatives of  $f$  are

$$f_x(x, y) = e^x \cos y \quad f_y(x, y) = -e^x \sin y$$

Since  $f_x$  and  $f_y$  are continuous everywhere in the  $xy$ -plane, the function  $z = f(x, y)$  is differentiable. The differential  $dz$  is

$$dz = e^x \cos y \, dx - e^x \sin y \, dy$$

(b) The domain of  $f$  is  $\{(x, y) \mid x > 0, y \neq 0\}$ . The partial derivatives of  $f$  are

$$f_x(x, y) = \frac{1}{xy} \quad f_y(x, y) = -\frac{\ln x}{y^2}$$

Since both partial derivatives exist and are continuous at every point  $(x_0, y_0)$  in the domain of  $f$ , the function  $z = f(x, y)$  is differentiable at every point  $(x_0, y_0)$  in its domain. The differential  $dz$  is

$$dz = \frac{1}{xy} dx - \frac{\ln x}{y^2} dy$$

**NOW WORK** Problem 11.

If  $z = f(x, y)$  is a differentiable function, then  $\Delta z$  can be expressed in terms of the differential  $dz$ .

$$\begin{aligned} \Delta z &= f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \eta_1\Delta x + \eta_2\Delta y \\ &= \underbrace{f_x(x_0, y_0)dx + f_y(x_0, y_0)dy}_{dz} + \eta_1\Delta x + \eta_2\Delta y \end{aligned}$$

$\uparrow$   
 $dx = \Delta x$   
 $dy = \Delta y$

$$\Delta z = dz + \eta_1\Delta x + \eta_2\Delta y$$

where  $\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_1 = 0$  and  $\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_2 = 0$ .

When the differentials  $dx = \Delta x$  and  $dy = \Delta y$  are close to 0, then  $\eta_1$  and  $\eta_2$  are also close to 0, and the differential  $dz$  is approximately equal to  $\Delta z$ . That is,

$$\Delta z \approx dz = f_x(x_0, y_0) dx + f_y(x_0, y_0) dy \quad (4)$$

The differential  $dz$  is usually easier to calculate than  $\Delta z$ , making  $dz$  a useful approximation to  $\Delta z$ . The error introduced in using  $dz$  to approximate  $\Delta z$  equals the expression  $\eta_1\Delta x + \eta_2\Delta y$ .

### 3 Use the Differential $dz$ to Approximate a Change in $z$

#### EXAMPLE 4 Using the Differential $dz$ to Approximate the Change in $z$

For the function  $z = f(x, y) = x^2y - 1$ , use the differential  $dz$  to approximate the change in  $z$  from  $(1, 2)$  to  $(1.1, 1.9)$ .

**Solution** Example 2 shows  $f$  is differentiable and  $f_x(x, y) = 2xy$  and  $f_y(x, y) = x^2$ .

Let  $(x_0, y_0) = (1, 2)$  and  $(x_0 + \Delta x, y_0 + \Delta y) = (1.1, 1.9)$ . Then

$$dx = \Delta x = 1.1 - 1 = 0.1, \text{ and } dy = \Delta y = 1.9 - 2 = -0.1.$$

Using (4), an approximation to the change in  $z$  is

$$\Delta z \approx dz = f_x(1, 2)dx + f_y(1, 2)dy = 2(1)(2)(0.1) + (1)(-0.1) = 0.4 - 0.1 = 0.3$$

The actual change in  $z$  was computed in Example 1 to be 0.299, so using the differential  $dz$  to approximate  $\Delta z$  results in an error of 0.001.

#### NOW WORK Problem 33.

#### EXAMPLE 5 Using the Differential in Astronomy

The luminosity  $L$  (total power output in watts, W) of a star is given by the formula

$$L = L(R, T) = 4\pi R^2 \sigma T^4$$

where  $R$  is the radius of the star (in meters),  $T$  is its effective surface temperature (in kelvin, K), and  $\sigma$  is the **Stefan–Boltzmann constant**. For the sun,  $L_s = (3.90 \times 10^{26})$  W,  $R_s = (6.94 \times 10^8)$  m, and  $T_s = 4800$  K. Suppose in a billion years, the changes in the Sun will be  $\Delta R_s = (0.08 \times 10^8)$  m and  $\Delta T_s = 100$  K. What will be the resulting percent increase in luminosity?

**Solution** We begin with  $L = 4\pi R^2 \sigma T^4$ . Then

$$dL = 4\pi \sigma (2R)T^4 dR + 4\pi \sigma R^2 (4T^3) dT = 8\pi \sigma RT^3 (TdR + 2RdT)$$

The relative error in luminosity is

$$\begin{aligned} \frac{\Delta L}{L} &\approx \frac{dL}{L} = \frac{8\pi \sigma RT^3}{4\pi R^2 \sigma T^4} (TdR + 2RdT) = 2 \left( \frac{dR}{R} + 2 \frac{dT}{T} \right) = 2 \frac{\Delta R}{R} + 4 \frac{\Delta T}{T} \\ &= \frac{2(0.08 \times 10^8)}{6.94 \times 10^8} + \frac{4(100)}{4800} \approx 0.106 \end{aligned}$$

The percent increase in luminosity will be approximately 10.6%. ■

Incidentally, a reasonable, although rough, estimate of how this change would affect Earth's temperature is

$$\Delta T_e \approx \left( \frac{1}{4} \right) (0.106) T_e = (0.0265)(290 \text{ K}) \approx 7.69 \text{ K}$$

That is, the average temperature of Earth's surface will change from  $16.9^\circ \text{C}$  ( $62.4^\circ \text{F}$ ) to  $24.6^\circ \text{C}$  ( $76.3^\circ \text{F}$ ). Such a change in temperature would be enough to modify Earth's climate.

#### EXAMPLE 6 Using the Differential in Error Analysis

A cola company requires a can in the shape of a right circular cylinder of height 10 cm and radius 3 cm. If the manufacturer of the cans claims a percentage error of no more than 0.2% in the height and no more than 0.1% in the radius, what is the approximate maximum variation in the volume of the can?

**Solution** The volume  $V$  of a right circular cylinder of height  $h$  cm and radius  $R$  cm is  $V = \pi R^2 h$  cm<sup>3</sup>. We find the differential  $dV$ .

$$dV = \frac{\partial V}{\partial R} dR + \frac{\partial V}{\partial h} dh = 2\pi R h dR + \pi R^2 dh$$

The relative error in the radius  $R$  is  $\frac{|\Delta R|}{R} = \frac{|dR|}{R} = 0.001$ , and the relative error in the height  $h$  is  $\frac{|\Delta h|}{h} = \frac{|dh|}{h} = 0.002$ . The relative error in the volume  $V$  is

$$\begin{aligned} \frac{|\Delta V|}{V} &\approx \frac{|dV|}{V} = \frac{|2\pi R h dR + \pi R^2 dh|}{\pi R^2 h} = \left| 2 \frac{dR}{R} + \frac{dh}{h} \right| \\ &= \left| 2 \frac{\Delta R}{R} + \frac{\Delta h}{h} \right| \leq 2 \frac{|\Delta R|}{R} + \frac{|\Delta h|}{h} \\ &= 2(0.001) + 0.002 = 0.004 \end{aligned}$$

The maximum variation in the volume is approximately 0.4%, so the actual volume of the container varies as follows:

$$V = \pi R^2 h \pm 0.004(\pi R^2 h) = \pi R^2 h(1 \pm 0.004) = 90\pi(1 \pm 0.004) \text{ cm}^3$$

The volume  $V$  is between  $89.64\pi \approx 281.612 \text{ cm}^3$  and  $90.36\pi \approx 283.874 \text{ cm}^3$ . ■

### NOW WORK Problem 39.

## Continuity and Differentiability for Functions of Two Variables

Differentiable functions of a single variable are necessarily continuous. This result is also true for functions of two variables.

### THEOREM Differentiability Is Sufficient for Continuity

Let  $z = f(x, y)$  be a function of two variables whose domain is  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$ . If  $f$  is differentiable at  $(x_0, y_0)$ , then  $f$  is continuous at  $(x_0, y_0)$ .

**Proof** The function  $z = f(x, y)$  is continuous at  $(x_0, y_0)$  if  $\lim_{(x,y) \rightarrow (x_0,y_0)} f(x, y) = f(x_0, y_0)$ . This is equivalent to the statement  $\lim_{(x,y) \rightarrow (x_0,y_0)} \Delta z = 0$ . Since  $z = f(x, y)$  is differentiable at  $(x_0, y_0)$ , then  $\Delta z$  can be expressed as

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \eta_1\Delta x + \eta_2\Delta y$$

where  $\lim_{(\Delta x, \Delta y) \rightarrow (0,0)} \eta_1 = 0$  and  $\lim_{(\Delta x, \Delta y) \rightarrow (0,0)} \eta_2 = 0$ . Then

$$\Delta z = [f_x(x_0, y_0) + \eta_1] \Delta x + [f_y(x_0, y_0) + \eta_2] \Delta y$$

Now let  $\Delta x = x - x_0$  and  $\Delta y = y - y_0$ . Then  $(\Delta x, \Delta y) \rightarrow (0, 0)$  is equivalent to  $(x, y) \rightarrow (x_0, y_0)$  and

$$\begin{aligned} \lim_{(x,y) \rightarrow (x_0,y_0)} \Delta z &= \lim_{(x,y) \rightarrow (x_0,y_0)} \{[f_x(x_0, y_0) + \eta_1](x - x_0) \\ &\quad + [f_y(x_0, y_0) + \eta_2](y - y_0)\} = 0 \end{aligned}$$

That is,  $f$  is continuous at  $(x_0, y_0)$ . ■

For functions of two variables, differentiability implies continuity. However, the existence of partial derivatives at a point does not necessarily result in continuity at that point because  $f_x$  and/or  $f_y$  might not be continuous at the point. For example, the function

$$f(x, y) = \begin{cases} \frac{xy}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$$

has partial derivatives at  $(0, 0)$ , but as shown in Example 8 on page 835,  $f$  is not continuous at  $(0, 0)$ .

A function that is differentiable at  $(x_0, y_0)$  is continuous at  $(x_0, y_0)$ . So, a function that is not continuous at  $(x_0, y_0)$  is not differentiable at  $(x_0, y_0)$ .

The following corollary provides a condition for  $z = f(x, y)$  to be continuous.

### COROLLARY Continuity of a Function of Two Variables

Let  $z = f(x, y)$  be a function of two variables whose domain is  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$ . If the partial derivatives  $f_x$  and  $f_y$  exist at each point of some disk centered at  $(x_0, y_0)$ , and if  $f_x$  and  $f_y$  are each continuous at  $(x_0, y_0)$ , then  $f$  is continuous at  $(x_0, y_0)$ .

Although the precise formulations are given as theorems, the following summary might be helpful:

If  $z = f(x, y)$ ,

- The continuity of the partial derivatives  $f_x$  and  $f_y$  implies the differentiability of  $f$ .
- The differentiability of  $f$  implies the continuity of  $f$ .
- The continuity of the partial derivatives  $f_x$  and  $f_y$  implies the continuity of  $f$ .
- The existence of the partial derivatives  $f_x$  and  $f_y$  does not necessarily mean  $f$  is differentiable.
- The existence of the partial derivatives  $f_x$  and  $f_y$  does not necessarily mean  $f$  is continuous.

## 4 Find the Differential of a Function of Three or More Variables

Under suitable conditions, the definitions and theorems involving the differentiability of a function of two variables extend to functions of three or more variables. If  $w = f(x, y, z)$  is a function of three variables, the function  $f$  is **differentiable** at a point  $(x_0, y_0, z_0)$  if the change  $\Delta w$  in  $w$  can be expressed in the form

$$\Delta w = f_x(x, y, z)\Delta x + f_y(x, y, z)\Delta y + f_z(x, y, z)\Delta z + \eta_1\Delta x + \eta_2\Delta y + \eta_3\Delta z$$

where  $\eta_1$ ,  $\eta_2$ , and  $\eta_3$  are each functions of  $\Delta x$ ,  $\Delta y$ , and  $\Delta z$  for which

$$\lim_{(\Delta x, \Delta y, \Delta z) \rightarrow (0, 0, 0)} \eta_1 = 0 \quad \text{and} \quad \lim_{(\Delta x, \Delta y, \Delta z) \rightarrow (0, 0, 0)} \eta_2 = 0 \quad \text{and} \quad \lim_{(\Delta x, \Delta y, \Delta z) \rightarrow (0, 0, 0)} \eta_3 = 0$$

If  $w = f(x, y, z)$  is differentiable at a point  $(x_0, y_0, z_0)$ , the differentials  $dx$ ,  $dy$ , and  $dz$  are defined as

$$dx = \Delta x \quad dy = \Delta y \quad dz = \Delta z$$

The **differential**  $dw$  is defined as

$$dw = f_x(x_0, y_0, z_0) dx + f_y(x_0, y_0, z_0) dy + f_z(x_0, y_0, z_0) dz$$

It can be shown that if  $w = f(x, y, z)$  is defined within a ball centered at  $(x_0, y_0, z_0)$ , and if the partial derivatives  $f_x$ ,  $f_y$ , and  $f_z$  exist in this ball and are continuous at  $(x_0, y_0, z_0)$ , then  $f$  is differentiable at  $(x_0, y_0, z_0)$ .

### EXAMPLE 7 Finding the Differential of a Function of Three Variables

Find the differential  $dw$  of the function  $w = f(x, y, z) = 3x^2 \sin^2 y \cos z$ .

**Solution** The function  $f$  is defined everywhere in space. We begin by finding the partial derivatives of  $f$ .

$$\begin{aligned} f_x(x, y, z) &= 6x \sin^2 y \cos z & f_y(x, y, z) &= 6x^2 \sin y \cos y \cos z \\ f_z(x, y, z) &= -3x^2 \sin^2 y \sin z \end{aligned}$$

Since the partial derivatives are continuous everywhere, we have

$$\begin{aligned} dw &= f_x(x, y, z) dx + f_y(x, y, z) dy + f_z(x, y, z) dz \\ &= 6x \sin^2 y \cos z dx + 6x^2 \sin y \cos y \cos z dy - 3x^2 \sin^2 y \sin z dz \end{aligned}$$

### NOW WORK Problem 23.

The discussion above extends to functions of more than three variables in an analogous way.

## 12.4 Assess Your Understanding

### Concepts and Vocabulary

- True or False** If  $z = x \sin y$ , then the change in  $z$  from  $(0.9, 0)$  to  $\left(1, \frac{\pi}{4}\right)$  is  $\Delta z = \sin \frac{\pi}{4} - 0.9 \sin 0 = \frac{\sqrt{2}}{2}$ .
- True or False** If  $f_x(x, y) = -\frac{y^2}{1-x}$  and  $f_y(x, y) = 2y \ln(1-x)$ , then  $f$  is differentiable at  $(0, 2)$ .
- True or False** Let  $z = f(x, y) = e^x \cos y$ . Then the differential  $dz$  of  $z$  at  $\left(0, \frac{\pi}{2}\right)$  is  $dz = -dy$ .
- True or False** If the partial derivatives of a function  $z = f(x, y)$  are  $f_x(x, y) = 2x + y$  and  $f_y(x, y) = x$ , then  $f$  is continuous.
- True or False** If the partial derivatives of a function  $z = f(x, y)$  are  $f_x(x, y) = 2x + y$  and  $f_y(x, y) = x$ , then  $f$  is differentiable.
- True or False** If  $w = f(x, y, z) = e^{xyz}$ , then  $dw = yze^x dx + xze^y dy + xye^z dz$ .

### Skill Building

In Problems 7–10, for each function  $z = f(x, y)$ , find the change in  $z$ .

- $z = x^2 + y^2$  from  $(1, 3)$  to  $(1.1, 3.2)$
- $z = 2x^2 + xy - y^2$  from  $(2, -1)$  to  $(2.1, -1.1)$
- $z = e^x \ln(xy)$  from  $(1, 2)$  to  $(0.9, 2.1)$
- $z = \frac{xy}{x+y}$  from  $(-1, 2)$  to  $(-0.9, 1.9)$

In Problems 11–22, find the differential  $dz$  of each function.

- $z = x^2 + y^2$
- $z = 2x^2 + xy - y^2$
- $z = x \sin y + y \sin x$
- $z = e^x \cos y + e^{-x} \sin y$
- $z = \tan^{-1} \frac{y}{x}$
- $z = x \tan^{-1} y$
- $z = \ln \frac{y}{x}$
- $z = \ln(x^2 + y^2)$
- $z = e^{xy}$
- $z = e^{x^2+y}$
- $z = x^2y + e^{y^2}$
- $z = xy^3 - \ln x^2$

In Problems 23–28, find the differential  $dw$  of each function.

- $w = xe^{yz} + ye^{xz} + ze^{xy}$
- $w = x^2y + y^2z + z^2x$
- $w = \ln(x^2 + y^2 + z^2)$
- $w = \ln(xy) + \ln(xz) + \ln(yz)$

$$27. w = xyz$$

$$28. w = \frac{xyz}{x+y+z}$$

In Problems 29–32, show that the function  $z = f(x, y)$  is differentiable at any point  $(x_0, y_0)$  in its domain by:

- Finding  $\Delta z$ .
- Finding  $\eta_1$  and  $\eta_2$  so that  $\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \eta_1\Delta x + \eta_2\Delta y$  holds.
- Showing that  $\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_1 = 0$  and  $\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_2 = 0$ .

$$29. z = f(x, y) = xy^2 - 2xy \quad 30. z = f(x, y) = 3x^2 + y^2$$

$$31. z = f(x, y) = \frac{y}{x} \quad 32. z = f(x, y) = \frac{2x}{y}$$

- Use a differential to approximate the change in  $z = x^2 + y^2$  from  $(1, 3)$  to  $(1.1, 3.2)$ .
  - Compare the answer in (a) with the actual change in  $z$  found in Problem 7.
- Use a differential to approximate the change in  $z = 2x^2 + xy - y^2$  from  $(2, -1)$  to  $(2.1, -1.1)$ .
  - Compare the answer in (a) with the actual change in  $z$  found in Problem 8.
- Use a differential to approximate the change in  $z = e^x \ln(xy)$  from  $(1, 2)$  to  $(0.9, 2.1)$ .
  - Compare the answer in (a) with the actual change in  $z$  found in Problem 9.
- Use a differential to approximate the change in  $z = \frac{xy}{x+y}$  from  $(-1, 2)$  to  $(-0.9, 1.9)$ .
  - Compare the answer in (a) with the actual change in  $z$  found in Problem 10.

### Applications and Extensions

- Area of a Triangle** Approximate the increase in the area of a triangle if its base is increased from 2 to 2.05 cm and its height is increased from 5 to 5.1 cm.
- Area of a Triangle** Approximate the change in the area of a triangle if the base is increased from 5 to 5.1 cm and the height is decreased from 10 to 9.8 cm.

### 39. Volume and Surface Area of a Cylinder

- Use a differential to approximate the change in the volume of a right circular cylinder if the height changes from 2 to 2.1 cm and the radius changes from 0.5 to 0.49 cm.

- (b) Approximate the change in the surface area of the cylinder. Assume that the cylinder is closed on the top and on the bottom.

**40. Electricity** In a parallel circuit, the total resistance  $R$  due to two sources of resistance  $R_1$  and  $R_2$  is given by  $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$ .

If  $R_1 = 50 \Omega$  with a possible error of 1.2% and  $R_2 = 75 \Omega$  with a possible error of 1%, what is the approximate maximum variation in the total resistance?

**41. Specific Gravity** The specific gravity of an object is defined as  $s = \frac{a}{a-w}$ , where  $a$  is the weight of the object in the air and  $w$  is its weight in water. If  $a$  is found to be 6 lb with a possible error of 1% and  $w$  is 5 lb with a possible error of 2%, what is the approximate maximum variation in the specific gravity?

**42. Volume** A grain silo consists of a hemisphere mounted on a cylinder of the same radius (see the figure). The height and radius of the cylinder are measured as 14 m and 5 m, respectively. However, the device used to make this measurement was found to be in error by 1%. What is the approximate maximum variation in the volume of the silo?

**43. Snell's Law** The index of refraction is defined as  $\mu = \frac{\sin i}{\sin r}$ , where  $i$  is the angle of incidence and  $r$  is the angle of refraction. If  $i = 30^\circ$  and  $r = 60^\circ$ , and each measurement is subject to a possible error of 2%, what is the approximate maximum relative error for  $\mu$ ?

**44. Ideal Gas Law** The equation  $PV = kT$ , where  $k$  is a constant, relates the pressure  $P$ , volume  $V$ , and temperature  $T$  of one mole of an ideal gas. If  $P = 0.1 \text{ g/mm}^2$ ,  $V = 12 \text{ mm}^3$ , and  $T = 32^\circ\text{C}$ , approximate the change in  $P$  if  $V$  and  $T$  change to  $15 \text{ mm}^3$  and  $29^\circ\text{C}$ , respectively.

**45. Determining Density** In a laboratory experiment, the average density  $\rho$  of a spherical object is computed by measuring the mass  $m$  and diameter  $d$  of the sphere. In all empirical measurements, there is error caused by the inaccuracy of the tool, the scientist, or both. Suppose the experimental measurements are  $m = 24.0 \text{ g} \pm 1\%$  and  $d = 1.5 \text{ cm} \pm 5.0\%$ .

- Find the approximate maximum error in the computed density.
- Find the approximate maximum percentage error in the computed density.

**46. Geometry** Two sides,  $b$  and  $c$ , and the included angle  $\alpha$  of a triangle are measured by a ruler (for sides) and protractor (for angles), which are subject to errors of 2% and 3%, respectively. The area of the triangle is then computed from the formula

$$A = \frac{1}{2}bc \sin \alpha$$

(a) Show that  $\frac{dA}{A} = \frac{db}{b} + \frac{dc}{c} + \cot \alpha d\alpha$ .

(b) If  $\alpha = \frac{\pi}{4}$ , what is the approximate maximum relative variation in the computation of  $A$ ?

**47. (a)** Find the partial derivatives  $f_x$  and  $f_y$  of the function  $f(x, y) = \sqrt{x^2 + y^2 - 2x - 6y + 10}$ .

(b) Determine where the partial derivatives are continuous.

**(CAS) (c)** Graph the surface  $f(x, y) = \sqrt{x^2 + y^2 - 2x - 6y + 10}$ .

(d) Use the graph to give a geometric interpretation to the discontinuity found in (b).

**48.** If  $x = r \cos \theta$  and  $y = r \sin \theta$ , show that  $x dy - y dx = r^2 d\theta$ .

In Problems 49 and 50, show that each function  $f$  has partial derivatives at  $(0, 0)$ . Also show that  $f$  is not continuous at  $(0, 0)$ . Is  $f$  differentiable at  $(0, 0)$ ? Explain.

**49.** Let  $f(x, y) = \begin{cases} \frac{2xy}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$ .

**50.** Let  $f(x, y) = \begin{cases} \frac{xy(1 + y^2)}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$ .

**51.** Let  $f(x, y) = \begin{cases} \frac{xy - 1}{x^2 + y^2 - 2} & \text{if } x^2 + y^2 \neq 2 \\ \frac{1}{2} & \text{if } x^2 + y^2 = 2 \end{cases}$ .

Show that  $f_x(1, 1)$  and  $f_y(1, 1)$  each exist, but  $f$  is not differentiable at  $(1, 1)$ .

**52.** Let  $f(x, y) = \begin{cases} \frac{x^2 y^2}{x^4 + y^4} & \text{if } (x, y) \neq (0, 0) \\ 0 & \text{if } (x, y) = (0, 0) \end{cases}$ .

Show that  $f_x(0, 0)$  and  $f_y(0, 0)$  each exist, but  $f$  is not differentiable at  $(0, 0)$ .

## Challenge Problems

**53. Electrical Resistance** The electrical resistance  $R$  of a wire is

given by  $R = \frac{\rho L}{A}$ , where  $L$  is the length of the wire,  $A$  is its

cross-sectional area, and  $\rho$  is the resistivity of the wire. If the temperature of the wire increases by  $\Delta T$ , the wire expands so  $L$  and  $A$  change. The resistivity  $\rho$  also changes. The change in the length  $L$  is given by  $\Delta L = L_0 \alpha \Delta T$ , the change in the radius  $r$  is  $\Delta r = r_0 \alpha \Delta T$ , and the change in the resistivity  $\rho$  is  $\Delta \rho = \rho_0 K \Delta T$ , where  $\alpha$  and  $K$  are constants that depend on the material being heated,  $L_0$  is the initial length,  $r_0$  is the initial radius, and  $\rho_0$  is the initial resistivity.

A copper wire with a circular cross-sectional area  $A$  has a resistance  $R$  of  $0.50 \Omega$  at  $0^\circ\text{C}$ . But suppose the temperature of the wire increases to  $40^\circ\text{C}$  from the heat generated by the current passing through the wire. For copper,  $\alpha = 5.1 \times 10^{-5} (^\circ\text{C})^{-1}$  and  $K = 3.93 \times 10^{-3} (^\circ\text{C})^{-1}$ .

- Find the resistance  $R$  of the wire at  $40^\circ\text{C}$ .
- Find the percent change in the resistance  $R$  of the wire caused by the change in temperature.
- Which effect contributes more to the change in resistance: the expansion of the wire or the increase in the resistivity?

**54. (a)** Find the differential of  $f(x, y, z) = x^{y^z}$ .

(b) Find the differential of  $g(x, y, z) = (x^y)^z$ .

## 12.5 Chain Rules

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Differentiate functions of two or more variables where each variable is a function of a single variable (p. 849)
- 2 Differentiate functions of two or more variables where each variable is a function of two or more variables (p. 851)
- 3 Differentiate an implicitly-defined function of two or more variables (p. 853)
- 4 Use a Chain Rule in a proof (p. 855)

### 1 Differentiate Functions of Two or More Variables Where Each Variable Is a Function of a Single Variable

**NEED TO REVIEW?** The Chain Rule is discussed in Section 3.1, pp. 198–205.

Recall that the Chain Rule is used to find the derivative of a composite function. For functions of two or more variables, there are several versions of the Chain Rule. The first Chain Rule is used when the independent variables are each a function of a single variable  $t$ . For example, for the function  $z = f(x, y)$  of two variables, if  $x = x(t)$  and  $y = y(t)$ , then the composite function  $z = f(x(t), y(t))$  is a function of a single independent variable  $t$ .

#### THEOREM Chain Rule I: One Independent Variable

If  $x = x(t)$  and  $y = y(t)$  are differentiable functions of  $t$ , and if  $z = f(x, y)$  is a differentiable function of  $x$  and  $y$ , then  $z = f(x(t), y(t))$  is a differentiable function of  $t$ . Moreover,

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt}$$

**Proof** Since  $\frac{dz}{dt} = \lim_{\Delta t \rightarrow 0} \frac{\Delta z}{\Delta t}$ , we seek an expression for  $\Delta z$ . Since  $z = f(x, y)$  is differentiable, the change  $\Delta z$  is

$$\Delta z = \frac{\partial z}{\partial x} \Delta x + \frac{\partial z}{\partial y} \Delta y + \eta_1 \Delta x + \eta_2 \Delta y$$

where  $\eta_1$  and  $\eta_2$  are functions of  $\Delta x$  and  $\Delta y$  and  $\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_1 = 0$  and  $\lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_2 = 0$ . Next we divide both sides by  $\Delta t$ .

$$\frac{\Delta z}{\Delta t} = \frac{\partial z}{\partial x} \frac{\Delta x}{\Delta t} + \frac{\partial z}{\partial y} \frac{\Delta y}{\Delta t} + \eta_1 \frac{\Delta x}{\Delta t} + \eta_2 \frac{\Delta y}{\Delta t}$$

Then

$$\frac{dz}{dt} = \lim_{\Delta t \rightarrow 0} \frac{\Delta z}{\Delta t} = \lim_{\Delta t \rightarrow 0} \left[ \frac{\partial z}{\partial x} \frac{\Delta x}{\Delta t} + \frac{\partial z}{\partial y} \frac{\Delta y}{\Delta t} + \eta_1 \frac{\Delta x}{\Delta t} + \eta_2 \frac{\Delta y}{\Delta t} \right]$$

In the right-hand expression,  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  are evaluated at  $(x(t), y(t))$  and do not depend on  $\Delta t$ . Also, since  $x = x(t)$  and  $y = y(t)$  are differentiable,

$$\lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} = \frac{dx}{dt} \quad \text{and} \quad \lim_{\Delta t \rightarrow 0} \frac{\Delta y}{\Delta t} = \frac{dy}{dt}$$

Furthermore, as  $\Delta t \rightarrow 0$ , then  $(\Delta x, \Delta y) \rightarrow (0, 0)$ , so that  $\eta_1 \rightarrow 0$  and  $\eta_2 \rightarrow 0$ . Putting this all together, we get

$$\begin{aligned} \frac{dz}{dt} &= \frac{\partial z}{\partial x} \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} + \frac{\partial z}{\partial y} \lim_{\Delta t \rightarrow 0} \frac{\Delta y}{\Delta t} + \lim_{\Delta t \rightarrow 0} \eta_1 \cdot \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} + \lim_{\Delta t \rightarrow 0} \eta_2 \cdot \lim_{\Delta t \rightarrow 0} \frac{\Delta y}{\Delta t} \\ &= \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt} + 0 \cdot \frac{dx}{dt} + 0 \cdot \frac{dy}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt} \end{aligned}$$

Figure 38  $\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt}$

The tree diagram in Figure 38 may help you to remember the form of Chain Rule I.

### EXAMPLE 1 Differentiating a Function of Two Variables Where Each Variable Is a Function of $t$

Let  $z = x^2y - y^2x$ , where  $x = \sin t$  and  $y = e^t$ . Find  $\frac{dz}{dt}$ .

**Solution** We begin by finding the partial derivatives of  $z$ ,  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$ , and the derivatives  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$ .

$$\frac{\partial z}{\partial x} = 2xy - y^2 \quad \frac{\partial z}{\partial y} = x^2 - 2xy \quad \frac{dx}{dt} = \cos t \quad \frac{dy}{dt} = e^t$$

Then we use Chain Rule I to find  $\frac{dz}{dt}$ .

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt} = (2xy - y^2)(\cos t) + (x^2 - 2xy)(e^t) \quad (1)$$

↑  
Chain Rule I

Since  $z$  is a function of  $t$ , we express  $\frac{dz}{dt}$  in terms of  $t$ .

$$\begin{aligned} \frac{dz}{dt} &= (2e^t \sin t - e^{2t})(\cos t) + (\sin^2 t - 2e^t \sin t)(e^t) & x = \sin t, y = e^t \\ &= e^t[\sin(2t) - e^t \cos t + \sin^2 t - 2e^t \sin t] & 2 \sin t \cos t = \sin(2t) \end{aligned} \quad (2)$$

When  $\frac{dz}{dt}$  is expressed in terms of  $x$ ,  $y$ , and  $t$ , as in (1), we say it is expressed in

**mixed form**. When  $\frac{dz}{dt}$  is expressed in terms of  $t$  alone, as in (2), we say it is in **final form**. When computations become involved, we will leave our answers in mixed form.

#### NOW WORK Problem 3.

### EXAMPLE 2 Differentiating a Function of Two Variables Where Each Variable Is a Function of $t$

Let  $z = e^x \sin y$ , where  $x = e^t$  and  $y = \frac{\pi}{3}e^{-t}$ . Find  $\frac{dz}{dt}$  when  $t = 0$ .

**Solution** We begin by finding the partial derivatives of  $z$ ,  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$ , and the derivatives  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$ .

$$\frac{\partial z}{\partial x} = e^x \sin y \quad \frac{\partial z}{\partial y} = e^x \cos y \quad \frac{dx}{dt} = e^t \quad \frac{dy}{dt} = -\frac{\pi}{3}e^{-t}$$

Then we use Chain Rule I to find  $\frac{dz}{dt}$ .

$$\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt} = (e^x \sin y)e^t + (e^x \cos y)\left(-\frac{\pi}{3}e^{-t}\right)$$

↑  
Chain Rule I

We can stop here and evaluate  $\frac{dz}{dt}$ . When  $t = 0$ , then  $x = e^0 = 1$  and  $y = \frac{\pi}{3}e^0 = \frac{\pi}{3}$ . So, when  $t = 0$ ,

$$\frac{dz}{dt} = \left(e \sin \frac{\pi}{3}\right)(1) + \left(e \cos \frac{\pi}{3}\right)\left(-\frac{\pi}{3}\right) = \frac{e\sqrt{3}}{2} - \frac{\pi e}{6} = \frac{e}{6}(3\sqrt{3} - \pi)$$

#### NOW WORK Problem 9.

Chain Rule I can be extended to functions of three or more variables, where each of these variables is a function of a single variable  $t$ . If  $z = f(x_1, x_2, \dots, x_n)$  is differentiable and each variable  $x_i = x_i(t)$ ,  $i = 1, 2, \dots, n$ , is a differentiable function of  $t$ , then

$$\frac{dz}{dt} = \frac{\partial z}{\partial x_1} \frac{dx_1}{dt} + \frac{\partial z}{\partial x_2} \frac{dx_2}{dt} + \cdots + \frac{\partial z}{\partial x_n} \frac{dx_n}{dt}$$

where each of the partial derivatives  $\frac{\partial z}{\partial x_1}, \dots, \frac{\partial z}{\partial x_n}$  is expressed in terms of  $t$ .

### EXAMPLE 3 Differentiating a Function of Three Variables Where Each Variable Is a Function of $t$

If  $w = x^2y + y^2z$ , where  $x = t$ ,  $y = t^2$ , and  $z = t^3$ , then  $w$  is a function of  $t$ , and

$$\begin{aligned} \frac{dw}{dt} &= \frac{\partial w}{\partial x} \frac{dx}{dt} + \frac{\partial w}{\partial y} \frac{dy}{dt} + \frac{\partial w}{\partial z} \frac{dz}{dt} = \underbrace{(2xy)}_{\frac{\partial w}{\partial x}} \underbrace{(1)}_{\frac{dx}{dt}} + \underbrace{(x^2 + 2yz)}_{\frac{\partial w}{\partial y}} \underbrace{(2t)}_{\frac{dy}{dt}} + \underbrace{(y^2)}_{\frac{\partial w}{\partial z}} \underbrace{(3t^2)}_{\frac{dz}{dt}} \\ &= 2t^3 + (t^2 + 2t^5)(2t) + (t^4)(3t^2) = 7t^6 + 4t^3 \end{aligned}$$

### NOW WORK Problem 17.

## 2 Differentiate Functions of Two or More Variables Where Each Variable is a Function of Two or More Variables

A second version of the Chain Rule is used for differentiating  $z = f(x, y)$ , where  $x$  and  $y$  are each functions of two independent variables  $u$  and  $v$ . For example, if  $x = g(u, v)$  and  $y = h(u, v)$ , then the composite function  $z = f(x, y) = f(g(u, v), h(u, v))$  is a function of the two variables  $u$  and  $v$ . We seek the partial derivatives  $\frac{\partial z}{\partial u}$  and  $\frac{\partial z}{\partial v}$ .

### THEOREM Chain Rule II: Two Independent Variables

Let  $z = f(g(u, v), h(u, v))$  be the composite of  $z = f(x, y)$ , where  $x = g(u, v)$  and  $y = h(u, v)$ . If  $g$  and  $h$  are each continuous and have continuous first-order partial derivatives at a point  $(u, v)$  in the interior of the domains of both  $g$  and  $h$ , and if  $f$  is differentiable in some disk centered at the point  $(x, y) = (g(u, v), h(u, v))$ , then

$$\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u} \quad \text{and} \quad \frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v}$$

**Proof** To find  $\frac{\partial z}{\partial u}$ , we hold  $v$  fixed. Then  $x = g(u, v)$  and  $y = h(u, v)$  are functions of  $u$  alone, and we can use Chain Rule I. Then  $\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{dx}{du} + \frac{\partial z}{\partial y} \frac{dy}{du}$ . Now replace  $\frac{dx}{du}$

with  $\frac{\partial x}{\partial u}$ , and replace  $\frac{dy}{du}$  with  $\frac{\partial y}{\partial u}$ .

A similar argument is used for finding  $\frac{\partial z}{\partial v}$ . ■

The tree diagrams in Figures 39 and 40 on page 852 may help you remember the form of Chain Rule II.

Figure 39  $\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u}$

Figure 40  $\frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v}$

### EXAMPLE 4 Differentiating a Function of Two Variables Where Each Variable Is a Function of Two Variables

Find  $\frac{\partial z}{\partial u}$  and  $\frac{\partial z}{\partial v}$  if  $z = f(x, y) = x^2 + xy - y^2$  and  $x = e^{2u+v}$  and  $y = \ln \frac{v}{u}$ .

**Solution** The function  $z = f(x, y)$  is a composite function of two independent variables  $u$  and  $v$ . So, we use Chain Rule II.

$$\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u}$$

Since

$$\frac{\partial z}{\partial x} = 2x + y \quad \frac{\partial z}{\partial y} = x - 2y \quad \frac{\partial x}{\partial u} = 2e^{2u+v} \quad \frac{\partial y}{\partial u} = \frac{\partial}{\partial u}(\ln v - \ln u) = -\frac{1}{u}$$

we have

$$\begin{aligned} \frac{\partial z}{\partial u} &= \underbrace{(2x + y)}_{\frac{\partial z}{\partial x}} \underbrace{(2e^{2u+v})}_{\frac{\partial x}{\partial u}} + \underbrace{(x - 2y)}_{\frac{\partial z}{\partial y}} \underbrace{\left(-\frac{1}{u}\right)}_{\frac{\partial y}{\partial u}} \\ &= \left(2e^{2u+v} + \ln \frac{v}{u}\right)(2e^{2u+v}) - \left(e^{2u+v} - 2 \ln \frac{v}{u}\right)\left(\frac{1}{u}\right) \quad x = e^{2u+v}; y = \ln \frac{v}{u} \end{aligned}$$

Similarly, since  $\frac{\partial x}{\partial v} = e^{2u+v}$  and  $\frac{\partial y}{\partial v} = \frac{1}{v}$ , we have

$$\begin{aligned} \frac{\partial z}{\partial v} &= \underbrace{(2x + y)}_{\frac{\partial z}{\partial x}} \underbrace{(e^{2u+v})}_{\frac{\partial x}{\partial v}} + \underbrace{(x - 2y)}_{\frac{\partial z}{\partial y}} \underbrace{\left(\frac{1}{v}\right)}_{\frac{\partial y}{\partial v}} \\ &= \left(2e^{2u+v} + \ln \frac{v}{u}\right)(e^{2u+v}) + \left(e^{2u+v} - 2 \ln \frac{v}{u}\right)\left(\frac{1}{v}\right) \quad x = e^{2u+v}; y = \ln \frac{v}{u} \quad \blacksquare \end{aligned}$$

Notice that since  $z$  is a function of  $u$  and  $v$ , the final form of  $\frac{\partial z}{\partial u}$  and  $\frac{\partial z}{\partial v}$  is expressed in terms of only  $u$  and  $v$ .

### NOW WORK Problem 31.

The form of Chain Rule II stays the same if  $z$  is a function of  $m \geq 3$  variables. That is, if  $z = f(x_1, x_2, \dots, x_m)$  is a differentiable function, and if each of the variables  $x_1 = g_1(u_1, u_2, \dots, u_n)$ ,  $x_2 = g_2(u_1, u_2, \dots, u_n)$ ,  $\dots$ ,  $x_m = g_m(u_1, u_2, \dots, u_n)$  has continuous first-order partial derivatives, then the composite function

$z = f(g_1(u_1, \dots, u_n), g_2(u_1, \dots, u_n), \dots, g_m(u_1, \dots, u_n))$  is a function of  $u_1, u_2, \dots, u_n$ , and the partial derivatives are found using an extension of Chain Rule II.

$$\begin{aligned}\frac{\partial z}{\partial u_1} &= \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial u_1} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial u_1} + \cdots + \frac{\partial z}{\partial x_m} \frac{\partial x_m}{\partial u_1} \\ \frac{\partial z}{\partial u_2} &= \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial u_2} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial u_2} + \cdots + \frac{\partial z}{\partial x_m} \frac{\partial x_m}{\partial u_2} \\ &\vdots \\ \frac{\partial z}{\partial u_n} &= \frac{\partial z}{\partial x_1} \frac{\partial x_1}{\partial u_n} + \frac{\partial z}{\partial x_2} \frac{\partial x_2}{\partial u_n} + \cdots + \frac{\partial z}{\partial x_m} \frac{\partial x_m}{\partial u_n}\end{aligned}$$

These partial derivatives can be written more compactly as

$$\frac{\partial z}{\partial u_i} = \sum_{j=1}^m \frac{\partial z}{\partial x_j} \frac{\partial x_j}{\partial u_i} \quad i = 1, 2, \dots, n$$

### EXAMPLE 5 Differentiating a Function of Three Variables Where Each Variable Is a Function of Four Variables

Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$ ,  $\frac{\partial f}{\partial t}$  for the function  $f(x, y, z) = x^2 + y^2 + z^2$ , where  $x = uvwt$ ,  $y = e^{u+v+w+t}$ , and  $z = u + 2v + 3w + 4t$ .

**Solution** We use an extension of Chain Rule II.

$$\begin{aligned}\frac{\partial f}{\partial u} &= \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u} + \frac{\partial f}{\partial z} \frac{\partial z}{\partial u} & \frac{\partial f}{\partial v} &= \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v} + \frac{\partial f}{\partial z} \frac{\partial z}{\partial v} \\ &= (2x)(vwt) + (2y)(e^{u+v+w+t}) + (2z)(1) & &= (2x)(uwt) + (2y)(e^{u+v+w+t}) + (2z)(2) \\ &= 2uv^2w^2t^2 + 2e^{2(u+v+w+t)} + 2(u + 2v + 3w + 4t) & &= 2u^2vw^2t^2 + 2e^{2(u+v+w+t)} + 4(u + 2v + 3w + 4t) \\ \frac{\partial f}{\partial w} &= \frac{\partial f}{\partial x} \frac{\partial x}{\partial w} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial w} + \frac{\partial f}{\partial z} \frac{\partial z}{\partial w} & \frac{\partial f}{\partial t} &= \frac{\partial f}{\partial x} \frac{\partial x}{\partial t} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial t} + \frac{\partial f}{\partial z} \frac{\partial z}{\partial t} \\ &= (2x)(vut) + (2y)(e^{u+v+w+t}) + (2z)(3) & &= (2x)(uvw) + (2y)(e^{u+v+w+t}) + (2z)(4) \\ &= 2u^2v^2wt^2 + 2e^{2(u+v+w+t)} + 6(u + 2v + 3w + 4t) & &= 2u^2v^2w^2t + 2e^{2(u+v+w+t)} + 8(u + 2v + 3w + 4t)\end{aligned}$$

Again, notice that the partial derivatives of  $f$  in Example 5 are expressed in terms of  $u$ ,  $v$ ,  $w$ , and  $t$  alone. ■

### NOW WORK Problem 37.

## 3 Differentiate an Implicitly-Defined Function of Two or More Variables

If a differentiable function  $y = f(x)$  of one variable is defined implicitly by the equation

$F(x, y) = 0$ , then  $F(x, f(x)) = 0$ . We can find the derivative  $\frac{dy}{dx}$  as follows. Let

$$z = F(u, y) \quad \text{where} \quad u = x \quad \text{and} \quad y = f(x)$$

Since  $u$  and  $y$  are functions of one independent variable  $x$ , we use Chain Rule I to

find  $\frac{dz}{dx}$ .

$$\frac{dz}{dx} = \frac{\partial F}{\partial u} \cdot \frac{du}{dx} + \frac{\partial F}{\partial y} \cdot \frac{dy}{dx}$$

**NEED TO REVIEW?** Implicit differentiation is discussed in Section 3.2, pp. 209–213.

Since the composite function  $z = F(u, y) = F(x, f(x)) \equiv 0$ , the derivative  $\frac{dz}{dx} = 0$ .

Also because  $u = x$ ,  $\frac{\partial F}{\partial u} = \frac{\partial F}{\partial x}$  and  $\frac{du}{dx} = 1$ . So,

$$0 = \frac{\partial F}{\partial x}(1) + \frac{\partial F}{\partial y} \cdot \frac{dy}{dx}$$

Now if  $\frac{\partial F}{\partial y} \neq 0$ , we can solve for  $\frac{dy}{dx}$ .

$$\frac{dy}{dx} = -\frac{\frac{\partial F}{\partial x}}{\frac{\partial F}{\partial y}} = -\frac{F_x}{F_y} \quad \frac{\partial F}{\partial y} \neq 0$$

### Implicit Differentiation Formula I

Suppose  $F$  is a differentiable function and  $y = f(x)$  is a function defined implicitly by the equation  $F(x, y) = 0$ . Then

$$\boxed{\frac{dy}{dx} = -\frac{F_x(x, y)}{F_y(x, y)}} \quad (3)$$

provided  $\frac{\partial F}{\partial y} = F_y(x, y) \neq 0$ .

### EXAMPLE 6 Differentiating an Implicitly Defined Function

Find  $\frac{dy}{dx}$  if  $y = f(x)$  is defined implicitly by  $F(x, y) = e^y \cos x - x - 1 = 0$ .

**Solution** First we find the partial derivatives of  $F$ .

$$F_x = \frac{\partial F}{\partial x} = -e^y \sin x - 1 \quad \text{and} \quad F_y = \frac{\partial F}{\partial y} = e^y \cos x$$

Then we use (3). If  $e^y \cos x \neq 0$ ,

$$\frac{dy}{dx} = -\frac{F_x}{F_y} = -\frac{-e^y \sin x - 1}{e^y \cos x} = \frac{e^y \sin x + 1}{e^y \cos x}$$

### NOW WORK Problem 41.

If a differentiable function  $z = f(x, y)$  of two variables is defined implicitly by the equation  $F(x, y, z) = 0$ , we can find the partial derivatives  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  by using Chain Rule II.

We begin by letting  $w = F(u, v, z)$ , where  $u = x$ ,  $v = y$ , and  $z = f(x, y)$ . Since the composite function  $w = F(x, y, f(x, y)) \equiv 0$ , it follows that  $\frac{\partial w}{\partial x} = 0$  and  $\frac{\partial w}{\partial y} = 0$ .

To find an expression for  $\frac{\partial w}{\partial x}$ , we use Chain Rule II.

$$\frac{\partial w}{\partial x} = \frac{\partial F}{\partial u} \cdot \frac{\partial u}{\partial x} + \frac{\partial F}{\partial v} \cdot \frac{\partial v}{\partial x} + \frac{\partial F}{\partial z} \cdot \frac{\partial z}{\partial x} = 0$$

Since  $u = x$ , then  $\frac{\partial F}{\partial u} = \frac{\partial F}{\partial x}$  and  $\frac{\partial u}{\partial x} = 1$ , and since  $v = y$ , then  $\frac{\partial F}{\partial v} = \frac{\partial F}{\partial y}$  and  $\frac{\partial v}{\partial x} = 0$ . So,

$$\begin{aligned} \frac{\partial F}{\partial x} \cdot 1 + \frac{\partial F}{\partial y} \cdot 0 + \frac{\partial F}{\partial z} \cdot \frac{\partial z}{\partial x} &= 0 \\ \frac{\partial F}{\partial x} + \frac{\partial F}{\partial z} \cdot \frac{\partial z}{\partial x} &= 0 \end{aligned}$$

If  $\frac{\partial F}{\partial z} \neq 0$ , it follows that

$$\frac{\partial z}{\partial x} = -\frac{\frac{\partial F}{\partial x}}{\frac{\partial F}{\partial z}} = -\frac{F_x(x, y, z)}{F_z(x, y, z)}$$

In a similar way, it can be shown that

$$\frac{\partial z}{\partial y} = -\frac{F_y(x, y, z)}{F_z(x, y, z)}$$

### Implicit Differentiation Formulas II

If a differentiable function  $z = f(x, y)$  is defined implicitly by the equation  $F(x, y, z) = 0$ , then

$$\boxed{\frac{\partial z}{\partial x} = -\frac{F_x(x, y, z)}{F_z(x, y, z)} \quad \text{and} \quad \frac{\partial z}{\partial y} = -\frac{F_y(x, y, z)}{F_z(x, y, z)}} \quad (4)$$

provided  $\frac{\partial F}{\partial z} = F_z(x, y, z) \neq 0$ .

### EXAMPLE 7 Differentiating an Implicitly Defined Function

Find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  if  $z = f(x, y)$  is defined implicitly by the function

$$F(x, y, z) = x^2z^2 + y^2 - z^2 + 6yz - 10 = 0.$$

**Solution** First we find the partial derivatives of  $F$ .

$$F_x = \frac{\partial F}{\partial x} = 2xz^2 \quad F_y = \frac{\partial F}{\partial y} = 2y + 6z \quad F_z = \frac{\partial F}{\partial z} = 2x^2z - 2z + 6y$$

Then we use (4). If  $F_z = 2x^2z - 2z + 6y \neq 0$ ,

$$\frac{\partial z}{\partial x} = -\frac{2xz^2}{2x^2z - 2z + 6y} = -\frac{xz^2}{x^2z - z + 3y}$$

and

$$\frac{\partial z}{\partial y} = -\frac{2y + 6z}{2x^2z - 2z + 6y} = -\frac{y + 3z}{x^2z - z + 3y}$$

### NOW WORK Problem 49.

## 4 Use a Chain Rule in a Proof

The Chain Rules are often used in proofs involving functions of two or more variables.

### EXAMPLE 8 Using a Chain Rule in a Proof

Let  $p = f(v - w, v - u, u - w)$  be a differentiable function. Show that

$$\frac{\partial p}{\partial u} + \frac{\partial p}{\partial v} + \frac{\partial p}{\partial w} = 0$$

**Solution** Let  $x = v - w$ ,  $y = v - u$ , and  $z = u - w$ . Then  $p = f(x, y, z)$ . We use an extension of Chain Rule II. Since  $\frac{\partial x}{\partial u} = 0$ ,  $\frac{\partial y}{\partial u} = -1$ , and  $\frac{\partial z}{\partial u} = 1$ , we have

$$\frac{\partial p}{\partial u} = \frac{\partial p}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial p}{\partial y} \frac{\partial y}{\partial u} + \frac{\partial p}{\partial z} \frac{\partial z}{\partial u} = \frac{\partial p}{\partial x}(0) + \frac{\partial p}{\partial y}(-1) + \frac{\partial p}{\partial z}(1) = -\frac{\partial p}{\partial y} + \frac{\partial p}{\partial z}$$

Since  $\frac{\partial x}{\partial v} = 1$ ,  $\frac{\partial y}{\partial v} = 1$ , and  $\frac{\partial z}{\partial v} = 0$ , we have

$$\frac{\partial p}{\partial v} = \frac{\partial p}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial p}{\partial y} \frac{\partial y}{\partial v} + \frac{\partial p}{\partial z} \frac{\partial z}{\partial v} = \frac{\partial p}{\partial x}(1) + \frac{\partial p}{\partial y}(1) + \frac{\partial p}{\partial z}(0) = \frac{\partial p}{\partial x} + \frac{\partial p}{\partial y}$$

Since  $\frac{\partial x}{\partial w} = -1$ ,  $\frac{\partial y}{\partial w} = 0$ , and  $\frac{\partial z}{\partial w} = -1$ , we have

$$\frac{\partial p}{\partial w} = \frac{\partial p}{\partial x} \frac{\partial x}{\partial w} + \frac{\partial p}{\partial y} \frac{\partial y}{\partial w} + \frac{\partial p}{\partial z} \frac{\partial z}{\partial w} = \frac{\partial p}{\partial x}(-1) + \frac{\partial p}{\partial y}(0) + \frac{\partial p}{\partial z}(-1) = -\frac{\partial p}{\partial x} - \frac{\partial p}{\partial z}$$

Adding these, we get

$$\frac{\partial p}{\partial u} + \frac{\partial p}{\partial v} + \frac{\partial p}{\partial w} = \underbrace{\left(-\frac{\partial p}{\partial y} + \frac{\partial p}{\partial z}\right)}_{\frac{\partial p}{\partial u}} + \underbrace{\left(\frac{\partial p}{\partial x} + \frac{\partial p}{\partial y}\right)}_{\frac{\partial p}{\partial v}} + \underbrace{\left(-\frac{\partial p}{\partial x} - \frac{\partial p}{\partial z}\right)}_{\frac{\partial p}{\partial w}} = 0$$

**NOW WORK** Problem 65.

## 12.5 Assess Your Understanding

### Concepts and Vocabulary

- True or False** If a differentiable function  $z$  is defined implicitly by the equation  $F(x, y, z) = 0$ , then  $\frac{\partial z}{\partial x} = -\frac{F_x(x, y, z)}{F_z(x, y, z)}$ , provided  $F_z(x, y, z) \neq 0$ .
- True or False** If  $x = x(t)$  and  $y = y(t)$  are differentiable functions of  $t$  and if  $z = f(x, y)$  is a differentiable function of  $x$  and  $y$ , then  $\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt}$ .

### Skill Building

Answers to Problems 3–39 are given in final form and in mixed form.

In Problems 3–14, find  $\frac{dz}{dt}$  using Chain Rule I.

- $z = x^2 + y^2$ ,  $x = \sin t$ ,  $y = \cos(2t)$
- $z = x^2 - y^2$ ,  $x = \sin(2t)$ ,  $y = \cos t$
- $z = x^2 + y^2$ ,  $x = te^t$ ,  $y = te^{-t}$
- $z = x^2 - y^2$ ,  $x = te^{-t}$ ,  $y = t^2e^{-t}$
- $z = e^u \sin v$ ,  $u = \sqrt{t}$ ,  $v = \pi t$
- $z = e^{u/v}$ ,  $u = \sqrt{t}$ ,  $v = t^3 + 1$
- $z = e^{u/v}$ ,  $u = te^t$ ,  $v = e^{t^2}$
- $z = \ln(uv)$ ,  $u = t^5$ ,  $v = \sqrt{t+1}$
- $z = e^{x^2+y^2}$ ,  $x = \sin(2t)$ ,  $y = \cos t$
- $z = e^{x^2-y^2}$ ,  $x = \sin(2t)$ ,  $y = \cos(2t)$
- $z = \frac{xy}{x^2 + y^2}$ ,  $x = \sin t$ ,  $y = \cos t$
- $z = y \ln x + xy + \tan y$ ,  $x = \frac{t}{t+1}$ ,  $y = t^3 - t$

In Problems 15–22, find  $\frac{dp}{dt}$  using an extension of Chain Rule I.

- $p = x^2 + y^2 - z^2$ ,  $x = te^t$ ,  $y = te^{-t}$ ,  $z = e^{2t}$
- $p = x^2 - y^2 - z^2$ ,  $x = te^{-t}$ ,  $y = t^2e^{-t}$ ,  $z = e^{-t}$
- $p = e^x \sin y \cos z$ ,  $x = \sqrt{t}$ ,  $y = \pi t$ ,  $z = \frac{t}{2}$
- $p = \ln(xyz)$ ,  $x = t^5$ ,  $y = \sqrt{t+1}$ ,  $z = t^2$
- $p = w \ln\left(\frac{u}{v}\right)$ ,  $u = te^t$ ,  $v = e^{t^2}$ ,  $w = e^{2t}$
- $p = we^{u/v}$ ,  $u = \sqrt{t}$ ,  $v = t^3 + 1$ ,  $w = e^t$
- $p = u^2vw$ ,  $u = \sin t$ ,  $v = \cos t$ ,  $w = e^t$
- $p = \sqrt{uvw}$ ,  $u = e^t$ ,  $v = te^t$ ,  $w = t^2e^{2t}$

In Problems 23–34, find  $\frac{\partial z}{\partial u}$  and  $\frac{\partial z}{\partial v}$  using Chain Rule II.

- $z = x^2 + y^2$ ,  $x = ue^v$ ,  $y = ve^u$
- $z = x^2 - y^2$ ,  $x = u \ln v$ ,  $y = v \ln u$
- $z = e^x \sin y$ ,  $x = u^2v$ ,  $y = \ln(uv)$
- $z = \frac{1}{y} \ln x$ ,  $x = \sqrt{uv}$ ,  $y = \frac{v}{u}$
- $z = \ln(x^2 + y^2)$ ,  $x = \frac{v^2}{u}$ ,  $y = \frac{u}{v^2}$
- $z = x \sin y - y \sin x$ ,  $x = u^2v$ ,  $y = uv^2$
- $z = x^2 + y^2$ ,  $x = \sin(u-v)$ ,  $y = \cos(u+v)$
- $z = e^x + y$ ,  $x = \tan^{-1}\left(\frac{u}{v}\right)$ ,  $y = \ln(u+v)$
- $z = se^r$ ,  $r = u^2 + v^2$ ,  $s = \frac{v}{u}$
- $z = \sqrt{s^2 + r^2}$ ,  $s = \ln(uv)$ ,  $r = \sqrt{uv}$

33.  $z = xy^2w^3$ ,  $x = 2u + v$ ,  $y = 5u - 3v$ ,  $w = 2u + 3v$

34.  $z = x^2 - y^2 + w$ ,  $x = e^{u+v}$ ,  $y = uv$ ,  $w = \frac{v}{u}$

In Problems 35–40, find each partial derivative.

35. Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$  if  $f(x, y, z) = x^2 + y^2 + z^2$ ,  $x = uv$ ,

$y = e^{u+2v+3w}$ ,  $z = 2v + 3w$ .

36. Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$  if  $f(x, y, z) = x - y^2 + z^2$ ,  $x = \sqrt{u+v}$ ,

$y = (u+w)\ln v$ ,  $z = 2 - v + 3w$ .

37. Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$  if  $f(x, y, z) = x \cos y - z \cos x + x^2yz$ ,

$x = uvw$ ,  $y = u^2 + v^2 + w^2$ ,  $z = w$ .

38. Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$  if  $f(x, y, z) = x^2 + y^2$ ,  $x = \sin(u - v)$ ,

$y = \cos(u + v)$ ,  $z = uw^2$ .

39. Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$ ,  $\frac{\partial f}{\partial t}$  if  $f(x, y, z) = x + 2y^2 - z^2$ ,  $x = ut$ ,

$y = e^{u+2v+3w+4t}$ ,  $z = u + \frac{1}{2}v + 4t$ .

40. Find  $\frac{\partial f}{\partial u}$ ,  $\frac{\partial f}{\partial v}$ ,  $\frac{\partial f}{\partial w}$ ,  $\frac{\partial f}{\partial t}$  if  $f(x, y, z) = x^2 + y^2 + z$ ,

$x = \sin(u + t)$ ,  $y = \cos(v - t)$ ,  $z = uw^2$ .

In Problems 41–46,  $y$  is a function of  $x$ . Find  $\frac{dy}{dx}$ .

41.  $F(x, y) = x^2y - y^2x + xy - 5 = 0$

42.  $F(x, y) = x^3y^2 - xy + x^2y - 10 = 0$

43.  $F(x, y) = x \sin y + y \sin x - 2 = 0$

44.  $F(x, y) = xe^y + ye^x - xy = 0$

45.  $F(x, y) = x^{1/3} + y^{1/3} - 1 = 0$

46.  $F(x, y) = x^{2/3} + y^{2/3} - 1 = 0$

In Problems 47–52,  $z$  is a function of  $x$  and  $y$ . Find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$ .

47.  $F(x, y, z) = xz + 3yz^2 + x^2y^3 - 5z = 0$

48.  $F(x, y, z) = x^2z + y^2z + x^3y - 10z = 0$

49.  $F(x, y, z) = \sin z + y \cos z + xyz - 10 = 0$

50.  $F(x, y, z) = x \sin y - \cos z + x^2z = 0$

51.  $F(x, y, z) = xe^{yz} + ye^{xz} + xyz = 0$

52.  $F(x, y, z) = e^{yz} \ln x + ye^{xz} - yz = 0$

In Problems 53 and 54, find  $\frac{\partial w}{\partial x}$ ,  $\frac{\partial w}{\partial y}$ , and  $\frac{\partial w}{\partial z}$ .

53.  $w = (2x + 3y)^{4z}$

54.  $w = (2x)^{3y+4z}$

rate of  $5^\circ\text{C/s}$  and if, when the temperature is  $80^\circ\text{C}$ , the pressure  $P$  is  $10\text{ N/m}^2$  and is decreasing at the rate of  $2\frac{\text{N}}{\text{m}^2 \cdot \text{s}}$ , find the rate of change of the volume  $V$  with respect to time.

**56. Melting Ice** A block of ice of dimensions  $l$ ,  $w$ , and  $h$  is melting. When  $l = 3\text{ m}$ ,  $w = 2\text{ m}$ ,  $h = 1\text{ m}$ , these variables are changing so that  $\frac{dl}{dt} = -1\text{ m/h}$ ,  $\frac{dw}{dt} = -1\text{ m/h}$ , and  $\frac{dh}{dt} = -0.5\text{ m/h}$ .

(a) What is the rate of change in the surface area of the block of ice?

(b) What is the rate of change in the volume of the block of ice?

**57. Wave Equation** The one-dimensional wave equation

$\frac{\partial^2 f}{\partial x^2} = \frac{1}{v^2} \frac{\partial^2 f}{\partial t^2}$  describes a wave traveling with speed  $v$  along the  $x$ -axis. The function  $f$  represents the displacement  $x$  from the equilibrium of the wave at time  $t$ .

(a) Show that  $z = f(x, t) = \sin(x + vt)$  satisfies the wave equation.

(b) Show that  $z = f(x, t) = e^{x-vt}$  satisfies the wave equation.

(c) Show that  $z = f(x, t) = \sin x + \sin(vt)$  does not satisfy the wave equation.

(d) Show that any twice-differentiable function of the form  $f(x + vt)$  is a solution of the wave equation.

**58. Economics** A toy manufacturer's production function satisfies a **Cobb–Douglas model**,  $Q(L, M) = 400L^{0.3}M^{0.7}$ , where  $Q$  is the output in thousands of units,  $L$  is the labor in thousands of hours, and  $M$  is the machine hours (in thousands). Suppose the labor hours are decreasing at a rate of  $4000\text{ h/yr}$  and the machine hours are increasing at a rate of  $2000\text{ h/yr}$ . Find the rate of change of production when

(a)  $L = 19$  and  $M = 21$

(b)  $L = 21$  and  $M = 20$

**59. Related Rates** Let  $y = f(a, b)$ , where  $a = h(s, t)$  and  $b = k(s, t)$ . Suppose when  $s = 1$  and  $t = 3$ , we know that

$$\frac{\partial h}{\partial s} = 4 \quad \frac{\partial k}{\partial s} = -3 \quad \frac{\partial h}{\partial t} = 1 \quad \frac{\partial k}{\partial t} = -5$$

Also, suppose

$$h(1, 3) = 6 \quad k(1, 3) = 2 \quad f_a(6, 2) = 7 \quad f_b(6, 2) = 2$$

What are  $\frac{\partial y}{\partial s}$  and  $\frac{\partial y}{\partial t}$  at the point  $(1, 3)$ ?

**60. Related Rates** Let  $z = f(x, y)$ , where  $x = g(s, t)$  and  $y = k(s, t)$ . Suppose when  $s = 2$  and  $t = -1$ , we know that

$$\frac{\partial x}{\partial s} = 5 \quad \frac{\partial y}{\partial s} = 2 \quad \frac{\partial x}{\partial t} = -3 \quad \frac{\partial y}{\partial t} = -2$$

Also, suppose

$$g(2, -1) = 3 \quad h(2, -1) = 4 \quad f_x(3, 4) = 12 \quad f_y(3, 4) = 7$$

What are  $\frac{\partial z}{\partial s}$  and  $\frac{\partial z}{\partial t}$  at the point  $(2, -1)$ ?

**61.** If  $z = f(x, y)$ , where  $x = g(u, v)$  and  $y = h(u, v)$ , find expressions for  $\frac{\partial^2 z}{\partial u^2}$ ,  $\frac{\partial^2 z}{\partial u \partial v}$ , and  $\frac{\partial^2 z}{\partial v^2}$ .

## Applications and Extensions

**55. Ideal Gas Law** One mole of a gas obeys the Ideal Gas Law  $PV = 20T$ , where  $P$  is pressure,  $V$  is volume, and  $T$  is temperature. If the temperature  $T$  of the gas is increasing at the

62. If  $z = f(x, y)$  and  $x = r \cos \theta$ ,  $y = r \sin \theta$ , show that

$$\left(\frac{\partial z}{\partial r}\right)^2 + \frac{1}{r^2} \left(\frac{\partial z}{\partial \theta}\right)^2 = \left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2$$

63. If  $z = f(x, y)$ , where  $x = u \cos \theta - v \sin \theta$  and  $y = u \sin \theta + v \cos \theta$ , with  $\theta$  a constant, show that

$$\left(\frac{\partial f}{\partial u}\right)^2 + \left(\frac{\partial f}{\partial v}\right)^2 = \left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2.$$

64. If  $z = f(u - v, v - u)$ , show that  $\frac{\partial z}{\partial u} + \frac{\partial z}{\partial v} = 0$ .

(Hint: Let  $x = u - v$  and  $y = v - u$ .)

65. If  $z = vf(u^2 - v^2)$ , show that  $v \frac{\partial z}{\partial u} + u \frac{\partial z}{\partial v} = \frac{uz}{v}$ .

66. If  $w = f(u)$  and  $u = \sqrt{x^2 + y^2 + z^2}$ , show that

$$\left(\frac{\partial w}{\partial x}\right)^2 + \left(\frac{\partial w}{\partial y}\right)^2 + \left(\frac{\partial w}{\partial z}\right)^2 = \left(\frac{dw}{du}\right)^2.$$

67. If  $z = f\left(\frac{x}{y}\right)$ , show that  $x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = 0$ .

68. Show that if  $z = f\left(\frac{u}{v}, \frac{v}{w}\right)$ , then  $u \frac{\partial z}{\partial u} + v \frac{\partial z}{\partial v} + w \frac{\partial z}{\partial w} = 0$ .

69. Suppose we denote the expression  $\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$  by  $\Delta$ . If  $z = f(x, y)$ , where  $x = r \cos \theta$  and  $y = r \sin \theta$ , show that

$$\Delta f = \frac{\partial^2 f}{\partial r^2} + \frac{1}{r} \left(\frac{\partial f}{\partial r}\right) + \frac{1}{r^2} \left(\frac{\partial^2 f}{\partial \theta^2}\right).$$

70. Prove that if  $F(x, y, z) = 0$  is differentiable, then

$$\frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial y} \cdot \frac{\partial y}{\partial z} = -1.$$

## Challenge Problems

71. (a) Suppose that  $F(x, y)$  has continuous second-order partial derivatives and  $F(x, y) = 0$  defines  $y$  as a function of  $x$  implicitly. Show that

$$\frac{d^2 y}{dx^2} = -\frac{F_y^2 F_{xx} - 2F_x F_y F_{xy} + F_x^2 F_{yy}}{F_y^3} \quad F_y \neq 0$$

(b) Use the result from (a) to find  $\frac{d^2 y}{dx^2}$  for  $x^3 + 3xy - y^3 = 6$ .

72.  $f(t, x) = \int_0^{x/(2\sqrt{\lambda t})} e^{-u^2} du$ . Show that  $f_t = \lambda f_{xx}$ .

## THINGS TO KNOW

### 12.1 Functions of Two or More Variables and Their Graphs

#### Definitions:

- Function  $z = f(x, y)$  of two variables (p. 810)
- Function  $w = f(x, y, z)$  of three variables (p. 810)
- Contour line: A curve that is the intersection of a surface  $z = f(x, y)$  and the plane  $z = c$ , where  $c$  is a constant (p. 812)
- Level curve: the projection of a contour line onto the  $xy$ -plane (p. 813)

### 12.2 Limits and Continuity

#### Definitions:

- A  $\delta$ -neighborhood of  $P_0$ : the set of all points  $P$  that lie within a distance  $\delta$  of  $P_0$  (p. 819)
- In the plane, a  $\delta$ -neighborhood of  $P_0$  is called a disk of radius  $\delta$  centered at  $P_0$ .
- In space, a  $\delta$ -neighborhood of  $P_0$  is called a ball of radius  $\delta$  centered at  $P_0$ .
- Limit of a function  $f$  of two variables (p. 819)
- Limit of a function  $f$  of three variables (p. 820)
- Properties of limits (p. 821)
- Interior point, boundary point, open set, closed set (p. 825)
- Continuity at a point (p. 825)
- A function  $f$  is continuous if it is continuous at every point in its domain (p. 826)
- Properties of continuous functions (p. 826)

### 12.3 Partial Derivatives

- First-order partial derivatives of a function  $z = f(x, y)$ :

$$f_x(x, y) = \frac{\partial f}{\partial x} = \frac{\partial z}{\partial x} = \lim_{\Delta x \rightarrow 0} \frac{f(x + \Delta x, y) - f(x, y)}{\Delta x}$$

$$f_y(x, y) = \frac{\partial f}{\partial y} = \frac{\partial z}{\partial y} = \lim_{\Delta y \rightarrow 0} \frac{f(x, y + \Delta y) - f(x, y)}{\Delta y}$$

provided the limits exist (p. 830)

- Mixed partials:  $\frac{\partial^2 z}{\partial x \partial y} = f_{yx}(x, y)$  and  $\frac{\partial^2 z}{\partial y \partial x} = f_{xy}(x, y)$  (p. 834)
- Equality of mixed partials (Clairaut's Theorem) (p. 835)

### 12.4 Differentiability and the Differential

- Change in  $z$ :  $\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$  (p. 841)
- Differentiability of  $z = f(x, y)$  at a point  $(x_0, y_0)$  (p. 842)
- Differentials:  $dx = \Delta x$ ,  $dy = \Delta y$ ,  $dz = f_x(x_0, y_0) dx + f_y(x_0, y_0) dy$  (p. 843)

**Summary:** (p. 846) If  $z = f(x, y)$ ,

- The continuity of the partial derivatives  $f_x$  and  $f_y$  implies the differentiability of  $f$ .
- The differentiability of  $f$  implies the continuity of  $f$ .
- The continuity of the partial derivatives  $f_x$  and  $f_y$  implies the continuity of  $f$ .
- The existence of the partial derivatives  $f_x$  and  $f_y$  does not necessarily mean  $f$  is differentiable.
- The existence of the partial derivatives  $f_x$  and  $f_y$  does not necessarily mean  $f$  is continuous.

### 12.5 Chain Rules

- Chain Rule I:  $\frac{dz}{dt} = \frac{\partial z}{\partial x} \frac{dx}{dt} + \frac{\partial z}{\partial y} \frac{dy}{dt}$  (p. 849)

- Chain Rule II:  $\frac{\partial z}{\partial u} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial u}$   
 $\frac{\partial z}{\partial v} = \frac{\partial z}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \frac{\partial y}{\partial v}$  (p. 851)

- Implicit differentiation formula I:

$$\text{If } F(x, y) = 0, \quad \frac{dy}{dx} = -\frac{F_x(x, y)}{F_y(x, y)}$$

provided  $F_y \neq 0$ . (p. 854)

- Implicit differentiation formula II: If  $F(x, y, z) = 0$ ,

$$\frac{\partial z}{\partial x} = -\frac{F_x(x, y, z)}{F_z(x, y, z)} \quad \text{and} \quad \frac{\partial z}{\partial y} = -\frac{F_y(x, y, z)}{F_z(x, y, z)}$$

provided  $F_z \neq 0$ . (p. 855)

## OBJECTIVES

## REVIEW EXERCISES

In Problems 1–3, evaluate each function.

- $f(x, y) = e^x \ln y$        $f(x, y) = 2x^2 + 6xy - y^3$   
 (a)  $f(1, 1)$       (a)  $f(1, 1)$   
 (b)  $f(x + \Delta x, y)$       (b)  $f(x + \Delta x, y)$   
 (c)  $f(x, y + \Delta y)$       (c)  $f(x, y + \Delta y)$
- $f(x, y, z) = e^x \sin^{-1}(y + 2z)$   
 (a)  $f\left(\ln 3, \frac{1}{2}, \frac{1}{4}\right)$       (b)  $f\left(1, 0, \frac{1}{4}\right)$       (c)  $f(0, 0, 0)$

In Problems 4–7, find the domain of each function and graph the domain. Use a solid curve to indicate that the boundary is included and a dashed curve to indicate that the boundary is excluded.

- $z = f(x, y) = \ln(x^2 - 3y)$        $z = f(x, y) = \sqrt{9 - x^2 - 4y^2}$
- $z = f(x, y) = \frac{25xy}{\sqrt{5 - y^2}}$        $z = f(x, y) = \frac{(y - 3x)^2}{x + 2y}$
- Find the domain of  $w = f(x, y, z) = \frac{y^2 + z^2}{x^2}$ .
- Find the domain of  $w = f(x, y, z) = e^{x+y} \ln z$ .

In Problems 10–13, graph each surface.

- $z = f(x, y) = x - y + 5$        $z = f(x, y) = \sin x$
- $z = f(x, y) = \ln x$        $z = f(x, y) = e^y$
- For  $z = f(x, y) = x^2 - 2y$ , graph the level curves corresponding to  $c = -4, -1, 0, 1, 4$ .
- For  $z = f(x, y) = \sqrt{x^2 + y^2}$ , graph the level curves corresponding to  $c = 0, 1, 4, 9$ .
- For  $z = f(x, y) = e^{4x^2 + y^2}$ , graph the level curves corresponding to  $c = 1, e, e^4, e^{16}$ .
- Describe the level surfaces associated with the function  $w = f(x, y, z) = 4x^2 + y^2 + z^2$ .
- Describe the level surfaces associated with the function  $w = f(x, y, z) = x + y + 2z$ .
- Find  $\lim_{(x,y) \rightarrow (\pi/2, 0)} \frac{\sin x \cos y}{x}$ .
- Find  $\lim_{(x,y) \rightarrow (1, 2)} \frac{4x^2 + y^2}{2x + y}$ .
- Let  $f(x, y) = \frac{3xy^2}{x^2 + y^4}$ .  
 (a) Show that  $\lim_{(x,y) \rightarrow (0,0)} f(x, y) = 0$  along the lines  $y = mx$ .

- (b) Find  $\lim_{(x,y) \rightarrow (0,0)} f(x, y)$  along the parabola  $x = y^2$ .
- (c) What can you conclude?
22. Show that  $\lim_{(x,y,z) \rightarrow (0,0,0)} \frac{4xy}{x^2 + y^2 + z^2}$  does not exist.
23. Determine where the function  $f(x, y) = 2x^2y - y^2 + 3$  is continuous.
24. Determine where the function  $R(x, y) = \frac{xy}{x^2 - y^2}$  is continuous.
25. (a) Determine where the function  $f(x, y) = \tan^{-1} \frac{1}{x^2 + y^2}$  is continuous.
- (b) Find  $\lim_{(x,y) \rightarrow (0,1)} \tan^{-1} \frac{1}{x^2 + y^2}$ .
26. Find  $f_x$  and  $f_y$  for  $z = f(x, y) = e^{x^2+y^2} \sin(xy)$ .
27. Find  $f_x$  and  $f_y$  for  $z = f(x, y) = \frac{x+y}{y}$ .
28. Find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  for  $z = f(x, y) = \sqrt{x - 2y^2}$ .
29. Find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  for  $z = f(x, y) = e^x \ln(5x + 2y)$ .
30. For  $f(x, y) = \sqrt{x^2 - y^2}$ , find  $f_x(2, 1)$  and  $f_y(2, -1)$ .
31. For  $F(x, y) = e^x \sin y$ , find  $F_x\left(0, \frac{\pi}{6}\right)$  and  $F_y\left(0, \frac{\pi}{6}\right)$ .
32. Find symmetric equations for the tangent line to the curve of intersection of the ellipsoid  $\frac{x^2}{24} + \frac{y^2}{12} + \frac{z^2}{6} = 1$ , and the plane  $y = 1$ , where  $x = 4$  and  $z$  is positive.
33. Find symmetric equations for the tangent line to the curve of intersection of the surface  $z = 4x^2 - y^2 + 7$ :
- (a) With the plane  $y = -2$  at the point  $(1, -2, 7)$ .
- (b) With the plane  $x = 1$  at the point  $(1, -2, 7)$ .
34. **Boyle's Law** The volume  $V$  of a gas varies directly with the temperature  $T$  and inversely with the pressure  $P$ .
- (a) Find the rate of change of the volume  $V$  with respect to the temperature  $T$ .
- (b) Find the rate of change of the volume  $V$  with respect to the pressure  $P$ .
- (c) If  $T$  and  $P$  are functions of  $t$ , what is  $\frac{\partial V}{\partial t}$ ?

In Problems 35 and 36, find the second-order partial derivatives  $f_{xx}$ ,  $f_{xy}$ ,  $f_{yx}$ , and  $f_{yy}$ .

35.  $z = f(x, y) = (x + y^2)e^{3x}$       36.  $z = f(x, y) = \sec(xy)$

In Problems 37–40, find  $f_x$ ,  $f_y$ , and  $f_z$ .

37.  $w = f(x, y, z) = e^{xyz}$       38.  $w = f(x, y, z) = ze^{xy}$

39.  $f(x, y, z) = e^x \sin y + e^y \sin z$

40.  $w = f(x, y, z) = z \tan^{-1} \frac{y}{x}$

41. For the function  $z = x^3y^2 - 2xy^4 + 3x^2y^3$ , show that  $x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = 5z$ .
42. Find the change  $\Delta z$  in  $z = f(x, y) = xy^2 + 2$  from  $(x_0, y_0)$  to  $(x_0 + \Delta x, y_0 + \Delta y)$ . Use the answer to calculate the change in  $z$  from  $(1, 0)$  to  $(0.9, 0.2)$ .
43. Show that the function  $z = f(x, y) = xy - 5y^2$  is differentiable at any point  $(x, y)$  in its domain by:
- (a) Finding  $\Delta z$ .
- (b) Finding  $\eta_1$  and  $\eta_2$  so that  $\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \eta_1\Delta x + \eta_2\Delta y$ .
- (c) Show that  $\lim_{(\Delta x, \Delta y) \rightarrow (0,0)} \eta_1 = 0$  and  $\lim_{(\Delta x, \Delta y) \rightarrow (0,0)} \eta_2 = 0$ .

In Problems 44 and 45, find the differential  $dz$  of each function.

44.  $z = x\sqrt{1 + y^2}$       45.  $z = \sin^{-1} \frac{x}{y}$ ,  $y > 0$

In Problems 46 and 47, find the differential  $dw$  of each function.

46.  $w = ze^{xy}$       47.  $w = \ln(xyz)$

48. Use differentials to estimate the change in  $z = x\sqrt{1 + y^2}$  from  $(4, 0)$  to  $(4.1, 0.1)$ .
49. Use differentials to estimate the change in  $z = \sin^{-1} \frac{x}{y}$  from  $(0, 1)$  to  $(0.1, 1.1)$ .
50. Use the differential of  $f(x, y) = y^2 \cos x$  to find an approximate value of  $f(0.05, 1.98)$ . (Compare your answer with a calculator result.)
51. **Electricity** The electrical resistance  $R$  of a wire is  $R = k \frac{L}{D^2}$  where  $L$  is the length of the wire,  $D$  is the diameter of the wire, and  $k$  is a constant. If  $L$  has a 1% error and  $D$  has a 2% error, what is the approximate maximum percentage error in the computation of  $R$ ?
52. Find  $\frac{dz}{dt}$  if  $z = \sin(xy) - x \sin y$ , where  $x = e^t$  and  $y = te^t$ .
53. Find  $\frac{dw}{dt}$  if  $w = \frac{x}{y} + \frac{y}{z} + \frac{z}{x}$ , where  $x = \frac{1}{t}$ ,  $y = \frac{1}{t^2}$ , and  $z = \frac{1}{t^3}$ .
54. Find  $\frac{\partial w}{\partial u}$  and  $\frac{\partial w}{\partial v}$  if  $w = xy + yz - xz$ , where  $x = u + v$ ,  $y = uv$ , and  $z = v$ . Express each answer in terms of  $u$  and  $v$ .
55. Find  $\frac{\partial u}{\partial r}$  and  $\frac{\partial u}{\partial s}$  if  $u = \sqrt{x^2 + y^2 + z^2}$ , where  $x = r \cos s$ ,  $y = r \sin s$ , and  $z = \sqrt{r^2 + s^2}$ . Express each answer in terms of  $r$  and  $s$ .
56. Find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  if  $z = f(x, y)$  is defined implicitly by  $F(x, y, z) = x^2 + y^2 - 2xyz = 0$ .
57. Find  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  if  $z = f(x, y)$  is defined implicitly by  $F(x, y, z) = 2x \sin y + 2y \sin x + 2xyz = 0$ .
58. If  $z = uf(u^2 + v^2)$ , show that  $2v \frac{\partial z}{\partial u} - 2u \frac{\partial z}{\partial v} = \frac{2vz}{u}$ .

## CHAPTER 12 PROJECT

## Searching for Exoplanets

To find an exoplanet generally requires powerful telescopes, but some can be observed by amateur astronomers with smaller telescopes and careful observation using the transit method. When using less powerful telescopes, however, very small errors can

greatly affect the results of the observation since the change in apparent brightness of the star because of the transit is at most a few percent. Atmospheric scintillation, the main source of error, refers to variations, due to differences in the index of refraction of Earth's atmosphere, in the apparent brightness (magnitude) of an extrasolar object. When a star is viewed through a lens, the error  $E$  in magnitude due to atmospheric scintillation is estimated by

$$E(D, Z, h, T) = 0.09D^{-2/3}(2T)^{-1/2} \left( \frac{1}{\cos Z} \right)^{1.75} e^{(-h/8000)} \quad (1)$$

where  $D$  is the diameter, in centimeters, of the lens of the telescope;  $Z$  is the zenithal angle, in degrees, of the planet;  $h$  is the altitude, in meters above sea level, of the telescope; and  $T$  is the exposure time in seconds. The zenithal angle is defined to be the angle from the highest point in the sky ( $Z = 0^\circ$ ) to an object in the heavens, and it is important because there is less atmosphere to get in the way of viewing a star that is higher in the sky. To obtain observations accurate enough to detect the small fluctuation that would indicate the transit of an exoplanet, the fluctuation in magnitude due to scintillation needs to be smaller than 0.001.

1. Suppose the diameter of the telescope lens is 7.1 cm, the zenithal angle is  $20^\circ$ , and the altitude of the telescope is 3000 m. What is

the minimum exposure time needed to keep the error  $E$  in magnitude below 0.001? Round the answer to the nearest second.

2. Repeat Problem 1 for  $h = 4000$  m and  $h = 5000$  m. Comment on the effect of altitude on the error. Explain why your result makes sense in terms of the effects of atmospheric scintillation.
3. Find  $\lim_{Z \rightarrow 0} E(7.1, Z, 3000, 180)$  and  $\lim_{Z \rightarrow 90} E(7.1, Z, 3000, 180)$ . Comment on the effect of the zenithal angle on the error.
4. Find  $\frac{\partial E}{\partial D}$ . Interpret  $\frac{\partial E}{\partial D}$ .
5. Find  $\frac{\partial E}{\partial Z}$ . Interpret  $\frac{\partial E}{\partial Z}$ .
6. Find  $\frac{\partial E}{\partial h}$ . Interpret  $\frac{\partial E}{\partial h}$ .
7. Find  $\frac{\partial E}{\partial T}$ . Interpret  $\frac{\partial E}{\partial T}$ .
8. Find the differential  $dE$ . Interpret  $dE$ .
9. Suppose  $D = 7.1$ ,  $Z = 20$ ,  $h = 3000$ , and  $T = 180$ . Use the differential to determine which of the following reduces the error by a greater amount:
  - (a) using a telescope with a lens of diameter of 7.3 cm, or
  - (b) using a platform to increase the altitude of the telescope to 3200 m.
10. Suppose you are interested in astronomy and searching for exoplanets. You research the cost of telescopes with different-size lenses and the resulting effects that the different lenses will have on your observations. Do a cost benefit analysis, and then write a position paper supporting your decision to purchase the telescope you chose.

### Measuring Ice Thickness on Crystal Lake

Minnesota's nickname is the Land of 10,000 Lakes, and in the winter many of those lakes freeze over. While this might put an end to some water sports like swimming, it opens up a host of other activities for Minnesotans to enjoy—ice skating, ice fishing, ice hockey, ice golf, ice bowling, and ice driving, to name just a few. The annual Art Shanty Projects festival on Medicine Lake even features shacks (complete with radio and heaters), sculptures, printing presses, and concerts, all comfortably resting atop the lake's frozen surface.

Of course, a frozen lake can only host those people and events that its ice will support. Specific estimates vary, but the recommended ice depth that will safely support one ice skater is about four inches. A dozen or more ice skaters might require closer to 7 inches of ice. A small truck? That would be about 10.5 inches. But how do you determine the depth of the ice on a given lake? Trial and error is prohibitively risky. The Minnesota Department of Natural Resources suggests that you ask at local bait shops or resorts. In the chapter project, we examine another method for measuring ice depth.

**CHAPTER 13 PROJECT** In the Chapter Project on page 901, we use two hypothetical models to measure the ice depth in a frozen lake.

In Chapter 12 we defined the partial derivatives  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  of a function  $z = f(x, y)$  of two variables. One interpretation of  $\frac{\partial z}{\partial x}$  and  $\frac{\partial z}{\partial y}$  is that they equal the rate of change of  $z$  in the direction of the positive  $x$ -axis and in the direction of the positive  $y$ -axis, respectively. Here, we generalize these ideas to obtain the rate of change of  $z$  in any direction, a *directional derivative*.

Directional derivatives lead us to the *gradient*, a vector that is used in finding tangent planes to a surface. The gradient also provides information about paths of quickest ascent (or descent) on a surface.

Finally, we revisit optimization. Just as derivatives are used to find extreme values of functions of a single variable, partial derivatives are used to find extreme values of functions of several variables. We identify techniques for locating extreme values on a surface and investigate applications involving optimization of functions of two variables.

## 13.1 Directional Derivatives; Gradients

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the directional derivative of a function of two variables (p. 863)
- 2 Find the gradient of a function of two variables (p. 866)
- 3 Use properties of the gradient (p. 868)
- 4 Find the directional derivative and gradient of a function of three variables (p. 871)

### 1 Find the Directional Derivative of a Function of Two Variables

Recall that the partial derivatives of a function  $z = f(x, y)$  at the point  $(x_0, y_0)$  are defined as

$$f_x(x_0, y_0) = \lim_{\Delta x \rightarrow 0} \frac{f(x_0 + \Delta x, y_0) - f(x_0, y_0)}{\Delta x}$$

$$f_y(x_0, y_0) = \lim_{\Delta y \rightarrow 0} \frac{f(x_0, y_0 + \Delta y) - f(x_0, y_0)}{\Delta y}$$

where  $(x_0, y_0)$  is an interior point of the domain of  $f$ . The partial derivative  $f_x(x_0, y_0)$  equals the rate of change of  $f$  at  $(x_0, y_0)$  in the *direction of the positive  $x$ -axis*, and the partial derivative  $f_y(x_0, y_0)$  equals the rate of change of  $f$  at  $(x_0, y_0)$  in the *direction of the positive  $y$ -axis*. The *directional derivative* of  $f$  equals the rate of change of  $f$  at  $(x_0, y_0)$  in *any direction in the  $xy$ -plane*.

To lay the groundwork for defining the directional derivative, we consider a function  $z = f(x, y)$  whose graph is a surface in space. In Figure 1,  $P_0 = (x_0, y_0)$  is an interior point in the domain of  $f$ , and  $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$  is a unit vector in the  $xy$ -plane with its initial point at  $P_0$  making an angle  $\theta$ ,  $0 \leq \theta \leq 2\pi$ , with the positive  $x$ -axis.

The vector  $\mathbf{u}$  allows us to move away from  $P_0$  in any direction. Now draw a directed line segment  $L$  with initial point  $P_0$  in the direction of  $\mathbf{u}$ , and choose a point  $P = (x, y)$  on  $L$  different from  $P_0$ , so that the directed line segment  $\overrightarrow{P_0P}$  is in the domain of  $f$ . Then  $\overrightarrow{P_0P} = t\mathbf{u}$  for some  $t$  and the coordinates of  $P$  are  $(x_0 + t \cos \theta, y_0 + t \sin \theta)$ .

In Figure 2, we have drawn a surface  $z = f(x, y)$  and have labeled the points on the surface corresponding to  $P_0 = (x_0, y_0, 0)$ , namely  $Q_0 = (x_0, y_0, f(x_0, y_0))$ , and to  $P = (x_0 + t \cos \theta, y_0 + t \sin \theta, 0)$ , namely  $Q = (x_0 + t \cos \theta, y_0 + t \sin \theta, f(x_0 + t \cos \theta, y_0 + t \sin \theta))$ . The average rate of change of  $z$  with respect to  $t$  in the direction of  $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$  is

$$\frac{\Delta z}{\Delta t} = \frac{f(x_0 + t \cos \theta, y_0 + t \sin \theta) - f(x_0, y_0)}{t}$$

By taking the limit as  $t \rightarrow 0$ , we obtain the rate of change of  $f$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u}$ , provided the limit exists. This limit, denoted by  $D_{\mathbf{u}}f(x_0, y_0)$ , is the *directional derivative of  $f$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u}$* .

#### DEFINITION Directional Derivative of a Function of Two Variables

Suppose  $z = f(x, y)$  is a function of two variables whose domain is  $D$  and  $(x_0, y_0)$  is an interior point of  $D$ . If  $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$ ,  $0 \leq \theta \leq 2\pi$ , is a unit vector, the **directional derivative of  $f$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u}$**  is the number

$$D_{\mathbf{u}}f(x_0, y_0) = \lim_{t \rightarrow 0} \frac{f(x_0 + t \cos \theta, y_0 + t \sin \theta) - f(x_0, y_0)}{t}$$

provided the limit exists.

There are an infinite number of directions from  $P_0$  and so there are an infinite number of directional derivatives of  $f$  at the point  $(x_0, y_0)$ . The directional derivative

Figure 1

**NEED TO REVIEW?** Unit vectors are discussed in Section 10.3, pp. 708–709.

Figure 2

$D_{\mathbf{u}}f(x_0, y_0)$  depends not only on the point  $(x_0, y_0)$ , but also on the angle  $\theta$ , the direction taken from  $(x_0, y_0)$ . The partial derivatives  $f_x$  and  $f_y$  of  $f$  at  $(x_0, y_0)$  are special cases of the directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$ , where the direction taken is  $\mathbf{i}$  for  $f_x(x_0, y_0)$  and the direction taken is  $\mathbf{j}$  for  $f_y(x_0, y_0)$ . For example, if  $\theta = 0$ , then

$$\mathbf{u} = \cos 0\mathbf{i} + \sin 0\mathbf{j} = \mathbf{i}$$

Then using the definition of the directional derivative of  $f$  at  $(x_0, y_0)$  in the direction  $\mathbf{u} = \mathbf{i}$ , we find

$$D_{\mathbf{u}}f(x_0, y_0) = D_{\mathbf{i}}f(x_0, y_0) = \lim_{\substack{t \rightarrow 0 \\ \theta=0}} \frac{f(x_0 + t, y_0) - f(x_0, y_0)}{t} = f_x(x_0, y_0)$$

Similarly, if  $\theta = \frac{\pi}{2}$ , then

$$\mathbf{u} = \cos \frac{\pi}{2}\mathbf{i} + \sin \frac{\pi}{2}\mathbf{j} = \mathbf{j}$$

and

$$D_{\mathbf{j}}f(x_0, y_0) = f_y(x_0, y_0)$$

**NEED TO REVIEW?** Conditions under which a function  $z = f(x, y)$  is differentiable are discussed in Section 12.4, pp. 841–843.

Finding directional derivatives using the definition can be challenging. However, for functions  $z = f(x, y)$  that are differentiable, we can use the formula below to find directional derivatives.

### THEOREM Directional Derivative of a Differentiable Function $f$

If  $z = f(x, y)$  is a differentiable function, then the directional derivative of  $f$  at  $(x_0, y_0)$  in the direction of the unit vector  $\mathbf{u} = \cos \theta\mathbf{i} + \sin \theta\mathbf{j}$  is given by

$$D_{\mathbf{u}}f(x_0, y_0) = f_x(x_0, y_0) \cos \theta + f_y(x_0, y_0) \sin \theta \quad (1)$$

**Proof** If  $x = x_0 + t \cos \theta$ ,  $y = y_0 + t \sin \theta$ , and  $\theta$  is fixed, we can express  $z = f(x, y)$  as a function  $z = f(x_0 + t \cos \theta, y_0 + t \sin \theta) = g(t)$ . Then the derivative of  $g$  at  $t = 0$  is

$$\begin{aligned} g'(0) &= \lim_{t \rightarrow 0} \frac{g(t) - g(0)}{t - 0} = \lim_{t \rightarrow 0} \frac{f(x_0 + t \cos \theta, y_0 + t \sin \theta) - f(x_0, y_0)}{t} \\ &= D_{\mathbf{u}}f(x_0, y_0) \end{aligned} \quad (2)$$

Because  $f$  is differentiable, we can use Chain Rule I to find  $g'(t)$ .

$$\begin{aligned} g'(t) &= \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} && \text{Chain Rule I.} \\ &= \frac{\partial f}{\partial x} \cos \theta + \frac{\partial f}{\partial y} \sin \theta && \frac{dx}{dt} = \frac{d}{dt}(x_0 + t \cos \theta) = \cos \theta; \frac{dy}{dt} = \frac{d}{dt}(y_0 + t \sin \theta) = \sin \theta \end{aligned}$$

If  $t = 0$ , then  $x = x_0$  and  $y = y_0$ , and

$$g'(0) = f_x(x_0, y_0) \cos \theta + f_y(x_0, y_0) \sin \theta = D_{\mathbf{u}}f(x_0, y_0) \quad \text{by (2)}$$

### EXAMPLE 1 Finding the Directional Derivative of a Function

- (a) Find the directional derivative  $D_{\mathbf{u}}f(x, y)$  of  $f(x, y) = x^2y + y^2$  in the direction of  $\mathbf{u} = \cos \frac{\pi}{4}\mathbf{i} + \sin \frac{\pi}{4}\mathbf{j}$ .
- (b) What is  $D_{\mathbf{u}}f(1, 2)$ ?
- (c) Interpret  $D_{\mathbf{u}}f(1, 2)$ .

**Solution (a)** Since the partial derivatives of  $f$ , namely,

$$f_x(x, y) = 2xy \quad \text{and} \quad f_y(x, y) = x^2 + 2y$$

are continuous, the function  $f$  is differentiable. So, we can use formula (1) with the unit

vector  $\mathbf{u} = \cos \frac{\pi}{4} \mathbf{i} + \sin \frac{\pi}{4} \mathbf{j} = \frac{\sqrt{2}}{2} \mathbf{i} + \frac{\sqrt{2}}{2} \mathbf{j}$ . Then

$$\begin{aligned} D_{\mathbf{u}}f(x, y) &= f_x(x, y) \cos \theta + f_y(x, y) \sin \theta \\ &= 2xy \cos \frac{\pi}{4} + (x^2 + 2y) \sin \frac{\pi}{4} && f_x(x, y) = 2xy; \\ &= \sqrt{2}xy + \frac{\sqrt{2}}{2}(x^2 + 2y) && f_y(x, y) = x^2 + 2y; \theta = \frac{\pi}{4} \end{aligned}$$

$$(b) \quad D_{\mathbf{u}}f(1, 2) = 2\sqrt{2} + \frac{\sqrt{2}}{2}(1 + 4) = \frac{9\sqrt{2}}{2}.$$

(c) When we are at the point  $(1, 2)$  and moving in the direction  $\mathbf{u} = \frac{\sqrt{2}}{2} \mathbf{i} + \frac{\sqrt{2}}{2} \mathbf{j}$ , the function is changing at a rate of approximately 6.364 units per unit length. ■

**NOW WORK** Problem 11(a) and (b).

DF Figure 3

There is another (geometric) interpretation for a directional derivative. Look at Figure 3. If  $P_0 = (x_0, y_0, 0)$  is an interior point in the domain of  $z = f(x, y)$ , then the point  $Q_0 = (x_0, y_0, z_0) = (x_0, y_0, f(x_0, y_0))$  is a point on the surface of  $z$ . As we move in the domain of  $f$  along the line  $L$  in the direction of  $\mathbf{u}$ , points are traced out on a curve  $C$  that lie on the surface  $z = f(x, y)$ . This curve  $C$  is the intersection of the surface and the plane perpendicular to the  $xy$ -plane that contains the line  $L$ . It follows that for any point  $P = (x_0 + t \cos \theta, y_0 + t \sin \theta, 0)$  on  $L$  that is in the domain of  $f$ , there is a corresponding point  $Q$  on  $C$ . Furthermore, the expression

$$\frac{f(x_0 + t \cos \theta, y_0 + t \sin \theta) - f(x_0, y_0)}{t} \quad t \neq 0$$

equals the slope of the secant line containing the two points  $Q_0$  and  $Q$  on  $C$ , and the limit as  $t \rightarrow 0$  is the slope of the tangent line to  $C$  at  $Q_0$ . This proves the following result.

**THEOREM The Directional Derivative as a Slope**

If  $z = f(x, y)$  is a differentiable function, then the directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  of  $f$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u}$  equals the slope of the tangent line to the curve  $C$  at the point  $(x_0, y_0, f(x_0, y_0))$  on the surface  $z = f(x, y)$ , where  $C$  is the intersection of the surface with the plane perpendicular to the  $xy$ -plane and containing the line through  $(x_0, y_0, 0)$  in the direction  $\mathbf{u}$ .

**EXAMPLE 2** Interpreting the Directional Derivative as a Slope

Find the directional derivative of  $f(x, y) = x \sin y$  at the point  $(2, \frac{\pi}{3})$  in the direction of  $\mathbf{a} = 3\mathbf{i} + 4\mathbf{j}$ . Interpret the result as a slope.

**Solution** To find a directional derivative of a function  $f$  in the direction of  $\mathbf{a}$ , where  $\mathbf{a}$  is a nonzero vector, we must first find the unit vector in the direction of  $\mathbf{a}$ . The unit vector  $\mathbf{u}$  in the direction of  $\mathbf{a}$  is

$$\mathbf{u} = \frac{\mathbf{a}}{\|\mathbf{a}\|} = \frac{3\mathbf{i} + 4\mathbf{j}}{\sqrt{9 + 16}} = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}$$

The partial derivatives of  $f$

$$f_x(x, y) = \sin y \quad \text{and} \quad f_y(x, y) = x \cos y$$

**NOTE** The unit vector  $\mathbf{u}$  in the direction of a given vector is defined in Section 10.3, p. 708.

Figure 4  $f(x, y) = x \sin y$ 

are continuous throughout the plane, so  $f$  is differentiable. Using the unit vector

$$\mathbf{u} = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}, \text{ we find}$$

$$D_{\mathbf{u}}f(x, y) = f_x(x, y)\frac{3}{5} + f_y(x, y)\frac{4}{5} = \frac{3}{5}\sin y + \frac{4}{5}x \cos y$$

$$D_{\mathbf{u}}f(x, y) = f_x(x, y) \cos \theta + f_y(x, y) \sin \theta$$

At the point  $\left(2, \frac{\pi}{3}\right)$ ,

$$D_{\mathbf{u}}f\left(2, \frac{\pi}{3}\right) = \frac{3}{5}\sin \frac{\pi}{3} + \frac{4}{5}\left(2\cos \frac{\pi}{3}\right) = \frac{3}{5}\left(\frac{\sqrt{3}}{2}\right) + \frac{8}{5}\left(\frac{1}{2}\right) = \frac{3\sqrt{3} + 8}{10}$$

The slope of the tangent line to the curve  $C$  that is the intersection of the surface  $f(x, y) = x \sin y$  and the plane perpendicular to the  $xy$ -plane that contains the line through the point  $\left(2, \frac{\pi}{3}, 0\right)$  in the direction  $\mathbf{a}$  is approximately 1.32. See Figure 4. ■

### NOW WORK Problems 11(c) and 15.

## 2 Find the Gradient of a Function of Two Variables

The directional derivative of a differentiable function  $z = f(x, y)$  at a point  $(x_0, y_0)$  in the direction of the unit vector  $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$  is given by

$$D_{\mathbf{u}}f(x_0, y_0) = f_x(x_0, y_0) \cos \theta + f_y(x_0, y_0) \sin \theta$$

We can express  $D_{\mathbf{u}}f(x_0, y_0)$  as the dot product of two vectors as follows:

$$\begin{aligned} D_{\mathbf{u}}f(x_0, y_0) &= f_x(x_0, y_0) \cos \theta + f_y(x_0, y_0) \sin \theta \\ &= [f_x(x_0, y_0)\mathbf{i} + f_y(x_0, y_0)\mathbf{j}] \cdot [\cos \theta \mathbf{i} + \sin \theta \mathbf{j}] \\ &= [f_x(x_0, y_0)\mathbf{i} + f_y(x_0, y_0)\mathbf{j}] \cdot \mathbf{u} \end{aligned}$$

The vector  $f_x(x_0, y_0)\mathbf{i} + f_y(x_0, y_0)\mathbf{j}$  is called the *gradient of  $f$*  at  $(x_0, y_0)$ .

**NEED TO REVIEW?** The dot product is discussed in Section 10.4, pp. 715–716.

### DEFINITION Gradient of a Function of Two Variables

Let  $z = f(x, y)$  be a differentiable function. The vector  $\nabla f(x, y)$ , read “del  $f$ ,” is called the **gradient** of  $f$  and is defined as

$$\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}$$

**NOTE** “del  $f$ ” is short for “delta  $f$ ”; the symbol  $\nabla$  is an upside down Greek letter delta. In some books,  $\nabla f$  is written as “grad  $f$ .” The symbol  $\nabla$  has no meaning except when it operates on a function  $z = f(x, y)$ . So,  $\nabla$  is

referred to as an **operator**, just as  $\frac{d}{dx}$  is an operator indicating “take the derivative of  $x$ .”

The directional derivative  $D_{\mathbf{u}}f(x, y)$  of  $f$  can be expressed in terms of the gradient of  $f$ .

### THEOREM The Directional Derivative as a Dot Product

The dot product of the vector  $\nabla f(x, y)$  and the unit vector  $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$  is a scalar that is equal to the directional derivative  $D_{\mathbf{u}}f(x, y)$ . That is,

$$\nabla f(x, y) \cdot \mathbf{u} = D_{\mathbf{u}}f(x, y) \quad (3)$$

**Proof**  $\nabla f(x, y) \cdot \mathbf{u} = [f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}] \cdot [\cos \theta \mathbf{i} + \sin \theta \mathbf{j}]$   
 $= f_x(x, y) \cos \theta + f_y(x, y) \sin \theta = D_{\mathbf{u}}f(x, y).$  ■

**EXAMPLE 3** Finding the Gradient of a Function of Two Variables

- (a) Find the gradient of  $f(x, y) = x^3y$  at the point  $(2, 1)$ .  
 (b) Use the gradient to find the directional derivative of  $f$  at  $(2, 1)$  in the direction from  $(2, 1)$  to  $(3, 5)$ .

**Solution** (a) The gradient of  $f$  at  $(x, y)$  is

$$\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} = 3x^2y\mathbf{i} + x^3\mathbf{j}$$

The gradient of  $f$  at  $(2, 1)$  is

$$\nabla f(2, 1) = 12\mathbf{i} + 8\mathbf{j}$$

- (b) The unit vector  $\mathbf{u}$  from  $(2, 1)$  to  $(3, 5)$  is

$$\mathbf{u} = \frac{(3-2)\mathbf{i} + (5-1)\mathbf{j}}{\sqrt{(3-2)^2 + (5-1)^2}} = \frac{\mathbf{i} + 4\mathbf{j}}{\sqrt{17}}$$

We use formula (3) for the directional derivative to find  $D_{\mathbf{u}}f(2, 1)$ .

$$D_{\mathbf{u}}f(2, 1) = \nabla f(2, 1) \cdot \mathbf{u} = (12\mathbf{i} + 8\mathbf{j}) \cdot \frac{\mathbf{i} + 4\mathbf{j}}{\sqrt{17}} = \frac{44}{\sqrt{17}}$$

The directional derivative of  $f$  at  $(2, 1)$  in the direction of  $\mathbf{u}$  is  $\frac{44}{\sqrt{17}}$  ■

**NOW WORK** Problem 25.

Let's look more closely at the directional derivative  $D_{\mathbf{u}}f(x, y)$ .

$$D_{\mathbf{u}}f(x, y) = \nabla f(x, y) \cdot \mathbf{u} \quad (4)$$

- If  $\nabla f(x_0, y_0) = \mathbf{0}$ , then for any direction  $\mathbf{u}$ ,

$$D_{\mathbf{u}}f(x_0, y_0) = \nabla f(x_0, y_0) \cdot \mathbf{u} = \mathbf{0} \cdot \mathbf{u} = 0$$

- If  $\nabla f(x_0, y_0) \neq \mathbf{0}$  and  $\phi$ ,  $0 \leq \phi \leq \pi$ , is the angle between the unit vector  $\mathbf{u}$  and the gradient  $\nabla f(x_0, y_0)$ , then

$$D_{\mathbf{u}}f(x_0, y_0) = \nabla f(x_0, y_0) \cdot \mathbf{u} = \|\nabla f(x_0, y_0)\| \|\mathbf{u}\| \cos \phi = \|\nabla f(x_0, y_0)\| \cos \phi \quad (5)$$

The directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  is largest when  $\cos \phi = 1$ . This happens if the angle  $\phi$  between  $\mathbf{u}$  and  $\nabla f$  is 0, or equivalently, if  $\mathbf{u}$  and  $\nabla f(x_0, y_0)$  have the same direction. In this case, the *maximum value of the directional derivative* is

$$\text{Maximum value of } D_{\mathbf{u}}f(x_0, y_0) = \|\nabla f(x_0, y_0)\|$$

Similarly, the minimum value of  $D_{\mathbf{u}}f(x_0, y_0)$  occurs when  $\cos \phi = -1$ , that is, when  $\phi = \pi$ . This happens when  $\mathbf{u}$  and  $\nabla f$  are opposite in direction. The *minimum value of the directional derivative* is

$$\text{Minimum value of } D_{\mathbf{u}}f(x_0, y_0) = -\|\nabla f(x_0, y_0)\|$$

**THEOREM** Properties of the Gradient

Suppose the function  $z = f(x, y)$  is differentiable at  $(x_0, y_0)$ .

- If  $\nabla f(x_0, y_0) = \mathbf{0}$ , then  $D_{\mathbf{u}}f(x_0, y_0) = 0$  for all directions  $\mathbf{u}$ .
- If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , then the directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  of  $f$  at  $(x_0, y_0)$  is a maximum when  $\mathbf{u}$  is in the direction of  $\nabla f(x_0, y_0)$ . The maximum value of  $D_{\mathbf{u}}f(x_0, y_0)$  is  $\|\nabla f(x_0, y_0)\|$ .
- If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , then the directional derivative of  $f$  at  $(x_0, y_0)$  is a minimum when  $\mathbf{u}$  is in the direction of  $-\nabla f(x_0, y_0)$ . The minimum value of  $D_{\mathbf{u}}f(x_0, y_0)$  is  $-\|\nabla f(x_0, y_0)\|$ .

**NEED TO REVIEW?** The angle between two vectors is discussed in Section 10.4, pp. 716–719.

### 3 Use Properties of the Gradient

#### EXAMPLE 4 Using Properties of the Gradient

- (a) Find the direction for which the directional derivative of  $f(x, y) = x^2 - xy + y^2$  at  $(1, -2)$  is a maximum.  
 (b) Find the maximum value of the directional derivative.

**Solution** (a) We begin by finding the gradient of  $f$  at  $(1, -2)$ .

$$\begin{aligned}\nabla f(x, y) &= (2x - y)\mathbf{i} + (2y - x)\mathbf{j} & \nabla f(x, y) &= f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} \\ \nabla f(1, -2) &= 4\mathbf{i} - 5\mathbf{j} & x = 1; y = -2\end{aligned}$$

The direction  $\mathbf{u}$  for which  $D_{\mathbf{u}}f(1, -2)$  is maximum occurs when  $\nabla f$  and the unit vector  $\mathbf{u}$  have the same direction. That is, the directional derivative is a maximum when the direction is  $\mathbf{u} = \frac{4\sqrt{41}}{41}\mathbf{i} - \frac{5\sqrt{41}}{41}\mathbf{j}$ .

- (b) The maximum value of the directional derivative at  $(1, -2)$  equals the magnitude of the gradient, namely

$$\|\nabla f(1, -2)\| = \sqrt{16 + 25} = \sqrt{41}$$

#### NOW WORK Problem 35.

The directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  equals the rate of change of  $z = f(x, y)$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u}$ . When  $\mathbf{u}$  has the same direction as  $\nabla f(x_0, y_0)$ , then the rate of change of  $f$  at  $(x_0, y_0)$  is a maximum. It follows that  $f(x, y)$  will increase most rapidly in this direction.

#### THEOREM

Suppose  $z = f(x, y)$  is differentiable at  $(x_0, y_0)$  and  $\nabla f(x_0, y_0) \neq \mathbf{0}$ .

- The value of  $z = f(x, y)$  at  $(x_0, y_0)$  increases most rapidly in the direction of  $\nabla f(x_0, y_0)$  and decreases most rapidly in the direction of  $-\nabla f(x_0, y_0)$ .
- The value of  $z = f(x, y)$  remains the same for directions orthogonal to  $\nabla f(x_0, y_0)$ .

The second statement is a consequence of (5). If  $\phi$  is the angle between  $\mathbf{u}$  and  $\nabla f$ , the rate of change of  $z$  in the direction of  $\mathbf{u}$  is 0 when

$$D_{\mathbf{u}}f(x_0, y_0) = \nabla f \cdot \mathbf{u} = \|\nabla f(x_0, y_0)\| \cos \phi = 0 \quad 0 \leq \phi \leq \pi$$

If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , then  $\cos \phi = 0$ , or equivalently,  $\phi = \frac{\pi}{2}$ . In other words, the rate of change of  $z$  is 0 when the direction of  $\mathbf{u}$  is orthogonal to  $\nabla f(x_0, y_0)$ .

#### EXAMPLE 5 Modeling Temperature Change

A metal plate is placed on the  $xy$ -plane in such a way that the temperature  $T$  in degrees Celsius at any point  $P = (x, y)$  is inversely proportional to the distance of  $P$  from  $(0, 0)$ . Suppose the temperature of the plate at the point  $(-3, 4)$  equals  $50^\circ\text{C}$ .

- (a) Find  $T = T(x, y)$ .  
 (b) Find the gradient of  $T$  at the point  $(-3, 4)$ .  
 (c) In what directions does the temperature increase most rapidly?  
 (d) In what directions does the temperature decrease most rapidly?  
 (e) In what directions is the rate of change of  $T$  at  $(-3, 4)$  equal to 0?

**Solution** (a) The temperature  $T$  at any point  $(x, y)$  is inversely proportional to the distance of  $(x, y)$  from the origin  $(0, 0)$ . We can model  $T = T(x, y)$  as

$$T(x, y) = \frac{k}{\sqrt{x^2 + y^2}}$$

where  $k$  is the constant of proportionality. Since  $T = 50^\circ\text{C}$  when  $(x, y) = (-3, 4)$ , then

$$k = T\sqrt{x^2 + y^2} = 50\sqrt{(-3)^2 + 4^2} = 50(5) = 250$$

$$\text{So, } T = T(x, y) = \frac{250}{\sqrt{x^2 + y^2}}.$$

(b) The gradient of  $T = T(x, y) = \frac{250}{\sqrt{x^2 + y^2}}$  is

$$\nabla T(x, y) = T_x(x, y)\mathbf{i} + T_y(x, y)\mathbf{j} = -\frac{250x}{(x^2 + y^2)^{3/2}}\mathbf{i} - \frac{250y}{(x^2 + y^2)^{3/2}}\mathbf{j}$$

At  $(-3, 4)$ ,

$$\nabla T(-3, 4) = -\frac{250(-3)}{[(-3)^2 + 4^2]^{3/2}}\mathbf{i} - \frac{250(4)}{[(-3)^2 + 4^2]^{3/2}}\mathbf{j} = \frac{750}{125}\mathbf{i} - \frac{1000}{125}\mathbf{j} = 6\mathbf{i} - 8\mathbf{j}$$

(c) The temperature increases most rapidly in the direction  $\nabla T(-3, 4) = 6\mathbf{i} - 8\mathbf{j}$ .

(d) The temperature decreases most rapidly in the direction  $-\nabla T(-3, 4) = -6\mathbf{i} + 8\mathbf{j}$ .

(e) The rate of change in  $T$  at  $(-3, 4)$  equals 0 for directions orthogonal to  $\nabla T(-3, 4) = 6\mathbf{i} - 8\mathbf{j}$ . That is, the rate of change in  $T$  is 0 in either of the two directions orthogonal to  $6\mathbf{i} - 8\mathbf{j}$ , namely  $\pm(8\mathbf{i} + 6\mathbf{j})$ . ■

**Figure 5**  $T = T(x, y) = \frac{250}{\sqrt{x^2 + y^2}}$

Figure 5 shows the graph of the surface  $T = T(x, y)$ .

### NOW WORK Problem 47.

**NEED TO REVIEW?** Level curves are discussed in Section 12.1, pp. 812–814.

**NOTE** The grade of a mountain is a measure of its steepness. The name gradient given to  $\nabla f$  means the direction of steepest ascent.

Suppose the surface  $z = f(x, y)$  represents a mountain whose elevation above sea level is  $z$ . See Figure 6(a). The level curves of  $f$  shown in Figure 6(b) correspond to contour lines along which the elevation remains fixed. So along the level curves, the value of  $z$  does not change. The elevation increases (or decreases) most rapidly in directions perpendicular to the level curves. In other words, the most direct (but steepest) route to the top of the mountain is in the direction of  $\nabla f$ , which is orthogonal to the level curves. The shortest route down the mountain is in the direction of  $-\nabla f$ , which is also perpendicular to the level curves. A stream of water flows this way down the mountain. As water moves from one level curve to another, the gradient changes, giving the water a new direction. See Figure 7.

**DF** Figure 6

**Figure 7** Level curve of the graph of  $z = f(x, y)$ .

**THEOREM** The Gradient Is Normal to the Level Curve

Suppose the function  $z = f(x, y)$  is differentiable at a point  $P_0 = (x_0, y_0)$ . If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , then  $\nabla f(x_0, y_0)$  is normal to the level curve of  $f$  at  $P_0$ .

**RECALL** A normal vector to a curve at a point  $P$  is defined as a vector with initial point at  $P$  and orthogonal (perpendicular) to the tangent line to the curve at  $P$ .

**Proof** Let  $f(x, y) = k$  be the level curve through  $P_0$ . Suppose this level curve is represented parametrically by  $x = x(t)$  and  $y = y(t)$ , with  $x_0 = x(t_0)$  and  $y_0 = y(t_0)$ . Then

$$f(x(t), y(t)) = k$$

Differentiating  $f(x(t), y(t))$  with respect to  $t$ , we get

$$f_x(x(t), y(t)) x'(t) + f_y(x(t), y(t)) y'(t) = 0 \quad \text{Use Chain Rule 1.}$$

or, equivalently,

$$\nabla f(x, y) \cdot [x'(t)\mathbf{i} + y'(t)\mathbf{j}] = 0$$

Since  $x'(t)\mathbf{i} + y'(t)\mathbf{j}$  is tangent to the level curve, the vector  $\nabla f(x, y)$  is normal to the level curve. In particular, when  $t = t_0$ ,  $\nabla f(x_0, y_0)$  is normal to the level curve of  $f$  at  $(x_0, y_0)$ . ■

**EXAMPLE 6** Using Properties of the Gradient

For the function  $f(x, y) = \sqrt{x^2 + y^2}$ , graph the level curve containing the point  $(3, 4)$  and graph the gradient  $\nabla f(x, y)$  at this point.

**Solution** See Figure 8(a). The graph of the equation  $z = \sqrt{x^2 + y^2}$  is the upper half of a circular cone whose traces are circles. So, the level curves are concentric circles centered at  $(0, 0)$ . Because  $f(3, 4) = \sqrt{9 + 16} = 5$ , the level curve through  $(3, 4)$  is the circle  $x^2 + y^2 = 25$ . Since

$$\nabla f(x, y) = \frac{x}{\sqrt{x^2 + y^2}}\mathbf{i} + \frac{y}{\sqrt{x^2 + y^2}}\mathbf{j}$$

the gradient at  $(3, 4)$  is

$$\nabla f(3, 4) = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}$$

This vector is orthogonal to the level curve  $x^2 + y^2 = 25$ , as shown in Figure 8(b).

Figure 8

## 4 Find the Directional Derivative and Gradient of a Function of Three Variables

The concepts of directional derivative and gradient can be extended to a function  $w = f(x, y, z)$  of three variables.

### DEFINITION Directional Derivative of a Function of Three Variables

The **directional derivative**  $D_{\mathbf{u}}f(x_0, y_0, z_0)$  of a function  $w = f(x, y, z)$  at  $(x_0, y_0, z_0)$  in the direction of a unit vector  $\mathbf{u} = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$  is given by

$$D_{\mathbf{u}}f(x_0, y_0, z_0) = \lim_{t \rightarrow 0} \frac{f(x_0 + t \cos \alpha, y_0 + t \cos \beta, z_0 + t \cos \gamma) - f(x_0, y_0, z_0)}{t}$$

provided the limit exists.

If the function  $w = f(x, y, z)$  is differentiable, then the directional derivative of  $f$  in the direction of  $\mathbf{u} = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$  equals

$$D_{\mathbf{u}}f(x_0, y_0, z_0) = f_x(x_0, y_0, z_0) \cos \alpha + f_y(x_0, y_0, z_0) \cos \beta + f_z(x_0, y_0, z_0) \cos \gamma$$

As with functions of two variables, the directional derivative  $D_{\mathbf{u}}f(x_0, y_0, z_0)$  equals the rate of change of  $f$  at  $(x_0, y_0, z_0)$  in the direction of  $\mathbf{u}$ .

### DEFINITION Gradient of a Function of Three Variables

Let  $w = f(x, y, z)$  be a differentiable function. Then the **gradient** of  $f$  at  $(x_0, y_0, z_0)$  is the vector

$$\nabla f(x_0, y_0, z_0) = f_x(x_0, y_0, z_0)\mathbf{i} + f_y(x_0, y_0, z_0)\mathbf{j} + f_z(x_0, y_0, z_0)\mathbf{k}$$

Then, as for functions of two variables, the directional derivative of  $f$  at  $(x_0, y_0, z_0)$  in the direction of  $\mathbf{u}$  can be found using the gradient as follows:

$$D_{\mathbf{u}}f(x_0, y_0, z_0) = \nabla f(x_0, y_0, z_0) \cdot \mathbf{u} = \|\nabla f(x_0, y_0, z_0)\| \cos \phi$$

where  $\phi$  is the angle between  $\nabla f(x_0, y_0, z_0)$  and  $\mathbf{u}$ .

As with functions of two variables, the value of  $f$  increases most rapidly in the direction of the gradient  $\nabla f(x_0, y_0, z_0)$ , and decreases most rapidly in the direction of  $-\nabla f(x_0, y_0, z_0)$ .

For example, suppose  $T = T(x, y, z)$  is the temperature of a homogeneous object at the point  $(x, y, z)$ . At the point  $(x_0, y_0, z_0)$  on the object, heat will flow in the direction of greatest decrease in temperature, namely in the direction of  $-\nabla T(x_0, y_0, z_0)$ . This direction of greatest heat transfer is normal to the level surface through  $(x_0, y_0, z_0)$ .

### THEOREM The Gradient Is Normal to the Level Surface

Suppose the function  $w = f(x, y, z)$  is differentiable at a point  $P_0 = (x_0, y_0, z_0)$ . If  $\nabla f(x_0, y_0, z_0) \neq \mathbf{0}$ , the gradient  $\nabla f(x_0, y_0, z_0)$  is normal to the level surface of  $f$  through  $P_0$ .

You are asked to prove this in Problem 76.

## 13.1 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  equals the rate of change of  $z = f(x, y)$  at  $(x_0, y_0)$  in the direction of the unit vector  $\mathbf{u}$ .
- True or False** For a function  $z = f(x, y)$ , the partial derivative  $f_x(x_0, y_0)$  is the directional derivative at  $(x_0, y_0)$  in the direction of  $\mathbf{i}$ .
- True or False** Both the directional derivative  $D_{\mathbf{u}}f(x, y)$  and the gradient  $\nabla f(x, y)$  of a function  $z = f(x, y)$  are vectors.

4. **True or False** If  $z = f(x, y)$  is a differentiable function, then the directional derivative of  $f$  at  $(x_0, y_0)$  in the direction of  $\mathbf{u} = \cos \theta \mathbf{i} + \sin \theta \mathbf{j}$  is given by  $D_{\mathbf{u}}f(x_0, y_0) = f_x(x_0, y_0) \cos \theta + f_y(x_0, y_0) \sin \theta$ .
5. **True or False** The vector  $x\mathbf{i} + \sin y\mathbf{j}$  is the gradient of  $f(x, y) = x \sin y$ .
6. The directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  of  $f$  at  $(x_0, y_0)$  is a maximum when  $\mathbf{u} = \underline{\hspace{2cm}}$ .
7. The value of  $z = f(x, y)$  at  $(x_0, y_0)$  decreases most rapidly in the direction of  $\underline{\hspace{2cm}}$ .
8. For a differentiable function  $z = f(x, y)$ , the maximum value of  $D_{\mathbf{u}}f(x_0, y_0)$  is  $\underline{\hspace{2cm}}$ .

### Skill Building

In Problems 9–16,

(a) Find the directional derivative of each function at the indicated point and in the indicated direction.

(b) Interpret the result as a rate of change.

(c) Interpret the result as a slope.

9.  $f(x, y) = xy^2 + x^2$  at  $(-1, 2)$  in the direction  $\mathbf{u} = \frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j}$
10.  $f(x, y) = 3xy + y^2$  at  $(2, 1)$  in the direction  $\mathbf{u} = \frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}$
11.  $f(x, y) = 2xy - y^2$  at  $(-1, 3)$  in the direction  $\theta = \frac{2\pi}{3}$
12.  $f(x, y) = 2xy + x^2$  at  $(0, 3)$  in the direction  $\theta = \frac{4\pi}{3}$
13.  $f(x, y) = xe^y + ye^x$  at  $(0, 0)$  in the direction  $\theta = \frac{\pi}{6}$
14.  $f(x, y) = x \ln y$  at  $(5, 1)$  in the direction  $\theta = \frac{\pi}{4}$
15.  $f(x, y) = \tan^{-1} \frac{y}{x}$  at  $(1, 1)$  in the direction of  $\mathbf{a} = 3\mathbf{i} - 4\mathbf{j}$
16.  $f(x, y) = \ln \sqrt{x^2 + y^2}$  at  $(3, 4)$  in the direction of  $\mathbf{a} = 5\mathbf{i} + 12\mathbf{j}$

In Problems 17–32:

(a) Find the gradient of  $f$  at the given point  $P$ .

(b) Use the gradient to find the directional derivative of  $f$  at  $P$  in the direction from  $P$  to  $Q$ .

17.  $f(x, y) = xy^2 + x^2$ ;  $P = (1, 2)$ ,  $Q = (2, 4)$
18.  $f(x, y) = 2xy + x^2$ ;  $P = (-1, 1)$ ,  $Q = (1, 2)$
19.  $f(x, y) = 2xy + x^2$ ;  $P = (0, 3)$ ,  $Q = (4, 1)$
20.  $f(x, y) = 3xy + y^2$ ;  $P = (2, 1)$ ,  $Q = (4, 1)$
21.  $f(x, y) = xy + \sin x$ ;  $P = (0, 1)$ ,  $Q = (\pi, 2)$
22.  $f(x, y) = e^{xy} + \sin y$ ;  $P = \left(0, \frac{\pi}{2}\right)$ ,  $Q = (1, 0)$
23.  $f(x, y) = \tan^{-1} \frac{y}{x}$ ;  $P = (1, 0)$ ,  $Q = (4, \pi)$
24.  $f(x, y) = \ln \sqrt{x^2 + y^2}$ ;  $P = (3, 4)$ ,  $Q = (0, 5)$
25.  $f(x, y) = x^2e^y$ ;  $P = (2, 0)$ ,  $Q = (3, 0)$

26.  $f(x, y) = e^{x^2+y^2}$ ;  $P = (1, 2)$ ,  $Q = (2, 3)$
27.  $f(x, y, z) = x^2y - xyz^2$ ;  $P = (0, 1, 2)$ ,  $Q = (1, 4, 3)$
28.  $f(x, y, z) = x^2y + y^2z + z^2x$ ;  $P = (1, 2, -1)$ ,  $Q = (2, 0, 1)$
29.  $f(x, y, z) = z \tan^{-1} \frac{y}{x}$ ;  $P = (1, 1, 3)$ ,  $Q = (2, 0, -2)$
30.  $f(x, y, z) = \sin x \cos(y + z)$ ;  $P = (1, 1, 1)$ ,  $Q = (2, -1, 0)$
31.  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ ;  $P = (3, 4, 0)$ ,  $Q = (1, -1, 1)$
32.  $f(x, y, z) = \frac{x}{\sqrt{x^2 + 2y^2 + 3z^2}}$ ;  $P = (1, 2, 1)$ ,  $Q = (-1, 1, 1)$

In Problems 33–40:

(a) Find the direction for which the directional derivative of the function  $f$  is a maximum.

(b) Find the maximum value of the directional derivative.

33.  $f(x, y) = xy^2 + x^2$  at  $P = (-1, 2)$
34.  $f(x, y) = 3xy + y^2$  at  $P = (2, 1)$
35.  $f(x, y) = xe^y + ye^x$  at  $P = (0, 0)$
36.  $f(x, y) = x \ln y$  at  $P = (5, 1)$
37.  $f(x, y) = \frac{x}{x^2 + y^2}$  at  $P = (1, 2)$
38.  $f(x, y) = \sqrt{x^2 + y^2}$  at  $P = (3, 4)$
39.  $f(x, y, z) = z \tan^{-1} \frac{y}{x}$  at  $P = (1, 1, 3)$
40.  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$  at  $P = (3, 4, 0)$

In Problems 41–46, graph the level curve of  $f$  containing the point  $P$  and the gradient  $\nabla f$  at that point.

41.  $f(x, y) = x^2 + y^2$  containing  $P = (3, 4)$
42.  $f(x, y) = x^2 - y^2$  containing  $P = (2, -1)$
43.  $f(x, y) = x^2 - 4y^2$  containing  $P = \left(3, \frac{\sqrt{5}}{2}\right)$
44.  $f(x, y) = x^2 + 4y^2$  containing  $P = (-2, 0)$
45.  $f(x, y) = x^2y$  containing  $P = \left(3, \frac{1}{9}\right)$
46.  $f(x, y) = xy$  containing  $P = (1, 1)$

### Applications and Extensions

47. **Heat Transfer** A metal plate is placed on the  $xy$ -plane in such a way that the temperature  $T$  at any point  $(x, y)$  is given by  $T = e^x(\sin x + \sin y)^\circ\text{C}$ .

- (a) What is the rate of change in temperature at  $(0, 0)$  in the direction of  $3\mathbf{i} - 4\mathbf{j}$ ?
- (b) At  $(0, 0)$ , in what direction is the temperature increasing most rapidly?
- (c) In what direction is the temperature decreasing most rapidly?
- (d) In what direction does the temperature remain the same?

**48. Electrical Potential** The electrical potential  $V$  at any point  $(x, y)$  is given by  $V = \ln \sqrt{x^2 + y^2}$ . Find the rate of change of potential  $V$  at any point  $(x, y) \neq (0, 0)$ :

- In a direction toward  $(0, 0)$ .
- In the two directions orthogonal to a direction toward  $(0, 0)$ .
- In what direction is the potential  $V$  increasing most rapidly?
- In what direction is the potential  $V$  decreasing most rapidly?

**49. Geography** The surface of a hill is modeled by the equation  $z = (8 - 2x^2 - y^2)$  m. See the figure below. If a freshwater spring is located at the point  $(1, 2, 2)$ , in what direction will the water flow?

The graph of  $z$  and its level curves.

**50. Temperature Change** Suppose that the temperature in degrees Celsius at each point of the coordinate plane is  $T = (3x^2 + 4y^2 + 5)^\circ\text{C}$ .

- If we leave the point  $(3, 4)$  heading for the point  $(4, 3)$ , how fast (in degrees per unit of distance) is the temperature changing at the point  $(4, 3)$ ?
- After reaching  $(4, 3)$ , in what direction should we go if we want to cool off as fast as possible? How fast is the temperature changing at the point  $(4, 3)$ ?
- Suppose that we want to move away from  $(4, 3)$  along a path of constant temperature. What is an equation of our path and what is the temperature?
- A person at the origin may go in *any* direction and will experience the same rate of change of temperature. Why? What is the rate?

**51. Temperature Change** The temperature at any point  $(x, y)$  of a rectangular plate lying in the  $xy$ -plane is given by  $T = [x \sin(2y)]^\circ\text{C}$ . Find the rate of change of temperature at the point  $\left(1, \frac{\pi}{4}\right)$  in the direction making an angle of  $\frac{\pi}{6}$  with the positive  $x$ -axis.

**52. Rate of Change** Suppose that  $z = xy^2$ . In what direction(s) can we go from the point  $(-1, 1)$  if we want the rate of change of  $z$  to be 2?

**53. Rate of Change**

- Find the direction through the point  $(2, 1)$  in which the function  $z = 4x^2 + 9y^2$  has a maximum rate of change.
- Verify that this direction is that of the normal to the curve  $4x^2 + 9y^2 = 25$  at the point  $(2, 1)$ . See the figure in next column.

(c) Find the value of this maximum rate of change.

The graph of  $z$  and its level curves. The curve  $4x^2 + 9y^2 = 25$  appears in red.

**54.** Show that the level curves of  $z = f(x, y) = x^2 - y^2$  are orthogonal to the level curves of  $h(x, y) = xy$  for all  $(x_0, y_0) \neq (0, 0)$ . See the figure below.

The level curves of  $z$  are in blue. The level curves of  $h$  are in red.

**55.** Find a unit vector  $\mathbf{u}$  that is normal to the level curve of  $f(x, y) = 4x^2y$  through  $P = (1, -2)$  at  $P$ . See the figure below.

The level curves of  $f(x, y) = 4x^2y$ .

**56.** Find a unit vector  $\mathbf{u}$  that is normal to the level curve of  $f(x, y) = 2x^2 + y^2 + 1$  through  $P = (1, 1)$  at  $P$ . See the figure below.

The level curves of  $f(x, y) = 2x^2 + y^2 + 1$ .

**57. Isothermal Curves** Using the information from Example 5:

- Find the level curves of  $T = T(x, y) = \frac{250}{\sqrt{x^2 + y^2}}$ .
- Graph the level curves for  $T = 25$ , 50, and 250.
- Write the equation of the level curve for  $T$  that passes through the point  $(-3, 4)$ .
- Graph the level curve from (c) along with the vector  $\nabla T(-3, 4)$ .
- Since Example 5 deals with temperature, the level curves for  $T$  are called **isothermal curves**. Explain how they relate to the temperature  $T$ .

**58. Mountaineering** Suppose that you are climbing a mountain whose surface is modeled by the equation  $x^2 + y^2 - 5x + z = 0$ . (The  $x$ -axis points east, the  $y$ -axis north, and the  $z$ -axis up; units are in thousands of feet.)

The graph of  $z$  and its level curves.

- Your route is such that as you pass through the point  $(1, 1, 3)$ , you are heading northeast. At what rate (with respect to distance) is your altitude changing at that point?
  - Another climber at  $(1, 2, 0)$  wants to reach the summit in as short a distance as possible. In what direction should he start? At what rate is his altitude changing when he starts?
  - A third climber at  $(2, 1, 5)$  wants to remain at the same altitude. In what direction(s) may she go?
- 59. Electrical Potential** Suppose that the electrical potential (voltage  $V$ ) at each point in space is  $V = e^{xyz}$  volts and that electric charges move in the direction of greatest *potential drop* (most rapid decrease of potential). In what direction does a charge at the point  $(1, -1, 2)$  move? How fast does the potential change as the charge leaves this point?
- 60. Electric Field** The electric field vector  $\mathbf{E}$  is the negative of the gradient of the electrostatic potential  $V$ . That is,  $\mathbf{E} = -\nabla V$ . If  $Q$  is a point charge at the origin, then the electrostatic potential  $V$  at the point  $P(x, y, z)$  is given by  $V = \frac{kQ}{\sqrt{x^2 + y^2 + z^2}}$ , where  $k$  is a constant.
- Find the electric field vector  $\mathbf{E}$  at the point  $P(x, y, z)$ .
  - Use (a) to show that the magnitude of the electric field is  $\|\mathbf{E}\| = \frac{kQ}{r^2}$ , where  $r$  is the distance from the origin to the point  $P(x, y, z)$ .
  - Verify that the electric field vector  $\mathbf{E}$  is normal to the equipotential surfaces (surfaces on which the electrostatic potential  $V$  is constant).

**61. Modeling Temperature Change** The temperature at each point of the region  $x^2 + y^2 + z^2 \leq 9$  is  $T = \sqrt{9 - x^2 - y^2 - z^2}^\circ\text{C}$ . If we start at the point  $(0, 1, 2)$  and move across the region in a straight path ending at  $(2, 1, 2)$ , find the rate of change of  $T$  at an arbitrary point on the path.

**62. Chemotaxis** Chemotaxis is the phenomenon in which bodily cells, bacteria, and other organisms direct their movement according to a chemical stimulus. Suppose the concentration of a certain biochemical distribution at a wounded place is given by

$$w = f(x, y, z) = \frac{1}{x^2 + y^2 + z^2}.$$

If a cell that reacts by chemotaxis is located at the point  $(1, 2, 3)$ , find the direction it will move by chemotaxis if the direction of movements is along the gradient of  $f$ .

**Source:** Problem submitted by the students at Minnesota State University

**63. Gravitational Potential Energy** In the study of mechanics in physics, it is shown that the gravitational force  $\mathbf{F}_g$  on an object equals the negative of the gradient of the gravitational potential energy  $U_g$  of the object. That is,  $\mathbf{F}_g = -\nabla U_g$ . In a uniform gravitational field (such as near Earth's surface), the gravitational potential energy is given by  $U_g = mgz$ , where  $m$  is the mass of an object,  $z$  (in meters) is its altitude above Earth's surface, and  $g = 9.8 \text{ m/s}^2$ . Use the gradient  $\nabla U_g$  to show that the gravitational force is downward and has magnitude  $mg$ .

**64. Gravitational Field** Two objects of masses  $M$  and  $m$  are a distance  $r$ , in meters, apart. The gravitational potential energy

between these objects is given by  $U_g = -G \frac{mM}{r}$ , where

$G = 6.67 \times 10^{-11} \text{ Nm}^2/\text{kg}^2$ . If one object is at the origin and the other at the point  $(x, y, z)$ , then the gravitational field  $\mathbf{F}_g$  equals  $-\nabla U_g$ . Show that the magnitude of the force  $\mathbf{F}_g$  equals  $G \frac{mM}{r^2}$ .

**Source:** Problem contributed by the students at Minnesota State University

**65.** If the function  $z = f(x, y)$  is differentiable at a point  $P_0 = (x_0, y_0)$  and  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , show that  $D_{\mathbf{u}}f(x_0, y_0) = 0$  in the direction orthogonal to that of  $\nabla f(x_0, y_0)$ .

**66. Algebraic Properties of the Gradient** If  $u = f(x, y)$  and  $v = g(x, y)$  are differentiable, show that:

- $\nabla(ku) = k\nabla u$ , where  $k$  is a constant.
- $\nabla(u + v) = \nabla u + \nabla v$ .
- $\nabla(uv) = u\nabla v + v\nabla u$ .
- $\nabla\left(\frac{u}{v}\right) = \frac{v\nabla u - u\nabla v}{v^2}$ .
- $\nabla u^a = au^{a-1}\nabla u$ , where  $a$  a real number.

**67.** Show that for a nonzero vector  $\mathbf{a} = a_1\mathbf{i} + a_2\mathbf{j}$  and a differentiable function  $z = f(x, y)$ ,

$$D_{\mathbf{u}}f(x, y) = \frac{a_1 \frac{\partial f}{\partial x} + a_2 \frac{\partial f}{\partial y}}{\sqrt{a_1^2 + a_2^2}}$$

where  $\mathbf{u} = \frac{\mathbf{a}}{\|\mathbf{a}\|}$ .

68. Let  $F(x, y) = 0$  be the equation of a curve in the  $xy$ -plane. If  $F$  is differentiable and if  $(x_0, y_0)$  is a point on the curve, show that  $\nabla F(x_0, y_0)$  is normal to the curve at  $(x_0, y_0)$ .
69. Use Problem 68 to show that the tangent line to the curve  $F(x, y) = 0$  at  $(x_0, y_0)$  is given by  $a(x - x_0) + b(y - y_0) = 0$ , where  $a = F_x(x_0, y_0)$  and  $b = F_y(x_0, y_0)$ . (Assume that  $a$  and  $b$  are not both 0.)
70. Use Problem 69 to find the following tangent lines to the hyperbola  $x^2 - y^2 = 16$ :
- The tangent line at  $(5, 3)$ . Check the result by finding  $\frac{dy}{dx}$  at  $(5, 3)$  using implicit differentiation.
  - The tangent line at  $(4, 0)$ . Note that this tangent line is vertical and requires special treatment in single variable calculus.
71. Suppose  $z = f(x, y)$  has directional derivatives in all directions. Must  $f$  be differentiable? Explain.
72. If  $f(x, y, z) = z^3 + 3xz - y^2$ , find the directional derivative of  $f$  at  $(1, 2, 1)$  in the direction of the line  $x - 1 = y - 2 = z - 1$ .

### Challenge Problems

73. Let  $\mathbf{r} = x\mathbf{i} + y\mathbf{j}$  and  $r = \|\mathbf{r}\| = \sqrt{x^2 + y^2}$ .
- Show that  $\nabla r^n = nr^{n-2}\mathbf{r}$ .
  - Show that  $\nabla g(r) = g'(r)\frac{\mathbf{r}}{r}$ .
  - Show that  $D_{\mathbf{u}}[g(r)] = \frac{g'(r)}{r}(\mathbf{u} \cdot \mathbf{r})$ .

(d) Show that  $\nabla\left(\frac{x}{r}\right) = \frac{\mathbf{i}}{r} - \left(\frac{x}{r}\right)\left(\frac{\mathbf{r}}{r^2}\right)$ .

74. Find the directional derivative of

$$f(x, y) = \begin{cases} \frac{\sin(x^2 + y^2)}{x^2 + y^2} & \text{if } (x, y) \neq (0, 0) \\ 1 & \text{if } (x, y) = (0, 0) \end{cases}$$

at  $(0, 0)$  in the direction of  $\mathbf{a} = \mathbf{i} + \mathbf{j}$ .

75. Show that if  $\nabla f(x, y) = c(x\mathbf{i} + y\mathbf{j})$ , where  $c$  is a constant, then  $f(x, y)$  is constant on any circle of radius  $k$ , centered at  $(0, 0)$ .
76. **The Gradient Is Normal to the Level Surface** Show that if the function  $w = f(x, y, z)$  is differentiable at a point  $P_0 = (x_0, y_0, z_0)$ , and if  $\nabla f(x_0, y_0, z_0) \neq \mathbf{0}$ , then the gradient  $\nabla f(x_0, y_0, z_0)$  is normal to the level surface of  $f$  through  $P_0$ .
77. Let  $z = f(x, y)$  have continuous second-order partial derivatives. If  $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}$  is a unit vector, we have a directional derivative  $D_{\mathbf{u}}f(x, y) = g(x, y)$ . If  $g(x, y)$  is differentiable and  $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j}$  is a unit vector, we have a directional derivative  $D_{\mathbf{v}}g(x, y)$ . We can view this second quantity as a second-order directional derivative for  $z = f(x, y)$ . Express it in terms of  $f_{xx}$ ,  $f_{xy}$ , and  $f_{yy}$  by showing that it has the value

$$u_1v_1f_{xx} + (u_1v_2 + u_2v_1)f_{xy} + u_2v_2f_{yy}$$

78. Assuming that  $b \neq 0$  in Problem 69, show that the slope of the tangent line to the curve  $F(x, y) = 0$  at  $(x_0, y_0)$  is
- $$m = -\frac{F_x(x_0, y_0)}{F_y(x_0, y_0)}.$$
- (This is a proof of the Implicit Differentiation Formula I from Chapter 12, Section 12.5.)

## 13.2 Tangent Planes

**OBJECTIVES** When you finish this section, you should be able to:

- Find a tangent plane to a surface (p. 876)
- Find a normal line to a tangent plane (p. 876)

Figure 9

**NEED TO REVIEW?** A smooth curve is discussed in Section 9.2, pp. 647–648.

Earlier (Chapter 4), we saw the role of the tangent line in locating local maxima and local minima of a differentiable function  $y = f(x)$ . For a surface,  $z = f(x, y)$ , the tangent plane plays a similar role.

### DEFINITION Tangent Plane to a Surface

Let  $P_0 = (x_0, y_0, z_0)$  be a point on a surface  $S$ , and let  $C$  be any smooth curve containing the point  $P_0$  and lying entirely on  $S$ . If the tangent lines to all such curves  $C$  at  $P_0$  lie in the same plane, then this plane is called the **tangent plane to  $S$  at  $P_0$** . See Figure 9.

Now suppose the surface  $S$  is defined implicitly by the equation  $F(x, y, z) = 0$ . Then  $S$  is equivalent to a level surface of the function  $w = F(x, y, z)$ . Let  $P_0 = (x_0, y_0, z_0)$  be a point on the surface  $S$ . Suppose  $F$  is differentiable at  $P_0$  and  $\nabla F(x_0, y_0, z_0) \neq \mathbf{0}$ . Then the gradient  $\nabla F(x_0, y_0, z_0)$  is normal to the level surface that contains the point  $P_0$ . That is, for any smooth curve  $C$  on the surface  $S$  that contains the point  $P_0$ , the tangent lines to  $C$  at  $P_0$  are orthogonal to the vector  $\nabla F(x_0, y_0, z_0)$ . As a result, the tangent lines to  $C$  at the point  $P_0$  all lie in the same plane, and the surface  $S$  has a tangent plane at  $P_0$ .

**NEED TO REVIEW?** The equation of a plane is discussed in Section 10.6, pp. 737–738.

**DF** Figure 10  $F(x, y, z) = 0$

See Figure 10. Suppose  $(x, y, z)$  is any point on the tangent plane to  $S$  at the point  $P_0 = (x_0, y_0, z_0)$ . Since  $\nabla F(x_0, y_0, z_0)$  is normal to the tangent plane at  $P_0$ , an equation of the tangent plane is

$$\nabla F(x_0, y_0, z_0) \cdot [(x - x_0)\mathbf{i} + (y - y_0)\mathbf{j} + (z - z_0)\mathbf{k}] = 0$$

where  $(x - x_0)\mathbf{i} + (y - y_0)\mathbf{j} + (z - z_0)\mathbf{k}$  is a vector in the direction of the tangent line to a smooth curve  $C$  at the point  $P_0$ . Since

$$\nabla F(x_0, y_0, z_0) = F_x(x_0, y_0, z_0)\mathbf{i} + F_y(x_0, y_0, z_0)\mathbf{j} + F_z(x_0, y_0, z_0)\mathbf{k}$$

an equation of the tangent plane is

$$F_x(x_0, y_0, z_0)(x - x_0) + F_y(x_0, y_0, z_0)(y - y_0) + F_z(x_0, y_0, z_0)(z - z_0) = 0$$

### THEOREM Equation of a Tangent Plane

If  $F$  is differentiable at a point  $P_0 = (x_0, y_0, z_0)$  on the surface  $F(x, y, z) = 0$ , and if  $\nabla F(x_0, y_0, z_0) \neq \mathbf{0}$ , then the surface has a tangent plane at  $P_0$ . An equation of the tangent plane at  $P_0$  is

$$F_x(x_0, y_0, z_0)(x - x_0) + F_y(x_0, y_0, z_0)(y - y_0) + F_z(x_0, y_0, z_0)(z - z_0) = 0$$

## 1 Find a Tangent Plane to a Surface

### EXAMPLE 1 Finding an Equation of a Tangent Plane to a Surface

Find an equation of the tangent plane to the hyperboloid of one sheet  $x^2 + y^2 - z^2 = 24$  at the point  $(3, -4, 1)$ .

**Solution** The surface is given by the function  $F(x, y, z) = x^2 + y^2 - z^2 - 24 = 0$ . The partial derivatives of  $F$  are

$$F_x(x, y, z) = 2x \quad F_y(x, y, z) = 2y \quad F_z(x, y, z) = -2z$$

At the point  $(3, -4, 1)$ , the partial derivatives are

$$F_x(3, -4, 1) = 6 \quad F_y(3, -4, 1) = -8 \quad F_z(3, -4, 1) = -2$$

An equation of the tangent plane at  $(3, -4, 1)$  is

$$\begin{aligned} 6(x - 3) - 8(y + 4) - 2(z - 1) &= 0 \\ 3x - 4y - z &= 24 \end{aligned}$$

**Figure 11**  $x^2 + y^2 - z^2 = 24$

Figure 11 shows the hyperboloid and part of the tangent plane at the point  $(3, -4, 1)$ .

**NOW WORK** Problems 3 and 11(a).

## 2 Find a Normal Line to a Tangent Plane

The line normal to the tangent plane to a surface  $F(x, y, z) = 0$  at the point  $P_0 = (x_0, y_0, z_0)$  is called the **normal line to the surface at  $P_0$** . Since the gradient  $\nabla F(x_0, y_0, z_0)$  is normal to the tangent plane at  $P_0$ , it follows that the normal line is in the direction of the gradient. The vector equation of the normal line is

$$\mathbf{r}(t) = \mathbf{r}_0 + t\nabla F(x_0, y_0, z_0)$$

where  $\mathbf{r}_0 = x_0\mathbf{i} + y_0\mathbf{j} + z_0\mathbf{k}$  is the position vector of  $P_0$  and  $\mathbf{r}$  is the position vector of any point  $P$  on the normal line.

The corresponding parametric equations of the normal line are

$$x = x_0 + at \quad y = y_0 + bt \quad z = z_0 + ct$$

**NEED TO REVIEW?** Lines in space are discussed in Section 10.6, pp. 733–736.

where  $a = F_x(x_0, y_0, z_0)$ ,  $b = F_y(x_0, y_0, z_0)$ , and  $c = F_z(x_0, y_0, z_0)$ . If  $abc \neq 0$ , symmetric equations of the normal line are

$$\frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$$

### EXAMPLE 2 Finding a Normal Line to a Tangent Plane

Find symmetric equations of the normal line to the hyperboloid of one sheet defined by the equation  $x^2 + y^2 - z^2 = 24$  at the point  $(3, -4, 1)$ .

**Solution** The surface is given by  $F(x, y, z) = x^2 + y^2 - z^2 - 24 = 0$ . From Example 1,  $\nabla F(3, -4, 1) = 6\mathbf{i} - 8\mathbf{j} - 2\mathbf{k}$ . Since the normal line is in the direction of the gradient, symmetric equations of the normal line to the hyperboloid at  $(3, -4, 1)$  are

$$\frac{x - 3}{6} = \frac{y + 4}{-8} = \frac{z - 1}{-2}$$

### NOW WORK Problem 11(b).

### Surfaces Defined Explicitly by $z = f(x, y)$

To find an equation of the tangent plane to the surface  $z = f(x, y)$  at  $(x_0, y_0, z_0)$ ,  $z_0 = f(x_0, y_0)$ , we write the equation of the surface implicitly as

$$F(x, y, z) = z - f(x, y) = 0$$

Then

$$F_x = -f_x \quad F_y = -f_y \quad F_z = 1$$

An equation of the tangent plane to  $z = f(x, y)$  at  $(x_0, y_0, z_0)$  is

$$\begin{aligned} F_x(x_0, y_0, z_0)(x - x_0) + F_y(x_0, y_0, z_0)(y - y_0) + F_z(x_0, y_0, z_0)(z - z_0) &= 0 \\ -f_x(x_0, y_0)(x - x_0) - f_y(x_0, y_0)(y - y_0) + (z - z_0) &= 0 \end{aligned}$$

$$z - z_0 = f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0)$$

where  $z_0 = f(x_0, y_0)$ . The parametric equations of the normal line to  $z = f(x, y)$  at the point  $(x_0, y_0, z_0)$  are

$$x = x(t) = x_0 + tf_x(x_0, y_0) \quad y = y(t) = y_0 + tf_y(x_0, y_0) \quad z = z(t) = z_0 - t$$

## 13.2 Assess Your Understanding

### Concepts and Vocabulary

- True or False** If  $F$  is differentiable at a point  $P_0 = (x_0, y_0, z_0)$  on the surface  $F(x, y, z) = 0$ , and if  $\nabla F(x_0, y_0, z_0) \neq \mathbf{0}$ , then the surface has a tangent plane at  $P_0$ .
- True or False** The normal line to the surface  $F(x, y, z) = 0$  at a point  $P_0 = (x_0, y_0, z_0)$  is in the direction of the gradient  $\nabla F(x_0, y_0, z_0)$ , provided  $\nabla F(x_0, y_0, z_0) \neq \mathbf{0}$ .

### Skill Building

In Problems 3–6, find an equation of the tangent plane to each surface at the given point.

- $z = 10 - 2x^2 - y^2$  at  $(0, 2, 6)$
- $z = 4 + x^2 + y^2$  at  $(1, -2, 9)$

5.  $z = 4x^2 + 9y^2$  at  $(1, 1, 13)$

6.  $z = \sqrt{x^2 + 3y^2}$  at  $(1, 1, 2)$

In Problems 7–18:

- (a) Find an equation of the tangent plane to each surface at the given point.  
 (b) Find symmetric equations of the normal line to each surface at the given point.

7.  $x^2 + y^2 + z^2 = 14$  at  $(1, -2, 3)$

8.  $2x^2 + 3y^2 + z^2 = 12$  at  $(2, 1, -1)$

9.  $4x^2 + y^2 - 2z^2 = 3$  at  $(1, 1, -1)$

10.  $z^2 = x^2 + 3y^2$  at  $(1, -1, -2)$

11.  $z = x^2 + y^2$  at  $(-2, 1, 5)$

12.  $z = 2x^2 - 3y^2$  at  $(2, 1, 5)$

13.  $2x^2 - y^2 = z$  at  $(1, 0, 2)$

14.  $x^2 + y^2 - 2z^2 = -13$  at  $(2, 1, 3)$

15.  $x^2 - 3y^2 - 4z^2 = 2$  at  $(3, 1, 1)$

16.  $x^2 + 2y^2 - 5z^2 = 4$  at  $(1, 2, 1)$

17.  $f(x, y) = \ln(\sec(x^2 + y^2))$  at  $\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}, \ln \sqrt{2}\right)$

18.  $f(x, y) = \frac{x^2 - y^2}{x^2 + y^2}$  at  $\left(1, 2, -\frac{3}{5}\right)$

In Problems 19–22:

- (a) Find an equation of the tangent plane to each surface at the given point.  
 (b) Find symmetric equations of the normal line to each surface at the given point.

**CAS** (c) Use technology to graph each surface and the tangent plane to the surface at the given point.

19.  $z = e^x \cos y$  at  $\left(0, \frac{\pi}{2}, 0\right)$

20.  $z = \ln(x^2 + y^2)$  at  $(1, -1, \ln 2)$

21.  $x^{2/3} + y^{2/3} + z^{2/3} = 9$  at  $(1, 8, -8)$

22.  $x^{1/2} + y^{1/2} + z^{1/2} = 6$  at  $(1, 4, 9)$

24. Show that the same results would have been obtained in Example 2 by solving the equation  $x^2 + y^2 - z^2 - 24 = 0$  for  $z$  and using the function  $z = f(x, y) = \sqrt{x^2 + y^2 - 24}$  whose graph is the part of the hyperboloid lying above the  $xy$ -plane.

In Problems 25–30, determine the point(s) on the surface of  $z = f(x, y)$  at which the tangent plane is parallel to the  $xy$ -plane.

25.  $z = 6x - 4y - x^2 - 2y^2$

26.  $z = 4x - 2y + x^2 + y^2$

27.  $z = x^2 + 2xy + y^2$

28.  $z = x^2 - 3xy + y^2$

29.  $z = 2x^4 - y^2 - x^2 - 2y$

30.  $z = x^2 + y^4 - 4y^2 - 2x$

31. **Solar Panel** An engineer is building experimental, dome-shaped living quarters 4 m high and modeled by the function  $z = 4 - x^2 - y^2$ . She wants to bolt a flat solar panel to the dome at the point  $(1, 1, 2)$ . In what direction should the engineer drill?

32. (a) Two surfaces are said to be **tangent at a common point**  $P_0$  if each has the same tangent plane at  $P_0$ . Show that the surfaces  $x^2 + z^2 + 4y = 0$  and  $x^2 + y^2 + z^2 - 6z + 7 = 0$  are tangent at the point  $(0, -1, 2)$ .

**CAS** (b) Graph each surface.

33. (a) Show that the surfaces  $x^2 + y^2 + z^2 = 1$  and  $x^2 + y^2 - z^2 = 1$  are tangent at every point of intersection.

**CAS** (b) Graph each surface.

34. (a) Two surfaces are **orthogonal at a common point**  $P_0$  if their normal lines at  $P_0$  are orthogonal. Show that the surfaces  $x^2 + y^2 + z^2 = 4$  and  $x^2 + y^2 - z^2 = 0$  are orthogonal at  $(0, \sqrt{2}, \sqrt{2})$ . In fact, show that the surfaces are orthogonal at every point of intersection.

**CAS** (b) Graph each surface.

35. **Normal Lines of a Sphere** Show that the normal lines of a sphere  $x^2 + y^2 + z^2 = R^2$  pass through the center of the sphere.

36. **Normal Line of a Sphere** Let  $P_0 = (x_0, y_0, z_0)$  be a point on the sphere  $x^2 + y^2 + z^2 = R^2$ . Show that the normal line to the sphere at  $P_0$  passes through the point  $(-x_0, -y_0, -z_0)$ .

37. **Tangent Plane** Find equations of the tangent plane and normal line to  $\sin(x + y) + \sin(y + z) = 1$  at the point  $\left(0, \frac{\pi}{2}, \frac{\pi}{2}\right)$ .

38. **Tangent Plane to an Ellipsoid** Find the points on the surface  $\frac{x^2}{9} + \frac{y^2}{4} + \frac{z^2}{36} = 1$ , where the tangent plane is parallel to the plane  $2x - 3y + z = 4$ .

39. **Tangent Plane to a Cylinder** Show that the tangent plane to the cylinder  $x^2 + y^2 = a^2$  at the point  $(x_0, y_0, z_0)$  is given by the equation  $x_0x + y_0y = a^2$ .

40. **Tangent Plane to a Cone** Show that the tangent plane to the cone  $\frac{z^2}{c^2} = \frac{x^2}{a^2} + \frac{y^2}{b^2}$  at the point  $(x_0, y_0, z_0) \neq (0, 0, 0)$  is given by the equation  $\frac{z_0}{c^2}z = \frac{x_0}{a^2}x + \frac{y_0}{b^2}y$ . Why must the point of tangency be different from the origin?

## Applications and Extensions

23. Show that the same results would have been obtained in Example 1 by solving the equation  $x^2 + y^2 - z^2 - 24 = 0$  for  $z$  and using the function  $z = f(x, y) = \sqrt{x^2 + y^2 - 24}$  whose graph is the part of the hyperboloid lying above the  $xy$ -plane.

41. Show that at any point, the sum of the intercepts on the coordinate axes of the tangent plane to the surface  $x^{1/2} + y^{1/2} + z^{1/2} = a^{1/2}$ ,  $a > 0$ , is a constant.

### Challenge Problems

42. **Tangent Line** Find an equation of the tangent line to the curve of intersection of the surfaces  $x \sin(yz) = 1$  and  $ze^{y^2-x^2} = \frac{\pi}{2}$  at the point  $\left(1, 1, \frac{\pi}{2}\right)$ .
43. Find equations of the tangent plane and normal line to  $(yz)^{xz} = 16$  at the point  $(2, 1, 2)$ .

44. Consider the tangent plane to the graph of a differentiable function  $z = f(x, y)$  at a point  $(x_0, y_0)$ . Suppose  $\mathbf{v}_1$  is a tangent vector on the plane whose  $\mathbf{j}$  component is 0 and  $\mathbf{v}_2$  is a tangent vector on the plane whose  $\mathbf{i}$  component is 0. Must  $\mathbf{v}_1$  and  $\mathbf{v}_2$  be at right angles? See the figure.

## 13.3 Extrema of Functions of Two Variables

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find Critical Points (p. 880)
- 2 Use the Second Partial Derivative Test (p. 882)
- 3 Find the absolute extrema of a function of two variables (p. 883)
- 4 Solve optimization problems (p. 886)

**NEED TO REVIEW?** Local extrema and absolute extrema of a function of a single variable are discussed in Section 4.2, pp. 263–272.

An important application of the derivative of a function of a single variable is to identify local extrema and absolute extrema. In a similar way, partial derivatives are used to identify the extrema of a function of several variables. We begin with the definitions of the local maximum and the local minimum of a function  $z = f(x, y)$  of two variables. Compare these definitions to those given for a function  $f$  of a single variable.

### DEFINITION Local Maximum, Local Minimum

Let  $z = f(x, y)$  be a function with domain  $D$  and let  $(x_0, y_0)$  be an interior point of  $D$ . Then  $f$  has a **local maximum** at  $(x_0, y_0)$  if

$$f(x_0, y_0) \geq f(x, y)$$

for all points  $(x, y)$  within some disk centered at  $(x_0, y_0)$ . The number  $f(x_0, y_0)$  is called a **local maximum value**.

The function  $f$  has a **local minimum** at  $(x_0, y_0)$  if

$$f(x_0, y_0) \leq f(x, y)$$

for all points  $(x, y)$  within some disk centered at  $(x_0, y_0)$ . The number  $f(x_0, y_0)$  is called a **local minimum value**.

Collectively, the local maxima and local minima of  $f$  are called **local extrema**.

### DEFINITION Absolute Maximum, Absolute Minimum

Let  $z = f(x, y)$  be a function with domain  $D$ . If there is a point  $(x_0, y_0)$  in  $D$  for which  $f(x_0, y_0) \geq f(x, y)$  for all  $(x, y)$  in  $D$ , then  $f$  has an **absolute maximum** at  $(x_0, y_0)$  and  $f(x_0, y_0)$  is called the **absolute maximum value** of  $f$  on  $D$ .

If there is a point  $(x_0, y_0)$  in  $D$  for which  $f(x_0, y_0) \leq f(x, y)$  for all  $(x, y)$  in  $D$ , then  $f$  has an **absolute minimum** at  $(x_0, y_0)$  and  $f(x_0, y_0)$  is the **absolute minimum value** of  $f$  on  $D$ .

The absolute maximum and absolute minimum of  $f$  are called the **absolute extrema** of the function.

Figure 12

Figure 13

Figure 12 illustrates these definitions. Notice that the tangent plane at each local extremum is parallel to the  $xy$ -plane.

Let  $z = f(x, y)$  be a function of two variables that is defined and continuous on an open set  $D$ . Suppose  $f$  has a local maximum at the point  $(x_0, y_0)$  in  $D$ . Then the curve that results from the intersection of the surface  $z = f(x, y)$  and any plane through  $(x_0, y_0, 0)$  that is perpendicular to the  $xy$ -plane will have a local maximum at  $(x_0, y_0)$ . See Figure 13.

In particular, the curve that results from intersecting  $z = f(x, y)$  with the plane  $x = x_0$  has this property. This means that if  $f_y(x_0, y_0)$  exists, then  $f_y(x_0, y_0) = 0$ . By a similar argument, if the surface  $z = f(x, y)$  is intersected by the plane  $y = y_0$ , then the curve that results has a local maximum at  $(x_0, y_0)$ , and if  $f_x(x_0, y_0)$  exists, then  $f_x(x_0, y_0) = 0$ .

### THEOREM A Necessary Condition for Local Extrema

Let  $z = f(x, y)$  be a function of two variables that is defined and continuous on an open set containing the point  $(x_0, y_0)$ . Suppose  $f_x$  and  $f_y$  each exist at  $(x_0, y_0)$ . If  $f$  has a local extremum at  $(x_0, y_0)$ , then

$$f_x(x_0, y_0) = 0 \quad \text{and} \quad f_y(x_0, y_0) = 0$$

The theorem asserts that if a function  $f$  has local extrema, they will occur at those points at which the partial derivatives of  $f$  exist and equal 0. Further, if  $f$  has a local extremum at  $(x_0, y_0)$ , then the tangent plane to  $f$  at  $(x_0, y_0)$  is  $z - z_0 = 0$ , where  $z_0 = f(x_0, y_0)$ . That is, the tangent plane is parallel to the  $xy$ -plane.

It can also happen that the local extrema of a function occur at points at which one or both of the partial derivatives fail to exist. For example, the cone  $z = \sqrt{x^2 + y^2}$  has a local minimum at  $(0, 0)$  where both  $f_x$  and  $f_y$  do not exist.

### DEFINITION Critical Point

Let  $z = f(x, y)$  be a function of two variables whose domain is an open set  $D$  containing the point  $(x_0, y_0)$ . The point  $(x_0, y_0)$  is a **critical point** of  $f$  if:

- $f_x(x_0, y_0) = f_y(x_0, y_0) = 0$ .
- either  $f_x(x_0, y_0)$  or  $f_y(x_0, y_0)$  does not exist.

Using the definition of critical point, the necessary condition for local extrema is restated.

### THEOREM A Necessary Condition for Local Extrema

Let  $z = f(x, y)$  be a function of two variables whose domain is an open set  $D$ . If  $f$  has a local extremum at  $(x_0, y_0)$ , then  $(x_0, y_0)$  is a critical point of  $f$ .

## 1 Find Critical Points

### EXAMPLE 1 Finding Critical Points

Find the critical points of the function

$$z = f(x, y) = x^2 + y^2 - 2x + 4y$$

**Solution** The partial derivatives of  $f$  are

$$f_x = 2x - 2 \quad \text{and} \quad f_y = 2y + 4$$

Since both partial derivatives exist for all  $x$  and  $y$ , the critical points of  $f$  satisfy the system of equations

$$\begin{cases} 2x - 2 = 0 \\ 2y + 4 = 0 \end{cases}$$

Solving the system simultaneously, we find that the only critical point is  $(1, -2)$ . ■

We can determine whether the function in Example 1 has a local maximum or a local minimum or neither at the critical point by rewriting the function in a simpler form.

$$\begin{aligned} z &= x^2 + y^2 - 2x + 4y \\ z &= (x^2 - 2x + 1) + (y^2 + 4y + 4) - 5 && \text{Complete the squares.} \\ z &= (x - 1)^2 + (y + 2)^2 - 5 && \text{Factor.} \end{aligned}$$

Since  $z \geq -5$ , there is a local minimum at  $(1, -2)$ ; the local minimum value is  $-5$ . In fact, the absolute minimum occurs at the point  $(1, -2)$  and the absolute minimum value is  $-5$ . See Figure 14.

**Figure 14**  $z = f(x, y) = x^2 + y^2 - 2x + 4y$  has a local minimum at  $(1, -2)$ .

### NOW WORK Problem 7.

As with functions of one variable, it is possible for a function  $z = f(x, y)$  to have a critical point at  $(x_0, y_0)$ , but no local extremum at  $(x_0, y_0)$ .

### EXAMPLE 2 Finding Critical Points

Consider the hyperbolic paraboloid defined by the equation  $z = f(x, y) = y^2 - x^2$ . Show that  $(0, 0)$  is the only critical point of  $f$ , but that  $f$  has neither a local maximum nor a local minimum at  $(0, 0)$ .

**Solution** The partial derivatives of  $f$  are

$$f_x(x, y) = -2x \quad \text{and} \quad f_y(x, y) = 2y$$

At  $(0, 0)$ , both partial derivatives equal 0, so  $(0, 0)$  is the only critical point.

See Figure 15. If we consider the values of  $f(x, 0) = -x^2$ , the function attains a maximum value of 0 at the origin. However, if we consider the values of  $f(0, y) = y^2$ , the function attains a minimum value at the origin. In other words, at the critical point  $(0, 0)$ , the function appears to have a maximum when viewed in one direction and to have a minimum when viewed in another direction. As a result,  $z = f(x, y) = y^2 - x^2$  has neither a maximum nor a minimum at  $(0, 0)$ . ■

Example 2 and Figure 15 help explain the next definition.

### DEFINITION Saddle Point

A point  $(x_0, y_0, f(x_0, y_0))$  is called a **saddle point** of  $z = f(x, y)$  if both  $f_x(x_0, y_0) = 0$  and  $f_y(x_0, y_0) = 0$ , but  $f$  does not have a local extremum at  $(x_0, y_0)$ .

**Figure 15**  $z = f(x, y) = y^2 - x^2$  has a saddle point at  $(0, 0, 0)$ .

In Examples 1 and 2, we used algebraic and/or geometric arguments to determine whether a critical point resulted in a local maximum, a local minimum, or a saddle point. For most functions, such arguments cannot be used. The following test, which is stated without a proof, provides an analytic method to determine the nature of critical points. The test is analogous to the Second Derivative Test for functions of one variable. A proof of the theorem can be found in texts on advanced calculus.

**THEOREM** Second Partial Derivative Test for Local Extrema

Let  $z = f(x, y)$  be a function of two variables for which the first- and second-order partial derivatives are continuous in some disk containing the point  $(x_0, y_0)$ . Suppose  $f_x(x_0, y_0) = 0$  and  $f_y(x_0, y_0) = 0$ . Let

$$A = f_{xx}(x_0, y_0) \quad B = f_{xy}(x_0, y_0) \quad C = f_{yy}(x_0, y_0)$$

- If  $AC - B^2 > 0$  and  $A > 0$ , then  $f$  has a local minimum at  $(x_0, y_0)$ .
- If  $AC - B^2 > 0$  and  $A < 0$ , then  $f$  has a local maximum at  $(x_0, y_0)$ .
- If  $AC - B^2 < 0$ , then  $f$  has a saddle point at  $(x_0, y_0)$ .
- If  $AC - B^2 = 0$ , then the test gives no information.

**NOTE** The expression

$$AC - B^2 = f_{xx}f_{yy} - f_{xy}^2$$

is also called the **discriminant** or

**Hessian** of  $f$ . It is often written as the determinant

$$AC - B^2 = f_{xx}f_{yy} - f_{xy}^2 = \begin{vmatrix} f_{xx} & f_{xy} \\ f_{xy} & f_{yy} \end{vmatrix}$$

**Figure 16**  $z = f(x, y)$   
 $= x^2 + xy + y^2 - 6x + 6$

**NOTE** To find the critical points of a function  $z = f(x, y)$  we must solve the system of equations  $f_x = 0$  and  $f_y = 0$ . If the system is nonlinear, no general method of solution is available and a CAS is generally used. If solving by hand, care must be taken because extraneous roots are sometimes introduced.

**2** Use the Second Partial Derivative Test**EXAMPLE 3** Using the Second Partial Derivative Test

Find all local maxima, local minima, and saddle points for

$$z = f(x, y) = x^2 + xy + y^2 - 6x + 6$$

**Solution** The critical points of  $f$  are solutions of the system of equations

$$\begin{cases} f_x(x, y) = 2x + y - 6 = 0 \\ f_y(x, y) = x + 2y = 0 \end{cases}$$

The only solution is  $x = 4$  and  $y = -2$ , so  $(4, -2)$  is the only critical point.

The second-order partial derivatives of  $f$  are

$$f_{xx}(x, y) = 2 \quad f_{xy}(x, y) = f_{yx}(x, y) = 1 \quad f_{yy}(x, y) = 2$$

The function  $f$  meets the requirements of the Second Partial Derivative test at the critical point  $(4, -2)$ . Now

$$A = f_{xx}(4, -2) = 2 \quad B = f_{xy}(4, -2) = 1 \quad C = f_{yy}(4, -2) = 2$$

$$AC - B^2 = (2)(2) - 1^2 = 3 > 0$$

Since  $AC - B^2 > 0$  and  $A = f_{xx}(4, -2) = 2 > 0$ , the Second Partial Derivative Test guarantees that  $f$  has a local minimum at  $(4, -2)$ . The local minimum value is  $z = f(4, -2) = -6$ . See Figure 16. ■

**NOW WORK** Problems 13 and 17.

**EXAMPLE 4** Using the Second Partial Derivative Test

Find all local maxima, local minima, and saddle points for

$$z = f(x, y) = x^3 + y^2 + 2xy - 4x - 3y + 5$$

**Solution** The critical points are the solutions of the system of equations

$$\begin{cases} f_x(x, y) = 3x^2 + 2y - 4 = 0 \\ f_y(x, y) = 2y + 2x - 3 = 0 \end{cases}$$

We solve the system using substitution. Solving for  $y$  in  $f_y(x, y) = 0$ , we obtain  $y = \frac{1}{2}(3 - 2x)$ . Then if we substitute for  $y$  in  $f_x(x, y) = 0$ , the result is

$$3x^2 + 2 \left[ \frac{1}{2}(3 - 2x) \right] - 4 = 0$$

$$3x^2 - 2x - 1 = 0$$

$$(3x + 1)(x - 1) = 0$$

$$x = -\frac{1}{3} \quad \text{or} \quad x = 1$$

$$\text{When } x = -\frac{1}{3}, \text{ then } y = \frac{1}{2}(3 - 2x) = \frac{1}{2} \left( 3 + \frac{2}{3} \right) = \frac{11}{6}.$$

$$\text{When } x = 1, \text{ then } y = \frac{1}{2}(3 - 2x) = \frac{1}{2}.$$

$$\text{The critical points are } \left( -\frac{1}{3}, \frac{11}{6} \right) \text{ and } \left( 1, \frac{1}{2} \right).$$

The second-order partial derivatives of  $f$  are

$$f_{xx}(x, y) = 6x \quad f_{xy}(x, y) = 2 \quad f_{yy}(x, y) = 2$$

The function  $f$  satisfies the requirements of the Second Partial Derivative test at each critical point. At  $\left( -\frac{1}{3}, \frac{11}{6} \right)$ ,

$$A = f_{xx} \left( -\frac{1}{3}, \frac{11}{6} \right) = -2 \quad B = f_{xy} \left( -\frac{1}{3}, \frac{11}{6} \right) = 2 \quad C = f_{yy} \left( -\frac{1}{3}, \frac{11}{6} \right) = 2$$

$$AC - B^2 = -4 - 4 = -8 < 0$$

So,  $\left( -\frac{1}{3}, \frac{11}{6}, \frac{317}{108} \right)$  is a saddle point of  $f$ . At  $\left( 1, \frac{1}{2} \right)$ ,

$$A = f_{xx} \left( 1, \frac{1}{2} \right) = 6 \quad B = f_{xy} \left( 1, \frac{1}{2} \right) = 2 \quad C = f_{yy} \left( 1, \frac{1}{2} \right) = 2$$

Since  $AC - B^2 = 8 > 0$ ,  $f$  has a local minimum at  $\left( 1, \frac{1}{2} \right)$ , where  $f \left( 1, \frac{1}{2} \right) = \frac{7}{4}$  ■

**Figure 17**  $z = f(x, y)$   
 $= x^3 + y^2 + 2xy - 4x - 3y + 5$

A graph of  $z = f(x, y) = x^3 + y^2 + 2xy - 4x - 3y + 5$  is shown in Figure 17.

**NOW WORK** Problems 19 and 23.

### 3 Find the Absolute Extrema of a Function of Two Variables

For a function  $f$  of one variable, the Extreme Value Theorem states that if  $f$  is continuous on a closed interval  $[a, b]$ , then  $f$  has an absolute maximum value and an absolute minimum value on that interval. For functions of two variables, there is a similar theorem. But first we need to define the set in the plane that is analogous to a closed interval on the real line.

Recall that a set  $D$  is closed if it contains all its boundary points. We say that  $D$  is **bounded** if  $D$  can be enclosed by some disk (if  $D$  is in the plane) or by some ball (if  $D$  is in space). With this definition, we can state the following two-variable version of the Extreme Value Theorem:

#### **THEOREM** Extreme Value Theorem for Functions of Two Variables

Let  $z = f(x, y)$  be a function of two variables. If  $f$  is continuous on a closed, bounded set  $D$ , then  $f$  has an absolute maximum and an absolute minimum on  $D$ .

To find the absolute extrema of a function meeting the criteria of the Extreme Value Theorem for Functions of Two Variables, we note that if  $f$  has an extreme value at

**NEED TO REVIEW?** Open and closed sets are discussed in Section 12.2, p. 825.

$(x_0, y_0)$ , then  $(x_0, y_0)$  either is a critical point of  $f$  or is a boundary point of  $D$ . As a result, we have the following test:

### THEOREM Test for Absolute Maximum and Absolute Minimum

Let  $z = f(x, y)$  be a function of two variables defined on a closed, bounded set  $D$ . If  $f$  is continuous on  $D$ , then the absolute maximum value and the absolute minimum value of  $f$  are, respectively, the largest and smallest values found among the following:

- The values of  $f$  at the critical points of  $f$  in  $D$
- The values of  $f$  on the boundary of  $D$

### EXAMPLE 5 Finding Absolute Extrema

Find the absolute maximum and the absolute minimum of

$$z = f(x, y) = 2x - 2xy + y^2$$

whose domain is the region defined by  $0 \leq x \leq 4$  and  $0 \leq y \leq 3$ .

**Solution** The function  $f$  is continuous on its domain, which is a closed, bounded set. Then the Extreme Value Theorem guarantees that  $f$  has an absolute maximum and an absolute minimum on its domain. To find them, we first find the critical points of  $f$ , namely the solutions of the system of equations

$$\begin{cases} f_x(x, y) = 2 - 2y = 0 \\ f_y(x, y) = -2x + 2y = 0 \end{cases}$$

Solving the system of equations, we find that the only critical point is  $(1, 1)$ . The value of  $f$  at  $(1, 1)$  is

$$f(1, 1) = 2(1) - 2(1)(1) + 1^2 = 1$$

The domain of  $f$  is the set  $0 \leq x \leq 4$ ,  $0 \leq y \leq 3$ . The boundary of the domain of  $f$  consists of the four line segments  $L_1$ ,  $L_2$ ,  $L_3$ , and  $L_4$  shown in Figure 18. We evaluate  $f$  on each line segment.

- **On  $L_1$ :**  $x$  is in the interval  $[0, 4]$  and  $y = 0$ . The function  $f(x, y) = f(x, 0) = 2x$  is increasing on  $0 \leq x \leq 4$ , so its extreme values occur at the endpoints 0 and 4.

$$\text{At } x = 0, f(0, 0) = 0 \quad \text{and} \quad \text{at } x = 4, f(4, 0) = 8$$

- **On  $L_2$ :**  $x = 4$  and  $y$  is in the interval  $[0, 3]$ . The function  $f(x, y) = f(4, y) = 8 - 8y + y^2$ . To find the extreme values of  $f$  on  $[0, 3]$ , we begin by finding the critical number(s) of the function  $g(y) = 8 - 8y + y^2$ . That is, we find where  $g'(y) = 0$ .

$$\begin{aligned} g'(y) &= -8 + 2y = 0 \\ y &= 4 \end{aligned}$$

Since 4 is not in the interval  $[0, 3]$ , the extreme values occur at the endpoints 0 and 3.

$$\text{At } y = 0, f(4, 0) = 8 \quad \text{and} \quad \text{at } y = 3, f(4, 3) = -7$$

- **On  $L_3$ :**  $x$  is in the interval  $[0, 4]$  and  $y = 3$ . The function  $f(x, y) = f(x, 3) = 2x - 6x + 9 = -4x + 9$  is decreasing on  $0 \leq x \leq 4$ , so its extreme values occur at the endpoints 0 and 4.

$$\text{At } x = 0, f(0, 3) = 9 \quad \text{and} \quad \text{at } x = 4, f(4, 3) = -7$$

- **On  $L_4$ :**  $x = 0$  and  $y$  is in the interval  $[0, 3]$ . The function  $f(x, y) = f(0, y) = y^2$  is increasing on  $0 \leq y \leq 3$ , so its extreme values occur at the endpoints 0 and 3.

$$\text{At } y = 0, f(0, 0) = 0 \quad \text{and} \quad \text{at } y = 3, f(0, 3) = 9$$

**Figure 18**  $z = f(x, y) = 2x - 2xy + y^2$ ,  $0 \leq x \leq 4$ ,  $0 \leq y \leq 3$

The values of  $f$  at the critical point  $(1, 1)$  and at the extreme values on the boundary are

| Point | $(1, 1)$ | $(0, 0)$ | $(4, 0)$ | $(4, 3)$ | $(0, 3)$ |
|-------|----------|----------|----------|----------|----------|
| Value | 1        | 0        | 8        | -7       | 9        |

The absolute maximum value of  $f$  is  $f(0, 3) = 9$ ; the absolute minimum value is  $f(4, 3) = -7$ . ■

### NOW WORK Problem 33.

### EXAMPLE 6 Finding Absolute Extrema

Find the absolute maximum and the absolute minimum of

$$z = f(x, y) = x^2 + y^2 - 2x + 2y - 5$$

whose domain is the disk  $x^2 + y^2 \leq 9$ .

**Solution** The function  $f$  is continuous on its domain, a closed, bounded set. The Extreme Value Theorem guarantees that  $f$  has an absolute maximum and an absolute minimum on its domain. To find them, we find the critical points of  $f$ , namely the solutions of the system of equations

$$\begin{cases} f_x(x, y) = 2x - 2 = 0 \\ f_y(x, y) = 2y + 2 = 0 \end{cases}$$

The only solution is  $x = 1, y = -1$ , which is an interior point of the domain of  $f$ . The value of  $f$  at the critical point is  $f(1, -1) = -7$ .

The boundary of the domain of  $f$  is the circle  $x^2 + y^2 = 9$ . We express the boundary using the parametric equations  $x = x(t) = 3 \cos t, y = y(t) = 3 \sin t, 0 \leq t \leq 2\pi$ . Next we evaluate  $f$  on its boundary.

$$\begin{aligned} z = f(x, y) &= f(3 \cos t, 3 \sin t) \\ &= 9 \cos^2 t + 9 \sin^2 t - 6 \cos t + 6 \sin t - 5 \\ &= 4 - 6 \cos t + 6 \sin t \end{aligned}$$

Now we find where  $\frac{dz}{dt} = 0$ .

$$\begin{aligned} \frac{dz}{dt} &= 6 \sin t + 6 \cos t = 0 \\ \tan t &= -1 \\ t &= \frac{3\pi}{4} \quad \text{or} \quad t = \frac{7\pi}{4} \end{aligned}$$

At  $t = \frac{3\pi}{4}$ , the value of  $f$  is

$$\begin{aligned} f\left(3 \cos \frac{3\pi}{4}, 3 \sin \frac{3\pi}{4}\right) &= 4 - 6 \cos \frac{3\pi}{4} + 6 \sin \frac{3\pi}{4} = 4 - 6\left(-\frac{\sqrt{2}}{2}\right) + 6\left(\frac{\sqrt{2}}{2}\right) \\ &= 4 + 6\sqrt{2} \end{aligned}$$

At  $t = \frac{7\pi}{4}$ , the value of  $f$  is

$$\begin{aligned} f\left(3 \cos \frac{7\pi}{4}, 3 \sin \frac{7\pi}{4}\right) &= 4 - 6 \cos \frac{7\pi}{4} + 6 \sin \frac{7\pi}{4} = 4 - 6\left(\frac{\sqrt{2}}{2}\right) + 6\left(-\frac{\sqrt{2}}{2}\right) \\ &= 4 - 6\sqrt{2} \end{aligned}$$

Figure 19

The absolute maximum value of  $f$  is  $4 + 6\sqrt{2} \approx 12.485$ ; the absolute minimum value of  $f$  is  $-7$ . ■

Figure 19 shows the graph of  $z = f(x, y) = x^2 + y^2 - 2x + 2y - 5$ .

### NOW WORK Problem 35.

## 4 Solve Optimization Problems

Now that we have the tools for finding the extrema of functions of two variables, we can investigate applied problems that involve optimization.

### Solving an Optimization Problem:

#### EXAMPLE 7 Minimizing Resources Used

A manufacturer wants to make an open rectangular box of volume  $V = 500$  cubic centimeters ( $\text{cm}^3$ ) using the least possible amount of material. Find the dimensions of the box.

**Solution** Let  $x$  and  $y$  be the dimensions of the base of the box, and let  $z$  be the height of the box. Then

$$V = 500 = xyz \text{ cm}^3 \quad x > 0 \quad y > 0 \quad z > 0$$

The manufacturer wants to minimize the amount of material used, which equals the surface area  $S$  of the box. Since the box is open,

$$S = xy + 2xz + 2yz$$

If we solve the equation  $500 = xyz$  for  $z$  and substitute  $z = \frac{500}{xy}$  into the formula for the surface area  $S$  of the box, we can express  $S$  as a function of two variables.

$$S = S(x, y) = xy + 2x\left(\frac{500}{xy}\right) + 2y\left(\frac{500}{xy}\right) = xy + \frac{1000}{y} + \frac{1000}{x}$$

This is the function to be minimized. The partial derivatives of  $S$  are

$$S_x = y - \frac{1000}{x^2} \quad \text{and} \quad S_y = x - \frac{1000}{y^2}$$

Since  $x > 0$  and  $y > 0$ , the critical points satisfy the system of equations

$$\begin{cases} y - \frac{1000}{x^2} = 0 \\ x - \frac{1000}{y^2} = 0 \end{cases}$$

Using substitution, we find

$$x = y = 1000^{1/3} = 10$$

The second-order partial derivatives of  $S$  are

$$S_{xx} = \frac{\partial}{\partial x} \left( y - \frac{1000}{x^2} \right) = \frac{2000}{x^3} \quad S_{xy} = \frac{\partial}{\partial x} \left( x - \frac{1000}{y^2} \right) = 1$$

$$S_{yy} = \frac{\partial}{\partial y} \left( x - \frac{1000}{y^2} \right) = \frac{2000}{y^3}$$

At the critical point  $(10, 10)$ ,

$$A = S_{xx}(10, 10) = \frac{2000}{10^3} = 2 \quad B = S_{xy}(10, 10) = 1 \quad C = S_{yy}(10, 10) = \frac{2000}{10^3} = 2$$

$$AC - B^2 = 3 > 0$$

From the Second Partial Derivative Test,  $S$  has a local minimum at  $(10, 10)$ .

But, we want to know where  $S$  attains its absolute minimum. Since the physical properties of the problem require that the absolute minimum exists, the local minimum

is also the absolute minimum. Consequently, the dimensions (in centimeters) of the open box of volume  $V = 500 \text{ cm}^3$  that uses the least amount of material are

$$x = 10 \text{ cm} \quad y = 10 \text{ cm} \quad z = \frac{500}{100} = 5 \text{ cm}$$

In Example 7, the conditions of the Extreme Value Theorem for Functions of Two Variables were not met, since the domain of  $S$  is not bounded. Fortunately, in applied problems (such as Example 7), it is often possible to argue from physical or geometric properties that an absolute extremum must exist and that it must occur at one of the local extrema.

### NOW WORK Problem 43.

### EXAMPLE 8 Solving an Optimization Problem: Maximizing Profit

The demand functions for two products are

$$p = 12 - 2x \quad \text{and} \quad q = 20 - y$$

where  $p$  and  $q$  are the respective prices (in thousands of dollars) of each product, and  $x$  and  $y$  are the respective amounts (in thousands of units) of each sold. Suppose the joint cost function is

$$C(x, y) = x^2 + 2xy + 2y^2$$

- (a) Find the revenue function and the profit function.
- (b) Determine the prices and amounts that will maximize profit.
- (c) What is the maximum profit?

**Solution** (a) Revenue is the amount of money brought in. That is, revenue is the product of price and quantity sold. The revenue function  $R$  is the sum of the revenues from each product.

$$R(x, y) = xp + yq = x(12 - 2x) + y(20 - y)$$

Profit is the difference between revenue and cost. The profit function  $P$  is

$$\begin{aligned} P(x, y) &= R(x, y) - C(x, y) = [x(12 - 2x) + y(20 - y)] - [x^2 + 2xy + 2y^2] \\ &= 12x - 2x^2 + 20y - y^2 - x^2 - 2xy - 2y^2 \\ &= -3x^2 - 3y^2 - 2xy + 12x + 20y \end{aligned}$$

- (b) The partial derivatives of  $P$  are

$$\begin{aligned} P_x(x, y) &= \frac{\partial}{\partial x}(-3x^2 - 3y^2 - 2xy + 12x + 20y) = -6x - 2y + 12 \\ P_y(x, y) &= \frac{\partial}{\partial y}(-3x^2 - 3y^2 - 2xy + 12x + 20y) = -6y - 2x + 20 \end{aligned}$$

We find the critical points by solving the system of equations:

$$\begin{cases} -6x - 2y + 12 = 0 \\ -2x - 6y + 20 = 0 \end{cases}$$

We solve the first equation for  $y$  and substitute the result into the second equation. Since  $y = 6 - 3x$ , then

$$\begin{aligned} -2x - 6(6 - 3x) + 20 &= 0 \\ x &= 1 \end{aligned}$$

and  $y = 6 - 3(1) = 3$ , so  $(1, 3)$  is the only critical point.

The second-order partial derivatives are

$$A = P_{xx}(x, y) = -6 \quad B = P_{xy}(x, y) = -2 \quad C = P_{yy}(x, y) = -6$$

Figure 20 The boundary of  $P$ 

At the critical point  $(1, 3)$ ,

$$P_{xx}(1, 3) = -6 < 0 \quad P_{xy}(1, 3) = -2 \quad P_{yy}(1, 3) = -6 \quad AC - B^2 = 36 - 4 = 32 > 0$$

From the Second Partial Derivative Test,  $P$  has a local maximum at  $(1, 3)$ .

The domains of the demand functions  $p = 12 - 2x$  and  $q = 20 - y$  are  $0 \leq x \leq 6$  and  $0 \leq y \leq 20$ , respectively. Since the domain of the profit function  $P$  is  $0 \leq x \leq 6$ ,  $0 \leq y \leq 20$ , the domain is closed and bounded, so a maximum profit exists. From the test for absolute maximum and absolute minimum, the maximum profit is found at a critical point or on the boundary of the domain.

Figure 20 shows the boundary of the profit function  $P$  and Table 1 gives the maximum value of  $P$  on its boundary and at the critical point  $(1, 3)$ .

TABLE 1

|                                |                                | Maximum $P$                  |
|--------------------------------|--------------------------------|------------------------------|
| $L_1: 0 \leq x \leq 6, y = 0$  | $P(x, 0) = -3x^2 + 12x$        | $P(2, 0) = 12$               |
| $L_2: x = 6, 0 \leq y \leq 20$ | $P(6, y) = -3y^2 + 8y - 36$    | $P(6, y) < 0$                |
| $L_3: 0 \leq x \leq 6, y = 20$ | $P(x, 20) = -3x^2 - 28x - 800$ | $P(x, 20) < 0$               |
| $L_4: x = 0, 0 \leq y \leq 20$ | $P(0, y) = -3y^2 + 20y$        | $P(0, \frac{10}{3}) = 33.33$ |
| Critical point $(1, 3)$ :      |                                | $P(1, 3) = 36$               |

We conclude that by selling 1000 units of product  $x$  for the price  $p = 12 - 2(1) = 10$  thousand dollars and 3000 units of product  $y$  for the price  $q = 20 - 3 = 17$  thousand dollars, the profit is maximized.

(c) The maximum profit is  $P(1, 3) = \$36,000$ . ■

### NOW WORK Problem 55.

## 13.3 Assess Your Understanding

### Concepts and Vocabulary

- Multiple Choice** Suppose  $z = f(x, y)$  is a function with domain  $D$ , and  $(x_0, y_0)$  is an interior point of  $D$ . If  $f(x_0, y_0) \geq f(x, y)$  for all points  $(x, y)$  within some disk centered at  $(x_0, y_0)$ , then  $f$  has [(a) a local maximum, (b) a local minimum, (c) a saddle point, (d) none of these] at  $(x_0, y_0)$ .
- If  $z = f(x, y)$  is a function of two variables whose domain is an open set  $D$  containing the point  $(x_0, y_0)$ , then the point  $(x_0, y_0)$  is a critical point of  $f$  if \_\_\_\_\_ or if  $f_x(x_0, y_0)$  or  $f_y(x_0, y_0)$  does not exist.
- True or False** It is possible for a function  $z = f(x, y)$  to have a local extremum at a point  $(x_0, y_0)$  that is not a critical point.
- Multiple Choice** If  $f_x(x_0, y_0) = 0$  and  $f_y(x_0, y_0) = 0$ , but  $f$  does not have a local extremum at  $(x_0, y_0)$ , then the point  $(x_0, y_0, f(x_0, y_0))$  is called [(a) a local maximum value, (b) a local minimum value, (c) a saddle point, (d) none of these].
- True or False** The Extreme Value Theorem for Functions of Two Variables guarantees that a function  $z = f(x, y)$  of two variables, that is continuous on a closed, bounded set  $D$ , has an absolute maximum and an absolute minimum on  $D$ .
- If  $z = f(x, y)$  is a function of two variables that is continuous on a closed, bounded set  $D$ , then the absolute extrema are either at the critical points of  $f$  in  $D$  or on the \_\_\_\_\_ of  $D$ .

### Skill Building

In Problems 7–12, find all the critical points for each function.

- $f(x, y) = x^4 - 2x^2 + y^2 + 5$
- $f(x, y) = x^2 - y^2 + 6x - 2y + 4$
- $f(x, y) = 4xy - x^4 - y^4 + 2$
- $f(x, y) = x^3 + 6xy + 3y^2 + 3$
- $f(x, y) = e^{-x}(x^2 + y)$
- $f(x, y) = xy + \frac{2}{x} + \frac{4}{y}$

In Problems 13–32, find the local maxima, local minima, and saddle points, if any, for each function.

- $z = x^2 + y^2 - 2x + 4y + 2$
- $z = x^2 + y^2 - 4x + 2y - 4$
- $z = x^2 + 4y^2 - 4x + 8y - 1$
- $z = 2x^2 - y^2 + 4x - 4y + 8$
- $z = x^3 - 6xy + y^3$
- $z = x^2 - 3xy - y^2$
- $z = x^2 + 3xy - y^2 + 4y - 6x$
- $z = 2x^2 + xy + y^2 - 2x + 3y + 6$
- $z = x^3 + 3xy + y^3$
- $z = x^3 - 3xy - y^3$
- $z = x^3 + x^2y + y^2$
- $z = 3y^3 - x^2y + x$

25.  $z = \frac{y}{x+y}$

26.  $z = \frac{x}{x+y}$

27.  $z = \cos x + \cos y$

28.  $z = x^2 + 4 - 4x \cos y$

29.  $z = y^2 - 6y \cos x + 6$

30.  $z = x^2 - 6x \sin y + 2$

31.  $z = e^{xy}$

32.  $z = xye^{-(x+y)}$

In Problems 33–38, find the absolute maximum and absolute minimum of  $f$  on the domain  $D$ .

33.  $z = f(x, y) = x^2 - 4xy + 4y$ ;  $D: 0 \leq x \leq 2, 0 \leq y \leq 1$

34.  $z = f(x, y) = x^2 - 4xy + 4y$ ;  $D: 0 \leq x \leq 3, 0 \leq y \leq 2$

35.  $z = f(x, y) = x^2 + 2x + y^2 - 2y$ ;  $D: x^2 + y^2 \leq 4$

36.  $z = f(x, y) = x^2 - 4x + y^2 - 4y$ ;  $D: x^2 + y^2 \leq 9$

37.  $z = f(x, y) = xy + 4x - 3y + 5$ ;  $D$ : the closed triangular region whose vertices are  $(0, 0)$ ,  $(0, 4)$ , and  $(5, 4)$

38.  $z = f(x, y) = 3xy - 3x - 6y + 1$ ;  $D$ : the closed triangular region whose vertices are  $(0, 0)$ ,  $(5, 0)$ , and  $(0, 3)$

### Applications and Extensions

39. Find the local extrema and saddle points, if any, of  $f(x, y) = \sin x \sin y$ .

40. Find the highest point of the paraboloid  $x^2 + y^2 - 6x + 4y + z + 12 = 0$  as follows:

- Find the vertex of the paraboloid without using calculus.
- Express  $z$  as a function of  $x$  and  $y$  and use calculus to find its maximum value. See the figure.

41. **Geography** The surface of a mountain is modeled by the graph of the function  $z = 2xy - 2x^2 - y^2 - 8x + 6y + 4$  where  $z$  is the height in kilometers. See the figure. If sea level is the  $xy$ -plane, how high is the mountain above sea level?

### 42. Geometry

- Find the point on the plane  $3x + 2y + z = 14$  that is nearest the origin.
- What is the distance of the point found in (a) from the origin?

43. **Constructing a Box** A rectangular box open at the top has a fixed surface area  $S$ . Find the dimensions that make its volume a maximum. Express the length, width, and depth of the box in terms of  $S$ .

44. **Constructing a Box** Rework Problem 43 if the box is closed.

45. **Constructing a Box** Rework Example 7 if the box is closed.

46. **Minimizing Cost** Find the dimensions of an open rectangular box having a volume of 80 cubic meters if the cost per square meter of the material to be used is \$4 for the bottom, \$3 for one of the sides, and \$2 for the three remaining sides, and the total cost is to be minimized.

47. **Standard Post Regulations** The U.S. Postal Service regulations state that individual packages can be up to 130 in. in combined length and girth (the perimeter of a cross section at the widest spot) before additional charges apply.

- Find the dimensions of maximum volume of a rectangular box that can be sent without additional charges.
- Find the dimensions of maximum volume if the package is cylindrical.

**Source:** U.S. Postal Service, October, 2013, <https://www.usps.com/standardpost.htm>.

48. **Pharmacology** A patient's reaction to an injection of  $x$  units of a certain drug,  $t$  hours after the injection, is given by

$$y = x^2(a - x)te^{-t} \quad 0 \leq x \leq a \quad 0 \leq t$$

where  $a > 0$  is a constant. Find the values of  $x$  and  $t$ , if any, that will maximize  $y$ .

49. **Pharmacology** Two drugs A and B are used simultaneously to treat a disease. A patient's reaction  $R$  to  $x$  units of Drug A and  $y$  units of Drug B is

$$R(x, y) = x^2y^2(a - x)(b - y) \quad 0 \leq x \leq a \quad 0 \leq y \leq b$$

- For a fixed amount  $x$  of Drug A, what amount  $y$  of Drug B produces the maximum reaction?
- For a fixed amount  $y$  of Drug B, what amount  $x$  of Drug A produces the maximum reaction?
- If amounts  $x$  and  $y$  are both variable, what amount of each maximizes the reaction?

50. **Agriculture** An open irrigation channel is to be made into a symmetric form with three straight sides, as indicated in the figure.

- If the total length of the three sides is  $L$ , find a channel design that will allow the maximum possible flow.
- Is this design preferable to an open semicircular channel? Give the reasons why.

51. **Fuel Cost** See the figure.

A fuel reservoir at  $D$  is planned to service plants located at  $A$ ,  $B$ , and  $C$ . The cost, in thousands of dollars, of connecting the plants to  $D$  is determined by the formula

$$F = 6x^2 + 6y^2 - 4x - 6y + 5$$

Find the location of  $D$  that will minimize this cost.

- 52. Minimizing Cost** The cost of material for the sides of a rectangular shipping container is  $a$  cents per square foot; the cost of the top and bottom material is  $\frac{3}{2}a$  cents per square foot. If the volume is to be  $\frac{3}{2}$  cubic feet, what dimensions of the container will minimize its cost?

- 53. Metal Detector** A metal detector is used to locate an underground pipe. When several meter readings of the detector are compared, the reading at an arbitrary point  $(x, y)$ , where  $x \geq 0$  and  $y \geq 0$ , is modeled by

$$M = y(x - x^2) - y^2$$

Find the point  $(x, y)$  with the highest reading.

- 54. Maximizing Profit** A steel manufacturer produces two grades of steel,  $x$  kilograms of Grade A and  $y$  kilograms of Grade B. The cost  $C$  and revenue  $R$  in dollars are given by

$$C = \frac{1}{20}x^2 + 700x + y^2 - 150y - \frac{1}{2}xy$$

$$R = 2700x - \frac{3}{20}x^2 + 1000y - y^2 + \frac{1}{2}xy + 10,000$$

If  $P = \text{Profit} = R - C$ , find the production (in kilograms) of Grades A and B that maximizes the manufacturer's profit.

- 55. Economics** The demand functions for two products are  $p = 12 - x$  and  $q = 8 - y$ , where  $p$  and  $q$  are the respective prices (in thousands of dollars) of each product, and  $x$  and  $y$  are the respective amounts (in thousands of units) of each product sold. If the joint cost function is

$$C(x, y) = x^2 + 2xy + 3y^2$$

find the quantities  $x$  and  $y$  and the prices  $p$  and  $q$  that maximize profit. What is the maximum profit?

- 56. Economics** The labor cost of a firm is modeled by the function

$$Q(x, y) = x^2 + y^2 - 6xy + 3x + 6y - 5$$

where  $x$  is the number of workdays required by a skilled worker and  $y$  is the number of workdays required by a semiskilled worker. Find the values of  $x$  and  $y$  for which the labor cost is a minimum.

- 57. Second Partial Derivative Test** Suppose

$$g(x, y) = Ax^2 + 2Bxy + Cy^2$$

where  $A$ ,  $B$ , and  $C$  are constants. Show that:

- (a) If  $AC - B^2 > 0$ ,  $A \neq 0$ , then  $g(x, y)$  has a maximum at  $(0, 0)$  if  $A < 0$  and a minimum at  $(0, 0)$  if  $A > 0$ .

- (b) If  $AC - B^2 < 0$ , then  $g(x, y)$  has both positive and negative values at points  $(x, y)$  near  $(0, 0)$ , and  $(0, 0, 0)$  is a saddle point for  $z = g(x, y)$ .

### Challenge Problems

- 58.** Find the distance between the skew lines  $L_1: x = t - 6, y = t, z = 2t$  and  $L_2: x = t, y = t, z = -t$ .

- 59. Method of Least Squares** A scientist plots the points  $(x_1, y_1), \dots, (x_n, y_n)$  from her experimental data. Her theory tells her that the points should lie on a straight line, but they do not; perhaps as a result of experimental error. She is looking for the line  $y = mx + b$  that "best" fits the data. The most often used criterion is the *least-squares fit*, in which  $m$  and  $b$  are chosen to minimize

$$\sum_{k=1}^n (mx_k + b - y_k)^2$$

- (a) Show that the minimizing values of  $m$  and  $b$  are

$$m = \frac{n \sum_{k=1}^n x_k y_k - \sum_{k=1}^n x_k \sum_{k=1}^n y_k}{n \sum_{k=1}^n x_k^2 - \left( \sum_{k=1}^n x_k \right)^2}$$

$$b = \frac{1}{n} \left( \sum_{k=1}^n y_k - m \sum_{k=1}^n x_k \right)$$

- (b) Find the least-squares estimate  $y = mx + b$  for the points  $(0, 2)$ ,  $(1, 1)$ ,  $(2, 2)$ ,  $(3, 4)$ , and  $(4, 4)$ . Plot the points and draw the line.

- 60.** Let  $z = f(x, y)$  have continuous second-order partial derivatives. If  $\mathbf{u} = u_1 \mathbf{i} + u_2 \mathbf{j}$  is a unit vector, there is a directional derivative  $D_{\mathbf{u}} f(x, y) = g(x, y)$ . If  $g(x, y)$  is differentiable and if  $\mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j}$  is a unit vector, then  $D_{\mathbf{v}} g(x, y) = u_1 v_1 f_{xx} + (u_1 v_2 + u_2 v_1) f_{xy} + u_2 v_2 f_{yy}$ . If we let  $A = f_{xx}(x_0, y_0)$ ,  $B = f_{xy}(x_0, y_0)$ , and  $C = f_{yy}(x_0, y_0)$ , then we have an expression in the components  $u_1$  and  $u_2$  of  $\mathbf{u}$ , and  $v_1$  and  $v_2$  of  $\mathbf{v}$ . (See Section 13.1, Problem 77.)

- (a) In particular, if  $\mathbf{u} = \mathbf{v}$ , show that the second-order directional derivative at  $(x_0, y_0)$  is given by  $Au_1^2 + 2Bu_1u_2 + Cu_2^2$ .
- (b) Let  $f_x(x_0, y_0) = 0 = f_y(x_0, y_0)$ . Show that if  $A > 0$  and  $AC - B^2 > 0$ , then  $z = f(x, y)$  has a local minimum at  $(x_0, y_0)$ ; if  $A < 0$  and  $AC - B^2 > 0$ , then  $z = f(x, y)$  has a local maximum at  $(x_0, y_0)$ ; and if  $AC - B^2 < 0$ , then  $z = f(x, y)$  has a saddle point at  $(x_0, y_0)$ .

- (c) Show by examples that if  $AC - B^2 = 0$ , we may have any of the above three possibilities.

## 13.4 Lagrange Multipliers

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Use Lagrange multipliers for an optimization problem with one constraint (p. 892)
- 2 Use Lagrange multipliers for an optimization problem with two constraints (p. 896)

Many applications require finding maximum (or minimum) values of a function when a certain condition or constraint is present. For example, we might want to maximize the volume of a box using a fixed amount of material (its surface area). A solution to such problems can be obtained using Lagrange multipliers.

We begin by finding a minimum value subject to one constraint.

### EXAMPLE 1 Solve an Optimization Problem

Find the point in the first quadrant on the hyperbola  $xy = 4$  where the value of  $z = 12x + 3y$  is a minimum. What is the minimum value?

**Solution** We seek the minimum value of  $z = 12x + 3y$  subject to the condition, or constraint, that  $x$  and  $y$  satisfy the equation  $xy = 4$ . Since  $x > 0$  and  $y > 0$ , we can express this as a problem in one variable by solving  $xy = 4$  for  $y$  and substituting  $y = \frac{4}{x}$  in the expression  $z = 12x + 3y$ .

$$z = 12x + 3y = 12x + \frac{12}{x} \quad x > 0$$

$\uparrow$   
 $y = \frac{4}{x}$

Then

$$\frac{dz}{dx} = 12 - \frac{12}{x^2} = \frac{12x^2 - 12}{x^2} \quad x > 0$$

The critical numbers of  $z$  are  $-1$  and  $1$ . We exclude  $x = -1$ , since  $x > 0$ . To examine  $x = 1$ , we apply the Second Derivative Test. Since  $\frac{d^2z}{dx^2} = \frac{24}{x^3} > 0$  for  $x = 1$ , we conclude that  $z$  has a minimum when  $x = 1$  and  $y = \frac{4}{x} = 4$ . The minimum value of  $z$  is 24 at the point  $(1, 4)$  on the hyperbola. ■

In Example 1, we solved the problem by eliminating the variable  $y$  and treating the problem as a minimum problem in one variable. Sometimes, however, it is not easy, or perhaps it is impossible, to eliminate a variable. Then the Method of Lagrange Multipliers is useful. Before we use the method, let's look at a geometric rationale.

### A Geometric Rationale for the Method of Lagrange Multipliers

Consider Example 1 again. We want to minimize the function  $z = f(x, y) = 12x + 3y$ , subject to the constraint  $g(x, y) = xy - 4 = 0$ . The graph of  $g(x, y) = xy - 4 = 0$  is a curve (a hyperbola) in the  $xy$ -plane. We are interested in finding the smallest value of  $z = f(x, y)$ , where  $(x, y)$  is a point in the first quadrant on the graph of  $g(x, y) = 0$ .

Figure 21 shows the level curves of  $z = 12x + 3y$ . On a given level curve, the value of  $z$  is fixed. We are seeking the smallest  $z$  that coincides with the hyperbola  $xy = 4$ . We observe in Figure 21 that the minimum value of  $z$  occurs precisely at the point where the line  $12x + 3y = 24$  is tangent to the graph of the hyperbola  $xy = 4$ . At this point, the two curves have a common tangent line, so they must have the same normal line. Since the gradient gives the direction of the normal line to a curve, it follows that  $\nabla f$  is

**NEED TO REVIEW?** The Second Derivative Test is discussed in Section 4.4, pp. 291–292.

**Figure 21** Minimum value of  $z = 12x + 3y$  subject to  $xy = 4$  is  $z = 24$ .

parallel to  $\nabla g$ . That is, there is a scalar  $\lambda \neq 0$ , so that

$$\nabla f = \lambda \nabla g \quad \text{and} \quad g(x, y) = 0$$

This discussion leads to the following result.

### THEOREM Lagrange's Theorem

Let  $f$  and  $g$  be functions of two variables with continuous partial derivatives at every point of some open set containing the smooth curve  $g(x, y) = 0$ . Suppose that  $f$ , when restricted to points on the curve  $g(x, y) = 0$ , has a local extremum at the point  $(x_0, y_0)$  and that  $\nabla g(x_0, y_0) \neq \mathbf{0}$ . Then there is a number  $\lambda$  for which

$$\nabla f(x_0, y_0) = \lambda \nabla g(x_0, y_0)$$

**Proof** Express the smooth curve  $C$  defined by  $g(x, y) = 0$  as a parametric equation in vector form  $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$ . Define the function  $s(t) = f(x(t), y(t))$  and choose  $t_0$  so that  $x_0 = x(t_0)$ ,  $y_0 = y(t_0)$ . Now since  $f$  has a local extremum at the point  $(x_0, y_0)$ , the extreme value is given by

$$s(t_0) = f(x(t_0), y(t_0)) = f(x_0, y_0)$$

Then  $s'(t_0) = 0$ . By Chain Rule I,

$$\begin{aligned} s'(t_0) &= f_x(x_0, y_0)x'(t_0) + f_y(x_0, y_0)y'(t_0) & \frac{ds}{dt} &= \frac{\partial s}{\partial x} \frac{dx}{dt} + \frac{\partial s}{\partial y} \frac{dy}{dt} \\ &= \nabla f(x_0, y_0) \cdot \mathbf{r}'(t_0) & \text{Definition of the gradient} \\ &= 0 \end{aligned}$$

**ORIGINS** Joseph-Louis Lagrange (1736–1813), a.k.a. Giuseppe Lodovico Lagrangia, was a self-taught mathematician and astronomer. He was born and began his career teaching in Turin, Italy, but later moved first to Berlin and then to Paris, where he held prestigious positions at the Berlin Academy and Académie des Sciences. After the French Revolution (1789), Lagrange was named the first professor of analysis at the École Polytechnique, in Paris. Lagrange is one of 72 names of mathematicians, engineers, and scientists inscribed on the Eiffel Tower.

If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , it is orthogonal to  $\mathbf{r}'(t_0)$ , which is a tangent vector to  $C$  at  $(x_0, y_0)$ . Since the gradient is normal to the level curve at  $(x_0, y_0)$ , the vector  $\nabla g(x_0, y_0)$  is also orthogonal to  $\mathbf{r}'(t_0)$ . If  $\nabla f(x_0, y_0) = \mathbf{0}$ , then let  $\lambda = 0$ . Thus, in every case, there is a number  $\lambda$  for which  $\nabla f(x_0, y_0) = \lambda \nabla g(x_0, y_0)$ . ■

The number  $\lambda$  in the equations  $\nabla f(x, y) = \lambda \nabla g(x, y)$  is called a **Lagrange multiplier**. Since  $\nabla f = \lambda \nabla g$ , we have  $f_x\mathbf{i} + f_y\mathbf{j} = \lambda(g_x\mathbf{i} + g_y\mathbf{j})$ , so that  $f_x(x, y) = \lambda g_x(x, y)$  and  $f_y(x, y) = \lambda g_y(x, y)$ . These equations and the equation  $g(x, y) = 0$  form a system of three equations in the three unknowns  $x$ ,  $y$ , and  $\lambda$ .

$$f_x(x, y) = \lambda g_x(x, y) \quad f_y(x, y) = \lambda g_y(x, y) \quad g(x, y) = 0$$

A solution  $(x_0, y_0)$  of the system of equations is called a **test point**, since it is a candidate for the desired extrema. The maximum and minimum values, if they exist, are found by choosing the largest and smallest values of  $z = f(x, y)$  at the test points.

## 1 Use Lagrange Multipliers for an Optimization Problem with One Constraint

### EXAMPLE 2 Solving Example 1 Using Lagrange Multipliers

Find the point in the first quadrant on the hyperbola  $xy = 4$ , where the value of  $z = 12x + 3y$  is a minimum. What is the minimum value?

**Solution** We can reword the problem to read as follows: Find the minimum value of  $z = f(x, y) = 12x + 3y$  subject to the condition  $xy = 4$ , where  $x > 0$  and  $y > 0$ .

The test points satisfy the equations

$$\nabla f(x, y) = \lambda \nabla g(x, y) \quad g(x, y) = xy - 4 = 0 \quad x > 0 \quad y > 0$$

where  $\lambda$  is a number.

Solve the system of equations

$$\begin{cases} 12 = \lambda y & f_x(x, y) = \lambda g_x(x, y) \\ 3 = \lambda x & f_y(x, y) = \lambda g_y(x, y) \\ xy - 4 = 0 & g(x, y) = 0 \end{cases}$$

**NOTE** In eliminating  $\lambda$ , we use the fact that  $\lambda \neq 0$  since  $\nabla f \neq \mathbf{0}$ .

Eliminating  $\lambda$  from the first two equations results in  $y = 4x$ , so the third equation becomes

$$4x^2 - 4 = 0$$

$$x = 1 \quad \text{or} \quad x = -1$$

Since  $x > 0$ , we ignore  $x = -1$ . When  $x = 1$ , then  $y = 4$ , so the only test point is  $(1, 4)$ . The corresponding minimum value of  $z = 12x + 3y$  is  $z = 24$ . ■

### NOW WORK Problem 5.

#### Steps for Using Lagrange Multipliers

**Step 1** Express the problem in the following form: Find the maximum (or minimum) value of  $z = f(x, y)$  subject to the constraint  $g(x, y) = 0$ .

**Step 2** Check that the functions  $f$  and  $g$  satisfy Lagrange's Theorem.

**Step 3** Solve the equations  $\nabla f(x, y) = \lambda \nabla g(x, y)$  and  $g(x, y) = 0$  for the test points by solving the system of equations

$$\begin{cases} f_x(x, y) = \lambda g_x(x, y) \\ f_y(x, y) = \lambda g_y(x, y) \\ g(x, y) = 0 \end{cases}$$

**Step 4** Evaluate  $z = f(x, y)$  at each test point found in Step 3. Choose the maximum (or minimum) value of  $z$ .

#### EXAMPLE 3 Using Lagrange Multipliers

Find the maximum and minimum values of  $z = f(x, y) = 3x - y + 1$  subject to the constraint  $3x^2 + y^2 = 9$ .

**Solution** We use the steps for Lagrange multipliers:

**Step 1** The problem is expressed in the required form.

**Step 2** The functions  $f$  and  $g(x, y) = 3x^2 + y^2 - 9 = 0$  each have continuous partial derivatives.

**Step 3** Solve the system of equations

$$\begin{cases} 3 = 6\lambda x & f_x(x, y) = \lambda g_x(x, y) \\ -1 = 2\lambda y & f_y(x, y) = \lambda g_y(x, y) \\ 3x^2 + y^2 - 9 = 0 & g(x, y) = 0 \end{cases}$$

From the first two equations, we find that  $x = \frac{1}{2\lambda}$  and  $y = -\frac{1}{2\lambda}$  from which  $x = -y$ . Substituting into the third equation, we have

$$4x^2 = 9$$

$$x = \pm \frac{3}{2}$$

Then  $x = \pm \frac{3}{2}$ ,  $y = \mp \frac{3}{2}$ , and the test points are  $\left(\frac{3}{2}, -\frac{3}{2}\right)$  and  $\left(-\frac{3}{2}, \frac{3}{2}\right)$ .

**Step 4** The values of  $z$  corresponding to the test points are  $z = \frac{9}{2} + \frac{3}{2} + 1 = 7$

and  $z = -\frac{9}{2} - \frac{3}{2} + 1 = -5$ . The maximum value of  $z$  is 7 and the minimum value is  $-5$ . ■

**NOW WORK** Problem 9.

**EXAMPLE 4** Using Lagrange Multipliers to Find Absolute Extrema

Find the absolute maximum and absolute minimum of  $f(x, y) = x^2 + y^2 + 4x - 4y + 3$  subject to  $x^2 + y^2 \leq 2$ .

**Solution** From the Extreme Value Theorem,  $f$  has both an absolute maximum and an absolute minimum on the closed, bounded set  $x^2 + y^2 \leq 2$ . We begin by finding any critical points.

$$\begin{aligned} f_x = 2x + 4 = 0 & & f_y = 2y - 4 = 0 \\ x = -2 & & y = 2 \end{aligned}$$

The point  $(-2, 2)$  lies outside the disk  $x^2 + y^2 \leq 2$ , so  $f$  has no relevant critical points. The extrema must occur on the boundary of the domain, that is, on the curve  $x^2 + y^2 = 2$ . To find the extrema, we use Lagrange multipliers.

**Step 1** Using  $g(x, y) = x^2 + y^2 - 2 = 0$  as the constraint, the problem is expressed in the required form.

**Step 2** The functions  $f$  and  $g(x, y) = x^2 + y^2 - 2 = 0$  each have continuous partial derivatives.

**Step 3** We solve the system of equations  $\nabla f(x, y) = \lambda \nabla g(x, y)$  and  $g(x, y) = 0$ .

$$\begin{cases} 2x + 4 = 2\lambda x & f_x(x, y) = \lambda g_x(x, y) \\ 2y - 4 = 2\lambda y & f_y(x, y) = \lambda g_y(x, y) \\ x^2 + y^2 = 2 & g(x, y) = 0 \end{cases}$$

We eliminate  $\lambda$  from the first two equations.

$$\begin{aligned} 2x + 4 &= 2x\lambda & 2y - 4 &= 2y\lambda \\ \lambda &= \frac{2x + 4}{2x} & \lambda &= \frac{2y - 4}{2y} \\ \lambda &= 1 + \frac{2}{x} & \lambda &= 1 - \frac{2}{y} \end{aligned}$$

Then  $1 + \frac{2}{x} = 1 - \frac{2}{y}$ , so  $y = -x$ .

If we substitute  $y = -x$  into the third equation  $x^2 + y^2 = 2$ , we find  $2x^2 = 2$ . Then  $x = \pm 1$  and  $y = \mp 1$ . There are two test points:  $(1, -1)$  and  $(-1, 1)$ .

**Step 4** We evaluate  $z = f(x, y)$  at each test point.

$$\begin{aligned} f(1, -1) &= 13 & \text{Maximum value} \\ f(-1, 1) &= -3 & \text{Minimum value} \end{aligned}$$

The cylinder  $x^2 + y^2 = 2$  and the elliptic paraboloid  $z = (x + 2)^2 + (y - 2)^2 - 5$ , are shown in Figure 22.

Figure 22

**NOW WORK** Problem 17.

Lagrange multipliers can be used for functions of three variables. The extreme values of  $w = f(x, y, z)$  subject to the constraint  $g(x, y, z) = 0$ , if they exist, occur at the solutions  $(x, y, z)$  of the system of equations.

$$\nabla f(x, y, z) = \lambda \nabla g(x, y, z) \quad \text{and} \quad g(x, y, z) = 0$$

These equations form a system of four equations in the four unknowns  $x$ ,  $y$ ,  $z$ , and  $\lambda$ .

### EXAMPLE 5 Using Lagrange Multipliers with a Function of Three Variables

A container in the shape of a rectangular box is open on top and has a fixed volume of  $12 \text{ m}^3$ . The material used to make the bottom of the container costs \$3 per square meter, while the material used for the sides costs \$1 per square meter. What dimensions will minimize the cost of material?

**Solution** Let  $x$  be the width of the container,  $y$  its depth, and  $z$  its height. Then its volume is  $xyz = 12$ . The cost function  $C = C(x, y, z)$ , which is to be minimized, is

$$C(x, y, z) = 3xy + 2xz + 2yz$$

We use Lagrange multipliers.

**Step 1** The objective is to minimize  $C$  subject to the constraint

$$g(x, y, z) = xyz - 12 = 0.$$

**Step 2** The functions  $C$  and  $g$  each have continuous partial derivatives.

**Step 3** We solve the system of equations  $\nabla C(x, y, z) = \lambda \nabla g(x, y, z)$  and  $g(x, y, z) = 0$ .

$$\begin{cases} 3y + 2z = \lambda yz & C_x(x, y, z) = \lambda g_x(x, y, z) & (1) \\ 3x + 2z = \lambda xz & C_y(x, y, z) = \lambda g_y(x, y, z) & (2) \\ 2x + 2y = \lambda xy & C_z(x, y, z) = \lambda g_z(x, y, z) & (3) \\ xyz - 12 = 0 & g(x, y, z) = 0 & (4) \end{cases}$$

Now we use the facts that  $x > 0$ ,  $y > 0$ , and  $z > 0$  to solve the first three equations for  $\lambda$ , obtaining

$$\lambda = \frac{3}{z} + \frac{2}{y} \quad (5) \quad \lambda = \frac{3}{z} + \frac{2}{x} \quad (6) \quad \lambda = \frac{2}{y} + \frac{2}{x} \quad (7)$$

From these, we find that

$$y = x \quad \text{From equations (5) and (6)}$$

$$z = \frac{3}{2}x \quad \text{From equations (5) and (7)}$$

If we substitute these two equations into  $xyz - 12 = 0$ , we find

$$\begin{aligned} xyz - 12 &= 0 \\ x(x) \left( \frac{3}{2}x \right) - 12 &= 0 \\ \frac{3}{2}x^3 &= 12 \\ x &= 2 \end{aligned}$$

Then  $y = 2$ ,  $z = 3$ , and the test point is  $(2, 2, 3)$ .

**Step 4** The dimensions of the container that minimize the cost are 2 m by 2 m by 3 m. The minimum cost is  $C(2, 2, 3) = 3(2)(2) + 2(2)(3) + 2(2)(3) = \$36$ . ■

## 2 Use Lagrange Multipliers for an Optimization Problem with Two Constraints

Lagrange multipliers can be used to solve problems involving more than one constraint. In the two-constraint situation, we seek the extreme values of a function  $w = f(x, y, z)$  subject to two constraints  $g(x, y, z) = 0$  and  $h(x, y, z) = 0$ . The extreme values of  $f$ , if they exist, occur at solutions  $(x, y, z)$  of the system of five equations containing the five variables  $x, y, z, \lambda_1$  and  $\lambda_2$ .

$$\begin{cases} \nabla f(x, y, z) = \lambda_1 \nabla g(x, y, z) + \lambda_2 \nabla h(x, y, z) \\ g(x, y, z) = 0 \\ h(x, y, z) = 0 \end{cases}$$

where  $\lambda_1$  and  $\lambda_2$  are Lagrange multipliers.

### EXAMPLE 6 Using Lagrange Multipliers with Two Constraints

Find the points of intersection of the ellipsoid  $x^2 + y^2 + 9z^2 = 25$  and the plane  $x + 3y - 2z = 0$  that are farthest from the origin. Also find the points that are closest to the origin.

**Solution** See Figure 23.

Let  $C$  be the curve formed by intersecting the ellipsoid and the plane, and let  $P = (x, y, z)$  be a point on  $C$ . We use the steps for Lagrange multipliers.

**Step 1** The function to be optimized is the distance  $d$  from  $P$  to the origin:

$$d = f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$$

subject to the constraints

$$g(x, y, z) = x^2 + y^2 + 9z^2 - 25 = 0 \quad \text{The point must be on the ellipsoid.}$$

$$h(x, y, z) = x + 3y - 2z = 0 \quad \text{The point must be on the plane.}$$

**Step 2** The functions  $f$ ,  $g$ , and  $h$  are each functions of three variables, and each has continuous partial derivatives at every point of some open set containing the smooth curve defined by  $g(x, y, z) = 0$  and  $h(x, y, z) = 0$ .

**Step 3** We introduce two Lagrange multipliers and solve the system of equations  $\nabla f(x, y, z) = \lambda_1 \nabla g(x, y, z) + \lambda_2 \nabla h(x, y, z)$ ,  $g(x, y, z) = 0$ , and  $h(x, y, z) = 0$ .

$$\begin{cases} \frac{x}{\sqrt{x^2 + y^2 + z^2}} = 2\lambda_1 x + \lambda_2 & f_x(x, y, z) = \lambda_1 g_x(x, y, z) + \lambda_2 h_x(x, y, z) \\ \frac{y}{\sqrt{x^2 + y^2 + z^2}} = 2\lambda_1 y + 3\lambda_2 & f_y(x, y, z) = \lambda_1 g_y(x, y, z) + \lambda_2 h_y(x, y, z) \\ \frac{z}{\sqrt{x^2 + y^2 + z^2}} = 18\lambda_1 z - 2\lambda_2 & f_z(x, y, z) = \lambda_1 g_z(x, y, z) + \lambda_2 h_z(x, y, z) \\ x^2 + y^2 + 9z^2 - 25 = 0 & g(x, y, z) = 0 \\ x + 3y - 2z = 0 & h(x, y, z) = 0 \end{cases}$$

Eliminating  $\lambda_1$  and  $\lambda_2$  from the first three equations, we have two possibilities:  $z = 0$  or  $y = 3x$ . Using each of these equations with the constraints

Figure 23

$x^2 + y^2 + 9z^2 - 25 = 0$  and  $x + 3y - 2z = 0$  results in the following:

$$z = 0: \left( -\frac{15}{\sqrt{10}}, \frac{5}{\sqrt{10}}, 0 \right) \quad \text{5 units from the origin}$$

$$\left( \frac{15}{\sqrt{10}}, -\frac{5}{\sqrt{10}}, 0 \right) \quad \text{5 units from the origin}$$

$$y = 3x: \left( \frac{5}{\sqrt{235}}, \frac{15}{\sqrt{235}}, \frac{25}{\sqrt{235}} \right) \quad \sqrt{\frac{875}{235}} \approx 1.930 \text{ units from the origin}$$

$$\left( -\frac{5}{\sqrt{235}}, -\frac{15}{\sqrt{235}}, -\frac{25}{\sqrt{235}} \right) \quad \sqrt{\frac{875}{235}} \approx 1.930 \text{ units from the origin}$$

The points  $\left( -\frac{15}{\sqrt{10}}, \frac{5}{\sqrt{10}}, 0 \right)$  and  $\left( \frac{15}{\sqrt{10}}, -\frac{5}{\sqrt{10}}, 0 \right)$  are farthest from the origin, and the points  $\left( \frac{5}{\sqrt{235}}, \frac{15}{\sqrt{235}}, \frac{25}{\sqrt{235}} \right)$  and  $\left( -\frac{5}{\sqrt{235}}, -\frac{15}{\sqrt{235}}, -\frac{25}{\sqrt{235}} \right)$  are closest to the origin. Since the intersection of the ellipsoid and the plane is an ellipse, the points we have found are the endpoints of the major and minor axes of this ellipse. ■

### NOW WORK Problem 19.

## 13.4 Assess Your Understanding

### Concepts and Vocabulary

- Multiple Choice** The number  $\lambda$  in the equations  $\nabla f(x, y) = \lambda \nabla g(x, y)$  is called a [(a) factor, (b) Lagrangian, (c) Lagrange multiplier].
- True or False** Extreme values of the function  $z = f(x, y)$  subject to the constraint  $g(x, y) = 0$  are found as solutions of the system of equations  $\nabla f(x, y) = \lambda \nabla g(x, y)$  and  $g(x, y) = 0$ .
- True or False** Lagrange multipliers can be used only for functions of two variables.
- True or False** When using Lagrange multipliers to find the extreme values of a function, the number of Lagrange multipliers introduced depends on the number of variables in the function.
- $f(x, y) = 2xy, g(x, y) = x^2 + y^2 - 2 = 0$
- $f(x, y) = xy, g(x, y) = 9x^2 + 4y^2 - 36 = 0$
- $f(x, y) = x^2 - 4xy + 4y^2, g(x, y) = x^2 + y^2 - 4 = 0$
- $f(x, y) = 9x^2 - 6xy + y^2, g(x, y) = x^2 + y^2 - 25 = 0$
- $f(x, y, z) = 4x - 3y + 2z, g(x, y, z) = x^2 + y^2 - 6z = 0$
- $f(x, y, z) = x^2 + 2y^2 + z^2, g(x, y, z) = 2x - 3y + z - 6 = 0$
- Find the absolute maximum and the absolute minimum of the function  $f(x, y) = x^2 + y^2 + 4xy$  subject to the constraint  $x^2 + y^2 \leq 2$ .
- Find the absolute maximum and the absolute minimum of the function  $f(x, y) = 2x^2 + y^2$  subject to the constraint  $x^2 + y^2 \leq 4$ .
- Find the absolute maximum and the absolute minimum values of the function  $f(x, y, z) = x^2 + y^2 + z^2$  subject to the constraints  $z^2 = x^2 + y^2$  and  $x + y - z + 1 = 0$ .
- Find the absolute minimum value of  $w = x^2 + y^2 + z^2$  subject to the constraints  $2x + y + 2z = 9$  and  $5x + 5y + 7z = 29$ .

### Skill Building

In Problems 5–16, use Lagrange multipliers to find the maximum and minimum values of  $f$  subject to the constraint  $g(x, y) = 0$ .

- $f(x, y) = 3x + y, g(x, y) = xy - 8 = 0$
- $f(x, y) = 3x + y + 4, g(x, y) = xy - 1 = 0$
- $f(x, y) = 3x + y + 4, g(x, y) = x^2 + 4y^2 - 1 = 0$
- $f(x, y) = 3x + y, g(x, y) = x^2 + y^2 - 4 = 0$
- $f(x, y) = x - 2y^2, g(x, y) = x^2 + y^2 - 1 = 0$
- $f(x, y) = x^2 + 4y^3, g(x, y) = x^2 + 2y^2 - 2 = 0$

### Applications and Extensions

- Minimizing Distance** Find the point on the line  $x - 3y = 6$  that is closest to the origin.
- Minimizing Distance** Find the point on the plane  $2x + y - 3z = 6$  that is closest to the origin.

23. Find the maximum product of two numbers  $x$  and  $y$  subject to  $x + 2y = 21$ .
24. Find the minimum quotient of two positive numbers  $x$  and  $y$  subject to  $4x + 2y = 100$ .
25. (a) Find the points on the intersection of  $4x^2 + y^2 + z^2 = 16$  and the plane  $3 - y = 0$  that are farthest from the origin.  
(b) Find the points that are closest to the origin.
26. Find the point on the intersection of the sphere  $x^2 + 2x + y^2 + z^2 = 16$  and the plane  $3x + y - z = 0$  that is farthest from the origin. Also find the point that is closest to the origin.
27. At which points on the ellipse  $x^2 + 2y^2 = 2$  is the product  $xy$  a maximum?
28. **Maximizing Volume** Find the dimensions of an open-topped box that maximizes volume when the surface area is fixed at 48 square centimeters.
29. **Manufacturing and Design** Find the optimal dimensions for a can in the shape of a right circular cylinder of fixed volume  $V$ . That is, find the height  $h$  and the radius  $r$  of the can in terms of  $V$  so that the surface area is minimized. Assume the can is closed at the top and at the bottom.

*Source:* Problem submitted by the students at Minnesota State University

30. **Minimizing Materials** A manufacturer receives an order to build a closed rectangular container with a volume of  $216 \text{ m}^3$ . What dimensions will minimize the amount of material needed to produce the container?
31. **Cost of a Box** An open-topped box has a volume of  $12 \text{ m}^3$  and is to be made from material costing \$1 per square meter. What dimensions minimize the cost?
32. **Cost of a Box** A rectangular box is to have a bottom made from material costing \$2 per square meter, while the top and sides are made from material costing \$1 per square meter. If the volume of the box is to be  $18 \text{ m}^3$ , what dimensions will minimize the cost of production?

33. **Carry-On Luggage Requirements** The linear measurements (length + width + height) for luggage carried onto a Delta Airlines plane must not exceed 45 inches. Find the dimensions of the rectangular suitcase of greatest volume that meets this requirement.

*Source:* Delta Airlines, 2012.

34. **Extreme Temperature** Suppose that  $T = T(x, y, z) = 100x^2yz$  is the temperature (in degrees Celsius) at any point  $(x, y, z)$  on the sphere given by  $x^2 + y^2 + z^2 = 1$ . Find the points on the sphere where the temperature is greatest and least. What is the temperature at these points?
35. **Fencing** A farmer has 340 m of fencing for enclosing two separate fields, one of which is to be a rectangle twice as long as it is wide and the other a square. The square field must enclose at least 100 square meters ( $\text{m}^2$ ), and the rectangular one must enclose at least  $800 \text{ m}^2$ .

- (a) If  $x$  is the width of the rectangular field, what are the maximum and minimum values of  $x$ ?
- (b) What is the greatest number of square meters that can be enclosed in the two fields?

36. **Fencing in an Area** A Vinyl Fence Co. prices its Cape Cod Concave fence, which is 3 ft tall, at \$21.53 per linear foot. A home builder has \$5000 available to spend on enclosing a rectangular garden. What is the largest area that can be enclosed?

*Source:* A Vinyl Fence Co. San Jose, California, 2012.

37. **Joint Cost Function** Let  $x$  and  $y$  be the number of units (in thousands) of two products manufactured at a factory, and let  $C = 18x^2 + 9y^2$  in thousands of dollars be the joint cost of production of the products. If  $x + y = 5400$ , find  $x$  and  $y$  that minimize production cost.
38. **Production Function** The production function of a company is  $P(x, y) = x^2 + 3xy - 6x$ , where  $x$  and  $y$  represent two different types of input. Find the amounts of  $x$  and  $y$  that maximize production if  $x + y = 40$ .
39. **Economics: The Cobb–Douglas Model** Use the Cobb–Douglas production model  $P = 1.01K^{0.25}L^{0.75}$  as follows: Suppose that each unit of capital ( $K$ ) has a value of \$175 and each unit of labor ( $L$ ) has a value of \$125.
- (a) If there is a total of \$175,000 to invest in the economy, use Lagrange multipliers to find the units of capital and the units of labor that maximize the total production in the manufacturing sector of the economy.
- (b) What are the maximum units of production that the manufacturing sector of the economy could generate under these conditions?
40. The surface  $xyz = -1$  is cut by the plane  $x + y + z = 1$ , resulting in a curve  $C$ . Find the points on  $C$  that are nearest to the origin and farthest from the origin.
41. Find the minimum value of  $w = x^2 + y^2 + z^2$  subject to the constraints  $2x + y + 2z = 9$  and  $5x + 5y + 7z = 29$ .
42. **Maximizing Volume** A closed rectangular box of fixed surface area and maximum volume is a cube. Use Lagrange multipliers to confirm this fact.
43. **Maximizing Volume** A closed cylindrical can of fixed surface area and maximum volume has a height equal to the diameter of its base. Use Lagrange multipliers to confirm this fact.
44. Find the points of intersection of the plane  $x + y + z = 1$  and the hyperboloid  $x^2 + y^2 - z^2 = 1$  nearest the origin.
45. At what points on the union of the two curves  $x^2 + y^2 = 1$  and  $x^3 + y^3 = 1$  is the function  $f(x, y) = x^4 + y^4 + 4$  a maximum? At what points is it a minimum?
46. Find the extreme values of  $f(x, y, z) = xyz$  on the surface  $x^2 + y^2 + z^2 = 1$ .

### Challenge Problems

47. Minimize  $x^4 + y^4 + z^4$  subject to the constraint  $Ax + By + Cz = D$ .

48. Use Lagrange multipliers to show that the triangle of largest perimeter that can be inscribed in a circle of radius  $R$  is an equilateral triangle.
49. Find the point of the paraboloid  $z = 2 - x^2 - y^2$  that is closest to the point  $(1, 1, 2)$ .

50. What points of the surface  $xy - z^2 - 6y + 36 = 0$  are closest to the origin?

## Chapter Review

### THINGS TO KNOW

#### 13.1 Directional Derivative; Gradient

- The directional derivative of a differentiable function  $z = f(x, y)$  at the point  $(x_0, y_0)$  in the direction of the unit vector  $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$  is  
 $D_{\mathbf{u}}f(x_0, y_0) = f_x(x_0, y_0)\cos\theta + f_y(x_0, y_0)\sin\theta$ . (p. 864)
- The directional derivative  $D_{\mathbf{u}}f(x_0, y_0)$  equals the slope of the tangent line to the curve  $C$  at the point  $(x_0, y_0, f(x_0, y_0))$  on the surface of  $z = f(x, y)$ , where  $C$  is the intersection of the surface with the plane perpendicular to the  $xy$ -plane and containing the line through  $(x_0, y_0)$  in the direction  $\mathbf{u}$ . (p. 865)
- The gradient of a differentiable function  $f$ 
  - of two variables:  $\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}$  (p. 866)
  - of three variables:  
 $\nabla f(x, y, z) = f_x(x, y, z)\mathbf{i} + f_y(x, y, z)\mathbf{j} + f_z(x, y, z)\mathbf{k}$  (p. 871)

**Properties of the Gradient:** (p. 867)

- If  $\nabla f(x_0, y_0) = \mathbf{0}$ , then  $D_{\mathbf{u}}f(x_0, y_0) = 0$  for all directions  $\mathbf{u}$ .
- If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , then the directional derivative of  $f$  at  $(x_0, y_0)$  is a maximum when  $\mathbf{u}$  is in the direction of  $\nabla f(x_0, y_0)$ . The maximum value of  $D_{\mathbf{u}}f(x_0, y_0)$  is  $\|\nabla f(x_0, y_0)\|$ .
- If  $\nabla f(x_0, y_0) \neq \mathbf{0}$ , then the directional derivative of  $f$  at  $(x_0, y_0)$  is a minimum when  $\mathbf{u}$  is in the direction of  $-\nabla f(x_0, y_0)$ . The minimum value of  $D_{\mathbf{u}}f(x_0, y_0)$  is  $-\|\nabla f(x_0, y_0)\|$ .
- $z = f(x, y)$  increases most rapidly in the direction of  $\nabla f(x_0, y_0)$ .
- $z = f(x, y)$  decreases most rapidly in the direction of  $-\nabla f(x_0, y_0)$ .
- The value of  $z = f(x, y)$  remains the same for directions orthogonal to  $\nabla f(x_0, y_0)$ . (p. 868)

The gradient  $\nabla f(x_0, y_0)$  is normal to the level curve of  $f$  at  $P_0 = (x_0, y_0)$ . (p. 870)

$D_{\mathbf{u}}f(x, y) = \nabla f(x, y) \cdot \mathbf{u}$ ,  
 where  $\mathbf{u} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$ . (p. 866)

$D_{\mathbf{u}}f(x, y, z) = \nabla f(x, y, z) \cdot \mathbf{u}$ ,  
 where  $\mathbf{u} = \cos\alpha\mathbf{i} + \cos\beta\mathbf{j} + \cos\gamma\mathbf{k}$ . (p. 871)

#### 13.2 Tangent Planes

- Equation of a tangent plane to a surface (p. 876)
- The normal line to the tangent plane to  $F(x, y, z) = 0$  at the point  $P_0 = (x_0, y_0, z_0)$ :
  - vector equation:  $\mathbf{r}(t) = \mathbf{r}_0 + t\nabla F(x_0, y_0, z_0)$ , where  $\mathbf{r}_0 = x_0\mathbf{i} + y_0\mathbf{j} + z_0\mathbf{k}$  is the position vector of  $P_0$  and  $\mathbf{r}$  is the position vector of any point  $P$  on the normal line. (p. 876)

- parametric equations:  $x = x_0 + at$ ,  $y = y_0 + bt$ , and  $z = z_0 + ct$ , where  $a = F_x(x_0, y_0, z_0)$ ,  $b = F_y(x_0, y_0, z_0)$ , and  $c = F_z(x_0, y_0, z_0)$ . (p. 876)
- symmetric equations:  $\frac{x - x_0}{a} = \frac{y - y_0}{b} = \frac{z - z_0}{c}$  if  $abc \neq 0$ . (p. 877)

#### 13.3 Extrema of Functions of Two Variables

- Local maximum; local minimum (p. 879)
- Absolute maximum; absolute minimum (p. 879)
- Critical point (p. 880)
- Saddle point (p. 881)

**Second Partial Derivative Test:** (p. 882)

Let  $z = f(x, y)$  be a function of two variables for which the first- and second-order partial derivatives are continuous in some disk containing the point  $(x_0, y_0)$ . Suppose that  $f_x(x_0, y_0) = 0$  and  $f_y(x_0, y_0) = 0$ . Let

$$A = f_{xx}(x_0, y_0) \quad B = f_{xy}(x_0, y_0) \quad C = f_{yy}(x_0, y_0)$$

- If  $AC - B^2 > 0$  and  $f_{xx}(x_0, y_0) > 0$ , then  $f$  has a local minimum at  $(x_0, y_0)$ .
- If  $AC - B^2 > 0$  and  $f_{xx}(x_0, y_0) < 0$ , then  $f$  has a local maximum at  $(x_0, y_0)$ .
- If  $AC - B^2 < 0$ , then  $(x_0, y_0, f(x_0, y_0))$  is a saddle point of  $f$ .
- If  $AC - B^2 = 0$ , then the test gives no information.

**Extreme Value Theorem for Functions of Two Variables:** (p. 883)

Let  $z = f(x, y)$  be a function of two variables. If  $f$  is continuous on a closed, bounded set  $D$ , then  $f$  has an absolute maximum and an absolute minimum on  $D$ .

**Test for Absolute Maximum and Absolute Minimum:** (p. 884)

Let  $z = f(x, y)$  be a function of two variables defined on a closed, bounded set  $D$ . If  $f$  is continuous on  $D$ , then the absolute maximum and the absolute minimum of  $f$  are, respectively, the largest and smallest values found among the following:

- The values of  $f$  at the critical points of  $f$  in  $D$
- The values of  $f$  on the boundary of  $D$

#### 13.4 Lagrange Multipliers

**Lagrange multiplier:** (p. 892)

**The Method of Lagrange Multipliers:** (pp. 891–892)

The extreme values of  $z = f(x, y)$  subject to the condition  $g(x, y) = 0$ , if they exist, occur at the solutions  $(x, y)$  of the system equations.

$$\begin{cases} \nabla f(x, y) = \lambda \nabla g(x, y) \\ g(x, y) = 0 \end{cases}$$

**Steps for Using Lagrange Multipliers:** (p. 893)

## OBJECTIVES

| Section | You should be able to ...                                                                | Examples   | Review Exercises |
|---------|------------------------------------------------------------------------------------------|------------|------------------|
| 13.1    | 1 Find the directional derivative of a function of two variables (p. 863)                | 1, 2       | 1–3              |
|         | 2 Find the gradient of a function of two variables (p. 866)                              | 3          | 1–3              |
|         | 3 Use properties of the gradient (p. 868)                                                | 4, 5, 6    | 7–9              |
|         | 4 Find the directional derivative and gradient of a function of three variables (p. 871) |            | 4–6              |
| 13.2    | 1 Find a tangent plane to a surface (p. 876)                                             | 1          | 10–12            |
|         | 2 Find a normal line to a tangent plane (p. 876)                                         | 2          | 10–12            |
| 13.3    | 1 Find critical points (p. 880)                                                          | 1, 2       | 13–15, 25        |
|         | 2 Use the Second Partial Derivative Test (p. 882)                                        | 3, 4       | 16–18            |
|         | 3 Find the absolute extrema of a function of two variables (p. 883)                      | 5, 6       | 19, 20           |
|         | 4 Solve optimization problems (p. 886)                                                   | 7, 8       | 26–28            |
| 13.4    | 1 Use Lagrange multipliers for an optimization problem with one constraint (p. 892)      | 2, 3, 4, 5 | 21–24, 29–31     |
|         | 2 Use Lagrange multipliers for an optimization problem with two constraints (p. 896)     | 6          | 32               |

## REVIEW EXERCISES

In Problems 1–6, find the gradient and directional derivative of each function at the indicated point in the direction of  $\mathbf{a}$ .

- $f(x, y) = \ln(\sec(x^2 + y^2))$  at  $\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}\right)$ ;  $\mathbf{a} = \mathbf{i} + \mathbf{j}$
- $f(x, y) = \frac{x^2 - y^2}{x^2 + y^2}$  at  $(1, 1)$ ;  $\mathbf{a} = \mathbf{i} - \mathbf{j}$
- $f(x, y) = y \sin^{-1} x$  at  $(0, 1)$ ;  $\mathbf{a} = 3\mathbf{i} + \mathbf{j}$
- $f(x, y, z) = \ln(xyz)$  at  $(1, 1, 3)$ ;  $\mathbf{a} = \mathbf{i} + \mathbf{j} + 3\mathbf{k}$
- $f(x, y, z) = ye^{-x}(x^2 + y^2 + z^2 + 1)$  at  $(0, 0, 0)$ ;  $\mathbf{a} = 2\mathbf{i} + \mathbf{j} + 2\mathbf{k}$
- $f(x, y, z) = (2x + y + z)^2 + xyz$  at  $(1, 1, 1)$ ;  $\mathbf{a} = -\mathbf{i} - \mathbf{j} - \mathbf{k}$

In Problems 7–9:

- Find the direction for which the directional derivative of the function  $f$  is maximum.
- Find the maximum value and the minimum value of the directional derivative.

- $f(x, y) = \sec(x^2 + y^2)$  at  $\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}\right)$
- $f(x, y) = \frac{x^2 - y^2}{x^2 + y^2}$  at  $(1, 1)$
- $f(x, y) = y \sin^{-1} x$  at  $(0, 1)$

In Problems 10–12:

- Find an equation of the tangent plane to each surface at the given point.
  - Find symmetric equations of the normal line to the tangent plane of each surface at the given point.
- $x^2 - y^2 + z^2 = 4$  at  $(-1, 1, 2)$
  - $2x^2 + y^2 = z$  at  $(1, 0, 2)$
  - $f(x, y) = y \sin^{-1} x$  at  $(0, 1)$

In Problems 13–15, find the critical points of each function.

- $z = f(x, y) = x^2 + xy + y^2 + 6x$
- $z = f(x, y) = x^3 - y^3 + 3xy$
- $z = f(x, y) = xy$

In Problems 16–18, use the Second Partial Derivative Test to find any local maxima, local minima, and saddle points for each function.

- $z = f(x, y) = xe^{xy}$
- $z = f(x, y) = \sin x + \sin y$
- $z = f(x, y) = x^2 - 9y + y^2$

In Problems 19 and 20, find the absolute maximum and absolute minimum of  $f$  on the domain  $D$ .

- $z = f(x, y) = x^2 - 2xy + 2y$ ,  $D: 0 \leq x \leq 3, 0 \leq y \leq 4$ .
- $z = f(x, y) = 3xy^2$ ,  $D: x^2 + y^2 \leq 9$ .

In Problems 21–24, use Lagrange multipliers to find the maximum and minimum values of  $f$  subject to the constraints  $g(x, y) = 0$ .

- $z = f(x, y) = 5x^2 + 3y^2 + xy$ ,  $g(x, y) = 2x - y - 20 = 0$
  - $z = f(x, y) = x\sqrt{y}$ ,  $g(x, y) = 2x + y - 3000 = 0$
  - $z = f(x, y) = x^2 + y^2$ ,  $g(x, y) = 2x + y - 4 = 0$
  - $z = f(x, y) = xy^2$ ,  $g(x, y) = x^2 + y^2 - 1 = 0$
- 25. Heat Transfer** A metal plate is placed on the  $xy$ -plane in such a way that the temperature  $T$  at any point  $(x, y)$  is given by  $T = e^y(\sin x + \sin y)^\circ\text{C}$ .
- What is the rate of change in temperature at  $(0, 0)$  in the direction of  $4\mathbf{i} + 3\mathbf{j}$ ?
  - At  $(0, 0)$ , in what direction is the temperature increasing most rapidly?
  - In what direction is the temperature decreasing most rapidly?
  - In what direction does the temperature remain the same?
- 26. Maximizing Profit** A company produces two products at a total cost  $C(x, y) = x^2 + 200x + y^2 + 100y - xy$ , where  $x$  and  $y$  represent the units of each product sold. The revenue function is  $R(x, y) = 2000x - 2x^2 + 100y - y^2 + xy$ .
- Find the number of units of each product that will maximize profit.
  - What is the maximum profit?

- 27. Maximizing Profit** A manufacturer introduces a new product with a Cobb–Douglas production function of  $P(x, y) = 10K^{0.3}L^{0.7}$ , where  $K$  represents the units of capital and  $L$  the units of labor needed to produce  $P$  units of the product. A total of \$51,000 has been budgeted for production. Each unit of labor costs the manufacturer \$100 and each unit of capital costs \$50.
- How should the \$51,000 be allocated between labor and capital to maximize production?
  - What is the maximum number of units that can be produced?
- 28. Volume** Find the volume of the largest rectangular solid that can be inscribed in the interior of the surface
- $$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$
- if the sides of the solid are parallel to the axes.
- 29.** Use Lagrange multipliers to find the points on the surface  $xyz = 1$  closest to the origin.
- 30. Volume** Use Lagrange multipliers to maximize the volume of a rectangular solid that has three faces on the coordinate planes and one vertex on the plane  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ ,  $a > 0$ ,  $b > 0$ ,  $c > 0$ .
- 31. Minimizing Cost** The base of a rectangular box costs five times as much as do the other five sides. Use Lagrange multipliers to find the proportions of the dimensions for the cheapest possible box of volume  $V$ .
- 32.** Find the extreme values of  $f(x, y, z) = xyz$  subject to the constraints  $x^2 + y^2 = 1$  and  $y = 3z$ .

## CHAPTER 13 PROJECT

## Measuring Ice Thickness on Crystal Lake

In this project we examine safety issues involving frozen fresh-water lakes. When a lake freezes over, the depth of the ice varies from place to place on the lake. If we can construct a model that gives the depth of ice at any position on a

lake, then we can determine whether a given position is safe. Based on studies of ice depth required to support various activities on a lake, Table 1 lists minimum safe ice depths for various loads and activities on clear lake ice.

TABLE 1

| Load/Activity                       | Minimum Safe Ice Depth (in inches) |
|-------------------------------------|------------------------------------|
| Cross-country skiing (one person)   | 3                                  |
| Ice fishing or skating (one person) | 4                                  |
| One snowmobile                      | 5                                  |
| Ice boating                         | 6                                  |
| Group activities                    | 7                                  |
| One car                             | 8                                  |
| Several snowmobiles                 | 9                                  |
| Light truck (2.5 tons)              | 10.5                               |
| Medium truck (3.5 tons)             | 12                                 |
| 10-ton load                         | 15                                 |
| 25-ton load                         | 20                                 |

**Source:** U.S. Army Corps of Engineers, Minnesota Department of Natural Resources, Pennsylvania Fish and Boat Commission, and The Old Farmer's Almanac

Our study focuses on Crystal Lake in Otter Tail, MN. Crystal Lake is roughly circular in shape, with a radius of 0.838 mi.

- Place the center of the lake at the origin  $(0, 0)$  of a rectangular coordinate system. Using rectangular coordinates  $(x, y)$  measured in miles, write an equation for the shoreline of Crystal Lake. What are the minimum and maximum values of  $x$  and  $y$ ?

Draw a graph of the lake with the direction north pointing up. A simple model for determining the depth  $d$  of ice is

$$d = d(x, y) = \alpha + \alpha \sin(3\pi xy)$$

where  $d$  is measured in inches,  $(x, y)$  are the coordinates of a point on the lake, as given in Problem 1, and  $\alpha$ , measured in inches, is a nonnegative constant related to various conditions such as temperature, lake depth, currents, and so on. Suppose on a certain day in December, the value of  $\alpha$  for Crystal Lake is  $\alpha = 9$  in.

- What is the domain of  $d = d(x, y)$ ? What is the range? What are the minimum and maximum values of  $d$ ?
- What is the depth of the ice at the center of the lake?
- Graph the level curves of  $d(x, y) = c$ , for  $c = 0, 3, 6, 12, 15$ , and 18.
- Using the model, determine whether a snowmobile can safely cross the lake along the path  $y = x$ .
  - Using the model, determine whether a car can safely cross the lake along the path  $y = -x$ .
- Find the rate of change of  $d$  at the point  $(0.4, -0.1)$  in the direction east (the direction of  $\mathbf{i}$ ).
  - Find the rate of change of  $d$  at the point  $(0.4, -0.1)$  in the direction north (the direction of  $\mathbf{j}$ ).
  - Interpret the results obtained in (a) and (b).
- Find the direction from the point  $(0.4, -0.1)$  for which the ice depth increases most rapidly.
  - Travel a short distance, say 1 ft, in the direction found in (a). At the new point, recalculate the direction for which the ice depth increases most rapidly.
  - Explain the results obtained in (a) and (b).
- Find the direction from the point  $(0.4, -0.1)$  that results in no change in ice depth  $d$ .
  - Travel a short distance, say 1 ft, in the direction found in (a), and at the new point, recalculate the direction that again results in no change in ice depth.
  - Explain the results obtained in (a) and (b).

Another model for the depth of ice on Crystal Lake is given by

$$h = h(x, y) = \alpha|x + y| + \beta|x - y|$$

where  $h$  is measured in inches and  $\alpha, \beta$ , measured in inches per mile are nonnegative constants, determined by local conditions. Suppose that on a certain day in January, the value of  $\alpha = \beta = 9$  in/mi for Crystal Lake.

9. Sketch the level curves of  $h(x, y) = c$ , for  $c = 0, 3, 6, 12$ , and 15.
10. (a) Using this model, find the direction from the point  $(0.4, -0.1)$  for which the ice depth increases most rapidly.  
(b) Travel a short distance, say 1 ft, in the direction found in (a). At the new point, recalculate the direction for which the ice depth increases most rapidly.  
(c) Explain the results obtained in (a) and (b).
11. (a) Using this model find the direction from the point  $(0.4, -0.1)$  that results in no change in ice depth  $h$ .  
(b) Travel a short distance, say 1 ft, in the direction found in (a), and at the new point, recalculate the direction for no increase in ice depth.

A year earlier, the values of  $\alpha$  and  $\beta$  were different. For that day in January,  $\alpha = 5$  and  $\beta = 12$ .

12. Sketch the level curves of  $h(x, y) = 5|x + y| + 10|x - y|$ , for  $c = 0, 3, 6, 12$ , and 15.
13. (a) Find the direction from the point  $(0.4, -0.1)$  for which the ice depth increases most rapidly.  
(b) Travel a short distance, say 1 ft, in the direction found in (a). At the new point, recalculate the direction for which the ice depth increases most rapidly.  
(c) Explain the results obtained in (a) and (b).
14. (a) Find the direction from the point  $(0.4, -0.1)$  that results in no change in ice depth.  
(b) Travel a short distance, say 1 ft, in the direction found in (a), and at the new point, recalculate the direction for no increase in ice depth.  
(c) Explain the results obtained in (a) and (b).
15. What conditions might have influenced the difference in  $\alpha$  and  $\beta$  from one year to the next?
16. Compare the results obtained from the two models. Which would you choose to model the ice depth of Crystal Lake? Write a brief report that supports your decision.

### The Mass of Stars

Some of the most massive objects in the universe are not solid, but are large balls of gas—stars. The nearest star, the Sun, has a mass of  $1.99 \times 10^{30}$  kg and is about 333,000 times more massive than the Earth.

Stars are often depicted on a Hertzsprung–Russell diagram, or HR diagram, which compares the luminosity (brightness) and color (temperature) of stars. As centuries pass, the composition of a star changes because of the nuclear reactions at the center that generate the energy we see as light. Over billions of years changes in composition alter its structure and the star evolves, tracing a unique path in the HR diagram determined primarily by its mass.

**CHAPTER 14 PROJECT** The Chapter Project on page 971 investigates models for determining the mass of a star.

In Chapter 5, we defined the definite integral of a function (of a single variable). When extended to functions of two or more variables, definite integrals are called *multiple integrals*. The integral of a function of two variables is called a *double integral* and the integral of a function of three variables is a *triple integral*. For consistency, we refer to the integral of a function of one variable as a *single integral*.

In Chapter 6, we used a single integral to find area, the volume of a solid, arc length, and work done by a variable force. Two of the many uses of multiple integrals are to find areas and volumes of regions more general than those considered in Chapter 6.

## 14.1 The Double Integral over a Rectangular Region

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find Riemann sums of  $z = f(x, y)$  over a closed rectangular region (p. 904)
- 2 Find the value of a double integral defined on a closed rectangular region (p. 906)
- 3 Find the volume under a surface and over a rectangular region (p. 908)

Historically, the investigation of the area problem led to the definite integral. Similarly, the search for methods to find the volume of an irregularly shaped solid led to the development of multiple integrals.

### 1 Find Riemann Sums of $z = f(x, y)$ over a Closed Rectangular Region

Since the development of multiple integrals parallels that of a single integral, we begin by reviewing the process that led to the definition of a single integral.

To define a single integral, we begin with a function  $y = f(x)$  defined on a closed interval  $[a, b]$ . Then we:

- Partition  $[a, b]$  into  $n$  subintervals of lengths  $\Delta x_1, \Delta x_2, \dots, \Delta x_i, \dots, \Delta x_n$ . (Recall that the lengths of the subintervals need not be equal and the length of the largest subinterval is the norm,  $\max \Delta x_i$ , of the partition.)
- Choose a number  $u_i$  in each subinterval.
- Evaluate  $f$  at  $u_i$ , multiply  $f(u_i)$  by  $\Delta x_i$ , and form the Riemann sums  $\sum_{i=1}^n f(u_i) \Delta x_i$ .

If  $\lim_{\max \Delta x_i \rightarrow 0} \sum_{i=1}^n [f(u_i) \Delta x_i]$  exists, it is called the definite integral of  $f$  from  $a$  to  $b$  and is denoted by

$$\int_a^b f(x) dx = \lim_{\max \Delta x_i \rightarrow 0} \sum_{i=1}^n f(u_i) \Delta x_i$$

For a function  $f$  of two variables, the double integral of  $f$  is defined similarly. We begin with a function  $z = f(x, y)$  of two variables defined over a closed rectangular region  $R$  defined by  $a \leq x \leq b$  and  $c \leq y \leq d$ . We partition the interval  $[a, b]$  into  $n$  subintervals of length  $\Delta x_i$ ,  $i = 1, 2, \dots, n$ , and partition the interval  $[c, d]$  into  $m$  subintervals of length  $\Delta y_j$ ,  $j = 1, 2, \dots, m$ .

This partitions the rectangular region  $R$  into  $N = nm$  subrectangles  $R_k$ , each of area  $\Delta A_k = \Delta x_i \Delta y_j$ , and forms a **rectangular partition**  $P$  of the region  $R$ . We define the **norm**  $\|P\|$  of the partition as the length of the longest diagonal of the subrectangles  $R_k$ ,  $k = 1, 2, 3, \dots, N$ . See Figure 1.

In each subrectangle  $R_k$ , we choose a point  $(u_k, v_k)$  and evaluate the function  $z = f(x, y)$  at  $(u_k, v_k)$ . Then we multiply  $f(u_k, v_k)$  by the area  $\Delta A_k = \Delta x_i \Delta y_j$  of  $R_k$ ,  $k = 1, 2, \dots, N$ , and form the sums

$$\sum_{k=1}^N f(u_k, v_k) \Delta A_k$$

These are the **Riemann sums** of  $f$  for the partition  $P$ .

**Figure 1** A rectangular partition of the region  $R$ .

Figure 2

Figure 3

Figure 4

**EXAMPLE 1** Finding Riemann Sums

Let  $f(x, y) = x^2y$  be a function defined over the square having its lower left corner at  $(1, 0)$  and its upper right corner at  $(5, 4)$ , as shown in Figure 2.

- Find a Riemann sum of  $f$  over this region by partitioning the square into four congruent subsquares. Choose the lower left corner of each subsquare as  $(u_k, v_k)$ ,  $k = 1, 2, 3, 4$ .
- Find a Riemann sum of  $f$  over the partition used in (a) but choose the upper right corner of each subsquare as  $(u_k, v_k)$ ,  $k = 1, 2, 3, 4$ .
- Find a Riemann sum of  $f$  over this region by partitioning the square into eight congruent rectangles with sides of length  $\Delta x_i = 2$ ,  $i = 1, 2$ , and  $\Delta y_j = 1$ ,  $j = 1, 2, 3, 4$ . Choose the lower right corner of each rectangle as  $(u_k, v_k)$ ,  $k = 1, 2, \dots, 8$ .

**Solution** (a) We begin by partitioning the square in Figure 2 into  $N = 4$  congruent subsquares, as shown in Figure 3. For each subsquare,  $\Delta A_k = (2)(2) = 4$ . The Riemann sum for which  $(u_k, v_k)$  is the lower left corner of each subsquare is

$$\begin{aligned} \sum_{k=1}^4 f(u_k, v_k) \Delta A_k &= f(1, 0)(4) + f(3, 0)(4) + f(1, 2)(4) + f(3, 2)(4) \\ &= [f(1, 0) + f(3, 0) + f(1, 2) + f(3, 2)](4) \\ &= (0 + 0 + 2 + 18)(4) = 80 \end{aligned} \quad f(x, y) = x^2y$$

(b) See Figure 3. The Riemann sum using the upper right corner of each subsquare for  $(u_k, v_k)$  is

$$\begin{aligned} \sum_{k=1}^4 f(u_k, v_k) \Delta A_k &= f(3, 2)(4) + f(5, 2)(4) + f(3, 4)(4) + f(5, 4)(4) \\ &= [f(3, 2) + f(5, 2) + f(3, 4) + f(5, 4)](4) \\ &= (18 + 50 + 36 + 100)(4) = 816 \end{aligned}$$

(c) Now we partition the square in Figure 2 into  $N = 8$  congruent rectangles with sides  $\Delta x_i = 2$ ,  $i = 1, 2$ , and  $\Delta y_j = 1$ ,  $j = 1, 2, 3, 4$ , as shown in Figure 4. The Riemann sum, for which  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 8$ , is the lower right corner of each rectangle and  $\Delta A_k = (2)(1) = 2$ , is

$$\begin{aligned} \sum_{k=1}^8 f(u_k, v_k) \Delta A_k &= f(3, 0)(2) + f(5, 0)(2) + f(3, 1)(2) + f(5, 1)(2) + f(3, 2)(2) \\ &\quad + f(5, 2)(2) + f(3, 3)(2) + f(5, 3)(2) \\ &= [f(3, 0) + f(5, 0) + f(3, 1) + f(5, 1) + f(3, 2) + f(5, 2) \\ &\quad + f(3, 3) + f(5, 3)](2) \\ &= (0 + 0 + 9 + 25 + 18 + 50 + 27 + 75)(2) = 408 \end{aligned}$$

**NOW WORK** Problem 5.

As Example 1 demonstrates, the Riemann sums of a function  $z = f(x, y)$  over a region  $R$  depend on both the choice of the partition, which depends on  $\Delta x_i$ ,  $i = 1, 2, \dots, n$ , and  $\Delta y_j$ ,  $j = 1, 2, \dots, m$ , and the choice of the points  $(u_k, v_k)$ ,  $k = 1, 2, \dots, N$ , where  $N = nm$ . If  $\lim_{\|P\| \rightarrow 0} \sum_{k=1}^N f(u_k, v_k) \Delta A_k = I$  exists and does not depend on the choice of the partition or on the choice of  $(u_k, v_k)$ , then the number  $I$  is called the *double integral* of  $z = f(x, y)$  over the region  $R$  and is denoted by  $\iint_R f(x, y) dA$ .

**DEFINITION Double Integral**

Let  $f$  be a function of two variables defined on a closed rectangular region  $R$ . Then the **double integral of  $f$  over  $R$** , denoted by  $\iint_R f(x, y) dA$ , is defined by

$$\iint_R f(x, y) dA = \lim_{\|P\| \rightarrow 0} \sum_{k=1}^N f(u_k, v_k) \Delta A_k$$

provided this limit exists. In this case,  $f$  is said to be **integrable on  $R$** .

Since  $\Delta x_i \Delta y_j = \Delta y_j \Delta x_i = \Delta A_k$ , other symbols for the double integral of  $f$  over  $R$  are

$$\iint_R f(x, y) dx dy \quad \text{and} \quad \iint_R f(x, y) dy dx$$

In Chapter 5, an important theorem stated that if a function  $f$  is continuous on a closed interval  $[a, b]$ , then  $\int_a^b f(x) dx$  exists. A similar result holds for functions of two variables.

**THEOREM Existence of the Double Integral**

If a function  $z = f(x, y)$  is continuous on a closed, rectangular region  $R$ , then the double integral  $\iint_R f(x, y) dA$  exists.

A proof can be found in most advanced calculus books.

## 2 Find the Value of a Double Integral Defined on a Closed Rectangular Region

To find the value of a double integral of a function  $f$  of two variables whose domain is a closed rectangle without using Riemann sums, we need the concept of *partial integration*. **Partial integration** is the process of finding the single integral of a function  $f$  of two variables with respect to one variable, while treating the other variable as a constant. The symbol  $\int_a^b f(x, y) dx$  means treat  $y$  as a constant and integrate  $f$  with respect to the variable  $x$ . The result is a function of  $y$  alone. Similarly,  $\int_c^d f(x, y) dy$  means treat  $x$  as a constant and integrate  $f$  with respect to the variable  $y$ . This result is a function of  $x$  alone.

**IN WORDS** Partial Integration is the reverse of partial differentiation.

**EXAMPLE 2 Using Partial Integration**

Use partial integration to find:

$$(a) \int_1^2 x^3 y^2 dx \quad (b) \int_0^4 x^3 y^2 dy$$

**Solution** (a) For  $\int_1^2 x^3 y^2 dx$ , we treat  $y$  as a constant and integrate with respect to  $x$ :

$$\int_1^2 x^3 y^2 dx = y^2 \int_1^2 x^3 dx = y^2 \left[ \frac{x^4}{4} \right]_1^2 = y^2 \left( 4 - \frac{1}{4} \right) = \frac{15}{4} y^2$$

(b) For  $\int_0^4 x^3 y^2 dy$ , we treat  $x$  as a constant and integrate with respect to  $y$ :

$$\int_0^4 x^3 y^2 dy = x^3 \int_0^4 y^2 dy = x^3 \left[ \frac{y^3}{3} \right]_0^4 = \frac{64x^3}{3}$$

**NOW WORK Problem 11.**

**EXAMPLE 3** Using Partial Integration

Use partial integration to find:

$$(a) \int_0^4 \left[ \int_1^2 x^3 y^2 dx \right] dy \quad (b) \int_1^2 \left[ \int_0^4 x^3 y^2 dy \right] dx$$

**Solution** (a) We begin by using partial integration to find the integral within the bracket. Then we integrate the result with respect to  $y$ .

$$\int_0^4 \left[ \int_1^2 x^3 y^2 dx \right] dy = \int_0^4 \frac{15}{4} y^2 dy = \frac{15}{4} \left[ \frac{y^3}{3} \right]_0^4 = 80$$

↑ From Example 2(a)    ↑ Find the single integral.

$$(b) \int_1^2 \left[ \int_0^4 x^3 y^2 dy \right] dx = \int_1^2 \frac{64}{3} x^3 dx = \frac{64}{3} \left[ \frac{x^4}{4} \right]_1^2 = 80$$

↑ From Example 2(b)    ↑ Find the single integral.

**NOW WORK** Problem 29.

Integrals of the form

$$\int_a^b \left[ \int_c^d f(x, y) dy \right] dx \quad \text{and} \quad \int_c^d \left[ \int_a^b f(x, y) dx \right] dy$$

are called **iterated integrals**. In the iterated integral on the left, we integrate the function  $f$  partially with respect to  $y$  from  $c$  to  $d$ , obtaining a function of  $x$  that we then integrate with respect to  $x$  from  $a$  to  $b$ . In the iterated integral on the right, we integrate  $f$  partially with respect to  $x$  from  $a$  to  $b$ , obtaining a function of  $y$  that we then integrate with respect to  $y$  from  $c$  to  $d$ .

Notice in Example 3 that the iterated integrals  $\int_0^4 \left[ \int_1^2 x^3 y^2 dx \right] dy$  and  $\int_1^2 \left[ \int_0^4 x^3 y^2 dy \right] dx$  are equal. This is a consequence of *Fubini's Theorem*, which provides a practical way to find certain double integrals.

**ORIGINS** Guido Fubini (1879–1943) was an Italian mathematician born in Venice. His father was a mathematics teacher who encouraged Guido to study mathematics. A short man, Fubini made many contributions in diverse areas of math, earning him the nickname “the little giant.” In 1939 the anti-Semitic policies of Mussolini caused Fubini and his family to immigrate to the United States. He accepted a position at the Institute for Advanced Study in Princeton, NJ, and also taught at Princeton University for several years. He died in New York in 1943.

**THEOREM** Fubini's Theorem

If a function  $z = f(x, y)$  is continuous on a closed rectangular region  $R$  defined by  $a \leq x \leq b$  and  $c \leq y \leq d$ , then

$$\iint_R f(x, y) dA = \int_a^b \left[ \int_c^d f(x, y) dy \right] dx = \int_c^d \left[ \int_a^b f(x, y) dx \right] dy$$

Fubini's Theorem states that an iterated integral can be integrated in either order provided the function  $z = f(x, y)$  is continuous on the closed rectangular region  $R$ .

**EXAMPLE 4** Finding the Value of a Double Integral Using Fubini's Theorem

Find the value of  $\iint_R (2x + y) dA$  if  $R$  is the closed rectangular region defined by  $1 \leq x \leq 5$  and  $0 \leq y \leq 4$ .

**Solution** Using Fubini's Theorem, the double integral  $\iint_R (2x + y) dA$  equals either of the iterated integrals

$$\int_1^5 \left[ \int_0^4 (2x + y) dy \right] dx \quad \text{or} \quad \int_0^4 \left[ \int_1^5 (2x + y) dx \right] dy \quad (1)$$

Below we find the integral on the left.

$$\begin{aligned}\iint_R (2x + y) dA &= \int_1^5 \left[ \int_0^4 (2x + y) dy \right] dx = \int_1^5 \left[ 2xy + \frac{y^2}{2} \right]_0^4 dx \\ &\quad \text{Integrate partially with respect to } y \\ &= \int_1^5 (8x + 8) dx = [4x^2 + 8x]_1^5 = 140 - 12 = 128\end{aligned}$$

**NOW WORK** Example 4 using the integral on the right in (1).

**NOW WORK** Problem 41.

### 3 Find the Volume Under a Surface and over a Rectangular Region

The double integral  $\iint_R f(x, y) dA$  over a rectangular region  $R$  has a geometric interpretation. If the function  $z = f(x, y)$  is nonnegative over  $R$ , then  $f(u_k, v_k)$  represents the height of  $z$  at the point  $(u_k, v_k)$ , and the product  $f(u_k, v_k)\Delta A_k$  can be thought of as the volume of a small, rectangular cylinder of height  $f(u_k, v_k)$  with a base of area  $\Delta A_k$ , as shown in Figure 5. The sum of the volumes of these small cylinders,

$\sum_{k=1}^N f(u_k, v_k)\Delta A_k$ , is an approximation for the volume of the solid under the graph

of  $z = f(x, y)$ , and over  $R$  as illustrated in Figure 6. If  $f$  is continuous over  $R$ , then

$\lim_{\|P\| \rightarrow 0} \sum_{k=1}^N f(u_k, v_k)\Delta A_k$  exists, and  $\iint_R f(x, y) dA$  can be interpreted as the volume of the solid under the graph of  $z = f(x, y)$  and over the region  $R$ .

**DF** Figure 5

Figure 6

**NOTE** It can be proved that this formula for volume is consistent with the formulas for volume given in Chapter 6.

#### Volume Under a Surface

Let  $z = f(x, y)$  be a function of two variables that is continuous and nonnegative on a closed, rectangular region  $R$ . The volume  $V$  under the surface  $z = f(x, y)$  and over the region  $R$  is given by

$$V = \iint_R f(x, y) dA$$

**Figure 7**  $z = f(x, y) = 4 - x^2 - y^2$ ,  
 $-1 \leq x \leq 1$ ,  $0 \leq y \leq 1$

### EXAMPLE 5 Finding the Volume of a Solid

Find the volume  $V$  under the paraboloid  $z = f(x, y) = 4 - x^2 - y^2$  and over the rectangular region  $R$  defined by  $-1 \leq x \leq 1$  and  $0 \leq y \leq 1$ .

**Solution** We begin by graphing  $z = f(x, y)$  and the rectangular region  $R$ , as shown in Figure 7.

Since  $z = f(x, y)$  is continuous and  $z \geq 0$  over the rectangular region  $-1 \leq x \leq 1$ ,  $0 \leq y \leq 1$ , the volume  $V$  under the surface  $z = f(x, y)$  is given by

$$V = \iint_R f(x, y) \, dA = \iint_R (4 - x^2 - y^2) \, dA$$

Using Fubini's Theorem, we have

$$\begin{aligned} V &= \int_{-1}^1 \left[ \int_0^1 (4 - x^2 - y^2) \, dy \right] dx = \int_{-1}^1 \left[ 4y - x^2y - \frac{y^3}{3} \right]_0^1 dx \\ &= \int_{-1}^1 \left( 4 - x^2 - \frac{1}{3} \right) dx = \int_{-1}^1 \left( \frac{11}{3} - x^2 \right) dx = \left[ \frac{11}{3}x - \frac{x^3}{3} \right]_{-1}^1 \\ &= \left( \frac{11}{3} - \frac{1}{3} \right) - \left( -\frac{11}{3} + \frac{1}{3} \right) = \frac{20}{3} \text{ cubic units} \end{aligned}$$

**NOW WORK** Example 5 by finding  $\int_0^1 \left[ \int_{-1}^1 (4 - x^2 - y^2) \, dx \right] dy$ .

**NOW WORK** Problem 61.

## 14.1 Assess Your Understanding

### Concepts and Vocabulary

- True or False**  $\int_0^2 \left[ \int_0^1 xy^2 dy \right] dx = \left[ \int_0^2 x dx \right] \cdot \left[ \int_0^1 y^2 dy \right]$ .
- True or False** Fubini's Theorem states that if a function  $z = f(x, y)$  is continuous on a closed rectangular region  $R$  defined by  $a \leq x \leq b$  and  $c \leq y \leq d$ , then  $\int_c^d \left[ \int_a^b f(x, y) \, dx \right] dy = \int_a^b \left[ \int_c^d f(x, y) \, dy \right] dx$ .
- Multiple Choice** The result of integrating  $\int_1^4 x^2 \sqrt{y} \, dy$  is [(a) a number, (b) a function of  $y$ , (c) a function of  $x$  and  $y$ , (d) a function of  $x$ ].
- True or False** If a function  $z = f(x, y)$  is continuous on a closed, rectangular region  $R$ , then the double integral  $\iint_R f(x, y) \, dA$  exists.

### Skill Building

- Let  $f(x, y) = x(3 - y)$  be defined over the region  $R$  shown in the figure.
  - Find the Riemann sum of  $f$  over  $R$  by partitioning the region into nine congruent subsquares with sides  $\Delta x_i = 1$ ,  $i = 1, 2, 3$ , and  $\Delta y_j = 1$ ,  $j = 1, 2, 3$ .

Choose the lower right corner of each subsquare as  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 9$ .

- Find the Riemann sum of  $f$  over the partition used in (a) but choose the upper left corner of each subsquare as  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 9$ .
- Let  $f(x, y) = 3xy^2$  be defined over the rectangular region  $R$  defined by  $0 \leq x \leq 6$ ,  $0 \leq y \leq 4$ .
    - Find the Riemann sum of  $f$  over  $R$  by partitioning the region into six congruent subsquares, with sides  $\Delta x_i = 2$ ,  $i = 1, 2, 3$ , and  $\Delta y_j = 2$ ,  $j = 1, 2$ . Choose the lower left corner of each subsquare as  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 6$ .
    - Find the Riemann sum of  $f$  over the partition used in (a) but choose the lower right corner of each subsquare as  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 6$ .
  - Let  $f(x, y) = x^2 + y$  be defined over the rectangular region  $R$  defined by  $1 \leq x \leq 5$ ,  $2 \leq y \leq 4$ .
    - Find the Riemann sum of  $f$  over  $R$  by partitioning the region into four congruent subrectangles with sides  $\Delta x_i = 2$ ,  $i = 1, 2$ , and  $\Delta y_j = 1$ ,  $j = 1, 2$ . Choose the lower left corner of each subrectangle as  $(u_k, v_k)$ ,  $k = 1, 2, 3, 4$ .
    - Find the Riemann sum of  $f$  over the partition used in (a) but choose the upper right corner of each subrectangle as  $(u_k, v_k)$ ,  $k = 1, 2, 3, 4$ .

8. Let  $f(x, y) = x(1 - y)$  be defined over the rectangular region  $R$  defined by  $0 \leq x \leq 3$ ,  $0 \leq y \leq 4$ .
- (a) Find the Riemann sum of  $f$  over  $R$  by partitioning the region into six congruent subrectangles with sides  $\Delta x_i = 1$ ,  $i = 1, 2, 3$ , and  $\Delta y_j = 2$ ,  $j = 1, 2$ . Choose the lower left corner of each subrectangle as  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 6$ .
- (b) Find the Riemann sum of  $f$  over the partition used in (a) but choose the upper left corner of each subrectangle as  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 6$ .
9. Find the Riemann sum for Example 1 if  $R$  is divided into four congruent subsquares. Choose  $(u_k, v_k)$ ,  $k = 1, 2, 3, 4$ , as the center of the  $k$ th subsquare.
10. Find the Riemann sum for Example 1 if  $R$  is divided into eight congruent subrectangles with  $\Delta x_i = 1$ ,  $i = 1, 2, 3, 4$ , and  $\Delta y_j = 2$ ,  $j = 1, 2$ . Choose  $(u_k, v_k)$ ,  $k = 1, 2, 3, \dots, 8$ , as the center of the  $k$ th subrectangle.

In Problems 11–16, find the indicated partial integral.

11.  $\int_1^e \frac{x}{y} dy$       12.  $\int_0^2 \frac{x}{y} dx$       13.  $\int_0^{\pi/2} x \sin y dx$
14.  $\int_0^{\pi/2} x \sin y dy$       15.  $\int_0^1 e^x dx$       16.  $\int_0^1 e^x dy$

In Problems 17–36, find each iterated integral.

17.  $\int_0^1 \left[ \int_0^2 x^2 y dy \right] dx$       18.  $\int_0^2 \left[ \int_0^4 x^2 y dx \right] dy$
19.  $\int_0^3 \left[ \int_0^2 3xy dy \right] dx$       20.  $\int_0^2 \left[ \int_0^1 3xy dx \right] dy$
21.  $\int_{-1}^1 \left[ \int_0^1 3x^2 y^2 dx \right] dy$       22.  $\int_0^1 \left[ \int_0^2 3x^2 y^2 dy \right] dx$
23.  $\int_0^2 \left[ \int_{-1}^1 2xy^2 dx \right] dy$       24.  $\int_{-1}^1 \left[ \int_1^2 2xy^2 dy \right] dx$
25.  $\int_0^{\pi/4} \left[ \int_0^2 x \cos y dx \right] dy$       26.  $\int_0^2 \left[ \int_0^{\pi/3} x \cos y dy \right] dx$
27.  $\int_0^3 \left[ \int_0^{\pi/3} (4x - 3)^2 \sin y dy \right] dx$
28.  $\int_0^{\pi/3} \left[ \int_0^3 (4x - 3) \sin y dx \right] dy$
29.  $\int_0^1 \left[ \int_0^{\pi/2} e^x \cos y dy \right] dx$       30.  $\int_0^{\pi/4} \left[ \int_0^1 e^x \cos y dx \right] dy$
31.  $\int_0^2 \left[ \int_{-\pi/2}^{\pi/2} \frac{\sin y}{2x + 1} dy \right] dx$       32.  $\int_0^{\pi/2} \left[ \int_0^2 \frac{\sin y}{2x + 1} dx \right] dy$
33.  $\int_0^{\pi/2} \left[ \int_0^2 x e^x \sin y dx \right] dy$       34.  $\int_0^1 \left[ \int_0^{\pi/2} x e^x \sin y dy \right] dx$
35.  $\int_1^2 \left[ \int_0^{\pi/2} \frac{x \cos x}{y} dx \right] dy$       36.  $\int_0^{\pi/3} \left[ \int_1^2 \frac{x \cos x}{y} dy \right] dx$

In Problems 37–46, use Fubini's Theorem to find each double integral defined over the rectangular region  $R$ .

37.  $\iint_R (2x + y^2) dA$ ,  $0 \leq x \leq 2$ ,  $0 \leq y \leq 3$
38.  $\iint_R (x^2 - 3y) dA$ ,  $-1 \leq x \leq 2$ ,  $0 \leq y \leq 1$
39.  $\iint_R x(x^2 + 5) dA$ ,  $0 \leq x \leq 2$ ,  $-1 \leq y \leq 1$
40.  $\iint_R \sqrt{y}(3x^2 + x) dA$ ,  $0 \leq x \leq 2$ ,  $0 \leq y \leq 4$
41.  $\iint_R 2xe^y dA$ ,  $-3 \leq x \leq 2$ ,  $0 \leq y \leq 1$
42.  $\iint_R e^{2x+y} dA$ ,  $0 \leq x \leq 1$ ,  $-1 \leq y \leq 1$
43.  $\iint_R x \sec^2 y dA$ ,  $0 \leq x \leq 3$ ,  $0 \leq y \leq \frac{\pi}{4}$
44.  $\iint_R y^2 \sec x \tan x dA$ ,  $0 \leq x \leq \frac{\pi}{3}$ ,  $-1 \leq y \leq 3$
45.  $\iint_R \frac{x}{2y + 3} dA$ ,  $0 \leq x \leq 2$ ,  $0 \leq y \leq 1$
46.  $\iint_R \frac{y^2}{x - 3} dA$ ,  $4 \leq x \leq 5$ ,  $0 \leq y \leq 3$

### Applications and Extensions

In Problems 47–52, use Fubini's Theorem to find each double integral over the given rectangular region.

47.  $\iint_R x \sin(xy) dA$ ,  $0 \leq x \leq \frac{\pi}{2}$ ,  $0 \leq y \leq 1$
48.  $\iint_R y \cos(xy) dA$ ,  $0 \leq x \leq 1$ ,  $\frac{\pi}{2} \leq y \leq 2\pi$
49.  $\iint_R x^3 \cos(x^2 y) dA$ ,  $0 \leq x \leq \frac{\pi}{2}$ ,  $0 \leq y \leq 1$
50.  $\iint_R x^3 \sin(x^2 y) dA$ ,  $0 \leq x \leq \frac{\pi}{2}$ ,  $0 \leq y \leq 1$
51.  $\iint_R \frac{y^2}{(1 + xy^2)^3} dA$ ,  $0 \leq x \leq 2$ ,  $0 \leq y \leq 3$
52.  $\iint_R (x^3 + x)(x^2 y + y) dA$ ,  $0 \leq x \leq 1$ ,  $0 \leq y \leq 1$

In Problems 53 and 54:

(a) Use Fubini's Theorem to find each double integral over the given rectangular region.

**CAS** (b) Change the order of integration and use a CAS to find the double integral, showing that both orders of integration yield the same results.

$$53. \iint_R y^5 e^{xy^3} dA, \quad 0 \leq x \leq 1, 0 \leq y \leq 2$$

$$54. \iint_R x^5 y e^{x^3 y^2} dA, \quad 0 \leq x \leq 2, 0 \leq y \leq 1$$

In Problems 55–64, find the volume under the graph of  $z = f(x, y)$  and over the given rectangular region.

$$55. f(x, y) = x + 2y, \quad 0 \leq x \leq 1, 0 \leq y \leq 2$$

$$56. f(x, y) = 2x + 3y, \quad 0 \leq x \leq 2, 0 \leq y \leq 3$$

$$57. f(x, y) = x^2 + y^2, \quad 0 \leq x \leq 2, 0 \leq y \leq 1$$

$$58. f(x, y) = 4x^2 + 3y^2, \quad 0 \leq x \leq 3, -2 \leq y \leq 1$$

$$59. f(x, y) = \sin x, \quad 0 \leq x \leq \frac{\pi}{2}, 0 \leq y \leq 1$$

$$60. f(x, y) = \cos y, \quad 0 \leq x \leq 1, 0 \leq y \leq \frac{\pi}{2}$$

$$61. f(x, y) = \frac{x^2 + y^2}{xy}, \quad 1 \leq x \leq 2, 1 \leq y \leq 2$$

$$62. f(x, y) = \frac{y^2}{x^2}, \quad 1 \leq x \leq 2, 1 \leq y \leq 2$$

$$63. f(x, y) = e^{x+y}, \quad 0 \leq x \leq 2, 0 \leq y \leq 1$$

$$64. f(x, y) = e^{x-y}, \quad 0 \leq x \leq 2, 1 \leq y \leq 2$$

**65. Volume** Find the volume of the solid below the paraboloid  $z = x^2 + y^2$  and above the square in the  $xy$ -plane enclosed by the lines  $x = \pm 1$  and  $y = \pm 1$ .

**66.** Show that  $\iint_R dA = \int_c^d \left[ \int_a^b dx \right] dy = (b-a)(d-c)$ . That is, show that the volume of a solid with height 1,  $\iint_R dA$ , defined over a rectangular region  $a \leq x \leq b$ ,  $c \leq y \leq d$  is numerically equal to the area of the rectangle.

### Challenge Problems

**67. Average Value of a Function** Suppose that  $z = f(x, y)$  is integrable over a closed, rectangular region  $R$  in the  $xy$ -plane. Let  $P$  be a partition of  $R$  into  $N$  subrectangles of equal area  $\Delta A$ . Evaluate  $f$  at the center  $(u_k, v_k)$  of the  $k$ th subrectangle ( $k = 1, 2, \dots, N$ ), and let  $AVG$  be the average of these  $N$  values.

(a) Show that  $AVG = \frac{1}{A} \sum_{k=1}^N f(u_k, v_k) \Delta A$ , where  $A$  is the area of  $R$ .

(b) Explain why

$$\lim_{\|P\| \rightarrow 0} AVG = \frac{1}{A} \iint_R f(x, y) dA$$

(This is called the **average value of  $f$  over  $R$** .)

In Problems 68 and 69, find the average value of each function over the given rectangular region.

$$68. f(x, y) = y \cos x, \quad 0 \leq x \leq \pi, 1 \leq y \leq 5$$

$$69. f(x, y) = \frac{xy}{x^2 + 1}, \quad 0 \leq x \leq 1, 0 \leq y \leq 2$$

## 14.2 The Double Integral over Nonrectangular Regions

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Use Fubini's Theorem for an  $x$ -simple region (p. 914)
- 2 Use Fubini's Theorem for a  $y$ -simple region (p. 916)
- 3 Work with properties of double integrals (p. 917)
- 4 Use double integrals to find area and volume (p. 918)

In the previous section, we used Fubini's Theorem to find the double integral of a function  $f$  defined on a closed rectangular region. Although single integrals are always integrated over an interval, for double integrals the region of integration is not always rectangular. In this section, we see that Fubini's Theorem extends to double integrals defined over certain closed, bounded regions, which we classify as  $x$ -simple and  $y$ -simple regions.

Suppose  $z = f(x, y)$  is a function of two variables defined on a closed, bounded region  $R$ . See Figure 8(a) on page 912. Then  $R$  can be enclosed in a rectangle, as shown in Figure 8(b).

We partition the rectangle into subrectangles by drawing lines parallel to the coordinate axes, as shown in Figure 9(a). Then we discard all subrectangles that do not lie entirely in  $R$ , as shown in Figure 9(b).

**RECALL** A region  $R$  in the plane is closed if it contains all its boundary points. A region  $R$  is bounded if it can be enclosed by some circle, or equivalently, some rectangle in the plane.

Figure 8

Figure 9

After doing this, suppose  $R_k, k = 1, 2, \dots, N$ , subrectangles remain. Choose a point  $(u_k, v_k)$  in each of the remaining  $N$  subrectangles and evaluate  $f(u_k, v_k)$ . If  $\Delta A_k$  is the area of the  $k^{\text{th}}$  subrectangle,  $k = 1, 2, 3, \dots, N$ , we can form the Riemann sums  $\sum_{k=1}^N f(u_k, v_k) \Delta A_k$ . We define the norm  $\|P\|$  to be the longest diagonal of the subrectangles  $R_k, k = 1, 2, \dots, N$ . The **double integral** of the function  $z = f(x, y)$  defined on the closed, bounded region  $R$  is

$$\iint_R f(x, y) dA = \lim_{\|P\| \rightarrow 0} \sum_{k=1}^N f(u_k, v_k) \Delta A_k$$

provided the limit exists.

A condition under which  $\lim_{\|P\| \rightarrow 0} \sum_{k=1}^N f(u_k, v_k) \Delta A_k$  exists is given next. It extends the result given in Section 14.1 to regions that are not necessarily rectangular.

### THEOREM Existence of a Double Integral

If a function  $z = f(x, y)$  is continuous on a closed, bounded region  $R$ , then  $\iint_R f(x, y) dA$  exists.

When  $\iint_R f(x, y) dA$  exists, we say  $f$  is **integrable** on  $R$ .

If  $z = f(x, y) \geq 0$  on a closed, bounded region  $R$ , then the double integral  $\iint_R f(x, y) dA$  equals the volume of the solid under the surface  $z = f(x, y)$  and over the region  $R$ .

To see why, we partition  $R$ , as before, into subrectangles by drawing lines parallel to the coordinate axes and discarding all subrectangles that do not lie entirely in  $R$ . Suppose  $N$  subrectangles remain. Figure 10 shows a typical subrectangle  $R_k$  that results from partitioning  $R$ . We denote its area by  $\Delta A_k, k = 1, 2, 3, \dots, N$ .

Figure 10  $V_k = f(u_k, v_k)\Delta A_k$

Now suppose  $z = f(x, y)$  is a function of two variables that is continuous and nonnegative on the closed, bounded region  $R$ . Then  $z$  is a surface lying above the  $xy$ -plane. Pick a point  $(u_k, v_k)$  in  $R_k$ . The value  $f(u_k, v_k)$  is the height of a rectangular solid whose base has the area  $\Delta A_k$ . The volume  $V_k$  of this subrectangular solid is  $V_k = f(u_k, v_k)\Delta A_k$ . The sums  $\sum_{k=1}^N f(u_k, v_k)\Delta A_k$  over all the subrectangles of the partition approximate the volume  $V$  of the solid under the graph of the surface  $z = f(x, y)$  and above  $R$ . But the sums are also an approximation to the double integral  $\iint_R f(x, y) dA$ . As a result, the double integral  $\iint_R f(x, y) dA$  equals the volume of the solid under the surface  $z = f(x, y)$  and over the region  $R$ .

### Volume Under a Surface and over a Region $R$

Let  $z = f(x, y)$  be a function of two variables that is continuous and nonnegative on a closed, bounded region  $R$ . The volume  $V$  under the surface  $z = f(x, y)$  and over the region  $R$  is given by the double integral

$$V = \iint_R f(x, y) dA$$

Certain types of regions have properties that make it possible to find double integrals. One such type of region is called *x-simple*.

### DEFINITION *x*-Simple Region

Let  $R$  be a closed, bounded region.  $R$  is an ***x-simple region*** if the boundary of  $R$  consists of two smooth curves,  $y = g_1(x)$  and  $y = g_2(x)$ , each defined on a closed interval  $[a, b]$ , where  $g_1(x) \leq g_2(x)$  on  $[a, b]$ . The boundary may also consist of a portion of the vertical lines  $x = a$  and  $x = b$ .

**NEED TO REVIEW?** Smooth curves are discussed in Section 11.2, p. 768.

Figure 11 illustrates some typical *x-simple* regions. Notice in each case that the top and bottom boundaries of  $R$  can be expressed as functions of  $x$ , as the name *x-simple* implies.

Figure 11 Examples of *x-simple* regions.

Fubini's Theorem can be extended to regions that are *x-simple*.

### THEOREM Fubini's Theorem for an *x*-Simple Region

If a function  $z = f(x, y)$  of two variables is continuous on a closed, bounded region  $R$  that is *x-simple*, then the double integral of  $f$  on  $R$  is given by

$$\iint_R f(x, y) dA = \int_a^b \left[ \int_{g_1(x)}^{g_2(x)} f(x, y) dy \right] dx$$

where  $y = g_1(x)$  and  $y = g_2(x)$ ,  $g_1(x) \leq g_2(x)$ ,  $a \leq x \leq b$ , are two smooth curves that form the boundary of  $R$ .

**Figure 12**  $V = \int_a^b A(x) dx$   
 $A(x) = \int_{g_1(x)}^{g_2(x)} f(x, y) dy$

**NEED TO REVIEW?** Finding the volume of a solid using the slicing method is discussed in Section 6.4, pp. 433–437.

The proof of Fubini's Theorem can be found in advanced calculus books. Here, we give a geometric argument for Fubini's Theorem for  $x$ -simple regions when  $f(x, y) \geq 0$  is continuous on  $R$ .

Suppose we choose a number  $x_i$  in the closed interval  $[a, b]$  and let  $A(x_i)$  equal the area of the intersection of the plane  $x = x_i$  and the solid under the surface  $z = f(x, y)$  and over  $R$ . See Figure 12. Using the slicing method, the volume  $V$  of the solid under  $z = f(x, y)$  and over  $R$  from  $x = a$  to  $x = b$  is given by

$$V = \int_a^b A(x) dx$$

Since this volume  $V$  is also given by  $V = \iint_R f(x, y) dA$ , we have

$$V = \iint_R f(x, y) dA = \int_a^b A(x) dx \quad (1)$$

But  $A(x_i)$  is the area of the plane region under the surface  $z = f(x_i, y)$  from  $y = g_1(x_i)$  to  $y = g_2(x_i)$ . That is,

$$A(x) = \int_{g_1(x)}^{g_2(x)} f(x, y) dy$$

where  $x$  is held constant. By substituting  $\int_{g_1(x)}^{g_2(x)} f(x, y) dy$  for  $A(x)$  in the volume formula (1), we find

$$V = \iint_R f(x, y) dA = \int_a^b \underbrace{\left[ \int_{g_1(x)}^{g_2(x)} f(x, y) dy \right]}_{A(x)} dx$$

## 1 Use Fubini's Theorem for an $x$ -Simple Region

### EXAMPLE 1 Using Fubini's Theorem for an $x$ -Simple Region

Find  $\iint_R xy \, dA$  if  $R$  is the region enclosed by  $y = x^2$  and  $y = \sqrt{x}$ .

**Solution** We begin by graphing the region  $R$ . See Figure 13. Observe that  $R$  is a closed, bounded region. Also notice that the bottom and top boundaries of  $R$  are smooth curves expressed as functions of  $x$ :  $g_1(x) = x^2$ ,  $g_2(x) = \sqrt{x}$ ,  $0 \leq x \leq 1$ . That is,  $R$  is  $x$ -simple, so we can use Fubini's Theorem.

$$\begin{aligned} \iint_R xy \, dA &= \int_0^1 \left[ \int_{x^2}^{\sqrt{x}} xy \, dy \right] dx = \int_0^1 x \left[ \frac{y^2}{2} \right]_{x^2}^{\sqrt{x}} dx \\ &= \int_0^1 x \left( \frac{x - x^4}{2} \right) dx = \frac{1}{2} \int_0^1 (x^2 - x^5) dx \\ &= \frac{1}{2} \left[ \frac{x^3}{3} - \frac{x^6}{6} \right]_0^1 = \frac{1}{12} \end{aligned}$$

**Figure 13** The region  $R$  is  $x$ -simple.

### NOW WORK Problem 19.

Regions whose left and right boundaries consist of smooth curves expressed as functions of  $y$  are referred to as  $y$ -simple regions.

**DEFINITION** *y*-Simple Region

Let  $R$  be a closed, bounded region. Then  $R$  is a ***y*-simple region** if the boundary of  $R$  consists of two smooth curves,  $x = h_1(y)$  and  $x = h_2(y)$ , each defined on the closed interval  $c \leq y \leq d$ , where  $h_1(y) \leq h_2(y)$  on  $[c, d]$ . The boundary may also consist of a portion of the horizontal lines  $y = c$  and  $y = d$ .

Figure 14 illustrates some typical *y*-simple regions.

**Figure 14** Examples of *y*-simple regions.

Fubini's Theorem also applies to closed, bounded regions that are *y*-simple.

**THEOREM** Fubini's Theorem for a *y*-Simple Region

If a function  $f$  of two variables is continuous on a closed, bounded region  $R$  that is *y*-simple, the double integral of  $f$  on  $R$  is given by

$$\iint_R f(x, y) dA = \int_c^d \left[ \int_{h_1(y)}^{h_2(y)} f(x, y) dx \right] dy$$

where  $x = h_1(y)$  and  $x = h_2(y)$ ,  $h_1(y) \leq h_2(y)$ ,  $c \leq y \leq d$ , are two smooth curves that form the boundary of  $R$ .

**Figure 15**  $V = \int_c^d A(y) dy$ ,  
 $A(y) = \int_{h_1(y)}^{h_2(y)} f(x, y) dx$

Figure 15 provides justification for Fubini's Theorem for a *y*-simple region  $R$  when  $z = f(x, y) \geq 0$  is continuous on  $R$ . The volume  $V$  of the solid under  $z = f(x, y)$  from  $y = c$  to  $y = d$  is given by

$$V = \int_c^d A(y) dy$$

Since this volume  $V$  is also given by  $V = \iint_R f(x, y) dA$ , we have

$$V = \iint_R f(x, y) dA = \int_c^d A(y) dy \quad (2)$$

But  $A(y_i)$  is the area of the plane region under the surface  $z = f(x, y_i)$  from  $x = h_1(y_i)$  to  $x = h_2(y_i)$ . That is,

$$A(y) = \int_{h_1(y)}^{h_2(y)} f(x, y) dx$$

where  $y$  is held constant. By substituting  $\int_{h_1(y)}^{h_2(y)} f(x, y) dx$  for  $A(y)$  in the volume formula (2), we find

$$V = \iint_R f(x, y) dA = \int_c^d \underbrace{\left[ \int_{h_1(y)}^{h_2(y)} f(x, y) dx \right]}_{A(y)} dy$$

## 2 Use Fubini's Theorem for a y-Simple Region

### EXAMPLE 2 Using Fubini's Theorem for a y-Simple Region

Find  $\iint_R 3x^2y \, dA$  if  $R$  is the region bounded by the smooth curves  $x = \sqrt{y}$  and  $x = -y$ , and the line  $y = 1$ .

**Solution** We begin by graphing the region  $R$ . See Figure 16. Observe that  $R$  is a closed, bounded region that is  $y$ -simple, where  $h_1(y) = -y$  and  $h_2(y) = \sqrt{y}$ ,  $0 \leq y \leq 1$ . Using Fubini's Theorem for a  $y$ -simple region, we have

$$\begin{aligned}\iint_R 3x^2y \, dA &= \int_0^1 \left[ \int_{-y}^{\sqrt{y}} 3x^2y \, dx \right] dy = \int_0^1 [yx^3]_{-y}^{\sqrt{y}} dy \\ &= \int_0^1 y(y^{3/2} + y^3) dy = \int_0^1 (y^{5/2} + y^4) dy \\ &= \left[ \frac{y^{7/2}}{7/2} + \frac{y^5}{5} \right]_0^1 = \frac{2}{7} + \frac{1}{5} = \frac{17}{35}\end{aligned}$$

Figure 16 The region  $R$  is  $y$ -simple.

### NOW WORK Problem 15.

When the region  $R$  is both  $x$ -simple and  $y$ -simple, we can *choose* the order of integration. In some cases, integration in one order uses simpler techniques than the techniques needed to integrate in the opposite order.

### EXAMPLE 3 Finding a Double Integral over a Region That Is $x$ -Simple and $y$ -Simple

Find  $\iint_R e^{y^2} \, dA$ , where  $R$  is the region shown in Figure 17.

**Solution** The region  $R$  is both  $x$ -simple and  $y$ -simple.

If we treat  $R$  as  $x$ -simple, then the bottom boundary of  $R$  is  $y = 2x$  and the top boundary is  $y = 2$ ,  $0 \leq x \leq 1$ . Then by Fubini's Theorem,

$$\iint_R e^{y^2} \, dA = \int_0^1 \left[ \int_{2x}^2 e^{y^2} \, dy \right] dx$$

We cannot find  $\int_{2x}^2 e^{y^2} \, dy$  using the Fundamental Theorem of Calculus since this integral is not expressible in terms of elementary functions.

So, we consider the region  $R$  as  $y$ -simple. Then the left boundary of  $R$  is  $x = 0$  and the right boundary is  $x = \frac{y}{2}$ , where  $0 \leq y \leq 2$ . Then by Fubini's Theorem,

$$\begin{aligned}\iint_R e^{y^2} \, dA &= \int_0^2 \left[ \int_0^{y/2} e^{y^2} \, dx \right] dy = \int_0^2 e^{y^2} [x]_0^{y/2} dy = \int_0^2 \frac{y}{2} e^{y^2} dy \\ &= \frac{1}{2} \int_0^2 y e^{y^2} dy = \frac{1}{2} \left[ \frac{e^{y^2}}{2} \right]_0^2 = \frac{1}{4} (e^4 - 1)\end{aligned}$$

Figure 17 The region  $R$  is both  $x$ -simple and  $y$ -simple.

### NOW WORK Problems 25 and 37.

### 3 Work with Properties of Double Integrals

Double integrals have properties very similar to properties of single integrals.

**NEED TO REVIEW?** Properties of single integrals are discussed in Section 5.4, pp. 369–374.

#### THEOREM Properties of Double Integrals

Suppose  $f$  and  $g$  are functions of two variables that are continuous on a closed, bounded region  $R$ . Then both  $\iint_R f(x, y) dA$  and  $\iint_R g(x, y) dA$  exist.

- $\iint_R [f(x, y) \pm g(x, y)] dA = \iint_R f(x, y) dA \pm \iint_R g(x, y) dA.$
- $\iint_R cf(x, y) dA = c \iint_R f(x, y) dA$ , where  $c$  is a constant.
- If  $R$  consists of two subregions,  $R_1$  and  $R_2$ , that have no points in common except for points lying on portions of their common boundary, then

$$\iint_R f(x, y) dA = \iint_{R_1} f(x, y) dA + \iint_{R_2} f(x, y) dA$$

#### EXAMPLE 4 Using Properties of Double Integrals

If  $R$  is a closed, bounded region, then

- (a)  $\iint_R (x^2y + \sin x \cos y) dA = \iint_R x^2y dA + \iint_R \sin x \cos y dA$
- (b)  $\iint_R 8(x^2 + y^2) dA = 8 \iint_R (x^2 + y^2) dA$  ■

#### NOW WORK Problem 45.

The third property of double integrals is useful when the closed, bounded region  $R$  is neither  $x$ -simple nor  $y$ -simple. In such cases, it may be possible to partition  $R$  into subregions, each of which is  $x$ -simple or  $y$ -simple. Figure 18 illustrates how this can be done.

In Figure 18(a),  $R$  is neither  $x$ -simple nor  $y$ -simple. It is not  $x$ -simple because of the corner at the point  $P$ . It is not  $y$ -simple because of the corners at  $Q_1$  and  $Q_2$ . However, if we draw a vertical line through  $P$ , we partition  $R$  into two nonoverlapping subregions  $R_1$  and  $R_2$ , each of which is  $x$ -simple.

In Figure 18(b), the region  $R$  is neither  $x$ -simple nor  $y$ -simple. However, if we draw a vertical line that passes through the corner  $P$  of the left boundary, we partition  $R$  into three nonoverlapping subregions  $R_1$ ,  $R_2$ , and  $R_3$ , each of which is  $x$ -simple.

#### EXAMPLE 5 Using Properties of Double Integrals

Find  $\iint_R x^2y dA$ , where  $R$  is the region enclosed by the lines  $y = x$ ,  $y = x + 2$ ,  $y = -x + 2$ , and  $y = -x + 4$ .

**Solution** We begin by graphing the region  $R$  as shown in Figure 19(a) on page 918. We observe that  $R$  is a closed, bounded region, but it is neither  $x$ -simple nor  $y$ -simple. It is not  $x$ -simple due to the corners at  $(1, 3)$  and  $(1, 1)$ . It is not  $y$ -simple due to the corners at  $(0, 2)$  and  $(2, 2)$ . But we can partition  $R$  into two subregions  $R_1$  and  $R_2$ , both

Figure 18

Figure 19

of which are  $x$ -simple, by drawing a vertical line from  $(1, 3)$  to  $(1, 1)$ . See Figure 19(b). The subregion  $R_1$  is  $x$ -simple with  $g_1(x) = -x + 2$ ;  $g_2(x) = x + 2$ ,  $0 \leq x \leq 1$ . The subregion  $R_2$  is  $x$ -simple with  $h_1(x) = x$ ;  $h_2(x) = -x + 4$ ,  $1 \leq x \leq 2$ . Then

$$\begin{aligned} \iint_R x^2 y \, dA &= \iint_{R_1} x^2 y \, dA + \iint_{R_2} x^2 y \, dA \\ &= \int_0^1 \left[ \int_{-x+2}^{x+2} x^2 y \, dy \right] dx + \int_1^2 \left[ \int_x^{-x+4} x^2 y \, dy \right] dx \\ &= \int_0^1 x^2 \left[ \frac{y^2}{2} \right]_{-x+2}^{x+2} dx + \int_1^2 x^2 \left[ \frac{y^2}{2} \right]_x^{-x+4} dx \\ &= \frac{1}{2} \int_0^1 x^2 [(x+2)^2 - (-x+2)^2] dx + \frac{1}{2} \int_1^2 x^2 [(-x+4)^2 - x^2] dx \\ &= \frac{1}{2} \int_0^1 8x^3 dx + \frac{1}{2} \int_1^2 (-8x^3 + 16x^2) dx \\ &= 4 \left[ \frac{x^4}{4} \right]_0^1 - 4 \left[ \frac{x^4}{4} \right]_1^2 + 8 \left[ \frac{x^3}{3} \right]_1^2 = 1 - 15 + \frac{56}{3} = \frac{14}{3} \end{aligned}$$

In Example 5, we could have also partitioned  $R$  into two subregions, both of which are  $y$ -simple.

**NOW WORK** Example 5 using  $y$ -simple subregions.

#### 4 Use Double Integrals to Find Area and Volume

Double integrals can be used to find the area of a closed, bounded region  $R$ . To find area using a double integral, let  $f(x, y) = 1$  and use the theorem for finding the volume under a surface. The volume under the surface  $f(x, y) = 1$  and over the region  $R$  is numerically equal to the area of the region  $R$ . That is,

$$\text{Area of the region } R = \iint_R dA$$

#### EXAMPLE 6 Using a Double Integral to Find the Area of a Region

Use a double integral to find the area  $A$  of the region  $R$  in the first quadrant enclosed by the parabola  $y = 6x - x^2$  and the line  $y = 4x - 8$ .

**Solution** The graph of the region  $R$  is shown in Figure 20. Notice that  $R$  is neither  $x$ -simple nor  $y$ -simple. It is not  $x$ -simple because of the corner at  $(2, 0)$ ; it is not  $y$ -simple because of the corner at  $(4, 8)$ . If we partition  $R$  by drawing a vertical line through the point  $(2, 0)$ , we obtain two  $x$ -simple subregions  $R_1$  and  $R_2$ . Then the area  $A$  of the region  $R$  is

$$\begin{aligned} A &= \iint_R dA = \iint_{R_1} dA + \iint_{R_2} dA = \int_0^2 \left[ \int_0^{6x-x^2} dy \right] dx + \int_2^4 \left[ \int_{4x-8}^{6x-x^2} dy \right] dx \\ &= \int_0^2 (6x - x^2) dx + \int_2^4 (-x^2 + 2x + 8) dx \\ &= \left[ 3x^2 - \frac{x^3}{3} \right]_0^2 + \left[ -\frac{x^3}{3} + x^2 + 8x \right]_2^4 = \frac{56}{3} \text{ square units} \end{aligned}$$

Figure 20

**NOW WORK** Problems 29 and 49.

Figure 21

**EXAMPLE 7** Using a Double Integral to Find the Volume of a Solid

Find the volume  $V$  of the solid in the first octant enclosed by the plane  $x + y + z = 1$ .

**Solution** Figure 21(a) shows the solid in the first octant enclosed by the plane  $x + y + z = 1$ . The volume  $V$  of the solid lies under the plane  $z = f(x, y) = 1 - x - y$  and above the region  $R$  in the  $xy$ -plane bounded by the lines  $x = 0$ ,  $y = 0$ , and  $x + y = 1$ . See Figure 21(b). The region  $R$  is  $x$ -simple and  $y$ -simple. If we treat  $R$  as  $x$ -simple, then  $y$  varies from  $y = 0$  to  $y = 1 - x$ ,  $0 \leq x \leq 1$ . The volume  $V$  of the solid is

$$\begin{aligned} V &= \iint_R f(x, y) \, dA = \int_0^1 \left[ \int_0^{1-x} (1 - x - y) \, dy \right] dx = \int_0^1 \left[ (1 - x)y - \frac{y^2}{2} \right]_0^{1-x} dx \\ &= \int_0^1 \left[ (1 - x)^2 - \frac{(1 - x)^2}{2} \right] dx \\ &= \frac{1}{2} \int_0^1 (1 - x)^2 \, dx = \frac{1}{2} \left[ x - x^2 + \frac{x^3}{3} \right]_0^1 = \frac{1}{6} \text{ cubic unit} \quad \blacksquare \end{aligned}$$

**NOW WORK** Problem 51.

**EXAMPLE 8** Using a Double Integral to Find the Volume of a Solid

Find the volume  $V$  common to the two cylinders  $x^2 + y^2 = 1$  and  $x^2 + z^2 = 1$ .

**Solution** Each cylinder has radius 1; their axes are perpendicular to each other and lie on the  $z$ -axis and  $y$ -axis, respectively. Figure 22(a) shows the portion of the solid lying in the first octant. If we find the volume of this portion of the solid, then since the volume in each octant is the same, the volume  $V$  is eight times the volume in the first octant. That is, if  $z = f(x, y) = \sqrt{1 - x^2}$ , then

$$V = 8 \iint_R f(x, y) \, dA = 8 \iint_R (1 - x^2)^{1/2} \, dA$$

where  $R$  is the region in the first quadrant inside the circle  $x^2 + y^2 = 1$ . See Figure 22(b).

Consider the integrand. It is simpler to integrate with respect to  $y$  first. (Do you see why?) So, we treat  $R$  as an  $x$ -simple region. (If this approach fails, we would try treating  $R$  as a  $y$ -simple region.) If  $R$  is  $x$ -simple, then  $y$  varies from 0 to  $(1 - x^2)^{1/2}$ ,  $0 \leq x \leq 1$ . The volume  $V$  is

$$\begin{aligned} V &= 8 \int_0^1 \int_0^{\sqrt{1-x^2}} (1 - x^2)^{1/2} \, dy \, dx = 8 \int_0^1 \left[ \int_0^{\sqrt{1-x^2}} (1 - x^2)^{1/2} \, dy \right] dx \\ &= 8 \int_0^1 \left[ (1 - x^2)^{1/2} y \right]_0^{\sqrt{1-x^2}} dx \\ &= 8 \int_0^1 (1 - x^2) \, dx = 8 \left[ x - \frac{x^3}{3} \right]_0^1 = \frac{16}{3} \text{ cubic units} \quad \blacksquare \end{aligned}$$

**NOW WORK** Problem 55.

Figure 22

## 14.2 Assess Your Understanding

## Concepts and Vocabulary

1. A closed, bounded region  $R$  that has a boundary consisting of two smooth curves,  $y = g_1(x)$  and  $y = g_2(x)$ , defined on  $a \leq x \leq b$ , where  $g_1(x) \leq g_2(x)$  on  $[a, b]$  and possibly a portion of the vertical lines  $x = a$  and  $x = b$ , is called a(n) \_\_\_\_\_ region.
2. **True or False** The double integral of a function that is continuous on a closed, bounded,  $y$ -simple region  $R$  can be expressed as an iterated integral.
3. **True or False** The region  $R$  enclosed by the parabola  $y = x^2 + 1$  and the line  $y = 3x + 1$  is both  $x$ -simple and  $y$ -simple.
4. Explain why  $\int_0^1 \left[ \int_0^x f(x, y) dy \right] dx \neq \int_0^1 \left[ \int_0^y f(x, y) dx \right] dy$ .

## Skill Building

In Problems 5–8, express  $\iint_R xy^2 dA$  as an iterated integral in two ways:

- (a) one with the integration with respect to  $x$  first;
- (b) the other with the integration with respect to  $y$  first;
- (c) find each double integral over the region  $R$ .

5.

6.

7.

8.

In Problems 9–24, find each iterated integral. Identify and graph the region  $R$  associated with each integral.

9.  $\int_0^1 \left[ \int_{x^2}^{\sqrt{x}} dy \right] dx$

10.  $\int_0^1 \left[ \int_{y^2}^{\sqrt{y}} x dx \right] dy$

11.  $\int_{-1}^2 \left[ \int_{y^2}^{y+2} dx \right] dy$

12.  $\int_0^1 \left[ \int_x^{2x} y dy \right] dx$

13.  $\int_0^1 \left[ \int_x^{3x} xy dy \right] dx$

14.  $\int_0^1 \left[ \int_y^{\sqrt{y}} x^2 y dx \right] dy$

15.  $\int_0^1 \left[ \int_1^{e^y} \frac{y}{x} dx \right] dy$

16.  $\int_0^1 \left[ \int_0^{x^2} xe^y dy \right] dx$

17.  $\int_0^2 \left[ \int_y^{2y} xy dx \right] dy$

18.  $\int_2^4 \left[ \int_1^{y^2} \frac{y}{x^2} dx \right] dy$

19.  $\int_0^1 \left[ \int_{x^2}^x \sqrt{xy} dy \right] dx$

20.  $\int_0^1 \left[ \int_{x^2}^x \sqrt{x} dy \right] dx$

21.  $\int_0^1 \left[ \int_x^1 \frac{1}{x^2 + 1} dy \right] dx$

22.  $\int_0^1 \left[ \int_y^{\sqrt{y}} (x^2 + y^2) dx \right] dy$

23.  $\int_1^2 \left[ \int_0^{\ln x} xe^y dy \right] dx$

24.  $\int_2^3 \left[ \int_0^{1/y} \ln y dx \right] dy$

In Problems 25–28, find each double integral. Start by graphing the region  $R$ . Pay particular attention to the boundary, since it determines the correct limits of integration.

25.  $\iint_R (x + y) dA$ , where  $R$  is the region enclosed by  $y = x^2$  and  $y^2 = 8x$

26.  $\iint_R (x^2 - y^2) dA$ , where  $R$  is the region enclosed by  $y = x$  and  $y = x^2$

27.  $\iint_R y^2 dA$ , where  $R$  is the region enclosed by  $y = 2 - x$  and  $y = x^2$

28.  $\iint_R xy dA$ , where  $R$  is the region enclosed by  $y^2 = x + 1$  and  $y = 1 - x$

In Problems 29–36, use double integration to find the area of each region.

29. Enclosed by the graphs of  $y = x^3$  and  $y = x^2$

30. Enclosed by the graphs of  $y = 2\sqrt{x}$  and  $y = \frac{x^2}{4}$

31. Enclosed by the graphs of  $y = x^2 - 9$  and  $y = 9 - x^2$

32. Enclosed by the graphs of  $x^2 + y^2 = 16$  and  $y^2 = 6x$

33. Enclosed by the graph  $y = \frac{1}{\sqrt{x-1}}$ , the  $x$ -axis, and the lines  $x = 2$  and  $x = 5$

34. Enclosed by the graphs of  $y = x^{3/2}$  and  $y = x$

35. Enclosed by the line  $x + y = 3$  and the hyperbola  $xy = 2$

36. Enclosed by the hyperbola  $xy = \sqrt{3}$  and the circle  $x^2 + y^2 = 4$ , in the first quadrant only

In Problems 37–44, change the order of integration of each iterated integral to obtain an equivalent expression.

37.  $\int_0^1 \left[ \int_0^x f(x, y) dy \right] dx$

38.  $\int_0^2 \left[ \int_{y^2}^{2y} f(x, y) dx \right] dy$

39.  $\int_0^a \left[ \int_0^{\sqrt{a^2 - y^2}} f(x, y) dx \right] dy$

$$40. \int_0^{2\sqrt[3]{2}} \left[ \int_{x^2/4}^{\sqrt{x}} f(x, y) dy \right] dx$$

$$41. \int_0^{16} \left[ \int_{y/8}^{y^{1/4}} f(x, y) dx \right] dy$$

$$42. \int_2^5 \left[ \int_{x^2-6x+9}^{x-1} f(x, y) dy \right] dx$$

$$43. \int_1^2 \left[ \int_0^{\ln y} f(x, y) dx \right] dy \quad 44. \int_1^e \left[ \int_{\ln x}^1 f(x, y) dy \right] dx$$

In Problems 45–48, the functions  $f$  and  $g$  are continuous on a closed, bounded region  $R$ ,  $\iint_R f(x, y) dA = 8$  and  $\iint_R g(x, y) dA = -6$ . Use properties of double integrals to find each double integral.

$$45. \iint_R [f(x, y) - g(x, y)] dA \quad 46. \iint_R 4f(x, y) dA$$

$$47. \iint_R [3f(x, y) + 4g(x, y)] dA$$

$$48. \iint_R [2f(x, y) + 5g(x, y)] dA$$

### Applications and Extensions

**49. Area** Find the area of the region  $R$  in the first quadrant enclosed by the graphs of  $y = 6x - x^2$  and  $y = 4x - 8$  by partitioning  $R$  with a horizontal line through the point  $(4, 8)$ . Refer to Figure 20.

**50. Area** Use double integration to find the area in the first quadrant enclosed by the parabola  $x^2 = 9y$ , the  $y$ -axis, and the circle  $x^2 + y^2 = 10$ .

**Volume** In Problems 51–60, find the volume of each solid.

**51.** The tetrahedron enclosed by the plane  $x + 2y + z = 2$  and the coordinate planes

**52.** Enclosed by the elliptic paraboloid  $4x^2 + 9y^2 = 36$  and the planes  $z = 0$  and  $z = 1$

**53.** Below the paraboloid  $z = x^2 + y^2$  and above the triangular region  $R$  formed by the  $x$ - and  $y$ -axes and the line  $x + y = 1$ , as shown in the figure below.

**54.** Enclosed by the cylinder  $z = 9 - y^2$  and the planes  $x = 0$ ,  $x = 4$ , and  $z = 0$

**55.** Enclosed by the surface  $z = 4 - x^2 - y^2$  and  $z = 0$

**56.** Enclosed by the surfaces  $x^2 + y^2 = 1$ ,  $z = x$ , and  $z = x^2$

**57.** The solid bounded from above by the graph of  $z = x^2 + y^2$ , from below by the  $xy$ -plane, and on the sides by the cylinder  $x^2 + y^2 = 1$ , as shown in the figure.

**58.** Enclosed by a portion of the parabolic cylinder  $z = \frac{x^2}{2}$  and the four planes  $y = 0$ ,  $y = x$ ,  $x = 2$ , and  $z = 0$

**59.** Enclosed by the coordinate planes, the plane  $y = 3$ , and the surface  $z = y + 1 - x^2$

**60.** Enclosed by the surfaces  $z = xe^y$ ,  $z = 0$ ,  $y = 0$ ,  $x = 1$ , and  $y = x^2$

In Problems 61–68, (a) graph the region associated with each iterated integral, (b) reverse the order of integration, and (c) find the new iterated integral.

$$61. \int_0^{\sqrt{\pi/2}} \left[ \int_y^{\sqrt{\pi/2}} \sin x^2 dx \right] dy \quad 62. \int_0^{1/2} \left[ \int_{2x}^1 e^{y^2} dy \right] dx$$

$$63. \int_0^1 \left[ \int_0^{\sqrt{1-x^2}} \frac{1}{\sqrt{1-y^2}} dy \right] dx$$

$$64. \int_0^1 \left[ \int_y^1 \frac{\sin x}{x} dx \right] dy$$

$$65. \int_0^1 \left[ \int_y^1 \sqrt{2+x^2} dx \right] dy \quad 66. \int_0^1 \left[ \int_{\sqrt[3]{x}}^1 \sqrt{1+y^4} dy \right] dx$$

$$67. \int_0^1 \left[ \int_{\sqrt{y}}^1 e^{y/x} dx \right] dy \quad 68. \int_0^1 \left[ \int_{\sin^{-1} y}^{\pi/2} e^{\cos x} dx \right] dy$$

**69. Properties of Double Integrals** Let  $R$  be the region enclosed by  $y = 1$ ,  $y = -1$ ,  $x = 0$ , and  $x = 1$ ; let  $R_1$  and  $R_2$  be the subregions of  $R$  in the first and fourth quadrants, respectively. Suppose  $f$  is continuous on  $R$  and

$$\iint_R 3f(x, y) dA - 2 \iint_{R_1} f(x, y) dA = \iint_{R_2} f(x, y) dA,$$

$$\iint_{R_2} 5f(x, y) dA - 2 \iint_{R_1} f(x, y) dA = 18$$

Find  $\iint_R f(x, y) dA$ .

**70. Properties of Double Integrals** Let  $R$  be the region enclosed by  $y = 0$ ,  $y = 2$ ,  $x = -2$ , and  $x = 1$ ; let  $R_1$  and  $R_2$  be the subregions of  $R$  in the first and second quadrants, respectively. Suppose  $f$  is continuous on  $R$  and

$$\iint_{R_2} 3f(x, y) dA - \iint_{R_1} f(x, y) dA = 2 \iint_R f(x, y) dA,$$

$$\iint_{R_1} 4f(x, y) dA + \iint_{R_2} 2f(x, y) dA = 7$$

Find  $\iint_R f(x, y) dA$ .

- 71. Properties of Double Integrals** Let  $R$  be the region enclosed by  $y = x$ ,  $y = -1$ , and  $x = 2$ ; let  $R_1$  and  $R_2$  be the subregions of  $R$  above the  $x$ -axis and below the  $x$ -axis, respectively. Suppose  $f$  is continuous on  $R$  and

$$2 \iint_{R_2} f(x, y) dA - 7 \iint_{R_1} f(x, y) dA = 17$$

$$\iint_{R_2} f(x, y) dA - 2 \iint_{R_1} f(x, y) dA = 7$$

Find  $\iint_R f(x, y) dA$ .

- 72. Properties of Double Integrals** Let  $R$  be the region enclosed by  $y = x^2 + 1$ ,  $y = 0$ ,  $x = -1$ , and  $x = 2$ ; let  $R_1$  and  $R_2$  be the subregions of  $R$  in the first and second quadrants, respectively. Suppose  $f$  is continuous on  $R$  and

$$\iint_{R_2} 6f(x, y) dA - 3 \iint_{R_1} f(x, y) dA = -12$$

$$\iint_{R_2} 4f(x, y) dA + 2 = \iint_{R_1} f(x, y) dA$$

Find  $\iint_R f(x, y) dA$ .

In Problems 73–76, each of the iterated integrals represents the volume of a solid. Describe the solid.

**73.**  $\int_0^1 \left[ \int_0^1 \sqrt{1 - x^2 - y^2} dy \right] dx$

**74.**  $\int_0^2 \left[ \int_0^2 (4 - x^2 - y^2) dx \right] dy$

**75.**  $\int_0^4 \left[ \int_0^1 3 dy \right] dx$

**76.**  $\int_0^1 \left[ \int_0^2 2 dy \right] dx$

**77.** Find:

- (a)  $\iint_R x dA$ , where  $R$  is the region enclosed by the circle of radius 1 centered at the origin.
- (b)  $4 \iint_{R_1} x dA$ , where  $R_1$  is the region in the first quadrant enclosed by the circle of radius 1 centered at the origin (This shows that although the region over which we are integrating is symmetric about the  $x$ -axis and the  $y$ -axis, we must also consider properties of the integrand on this region before we use symmetry.)

**78. (a)** Find

$$\int_1^e \left[ \int_0^{\ln x} \frac{dy}{x} \right] dx.$$

- (b) Reverse the order of integration and find the resulting iterated integral.

**79. (a)** Find

$$\int_0^{\pi/2} \left[ \int_0^{\cos x} \sin x dy \right] dx.$$

- (b) Reverse the order of integration and find the resulting iterated integral.

- 80. Volume of a Liquid** A tank in the shape of a half-cylinder is lying on its flat side. The radius of the tank is 1 m and its length is 4 m. If the tank is filled with liquid to a depth of  $a$  meters, what is the volume of the liquid? (Hint: Position the half cylinder as shown in the figure below.)

- 81. Volume of a Liquid** Repeat Problem 80 if the tank is buried so its rounded base is 1 m under the ground and its flat side is at ground level. See the figure below.

- 82. Damming a Valley** A dam is built in a V-shaped valley. The top of the dam is 200 m wide and the lowest point in the V is 150 m below the top, as shown in the figure. The pressure  $P$  due to the water at a depth  $d$  meters below the surface is  $P = \rho g d$ , where  $\rho = 1000 \text{ kg/m}^3$  and  $g = 9.8 \text{ m/s}^2$ . What is the total outward force  $F$  from the water that this dam must be able to withstand? Express your answer in both newtons and pounds using the fact that  $1 \text{ N} \approx 0.2248 \text{ lb}$ .

(Recall that pressure is  $P = \frac{F}{A}$ , so the force  $F = PA$ .)

- 83.** Explain if the following equality is true or false without finding the exact value of the two integrals:

$$\int_{-3}^3 \int_{-\sqrt{9-y^2}}^{\sqrt{9-y^2}} (7-x) dx dy = 4 \int_0^3 \int_0^{\sqrt{9-y^2}} (7-x) dx dy$$

- 84. Volume** Find the volume of the tetrahedron enclosed by the coordinate planes and the plane  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$ . (Assume that  $a$ ,  $b$ , and  $c$  are positive.)

- 85.** Find  $\iint_R xy dA$ , where  $R$  is the region enclosed by  $y = 4 - x^2$  and  $y = x^2$  to the right of the  $y$ -axis.

- 86.** Find  $\iint_R xy dA$ , where  $R$  is the region enclosed by  $x = 4 - y^2$  and  $x = y^2$  above the  $x$ -axis.

- 87.** Find  $\iint_R e^{\sqrt{x}} dA$ , where  $R$  is the region enclosed by  $y = x$ ,  $x = 1$ ,  $y = 0$ .

88. (a) Graph the region  $R$  defined by  $0 \leq a \leq y \leq b$ ,  $0 \leq a \leq x \leq y$ .

(b) If  $y = f(x)$  is continuous on  $R$ , show that

$$\iint_R f(x) dA = \int_a^b (b-x)f(x) dx.$$

89. **Properties of Double Integrals** Using properties of double integrals, show that if the functions  $f$  and  $g$  are integrable

on  $R$  and  $f(x, y) \leq g(x, y)$  for all  $(x, y)$  in  $R$ , then

$$\iint_R f(x, y) dA \leq \iint_R g(x, y) dA.$$

### Challenge Problem

90. **Volume** Find the volume of the solid under the graph of the elliptic paraboloid  $z = 8 - 2x^2 - y^2$  and above the first quadrant of the  $xy$ -plane. (Hint: Use Wallis's formula from Section 7.1, Problem 69.)

## 14.3 Double Integrals Using Polar Coordinates

**OBJECTIVES** When you finish this section, you should be able to:

1 Find a double integral using polar coordinates (p. 924)

2 Find area and volume using polar coordinates (p. 925)

Suppose the function  $z = f(x, y)$  is continuous on a closed, bounded region  $R$ . Then the double integral,  $\iint_R f(x, y) dA$  exists, and  $dA = dx dy = dy dx$  is the differential of the area  $A$  of  $R$ . If the region  $R$  is enclosed by rays (lines through the origin) and parts of circles, it is often easier to find  $\iint_R f(x, y) dA$  by converting to polar coordinates.

We convert a function  $z = f(x, y)$  to polar coordinates  $(r, \theta)$  by using the equations  $x = r \cos \theta$ ,  $y = r \sin \theta$ . It remains to find the differential  $dA$  of area  $A$  in polar coordinates.

**NEED TO REVIEW?** Polar coordinates are discussed in Section 9.4, pp. 661–668.

Suppose the closed, bounded region  $R$  is enclosed by the rays  $\theta = \alpha$  and  $\theta = \beta$ , where  $0 \leq \alpha < \beta < 2\pi$ , and the smooth curves  $r = r_1(\theta)$  and  $r = r_2(\theta)$ , where  $0 \leq r_1 \leq r_2$ . See Figure 23.

We partition  $R$  using rays from  $\theta = \alpha$  to  $\theta = \beta$  and using concentric circles centered at the origin, as shown in Figure 24. The result is a collection of polar subregions. Let  $n$  denote the number of these polar subregions that lie entirely in  $R$ . They form a partition  $P$  of  $R$ .

Consider a typical polar subregion  $R_i$  as shown in Figure 25. The area  $\Delta A_i$  of this subregion is the difference of the areas of two circular sectors.

$$\Delta A_i = \frac{1}{2}r_i^2 \Delta\theta_i - \frac{1}{2}r_{i-1}^2 \Delta\theta_i = \frac{1}{2}(r_i^2 - r_{i-1}^2) \Delta\theta_i = \frac{1}{2}(r_i + r_{i-1})(r_i - r_{i-1}) \Delta\theta_i$$

Area  $A$  of a sector =  $\frac{1}{2}r^2\theta$

$$= \frac{1}{2}(r_i + r_{i-1}) \Delta r_i \Delta\theta_i \quad \Delta r_i = r_i - r_{i-1}$$

Figure 23

Figure 24

Figure 25  $\Delta A_i = \frac{1}{2}(r_i + r_{i+1}) \Delta r_i \Delta\theta_i$

Next we choose a point  $(\bar{r}_i, \bar{\theta}_i)$  in the polar subregion  $R_i$  so that  $\bar{r}_i = \frac{1}{2}(r_i + r_{i-1})$ . Then the area  $\Delta A_i$  of  $R_i$  is

$$\Delta A_i = \bar{r}_i \Delta r_i \Delta \theta_i$$

and the differential  $dA$  is

$$dA = r \, dr \, d\theta$$

It can be shown that if  $f$  is continuous on the region  $R$ , then

$$\iint_R f(x, y) dA = \iint_R f(r \cos \theta, r \sin \theta) r dr d\theta$$

## 1 Find a Double Integral Using Polar Coordinates

As with double integrals in rectangular coordinates, certain regions in polar coordinates will lead to iterated integrals.

### THEOREM Iterated Double Integral in Polar Coordinates

Let the function  $z = f(x, y)$  be continuous over a closed, bounded region  $R$ . Suppose  $R$  is enclosed by the rays  $\theta = \alpha$  and  $\theta = \beta$  and the curves  $r = r_1(\theta)$  and  $r = r_2(\theta)$ , where  $0 \leq r_1 \leq r_2$ . If  $r = r_1(\theta)$  and  $r = r_2(\theta)$  are continuous for  $\alpha \leq \theta \leq \beta$ , then

$$\iint_R f(x, y) \, dA = \iint_R f(r \cos \theta, r \sin \theta) \, dA = \int_{\alpha}^{\beta} \int_{r_1(\theta)}^{r_2(\theta)} f(r \cos \theta, r \sin \theta) r \, dr \, d\theta$$

Notice that we wrote the iterated double integral without using brackets to indicate the order of integration. In the iterated integral,  $dr$  appears before  $d\theta$ ; this indicates that we integrate with respect to  $r$  before we integrate with respect to  $\theta$ . In finding the inside integral  $\int_{r_1(\theta)}^{r_2(\theta)} f(r \cos \theta, r \sin \theta) r \, dr$ , we treat  $\theta$  as a constant and integrate partially with respect to  $r$ .

### EXAMPLE 1 Finding a Double Integral Using Polar Coordinates

Find  $\iint_R \cos \theta \, dA$ , where  $R$  is the region enclosed by the rays  $\theta = 0$  and  $\theta = \frac{\pi}{4}$  and the circle  $r = 4 \cos \theta$ .

**Solution** We begin with a graph of the region  $R$ . See Figure 26. Notice that  $\theta$  varies from 0 to  $\frac{\pi}{4}$  and  $r$  varies from  $r_1 = 0$  to the circle  $r_2 = 4 \cos \theta$ . Then

$$\begin{aligned}\iint_R \cos \theta \, dA &= \int_0^{\pi/4} \int_0^{4 \cos \theta} r \cos \theta \, dr \, d\theta = \int_0^{\pi/4} \left[ \frac{r^2}{2} \cos \theta \right]_0^{4 \cos \theta} d\theta = \int_0^{\pi/4} 8 \cos^3 \theta \, d\theta \\ &= 8 \int_0^{\pi/4} (1 - \sin^2 \theta) \cos \theta \, d\theta = 8 \int_0^{\sqrt{2}/2} (1 - u^2) \, du \\ &\quad \quad \quad \textcolor{blue}{u = \sin \theta; \, du = \cos \theta \, d\theta} \\ &= 8 \left[ u - \frac{u^3}{3} \right]_0^{\sqrt{2}/2} = 8 \left[ \frac{\sqrt{2}}{2} - \frac{\sqrt{2}}{12} \right] = \frac{10\sqrt{2}}{3}\end{aligned}$$

Figure 26

**NEED TO REVIEW?** Integrals containing trigonometric functions are discussed in Section 7.2, pp. 480–486.

**NOW WORK** Problems 9 and 15.

When the integrand of a double integral  $\iint_R f(x, y) dA$  is a function of  $x^2 + y^2$ , it is sometimes easier to integrate using polar coordinates than using rectangular coordinates.

### EXAMPLE 2 Finding an Iterated Integral Using Polar Coordinates

Find the iterated integral  $\int_0^2 \int_0^{\sqrt{4-x^2}} (x^2 + y^2) dy dx$ .

**NOTE** The order  $dy dx$  indicates the integration is done with respect to  $y$  first, then with respect to  $x$ .

**Figure 27**  $0 \leq y \leq \sqrt{4-x^2}$ ,  $0 \leq x \leq 2$   
 $0 \leq r \leq 2$ ,  $0 \leq \theta \leq \frac{\pi}{2}$

**Solution** The region  $R$  is enclosed by the graph of  $y = \sqrt{4-x^2}$  (a portion of a circle of radius 2),  $0 \leq x \leq 2$ , and the positive  $x$ - and  $y$ -axes. See Figure 27. In polar coordinates, this region  $R$  is given by  $0 \leq r \leq 2$  and  $0 \leq \theta \leq \frac{\pi}{2}$ . Then

$$\begin{aligned} \int_0^2 \int_0^{\sqrt{4-x^2}} (x^2 + y^2) dy dx &= \iint_R (x^2 + y^2) dA \\ &= \iint_R r^2 r dr d\theta \quad x^2 + y^2 = r^2; \quad dA = r dr d\theta \\ &= \int_0^{\pi/2} \int_0^2 r^3 dr d\theta = \int_0^{\pi/2} \left[ \frac{r^4}{4} \right]_0^2 d\theta \\ &= \int_0^{\pi/2} 4 d\theta = [4\theta]_0^{\pi/2} = 2\pi \end{aligned}$$

### NOW WORK Problems 25 and 29.

There are occasions when using polar coordinates converts an integral that is not expressible in terms of elementary functions to an integral that can be written in terms of elementary functions.

**NEED TO REVIEW?** Elementary functions are discussed in Section 7.6, p. 508.

### EXAMPLE 3 Finding a Double Integral Using Polar Coordinates

Find  $\iint_R e^{x^2+y^2} dA$ , where  $R$  is the region in the first quadrant inside the circle  $x^2 + y^2 = a^2$ .

**Solution** In rectangular coordinates,  $\iint_R e^{x^2+y^2} dA$  only can be approximated using numerical techniques. But the presence of  $x^2 + y^2$  in the integrand and the fact that the region  $R$  has part of a circle as its boundary suggest using polar coordinates. Figure 28 shows the region  $R$ . We use polar coordinates to obtain

**Figure 28**  $0 \leq r \leq a$ ,  $0 \leq \theta \leq \frac{\pi}{2}$

$$\begin{aligned} \iint_R e^{x^2+y^2} dA &= \iint_R e^{r^2} r dr d\theta = \int_0^{\pi/2} \int_0^a e^{r^2} r dr d\theta = \int_0^{\pi/2} \int_0^{a^2} \frac{1}{2} e^u du d\theta \\ &\quad \begin{array}{l} u = r^2, du = 2r dr \\ r = 0, \text{ then } u = 0; r = a, \text{ then } u = a^2 \end{array} \\ &= \frac{1}{2} \int_0^{\pi/2} [e^u]_0^{a^2} d\theta = \frac{1}{2} \int_0^{\pi/2} (e^{a^2} - 1) d\theta = \left( \frac{\pi}{4} \right) (e^{a^2} - 1) \end{aligned}$$

### NOW WORK Problem 35.

## 2 Find Area and Volume Using Polar Coordinates

Suppose  $z = f(x, y) \geq 0$ , where  $f$  is continuous over a closed, bounded region  $R$ . Then the double integral  $\iint_R f(x, y) dA = \iint_R f(r \cos \theta, r \sin \theta) r dr d\theta$  represents the volume  $V$  of the solid under the surface  $z = f(x, y)$  and above the region  $R$ .

Figure 29

**EXAMPLE 4** Finding the Volume of a Solid

Find the volume  $V$  of the solid under the circular paraboloid  $z = 12 - 3x^2 - 3y^2$  and above the  $xy$ -plane.

**Solution** We begin by graphing the paraboloid for  $z \geq 0$ , as shown in Figure 29.

The region  $R$  is determined by the intersection of the surface  $z$  and the  $xy$ -plane. So, we let  $z = 0$  and simplify the equation.

$$12 - 3x^2 - 3y^2 = 0$$

$$3x^2 + 3y^2 = 12$$

$$x^2 + y^2 = 4$$

So  $R$  is the region enclosed by the circle  $x^2 + y^2 = 4$ .

To convert the problem to polar coordinates, we let  $x = r \cos \theta$  and  $y = r \sin \theta$ . Then the paraboloid is  $z = 12 - 3x^2 - 3y^2 = 12 - 3(x^2 + y^2) = 12 - 3r^2$ , and the region  $R$  is enclosed by the circle  $r^2 = 4$ . So,  $R$  is given by  $0 \leq r \leq 2$  and  $0 \leq \theta \leq 2\pi$ .

Then

$$\begin{aligned} V &= \iint_R (12 - 3x^2 - 3y^2) \, dA = \int_0^{2\pi} \int_0^2 (12 - 3r^2) r \, dr \, d\theta = \int_0^{2\pi} \int_0^2 (12r - 3r^3) \, dr \, d\theta \\ &\quad \begin{array}{c} \uparrow \\ 3x^2 + 3y^2 = 3r^2 \\ dA = r \, dr \, d\theta \end{array} \\ &= \int_0^{2\pi} \left[ 6r^2 - 3\frac{r^4}{4} \right]_0^2 d\theta = \int_0^{2\pi} 12 \, d\theta = [12\theta]_0^{2\pi} = 24\pi \text{ cubic units} \end{aligned}$$

**NOW WORK** Problem 43.

**EXAMPLE 5** Finding the Volume of a Solid

Find the volume  $V$  of the solid under the surface  $z = x^2 + y^2$ , above the  $xy$ -plane, and inside the cylinder  $x^2 + y^2 = 2y$ .

**Solution** See Figure 30. The volume we seek lies above the region  $R$  in the  $xy$ -plane enclosed by the circle  $x^2 + y^2 = 2y$ , whose center is at  $(0, 1, 0)$  and whose radius is 1. To convert to polar coordinates, we let  $x = r \cos \theta$  and  $y = r \sin \theta$ . Then the region  $R$  is enclosed by

$$x^2 + y^2 = 2y$$

$$r^2 \cos^2 \theta + r^2 \sin^2 \theta = 2r \sin \theta$$

$$r^2 = 2r \sin \theta$$

$$r = 2 \sin \theta$$

The region  $R$  is bounded by  $0 \leq r \leq 2 \sin \theta$  and  $0 \leq \theta \leq \pi$ .

The volume  $V$  under  $z = x^2 + y^2 = r^2$ , above the  $xy$ -plane, and over  $R$  is

$$\begin{aligned} V &= \iint_R (x^2 + y^2) \, dA = \iint_R r^2 r \, dr \, d\theta = \int_0^\pi \int_0^{2 \sin \theta} r^3 \, dr \, d\theta = \int_0^\pi \left[ \frac{r^4}{4} \right]_0^{2 \sin \theta} d\theta \\ &= 4 \int_0^\pi \sin^4 \theta \, d\theta = 4 \int_0^\pi \left( \frac{1 - \cos(2\theta)}{2} \right)^2 d\theta \\ &= \int_0^\pi [1 - 2 \cos(2\theta) + \cos^2(2\theta)] \, d\theta = \int_0^\pi \left[ 1 - 2 \cos(2\theta) + \frac{1 + \cos(4\theta)}{2} \right] d\theta \\ &= \left[ \theta - \sin(2\theta) + \frac{1}{2}\theta + \frac{1}{2} \cdot \frac{\sin(4\theta)}{4} \right]_0^\pi = \frac{3\pi}{2} \text{ cubic units} \end{aligned}$$

**NOW WORK** Problem 45.

Figure 30

**NEED TO REVIEW?** Integrals containing trigonometric functions are discussed in Section 7.2, pp. 480–486.

The double integral  $\iint_R dA = \iint_R r \, dr \, d\theta$  represents the volume of a solid whose height is 1. As a result, the area  $A$  of the region  $R$  is numerically equal to

$$A = \iint_R r \, dr \, d\theta$$

### EXAMPLE 6 Finding the Area Enclosed by a Cardioid

Use double integration to find the area enclosed by the cardioid  $r = a(1 - \cos \theta)$ .

**Solution** The cardioid  $r = a(1 - \cos \theta)$  is shown in Figure 31. Using symmetry, the area enclosed by the cardioid is twice the area of the shaded region  $R$  in Figure 31. So,

$$A = 2 \iint_R r \, dr \, d\theta$$

where the region  $R$  is given by  $0 \leq r \leq a(1 - \cos \theta)$  and  $0 \leq \theta \leq \pi$ . Then

$$\begin{aligned} A &= 2 \int_0^\pi \int_0^{a(1-\cos \theta)} r \, dr \, d\theta = 2 \int_0^\pi \left[ \frac{r^2}{2} \right]_0^{a(1-\cos \theta)} d\theta \\ &= \int_0^\pi a^2 (1 - \cos \theta)^2 d\theta = a^2 \int_0^\pi (1 - 2\cos \theta + \cos^2 \theta) d\theta \\ &= a^2 \left[ \theta - 2\sin \theta + \left( \frac{\theta}{2} + \frac{\sin(2\theta)}{4} \right) \right]_0^\pi = \frac{3}{2} \pi a^2 \text{ square units} \end{aligned}$$

**Figure 31** The upper half of the cardioid is swept out by the rays going from  $\theta = 0$  to  $\theta = \pi$ .

### NOW WORK Problem 49.

## 14.3 Assess Your Understanding

### Concepts and Vocabulary

- Convert the function  $f(x, y) = \sqrt{4x^2 + 4y^2}$  to polar coordinates.
- In polar coordinates, the differential  $dA$  of area is  $dA =$  \_\_\_\_\_.
- True or False** Geometrically, if  $f(x, y) \geq 0$  and if  $f$  is continuous over a closed, bounded region  $R$ , then the double integral  $\iint_R f(r \cos \theta, r \sin \theta) \, dr \, d\theta$  represents the volume of the solid under the surface  $z = f(x, y)$  and above the region  $R$  in the  $xy$ -plane.
- True or False**  $\iint_R r \, dr \, d\theta$  equals the area  $A$  of the closed, bounded region  $R$ .

### Skill Building

In Problems 5–8, assume that  $z = f(x, y)$  is a continuous function over the region  $R$ . Express the double integral  $\iint_R f(x, y) \, dA$  over  $R$  as an iterated integral using polar coordinates.

In Problems 9–14, express each double integral over the region  $R$  as an iterated integral using polar coordinates; do not integrate.

- $\iint_R (x + y) \, dA$ ,  $R$  is enclosed by  $x^2 + y^2 = 9$ ,  $x \geq 0$ , and  $y \geq 0$ .
- $\iint_R (x^2 + y^2) \, dA$ ,  $R$  is enclosed by  $y = \sqrt{1 - x^2}$  and the lines  $y = x$  and  $y = -x$ .
- $\iint_R x \, dA$ ,  $R$  is enclosed by  $x = \sqrt{4 - y^2}$ , the positive  $x$ -axis, and the line  $y = x$ .
- $\iint_R y \, dA$ ,  $R$  is enclosed by  $y = \sqrt{16 - x^2}$ , in the first quadrant.
- $\iint_R (x + y^2) \, dA$ ,  $R$  is enclosed by  $x^2 + y^2 = 1$  and  $x^2 + y^2 = 4$ .
- $\iint_R \sqrt{x^2 + y^2} \, dA$ ,  $R$  is enclosed by  $x^2 + y^2 = \frac{1}{4}$  and  $x^2 + y^2 = 5$ .

In Problems 15–22, find each iterated integral.

15.  $\int_0^{\pi/4} \int_0^{4 \sin \theta} r \cos \theta \, dr \, d\theta$     16.  $\int_0^{5\pi/3} \int_0^{2 \cos \theta} r \sin \theta \, dr \, d\theta$
17.  $\int_0^{\pi/2} \int_0^{\pi/3} r \, d\theta \, dr$     18.  $\int_0^{\pi/3} \int_0^{\sin \theta} r \, dr \, d\theta$
19.  $\int_0^{\pi/4} \int_0^{\cos \theta} r \, dr \, d\theta$     20.  $\int_0^4 \int_{-\pi/4}^{\pi/4} r \cos \theta \, d\theta \, dr$
21.  $\int_0^2 \int_{-\pi/3}^{5\pi/3} r \sin \theta \, d\theta \, dr$     22.  $\int_0^{\pi} \int_0^{\pi/4} r \, d\theta \, dr$

In Problems 23–28, graph the region  $R$ , then find each double integral.

23.  $\int_R \int 3 \sin \theta \, dA, \quad 0 \leq r \leq 2, 0 \leq \theta \leq \frac{\pi}{2}$
24.  $\int_R \int 4 \cos \theta \, dA, \quad 0 \leq r \leq 3, 0 \leq \theta \leq \frac{\pi}{2}$
25.  $\int_R \int 2r \sin \theta \, dA, \quad 0 \leq r \leq 1, 0 \leq \theta \leq \frac{\pi}{2}$
26.  $\int_R \int 3r \cos \theta \, dA, \quad 0 \leq r \leq 2, 0 \leq \theta \leq \frac{\pi}{4}$
27.  $\int_R \int 3r^2 \sin \theta \, dA, \quad 0 \leq r \leq 2, -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$
28.  $\int_R \int 2r^2 \cos \theta \, dA, \quad 0 \leq r \leq 4, -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$

In Problems 29–42, find each double integral by changing to polar coordinates.

29.  $\int_0^1 \int_0^{\sqrt{1-x^2}} dy \, dx$     30.  $\int_0^3 \int_0^y \sqrt{x^2 + y^2} \, dx \, dy$
31.  $\int_{-2}^2 \int_0^{\sqrt{4-y^2}} (x^2 + y^2) \, dx \, dy$
32.  $\int_0^2 \int_0^{\sqrt{4-x^2}} \sqrt{4-x^2-y^2} \, dy \, dx$
33.  $\int_0^1 \int_0^{\sqrt{1-x^2}} \cos(x^2 + y^2) \, dy \, dx$
34.  $\int_0^1 \int_0^{\sqrt{1-y^2}} e^{\sqrt{x^2+y^2}} \, dx \, dy$
35.  $\iint_R e^{-(x^2+y^2)} \, dA$ ,  $R$  is the region in the first quadrant enclosed by the circles  $x^2 + y^2 = 1$  and  $x^2 + y^2 = 4$ .
36.  $\iint_R \frac{y}{\sqrt{x^2 + y^2}} \, dA$ ,  $R$  is the region in the first quadrant inside the circle  $x^2 + y^2 = a^2$ .
37.  $\iint_R x \, dA$ ,  $R$  is the region enclosed by the circle  $x^2 + y^2 = x$ .

38.  $\iint_R y^2 \, dA$ ,  $R$  is the region enclosed by the circle  $x^2 + y^2 = 2y$ .
39.  $\iint_R \sqrt{x^2 + y^2} \, dA$ ,  $R$  is the region enclosed by  $r = 3 + \cos \theta$ .
40.  $\iint_R (x^2 + y^2) \, dA$ ,  $R$  is the region enclosed by  $r = 2(1 + \sin \theta)$ .
41.  $\int_{-2}^2 \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} (x^2 + y^2)^2 \, dx \, dy$
42.  $\int_0^2 \int_{\sqrt{2x-x^2}}^{\sqrt{4x-x^2}} dy \, dx + \int_2^4 \int_0^{\sqrt{4x-x^2}} dy \, dx$

## Applications and Extensions

In Problems 43–52, use double integrals in polar coordinates.

43. **Volume** Find the volume of the solid enclosed by the ellipsoid  $x^2 + y^2 + 4z^2 = 4$ .
44. **Volume** Find the volume of the solid enclosed by the paraboloid  $x^2 + y^2 = az$ , the  $xy$ -plane, and the cylinder  $x^2 + y^2 = a^2$ .
45. **Volume** Find the volume of the portion of the **ball** (a solid sphere) of radius 4 and center at the origin that lies above the region enclosed by the circle  $r = 4 \sin \theta$ , as shown in the figure below.

46. **Volume** Find the volume of the solid cut from the ellipsoid  $x^2 + y^2 + 4z^2 = 4$  by the cylinder  $x^2 + y^2 = 1$ .
47. **Area** Find the area enclosed by one loop of  $r^2 = 9 \sin(2\theta)$ .
48. **Area** Find the area of the region that lies inside the circle  $r = 4 \cos \theta$  but outside the circle  $r = \cos \theta$ .
49. **Area** Find the area of the region in the first quadrant that lies inside the limaçon  $r = 3 + 2 \sin \theta$  but outside the circle  $r = 4 \sin \theta$ . See the figure.
50. **Area** Find the area of the region that lies inside the circle  $r = 1$  but outside the cardioid  $r = 1 + \cos \theta$ .
51. **Area** Find the area of the region that lies inside the cardioid  $r = 1 + \cos \theta$  but outside the circle  $r = \frac{1}{2}$ .

- 52. Area** Find the area of the region that lies inside the limaçon  $r = 3 - \cos \theta$  but outside the circle  $r = 5 \cos \theta$ .

In Problems 53 and 54, replace each iterated integral in polar coordinates with an iterated integral in rectangular coordinates. Do not find the integrals.

**53.**  $\int_0^{1/\sqrt{2}} \int_0^{\sin^{-1} r} r \, d\theta \, dr$

**54.**  $\int_0^1 \int_{\cos^{-1} r}^{\pi/2} r^2 \sin \theta \, d\theta \, dr$

- 55.** A tank in the shape of a hemisphere of radius 1 m is lying on its flat side. If the tank is filled with liquid to a depth of  $a$  meters, what is the volume of the liquid? (Hint: Position the hemisphere as shown in the figure.)

- 56.** Repeat Problem 55 if the tank is configured as in the figure, with its flat side at ground level and its rounded base under the ground.

**57. Area**

- (a) Use technology to graph  $r = \theta$ ,  $0 \leq \theta \leq 2\pi$ .  
 (b) Find the area of the region enclosed by the graph of  $r = \theta$  and the positive  $x$ -axis.

- 58. Volume** Find the volume of the solid cut from the sphere  $x^2 + y^2 + z^2 = a^2$  by the cylinder  $x^2 + y^2 = ay$ ,  $a > 0$ .

- 59. Area** Find the area enclosed by one leaf of the rose  $r = \sin(3\theta)$ .

**Challenge Problems**

- 60. (a)** Express  $f(x, y) = \frac{1}{x^2 \sqrt{x^2 + y^2}}$ ,  $1 \leq x \leq 2$ ,  $0 \leq y \leq 1$ , using polar coordinates.

**(b)** Find  $\int_1^2 \int_0^1 \frac{1}{x^2 \sqrt{x^2 + y^2}} \, dy \, dx$ .

- 61.** To find  $\int_{-\infty}^{\infty} e^{-x^2} \, dx$ , let  $I_a = \int_0^a e^{-x^2} \, dx$ .

- (a)** Show that:

$$I_a^2 = \int_0^a e^{-x^2} \, dx \int_0^a e^{-y^2} \, dy = \int_0^a \int_0^a e^{-(x^2+y^2)} \, dx \, dy$$

- (b)** Let  $J_a = \iint_R e^{-(x^2+y^2)} \, dA$ , where  $R$  is the quarter circle

$$0 \leq \theta \leq \frac{\pi}{2}, 0 \leq r \leq a. \text{ Show that}$$

$$|I_a^2 - J_a| < \frac{(4-\pi)a^2}{4} e^{-a^2}$$

- (c)** Find  $J_a$ .

- (d)** Show that

$$\lim_{a \rightarrow \infty} J_a = \frac{\pi}{4} \quad \text{and} \quad \lim_{a \rightarrow \infty} |I_a^2 - J_a| = 0$$

- (e)** Show that  $\int_{-\infty}^{\infty} e^{-x^2} \, dx = \sqrt{\pi}$ . (This integral is of special importance in statistics.)

## 14.4 Center of Mass; Moment of Inertia

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the mass and the center of mass of a lamina (p. 929)
- 2 Find moments of inertia (p. 933)

**NEED TO REVIEW?** The center of mass of a homogeneous lamina is discussed in Section 6.8, pp. 460–464.

**RECALL** The mass density of a two-dimensional material is defined as the mass per unit area of the material. In SI units, mass density is measured in kilograms per meter squared; in U.S. customary units, it is measured in slugs per foot squared.

### 1 Find the Mass and the Center of Mass of a Lamina

In many applications, thin sheets of material, such as copper stripping, are treated as if they were two-dimensional. A **lamina** is a plane area that represents a thin, flat sheet of material. If the mass density of the material is constant, the lamina is called **homogeneous**. The mass  $M$  of a homogeneous lamina is  $\rho A$ , where  $A$  is the area of the lamina and  $\rho$  is its constant mass density.

However, materials usually are not homogeneous and so the mass density is variable. Suppose a lamina is represented by a closed, bounded region  $R$  of the  $xy$ -plane and its mass density  $\rho = \rho(x, y)$  varies continuously over  $R$ . To find the mass  $M$  of this lamina, we use double integration.

We begin by partitioning the region  $R$  into  $n$  rectangles, as in Figure 32 on page 930. Then, in each rectangle  $R_i$  of area  $\Delta A_i$ , we choose a point  $(u_i, v_i)$ . An approximation to the mass  $M_i$  of the  $i$ th rectangle is

$$M_i = [\text{Mass density}] \times [\text{Area}] = \rho(u_i, v_i) \Delta A_i$$

Figure 32 Mass  $M_i = \rho(u_i, v_i)\Delta A_i$ .

**NOTE** Observe that if the mass density  $\rho$  is constant, then the formula for the mass of the lamina reduces to  $M = \iint_R \rho \, dA = \rho \iint_R dA = \rho A$  where  $A$  is the area of the region  $R$ .

**NEED TO REVIEW?** Moments of mass were discussed in Section 6.8, p. 459.

**NOTE** Sometimes  $M_a$  is referred to as the first moment of the particle about the axis  $a$ .

By adding up the masses of all the rectangles, the mass  $M$  of the lamina can be approximated by

$$M \approx \sum_{i=1}^n \rho(u_i, v_i) \Delta A_i$$

If the norm  $\|P\|$ , defined to be the length of the diagonal of the largest rectangle of the partition, is allowed to approach 0, then the mass  $M$  of the lamina is given by a double integral:

$$M = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n \rho(u_i, v_i) \Delta A_i = \iint_R \rho(x, y) \, dA$$

If a particle of mass  $m$  is located a distance  $d$  from a fixed axis  $a$ , the **moment of mass**  $M_a$  of the particle about the  $a$ -axis is defined as

$$M_a = md$$

The moment of mass  $M_a$  measures the tendency of the particle to rotate about the  $a$ -axis.

Look again at Figure 32. Suppose the region  $R$  represents a lamina of variable mass density  $\rho = \rho(x, y)$ . We partition  $R$  into  $n$  rectangles and consider the  $i$ th rectangle  $R_i$  whose area is  $\Delta A_i$ . We choose a point  $(u_i, v_i)$  in  $R_i$ . Then the moment of mass  $M_i$  about the  $x$ -axis of the  $i$ th rectangle is approximated by

$$M_i = [\text{Mass}] \times [\text{Distance from the } x\text{-axis}] = [\rho(u_i, v_i) \Delta A_i](v_i)$$

By summing all the moments  $m_i$  about the  $x$ -axis and taking the limit as the norm  $\|P\|$  approaches 0, we obtain the moment of mass  $M_x$  about the  $x$ -axis of the lamina.

$$M_x = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n v_i \rho(u_i, v_i) \Delta A_i = \iint_R y \rho(x, y) \, dA$$

Similarly, the moment of mass  $M_y$  about the  $y$ -axis of the lamina is given by

$$M_y = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n u_i \rho(u_i, v_i) \Delta A_i = \iint_R x \rho(x, y) \, dA$$

### THEOREM Mass of a Lamina

Suppose a lamina of variable mass density  $\rho = \rho(x, y)$  is represented by a closed, bounded region  $R$  of the  $xy$ -plane. If  $\rho$  is continuous on  $R$ , then the **mass of the lamina** is

$$M = \iint_R \rho(x, y) \, dA$$

The **moment of mass about the  $x$ -axis** is

$$M_x = \iint_R y \rho(x, y) \, dA$$

The **moment of mass about the  $y$ -axis** is

$$M_y = \iint_R x \rho(x, y) \, dA$$

The **center of mass of a lamina** is the point  $(\bar{x}, \bar{y})$  whose coordinates satisfy the equations

$$\bar{x} = \frac{M_y}{M} = \frac{\iint_R x\rho(x, y) dA}{\iint_R \rho(x, y) dA} \quad \bar{y} = \frac{M_x}{M} = \frac{\iint_R y\rho(x, y) dA}{\iint_R \rho(x, y) dA}$$

We distinguish between the *center of mass* (or *center of gravity*) of a lamina, which is defined by  $(\bar{x}, \bar{y}) = \left(\frac{M_y}{M}, \frac{M_x}{M}\right)$ , and the *centroid* of a lamina. The centroid is a purely geometric property of the lamina; it coincides with the center of mass in the case of a homogeneous lamina. To see the distinction, a square lamina always has its centroid at the (geometric) center, but the same square with variable density will almost always have its center of mass off-center.

For a physical interpretation, suppose a piece of string is attached to the lamina at the center of mass  $(\bar{x}, \bar{y})$ . Then the lamina, when suspended from the string, will hang in a horizontal position.

### EXAMPLE 1 Finding the Mass and the Center of Mass of a Lamina

Find the mass and center of mass of a lamina in the shape of an isosceles right triangle. The mass density function  $\rho = \rho(x, y)$  is directly proportional to the square of the distance from the vertex at the right angle.

**Solution** We position the lamina in the  $xy$ -plane so that the vertex at the right angle is at the origin and the two equal sides lie along the positive coordinate axes. See Figure 33. Suppose the equal sides of the triangle each measure  $a$ .

Since the distance of a point  $(x, y)$  from the origin is  $\sqrt{x^2 + y^2}$ , the mass density of the lamina is

$$\rho(x, y) = k(x^2 + y^2)$$

where  $k$  is the constant of proportionality. Since  $\rho = \rho(x, y)$  is continuous on  $R$ , the mass  $M$  of this lamina is given by a double integral.

$$\begin{aligned} M &= \iint_R \rho(x, y) dA = \iint_R k(x^2 + y^2) dA = k \int_0^a \int_0^{a-x} (x^2 + y^2) dy dx \\ &= k \int_0^a \left[ x^2 y + \frac{y^3}{3} \right]_0^{a-x} dx = k \int_0^a \left[ x^2 a - x^3 + \frac{(a-x)^3}{3} \right] dx \\ &= k \int_0^a \frac{1}{3} (a^3 - 3a^2 x + 6ax^2 - 4x^3) dx = \frac{k}{3} \left[ a^3 x - 3a^2 \frac{x^2}{2} + 2ax^3 - x^4 \right]_0^a \\ &= \frac{k}{3} \left( a^4 - \frac{3a^4}{2} + 2a^4 - a^4 \right) = \frac{ka^4}{6} \end{aligned}$$

Due to the symmetry of both the region  $R$  and the mass density, the center of mass  $(\bar{x}, \bar{y})$  lies on the line  $y = x$ . So, once we find  $\bar{x}$ , we also know  $\bar{y}$ . The moment of mass with respect to the  $y$ -axis,  $M_y$ , is

$$\begin{aligned} M_y &= \iint_R x\rho(x, y) dA = \iint_R xk(x^2 + y^2) dA = k \int_0^a \int_0^{a-x} (x^3 + xy^2) dy dx \\ &= \frac{k}{3} \int_0^a (a^3 x - 3a^2 x^2 + 6ax^3 - 4x^4) dx = \frac{ka^5}{15} \end{aligned}$$

**DF** Figure 33  $\rho(x, y) = k(x^2 + y^2)$

The center of mass  $(\bar{x}, \bar{y})$  is:

$$\bar{x} = \frac{M_y}{M} = \frac{\frac{ka^5}{15}}{\frac{ka^4}{6}} = \frac{2}{5}a = \bar{y}$$

The center of mass of the lamina is the point  $\left(\frac{2}{5}a, \frac{2}{5}a\right)$ . ■

**NOW WORK** Problem 11.

**EXAMPLE 2** Finding the Mass and the Center of Mass of a Lamina

Find the mass  $M$  and the center of mass  $(\bar{x}, \bar{y})$  of a lamina in the shape of a region  $R$  in the  $xy$ -plane that lies outside the circle  $x^2 + y^2 = a^2$  and inside the circle  $x^2 + y^2 = 2ax$ . The mass density  $\rho$  is inversely proportional to the distance from the origin.

**Solution** Figure 34 illustrates the region  $R$ . Since  $R$  involves two circles, we use polar coordinates. Then the two circles are given by  $r = a$  and by  $r = 2a \cos \theta$ . The circles intersect when  $a = 2a \cos \theta$  or  $\cos \theta = \frac{1}{2}$ , and the points of intersection are  $\left(a, \frac{\pi}{3}\right)$  and  $\left(a, -\frac{\pi}{3}\right)$ . The region  $R$  is given by  $a \leq r \leq 2a \cos \theta$ ,  $-\frac{\pi}{3} \leq \theta \leq \frac{\pi}{3}$ .

Since the distance of a point  $(x, y)$  from the origin is  $\sqrt{x^2 + y^2}$ , the mass density of the lamina at any point  $(x, y)$  in  $R$  is

$$\rho(x, y) = \frac{k}{\sqrt{x^2 + y^2}} = \frac{k}{r} \quad r^2 = x^2 + y^2$$

where  $k$  is the constant of proportionality. Since  $R$  does not contain the origin, the mass density  $\rho = \rho(x, y)$  is continuous on  $R$ . The mass  $M$  of the lamina is

$$\begin{aligned} M &= \iint_R \rho(x, y) \, dA = k \iint_R \frac{r \, dr \, d\theta}{r} = k \int_{-\pi/3}^{\pi/3} \int_a^{2a \cos \theta} dr \, d\theta \\ &= k \int_{-\pi/3}^{\pi/3} (2a \cos \theta - a) \, d\theta = k [2a \sin \theta - a\theta]_{-\pi/3}^{\pi/3} = k \left( 2a\sqrt{3} - a\frac{2\pi}{3} \right) \\ &= \frac{2ka}{3} (3\sqrt{3} - \pi) \end{aligned}$$

Both the mass density function and the region  $R$  are symmetric about the  $x$ -axis. So, the center of mass lies on the  $x$ -axis; that is,  $\bar{y} = 0$ . To find  $\bar{x}$ , we first find  $M_y$ .

$$\begin{aligned} M_y &= \iint_R x \rho(x, y) \, dA = \iint_R (r \cos \theta) \left( \frac{k}{r} \right) r \, dr \, d\theta = k \int_{-\pi/3}^{\pi/3} \int_a^{2a \cos \theta} r \cos \theta \, dr \, d\theta \\ &= \frac{k}{2} \int_{-\pi/3}^{\pi/3} (4a^2 \cos^2 \theta - a^2) \cos \theta \, d\theta = a^2 \frac{k}{2} \int_{-\pi/3}^{\pi/3} (3 - 4 \sin^2 \theta) \cos \theta \, d\theta \\ &= \frac{a^2 k}{2} \left[ 3 \sin \theta - \frac{4 \sin^3 \theta}{3} \right]_{-\pi/3}^{\pi/3} = ka^2 \sqrt{3} \end{aligned}$$

Then

$$\bar{x} = \frac{M_y}{M} = \frac{ka^2 \sqrt{3}}{\frac{2ka}{3} (3\sqrt{3} - \pi)} = \frac{3a\sqrt{3}}{2(3\sqrt{3} - \pi)} \approx 1.265a$$

The center of mass is approximately  $(1.265a, 0)$ . ■

**NOW WORK** Problem 17.

**Figure 34**  $a \leq r \leq 2a \cos \theta$ ,  $-\frac{\pi}{3} \leq \theta \leq \frac{\pi}{3}$

Figure 35

## 2 Find Moments of Inertia

In rectilinear motion, the mass  $m$  of an object can be thought of as a measure of the natural resistance of the object to being accelerated. In rotational motion, the *inertia*  $I$  of an object can be thought of as a measure of the resistance of the object to being rotated about an axis.

Suppose an object of mass  $m$  is located a distance  $d$  from a fixed axis  $a$ . Then its tendency to rotate about the  $a$ -axis, called the **moment of inertia**  $I_a$ , is defined as

$$I_a = md^2$$

See Figure 35.

Proceeding as we did for moments of mass, the moment of inertia  $I_x$  about the  $x$ -axis of a lamina of variable mass density  $\rho(x, y)$  represented by a closed, bounded region  $R$  of the  $xy$ -plane is given by

$$I_x = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n \underbrace{\rho(u_i, v_i) \Delta A_i}_{\text{Mass}} \underbrace{v_i^2}_{\text{Distance from } x\text{-axis squared}} = \iint_R y^2 \rho(x, y) dA$$

Similarly, the moment of inertia  $I_y$  about the  $y$ -axis is given by

$$I_y = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n \underbrace{\rho(u_i, v_i) \Delta A_i}_{\text{Mass}} \underbrace{u_i^2}_{\text{Distance from } y\text{-axis squared}} = \iint_R x^2 \rho(x, y) dA$$

and the moment of inertia  $I_O$  about the origin (the  $z$ -axis) is given by

$$I_O = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n \underbrace{\rho(u_i, v_i) \Delta A_i}_{\text{Mass}} \underbrace{(u_i^2 + v_i^2)}_{\text{Distance from the origin squared}} = \iint_R (x^2 + y^2) \rho(x, y) dA$$

The moment of inertia  $I_O$  about the origin is sometimes referred to as the **polar moment of inertia** or the **polar second moment**.

Using the sum property of double integrals, the sum of the moments of inertia about the  $x$ -axis and the  $y$ -axis equals the moment of inertia about the origin. That is,

$$I_x + I_y = I_O$$

The polar moment of inertia is often used to find the moments  $I_x$  and  $I_y$  when there is symmetry, that is, when  $I_x = I_y$ .

### EXAMPLE 3 Finding Moments of Inertia

- Find the polar moment of inertia  $I_O$  of a homogeneous lamina of mass density  $\rho$  in the shape of a region  $R$  in the  $xy$ -plane enclosed by the circle  $x^2 + y^2 = a^2$ ,  $a > 0$ .
- Use the polar moment to find the moments of inertia  $I_x$  and  $I_y$  of the lamina.

**Solution** (a) The region  $R$  is circular so we use polar coordinates  $(r, \theta)$ . Then  $0 \leq r \leq a$ ,  $0 \leq \theta \leq 2\pi$ , and  $dA = r dr d\theta$ . The polar moment of inertia is

$$\begin{aligned} I_O &= \iint_R (x^2 + y^2) \rho(x, y) dA = \iint_R \underbrace{r^2}_{x^2 + y^2 = r^2} \underbrace{\rho}_{\rho \text{ is constant}} r dr d\theta = \rho \int_0^{2\pi} \int_0^a r^3 dr d\theta \\ &= \rho \int_0^{2\pi} \frac{a^4}{4} d\theta = \frac{\pi a^4 \rho}{2} \end{aligned}$$

**NOTE** The moment of inertia  $I_a$  is often referred to as the **second moment** of the particle **about the axis**  $a$ . It is called the second moment because the distance is squared.

(b) By symmetry, the moment of inertia about the  $x$ -axis,  $I_x$ , equals the moment of inertia about the  $y$ -axis,  $I_y$ . Then

$$I_x = I_y = \frac{1}{2}I_O = \frac{1}{2}\left(\frac{\pi a^4 \rho}{2}\right) = \frac{\pi a^4 \rho}{4}$$

### NOW WORK Problem 25.

In dynamics, the moment of inertia of a lamina occurs in connection with the study of rotational motion. If a rigid object (a lamina) is rotated about an axis  $a$  with angular speed  $\omega$ , then its **rotational kinetic energy**  $K$  is given by

$$K = \frac{1}{2}I_a \omega^2$$

For example, suppose the homogeneous lamina in Example 3 has mass density  $\rho = 20 \text{ kg/m}^2$  and radius  $a = 1 \text{ m}$ . If it is rotated about the origin at the constant angular speed  $\omega = 2\pi \text{ rad/s}$ , then its kinetic energy  $K$  is

$$K = \frac{1}{2}I_O \omega^2 = \frac{1}{2}\left(\frac{\pi a^4 \rho}{2}\right)(2\pi)^2 = \frac{1}{2}(10\pi)(4\pi^2) = 20\pi^3 \frac{\text{kg}\cdot\text{m}^2}{\text{s}^2}$$

$a = 1; \rho = 20$

Observe the similarity between the formula for rotational kinetic energy  $K$  presented here and the formula for the kinetic energy  $K$  of an object of mass  $m$  moving in a straight line with speed  $v$ , namely,  $K = \frac{1}{2}mv^2$ .

## 14.4 Assess Your Understanding

### Concepts and Vocabulary

1. If a lamina represented by a closed, bounded region  $R$  has a continuous mass density function  $\rho = \rho(x, y)$ , then the double integral  $\iint_R \rho(x, y) dA$  gives the \_\_\_\_\_ of the lamina.
2. **True or False** If a lamina represented by a closed, bounded region  $R$  has a continuous mass density function  $\rho = \rho(x, y)$ , then  $\iint_R y \rho(x, y) dA$  is called the moment of mass about the  $y$ -axis.
3. If a lamina represented by a closed, bounded region  $R$  has a continuous mass density function  $\rho = \rho(x, y)$ , the moment of mass about the  $y$ -axis  $M_y$ , is given by the double integral \_\_\_\_\_.
4. **True or False** Center of mass and centroid are synonyms.
5. **True or False** The moment of mass  $M_a$  of a particle about the  $a$ -axis measures the tendency of the particle to rotate about the  $a$ -axis.
6. **True or False** The moment of inertia about the origin equals the difference between the moment of inertia about the  $x$ -axis and the moment of inertia about the  $y$ -axis.

### Skill Building

7. Find the mass  $M$  and center of mass  $(\bar{x}, \bar{y})$  of the triangular lamina shown in the figure. The mass density function of the lamina is  $\rho = \rho(x, y) = x^2 y$ .

8. Find the mass  $M$  and the center of mass  $(\bar{x}, \bar{y})$  of the square lamina shown in the figure. The mass density function of the lamina is  $\rho = \rho(x, y) = xy^2$ .

In Problems 9–20, find the mass and center of mass of each lamina.

9. The lamina enclosed by the lines  $x = 2$  and  $y = 4$ , and the coordinate axes, and whose mass density is  $\rho = \rho(x, y) = 3x^2 y$
10. The lamina enclosed by the lines  $x = 1$  and  $y = 2$ , and the coordinate axes, and whose mass density is  $\rho = \rho(x, y) = 2x^2 y^2$
11. The lamina in the first quadrant enclosed by  $y^2 = x$ ,  $x = 1$ , and the  $x$ -axis, and whose mass density is  $\rho = \rho(x, y) = 2x + 3y$
12. The lamina in the first quadrant enclosed by  $y^2 = 4x$ ,  $x = 1$ , and the  $x$ -axis, and whose mass density is  $\rho = \rho(x, y) = x + 1$
13. The lamina enclosed by  $y^2 = x$  and  $y = x$ , and whose mass density  $\rho = \rho(x, y)$  is proportional to the distance from the  $y$ -axis
14. The lamina enclosed by  $y = \sin x$  and the  $x$ -axis,  $0 \leq x \leq \pi$ , and whose mass density  $\rho = \rho(x, y)$  is proportional to the distance from the  $x$ -axis
15. The lamina enclosed by the lines  $2x + 3y = 6$ ,  $x = 0$ , and  $y = 0$ , and whose mass density  $\rho = \rho(x, y)$  is proportional to the sum of the distances from the coordinate axes

16. The lamina enclosed by the lines  $3x + 4y = 12$ ,  $x = 0$ , and  $y = 0$ , and whose mass density  $\rho = \rho(x, y)$  is proportional to the product of the distances from the coordinate axes
17. The lamina enclosed by the cardioid  $r = 1 + \sin \theta$ , and whose mass density  $\rho = \rho(r, \theta)$  is proportional to the distance from the pole
18. The lamina enclosed by  $r = \cos \theta$ ,  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ , whose mass density  $\rho = \rho(r, \theta)$  is proportional to the distance from the pole
19. A lamina inside the graph of  $r = 2a \sin \theta$  and outside the graph of  $r = a$ , whose mass density  $\rho = \rho(r, \theta)$  is inversely proportional to the distance from the pole
20. A lamina outside the limaçon  $r = 2 - \cos \theta$  and inside the circle  $r = 4 \cos \theta$ , whose mass density  $\rho = \rho(r, \theta)$  is inversely proportional to the distance from the pole

In Problems 21–26, find the moment of inertia about the indicated axis for each homogeneous lamina of mass density  $\rho$ .

21. The lamina enclosed by the lines  $2x + 3y = 6$ ,  $x = 0$ , and  $y = 0$  about the  $x$ -axis
22. Rework Problem 21 for the moment of inertia about the  $y$ -axis.
23. The lamina in the first quadrant enclosed by the lines  $x = a$  and  $y = b$  about the  $y$ -axis
24. Rework Problem 23 for the moment of inertia about the  $x$ -axis.
25. The lamina enclosed by  $y = x^2$  and  $y = 2 - x^2$ ; about the  $y$ -axis
26. The lamina enclosed by the loop of  $y^2 = x^2(4 - x)$ ; about the  $y$ -axis

### Applications and Extensions

27. **Mass** Find the mass of a flat circular washer with inner radius  $a$  and outer radius  $2a$  if its mass density  $\rho = \rho(x, y)$  is inversely proportional to the square of the distance from the center. See the figure.

28. **Mass** Rework Problem 27 if the mass density  $\rho = \rho(x, y)$  is inversely proportional to the distance from the center.
29. **Mass and Center of Mass** Find the mass and center of mass of a lamina in the shape of the region enclosed on the left by the line  $x = a$ ,  $a > 0$ , and on the right by the circle  $r = 2a \cos \theta$  if its mass density  $\rho$  is inversely proportional to the distance from the  $y$ -axis.
30. **Mass and Center of Mass** Find the mass and center of mass of a lamina in the shape of the smaller region cut from the circle  $r = 6$  by the line  $r \cos \theta = 3$  if its mass density is  $\rho = \rho(r, \theta) = \cos^2 \theta$ .
31. **Mass** Find the mass of the lamina enclosed by  $y = x^2$  and  $y = x^3$ ; the mass density is  $\rho = \rho(x, y) = \sqrt{xy}$ .
32. **Center of Mass** Find the center of mass of the lamina inside  $r = 4 \cos \theta$  and outside  $r = 2\sqrt{3}$  if the mass density  $\rho = \rho(r, \theta)$  is inversely proportional to the distance from the origin.
33. **Center of Mass** Find the mass and the center of mass of the lamina enclosed by  $x = y - 2$  and  $x = -y^2$ , if the mass density is  $\rho = \rho(x, y) = x^2$ .

34. **Center of Mass** Find the center of mass of the lamina enclosed by  $y = x^2$  and  $x - 2y + 1 = 0$ , if the mass density is  $\rho = \rho(x, y) = 2x + 8y + 2$ .
35. **Center of Mass** Find the center of mass of the homogeneous lamina enclosed by  $bx^2 = a^2y$  and  $ay = bx$ ,  $a > 0$ ,  $b > 0$ .
- CAS 36. **Center of Mass** Find the center of mass of the homogeneous lamina enclosed by  $y = \ln x$ , the  $x$ -axis, and the line  $x = e^2$ .
37. **Moment of Inertia** The mass density at each point of a circular washer of inner radius  $a$  and outer radius  $b$  is inversely proportional to the square of the distance from the center.
- (a) Find the mass of the washer. Then discuss its behavior as  $a \rightarrow 0^+$ . (Note that the mass density becomes unbounded as we approach the center of the washer.)
- (b) Find the moment of inertia of the washer about its center, and show that (unlike the mass) it remains finite as  $a \rightarrow 0^+$ .

### CAS 38. Moment of Inertia

- (a) Graph the limaçon  $r = 3 + 2 \cos \theta$  and the circle  $r = 2$ .
- (b) Set up the integral for the moment of inertia about the  $x$ -axis of the lamina inside the limaçon and outside the circle from (a) if the mass density  $\rho$  of the lamina is inversely proportional to the square of the distance from the origin.
- (c) Find the integral in (b).
39. Show that the center of mass of a rectangular homogeneous lamina lies at the intersection of its diagonals.
40. A homogeneous lamina is in the shape of the region enclosed by a right triangle of base  $b$  and height  $h$ . Show that its moment of inertia about the base is  $\frac{1}{6}mh^2$ , where  $m$  is the mass of the lamina. (Hint: Position the triangle so that the base lies on the positive  $x$ -axis from  $(0, 0)$  to  $(b, 0)$ .)

### Challenge Problems

41. Show that the center of mass of the region enclosed by a triangular homogeneous lamina lies at the point of intersection of its medians. (Hint: Position the triangle so that its vertices are at  $(a, 0)$ ,  $(b, 0)$ , and  $(0, c)$ , where  $a < 0$ ,  $b > 0$ , and  $c > 0$ )
42. Suppose that a homogeneous lamina occupies a region  $R$  in the  $xy$ -plane. Show that the average value of  $f(x, y) = x$  over  $R$  is  $\bar{x}$ , the first coordinate of the center of mass of the lamina. What is the average value of  $g(x, y) = y$  over  $R$ ? [Hint: The average value of  $f$  over a region  $R$  is defined to be the number  $\frac{1}{A} \iint_R f(x, y) dA$ .]

43. (a) Show that the moment of inertia about the  $z$ -axis of the thin flat plate in the figure equals the sum of its moments of inertia about the  $x$ - and  $y$ -axes.

- (b) Given that the moment of inertia of a disk about an axis through its center and perpendicular to its plane is  $\frac{mR^2}{2}$  (where  $m$  is mass and  $R$  is the radius), use (a) to find its moment of inertia about a diameter.

- (c) What is the moment of inertia of a disk about an axis tangent to its edge?

## 14.5 Surface Area

**OBJECTIVE** When you finish this section, you should be able to:

- 1** Find the surface area that lies above a region  $R$  (p. 938)

Figure 36

**NEED TO REVIEW?** Vectors are discussed in Section 10.2, pp. 699–702, and properties of the cross product are discussed in Section 10.5, pp. 724–730.

So far we have used a double integral to find the volume under a surface  $z = f(x, y) \geq 0$  and above a closed, bounded region  $R$  of the  $xy$ -plane. In this section, we use a double integral to find the surface area of  $z = f(x, y) \geq 0$  above a closed, bounded region  $R$ . In developing the formula for surface area, we use tangent planes to approximate surface area.

We begin with the simple case where the surface is a plane  $z = ax + by + c$  and the region  $R$  is a rectangle with sides of lengths  $\Delta x$  and  $\Delta y$ . The surface area  $S_p$  is the area of the part of the plane that lies above the rectangle, in this case, a parallelogram, as shown in Figure 36. Notice that this parallelogram is the intersection of the plane and the cylinder formed by projecting the perimeter of the rectangle with sides  $\Delta x$  and  $\Delta y$  vertically upward.

The adjacent sides of the parallelogram are given by the vectors  $\mathbf{u}$  and  $\mathbf{v}$ . Both  $\mathbf{u}$  and  $\mathbf{v}$  have the same initial point  $(x_0, y_0, ax_0 + by_0 + c)$  on the parallelogram. The terminal point of  $\mathbf{u}$  is  $(x_0 + \Delta x, y_0, a(x_0 + \Delta x) + by_0 + c)$  and the terminal point of  $\mathbf{v}$  is  $(x_0, y_0 + \Delta y, ax_0 + b(y_0 + \Delta y) + c)$ . So,  $\mathbf{u}$  and  $\mathbf{v}$  are given by

$$\mathbf{u} = \Delta x \mathbf{i} + a \Delta x \mathbf{k}, \quad \mathbf{v} = \Delta y \mathbf{j} + b \Delta y \mathbf{k}$$

The area of the parallelogram is

$$\begin{aligned} \|\mathbf{u} \times \mathbf{v}\| &= \|\Delta x(\mathbf{i} + a\mathbf{k}) \times \Delta y(\mathbf{j} + b\mathbf{k})\| = \|(\mathbf{i} + a\mathbf{k}) \times (\mathbf{j} + b\mathbf{k})\| \Delta x \Delta y \\ &= \|-a\mathbf{i} - b\mathbf{j} + \mathbf{k}\| \Delta x \Delta y = \sqrt{a^2 + b^2 + 1} \Delta x \Delta y \end{aligned}$$

Let  $R$  be a closed rectangular region in the  $xy$ -plane with sides of length  $\Delta x$  and  $\Delta y$ . If the perimeter of  $R$  is projected upward parallel to the  $z$ -axis, the result is a cylinder. Let  $S_p$  denote the area cut from the plane  $z = ax + by + c$  by this cylinder. Then the area  $S_p$  is given by

$$S_p = \sqrt{a^2 + b^2 + 1} \Delta x \Delta y \quad (1)$$

We now develop a formula for the surface area of the graph of a nonnegative function  $z = f(x, y)$  that is defined over a closed, bounded region  $R$ . We assume that  $f$  has first-order partial derivatives that are continuous at every point of the region  $R$ .

See Figure 37(a). Using lines parallel to the  $x$ - and  $y$ -axes, we partition  $R$  into  $N$  rectangles and consider the  $k$ th rectangle  $R_k$  having area  $A_k$ . Now we select a point  $(u_k, v_k)$  in  $R_k$  and construct the tangent plane to the surface at the corresponding point  $P_k = (u_k, v_k, f(u_k, v_k))$  on the surface. See Figure 37(b). The equation of this tangent plane can be written as

$$z = f_x(u_k, v_k)(x - u_k) + f_y(u_k, v_k)(y - v_k) + f(u_k, v_k) \quad (2)$$

**DF** Figure 37

The perimeter of the rectangle  $R_k$ , when it is projected upward parallel to the  $z$ -axis, results in a cylinder. Let  $\Delta S_k$  denote the area cut from the tangent plane at  $P_k$  by the cylinder. The number  $\Delta S_k$  is an approximation to the surface area of the part of the surface that lies above the  $k$ th rectangle  $R_k$ . By adding the  $N$  areas and taking the limit of the sums as the norm  $\|P\|$  of the partition approaches 0, we obtain the surface area  $S$  of the part of the surface  $z = f(x, y)$  that lies above the region  $R$ .

$$S = \lim_{\|P\| \rightarrow 0} \sum_{k=1}^N \Delta S_k \quad (3)$$

To obtain a formula for  $\Delta S_k$ , we combine (2), the equation of the tangent plane to the surface at the point  $P_k$ ,

$$z = f_x(u_k, v_k)(x - u_k) + f_y(u_k, v_k)(y - v_k) + f(u_k, v_k) \quad \text{Equation (2)}$$

and formula (1) for the surface area  $S_p$  of a plane  $z = ax + by + c$

$$S_p = \sqrt{a^2 + b^2 + 1} \Delta x \Delta y \quad \text{Formula (1)}$$

The result is

$$\Delta S_k = \sqrt{[f_x(u_k, v_k)]^2 + [f_y(u_k, v_k)]^2 + 1} \Delta A_k$$

Now we substitute this expression for  $\Delta S_k$  into (3) to obtain the surface area  $S$  of the part of the surface that lies above the region  $R$ . Then

$$S = \lim_{\|P\| \rightarrow 0} \sum_{k=1}^N \sqrt{[f_x(u_k, v_k)]^2 + [f_y(u_k, v_k)]^2 + 1} \Delta A_k$$

Since the first-order partial derivatives of  $f$  are continuous on  $R$ , the limit exists and  $S$  is a double integral.

### Surface Area Above a region $R$

Let  $z = f(x, y)$  be a function of two variables defined on a closed, bounded region  $R$ . If  $f_x$  and  $f_y$  are continuous on  $R$ , then the surface area  $S$  of the part of the surface that lies above  $R$  is given by

$$S = \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} dA$$

Figure 38  $z = \frac{2}{3}(x^{3/2} + y^{3/2})$

## 1 Find the Surface Area That Lies Above a Region $R$

### EXAMPLE 1 Finding Surface Area

Find the surface area of the part of the surface  $z = f(x, y) = \frac{2}{3}(x^{3/2} + y^{3/2})$  that lies above the region  $R$ , a rectangle enclosed by the lines  $x = 0$ ,  $x = 1$ ,  $y = 0$ , and  $y = 2$ .

**Solution** Figure 38 shows the surface  $z = f(x, y) = \frac{2}{3}(x^{3/2} + y^{3/2})$  and the surface area  $S$  above the rectangle  $R$ . We begin by finding the partial derivatives of  $z = f(x, y)$ :

$$f_x(x, y) = x^{1/2} \quad f_y(x, y) = y^{1/2}$$

Since  $f_x$  and  $f_y$  are continuous on  $R$ , the surface area  $S$  above  $R$  is

$$\begin{aligned} S &= \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} \, dA = \iint_R \sqrt{(x^{1/2})^2 + (y^{1/2})^2 + 1} \, dA \\ &= \int_0^1 \int_0^2 \sqrt{x + y + 1} \, dy \, dx = \int_0^1 \left[ \frac{2}{3}(x + y + 1)^{3/2} \right]_0^2 dx \\ &= \frac{2}{3} \int_0^1 [(x + 3)^{3/2} - (x + 1)^{3/2}] \, dx = \left( \frac{2}{3} \right) \left( \frac{2}{5} \right) [(x + 3)^{5/2} - (x + 1)^{5/2}]_0^1 \\ &= \frac{4}{15} (32 - 9\sqrt{3} - 4\sqrt{2} + 1) = \frac{4}{15} (33 - 9\sqrt{3} - 4\sqrt{2}) \end{aligned}$$

**NOW WORK** Problem 5.

### EXAMPLE 2 Finding Surface Area

Find the surface area of the part of the paraboloid  $z = f(x, y) = 1 - x^2 - y^2$  that lies above the  $xy$ -plane.

**Solution** Figure 39 shows the part of the surface  $z = 1 - x^2 - y^2$  that lies above the  $xy$ -plane and its projection onto the  $xy$ -plane, the region  $R$  enclosed by the circle  $x^2 + y^2 = 1$ . We begin by finding the partial derivatives of  $z = f(x, y)$ .

$$f_x(x, y) = -2x \quad f_y(x, y) = -2y$$

Since  $f_x$  and  $f_y$  are continuous on  $R$ , the surface area  $S$  of the part of  $z = f(x, y) = 1 - x^2 - y^2$  that lies above  $R$  is

$$\begin{aligned} S &= \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} \, dA = \iint_R \sqrt{(-2x)^2 + (-2y)^2 + 1} \, dA \\ &= \iint_R \sqrt{4(x^2 + y^2) + 1} \, dA \end{aligned}$$

Since both the region  $R$  (a circle) and the integrand involve  $x^2 + y^2$ , we use polar coordinates  $(r, \theta)$ . For the region  $R$ , we have  $0 \leq r \leq 1$  and  $0 \leq \theta \leq 2\pi$ . Then

$$\begin{aligned} S &= \iint_R \sqrt{4(x^2 + y^2) + 1} \, dA = \int_0^{2\pi} \int_0^1 \sqrt{4r^2 + 1} \, r \, dr \, d\theta \\ &= \int_0^{2\pi} \frac{1}{12} [(4r^2 + 1)^{3/2}]_0^1 d\theta = \frac{1}{12} (5\sqrt{5} - 1) \int_0^{2\pi} d\theta = \frac{1}{12} (5\sqrt{5} - 1) 2\pi \\ &= \frac{\pi}{6} (5\sqrt{5} - 1) \end{aligned}$$

**NOW WORK** Problem 9.

Figure 39  $z = 1 - x^2 - y^2$ ,  $z \geq 0$

Figure 40  $x^2 + y^2 + z^2 = a^2$ ,  $z \geq 0$

### EXAMPLE 3 Finding Surface Area

Find the surface area of the part of the sphere  $x^2 + y^2 + z^2 = a^2$  that lies above the  $xy$ -plane and is contained within the cylinder  $x^2 + y^2 = ax$ ,  $a > 0$ .

**Solution** Figure 40 shows the sphere and the cylinder. The equation of the surface in explicit form is

$$z = f(x, y) = \sqrt{a^2 - x^2 - y^2}$$

The partial derivatives of  $z = f(x, y)$  are

$$f_x(x, y) = -\frac{x}{\sqrt{a^2 - x^2 - y^2}} \quad f_y(x, y) = -\frac{y}{\sqrt{a^2 - x^2 - y^2}}$$

The projection of the cylinder onto the  $xy$ -plane is the region  $R$  enclosed by the circle  $x^2 + y^2 = ax$ ,  $a > 0$ . Then the surface area  $S$  that we seek is

$$S = \iint_R \sqrt{\frac{x^2}{a^2 - x^2 - y^2} + \frac{y^2}{a^2 - x^2 - y^2} + 1} \, dA = \iint_R \sqrt{\frac{a^2}{a^2 - x^2 - y^2}} \, dA$$

Since the integrand involves the expression  $x^2 + y^2$  and the boundary of  $R$  is the circle  $x^2 + y^2 = ax$ , we use polar coordinates  $(r, \theta)$ . We begin by finding the limits of integration. Since

$$\begin{aligned} x^2 + y^2 &= ax \\ r^2 &= ar \cos \theta \\ r &= a \cos \theta \end{aligned}$$

we find that  $r$  varies from 0 to  $a \cos \theta$ .

Since half the area is to the right of the  $xz$ -plane and half is to the left of the plane, we can let  $\theta$  vary from 0 to  $\frac{\pi}{2}$  and double the area. Then the surface area  $S$  is

$$\begin{aligned} S &= \iint_R \sqrt{\frac{a^2}{a^2 - x^2 - y^2}} \, dA = \iint_R \frac{a}{\sqrt{a^2 - r^2}} r \, dr \, d\theta \quad \text{Double the area} \\ &= 2 \int_0^{\pi/2} \int_0^{a \cos \theta} \frac{a}{\sqrt{a^2 - r^2}} r \, dr \, d\theta \\ &= -2a \int_0^{\pi/2} \left[ \sqrt{a^2 - r^2} \right]_0^{a \cos \theta} d\theta = -2a \int_0^{\pi/2} (a \sin \theta - a) d\theta \\ &= -2a^2 [-\cos \theta - \theta]_0^{\pi/2} = a^2(\pi - 2) \end{aligned}$$

### NOW WORK Problem 13.

## 14.5 Assess Your Understanding

### Concepts and Vocabulary

- True or False** Suppose  $R$  is a closed, rectangular region in the  $xy$ -plane with sides of length  $\Delta x$  and  $\Delta y$ . If the perimeter of  $R$  is projected upward parallel to the  $z$ -axis, the result is a cylinder. If  $S_p$  is the area cut from the plane  $z = ax + by + c$  by this cylinder, then  $S_p = \sqrt{a^2 + b^2 + 1} \Delta x \Delta y$ .
- True or False** Suppose  $z = f(x, y)$  is a function of two variables defined on a closed, bounded region  $R$ . If  $f_x$  and  $f_y$  are continuous on  $R$ , then the area  $S$  of the part of the surface that lies over  $R$  is given by  $S = \iint_R \sqrt{f_x^2(x, y) + f_y^2(x, y) + 1} \, dA$ .

### Skill Building

- Find the surface area of the part of the plane  $2x + 2y + z = 6$  that lies above the region in the  $xy$ -plane bounded by  $x^2 + y^2 = 4$ , the  $x$ -axis, and the  $y$ -axis, as shown in the figure.

4. Find the surface area of the part of the plane  $4z - 2x - y = 8$  that lies over the region enclosed by the triangle with vertices  $(0, 0, 0)$ ,  $(1, 0, 0)$ , and  $(1, 1, 0)$ , as shown in the figure.

In Problems 5–16, find the surface area described.

5. The part of the surface  $z = f(x, y) = \sqrt{9 - x^2}$  that lies above the rectangle enclosed by the lines  $x = 0$ ,  $x = 2$ ,  $y = -1$ ,  $y = 4$
6. The part of the surface  $z = f(x, y) = \sqrt{8 - y^2}$  that lies above the rectangle enclosed by the lines  $x = 0$ ,  $x = 5$ ,  $y = 0$ ,  $y = 2$
7. The part of the surface  $z = \frac{2}{3}(x^{3/2} + y^{3/2})$  that lies above the triangle enclosed by the lines  $x = 0$ ,  $y = 0$ , and  $2x + 3y = 6$
8. The part of the surface  $z = \frac{2}{3}(x^{3/2} + y^{3/2})$  that lies above the triangle enclosed by  $x = 0$ ,  $y = 0$ , and  $3x + y = 3$
9. The part of the paraboloid  $z = 4 - x^2 - y^2$  that lies above the  $xy$ -plane
10. The part of the cylinder  $z = \sqrt{a^2 - x^2}$  that lies above the square defined by  $-\frac{1}{2}a \leq x \leq \frac{1}{2}a$  and  $-\frac{1}{2}a \leq y \leq \frac{1}{2}a$ ,  $a > 0$
11. The part of the cone  $z = \sqrt{x^2 + y^2}$  that lies inside the cylinder  $x^2 + y^2 = 2x$
12. The part of the sphere  $x^2 + y^2 + z^2 = 4z$  that lies within the paraboloid  $x^2 + y^2 = 2z$
13. The part of the surface  $z = xy$  in the first octant that lies within the cylinder  $x^2 + y^2 = a^2$ ,  $a > 0$
14. The part of the surface  $z = x^2 - y^2$  in the first octant that lies within the cylinder  $x^2 + y^2 = 4$
15. The part of the sphere  $x^2 + y^2 + z^2 = 4z$  that lies between the planes  $z = 1$  and  $z = 3$ .
16. The part of the sphere  $x^2 + y^2 + z^2 = 4a^2$  that lies inside the cylinder  $x^2 + y^2 = 2ax$ ,  $a > 0$

### Applications and Extensions

17. **Surface Area** Find the surface area cut from the hyperbolic paraboloid  $y^2 - x^2 = 6z$  by the cylinder  $x^2 + y^2 = 36$ .
18. **Surface Area** Find the surface area of the part of  $z = 4 - y^2$  that lies in the first octant and is enclosed by  $z = 0$ ,  $x = 0$ ,  $x = y$ , and  $y = 2$ .
19. **Surface Area** Find the surface area of the part of  $x^2 = y$  that lies in the first octant under the plane  $x + z = 3$ . (Hint: Project the surface onto the  $xz$ -plane.)

20. **Surface Area** Find the surface area of the part of the paraboloid  $z = 9 - x^2 - y^2$  that lies between the planes  $z = 0$  and  $z = 8$ .

21. **Surface Area** Find the surface area of the part of the hemisphere  $x^2 + y^2 + z^2 = 16$ ,  $z \geq 0$ , that lies above the cylinder bounded by  $x^2 + y^2 = 4$ . See the figure.

22. **Surface Area of the Pantheon** The Pantheon in Rome is the largest unreinforced concrete dome in the world. Its inner surface is a hemisphere of diameter 43.3 m with an open circular ocular 9.1 m in diameter cut from its apex. Find the inner surface area of the dome.

### CAS 23. Surface Area

- (a) Graph the surface  $z = 10e^{-(x^2+y^2)}$  that lies inside the cylinder  $x^2 + y^2 = 4$ .
- (b) Find the surface area of the surface graphed in (a).

### 24. Surface Area

- (a) Set up, but do not evaluate, the integral to find the surface area of the part of the surface  $z = 1 - x^4 - y^2$  that lies above the  $xy$ -plane.

### CAS (b) Graph the surface.

25. Derive the formula  $S = \pi a \sqrt{a^2 + h^2}$  for the lateral surface area of a right circular cone of base radius  $a$  and altitude  $h$ .

26. Show that the area of the first-octant portion of the plane  $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$  (where  $a$ ,  $b$ , and  $c$  are positive) is  $S = \frac{1}{2} \sqrt{a^2b^2 + b^2c^2 + c^2a^2}$ .

27. Use a double integral to derive the formula for the surface area of a sphere of radius  $R$ .

### Challenge Problems

28. Let  $F$  denote a function of three variables that possesses continuous first-order partial derivatives at each point of its domain. Suppose also that  $F_z(x, y, z)$  is never 0. If  $S$  is the area of the part of the surface  $F(x, y, z) = 0$  that lies over the closed, bounded region  $R$ , show that

$$S = \iint_R \frac{\sqrt{[F_x(x, y, z)]^2 + [F_y(x, y, z)]^2 + [F_z(x, y, z)]^2}}{|F_z(x, y, z)|} dA$$

- 29. Surface Area** The center of a sphere of radius  $R$  is on the surface of a right circular cylinder of base radius  $\frac{R}{2}$ . Find the surface area of the sphere inside the cylinder. See the figure.

- 30.** For the plane surface  $F(x, y, z) = Ax + By + Cz - D = 0$ ,  $C \neq 0$ , if  $z = f(x, y)$ , show that the surface area  $S = \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} dA$  can be written as

$$S = \iint_R \sec \gamma dA$$

where  $\gamma$  is the positive acute angle between the normal  $\mathbf{n} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$  to the plane and  $\mathbf{k}$ .

## 14.6 The Triple Integral

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find a triple integral defined over a closed box (p. 942)
- 2 Find a triple integral defined over a more general solid (p. 942)
- 3 Find the volume of a solid (p. 944)
- 4 Find the mass, center of mass, and moments of inertia of a solid (p. 944)
- 5 Find a triple integral defined over  $xz$ -simple and  $yz$ -simple solids (p. 946)

Just as single integrals are used to integrate over closed intervals  $[a, b]$ , and double integrals are used to integrate over two-dimensional, closed, bounded regions  $R$ , triple integrals are used to integrate over three-dimensional, closed, bounded solids  $E$ . For example, we have seen that if  $\rho = \rho(x)$  is the mass density of a long thin wire, then the single integral  $\int_a^b \rho(x) dx$  models the mass of the wire from  $a$  to  $b$ . Also if  $\rho = \rho(x, y)$  is the mass density of a lamina, then the double integral  $\iint_R \rho(x, y) dA$  models the mass  $M$  of the lamina over  $R$ . Similarly, a triple integral can be used to find the mass of a solid with mass density  $\rho = \rho(x, y, z)$ .

We begin with a function  $f$  of three variables defined over a box-shaped solid  $E$  in three-dimensional space. Partition  $E$  into  $n$  smaller rectangular boxes  $E_1, E_2, \dots, E_i, \dots, E_n$  by drawing planes parallel to the three coordinate planes, as shown in Figure 41.

The **norm** of the partition, denoted by  $\|P\|$ , is defined as the length of the longest diagonal of the boxes  $E_i$ . If  $\Delta x_i$ ,  $\Delta y_i$ , and  $\Delta z_i$  denote the length, width, and height, respectively, of the  $i$ th box, then its volume is  $\Delta V_i = \Delta x_i \Delta y_i \Delta z_i$ . In each box  $E_i$ , we arbitrarily select a point  $(u_i, v_i, w_i)$ , evaluate  $f(u_i, v_i, w_i)$ , multiply  $f(u_i, v_i, w_i)$  by  $\Delta V_i$ , and form the sums

$$\sum_{i=1}^n f(u_i, v_i, w_i) \Delta V_i$$

Sums of this form are referred to as **Riemann sums** of  $f$  for the partition  $P$ . If

$\lim_{\|P\| \rightarrow 0} \sum_{i=1}^n f(u_i, v_i, w_i) \Delta V_i$  exists and does not depend on the choice of the partition or on the choice of  $(u_i, v_i, w_i)$ , then this limit is called the **triple integral of  $f$  over  $E$** .

### DEFINITION Triple Integral

Let  $f$  be a function of three variables defined over a closed, bounded, box-shaped solid  $E$ . The **triple integral of  $f$  over  $E$**  is defined as

$$\iiint_E f(x, y, z) dV = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n f(u_i, v_i, w_i) \Delta V_i$$

provided the limit exists.

**DF** Figure 41

As with single integrals and double integrals, it can be shown that if  $f$  is continuous on  $E$ , then  $\iiint_E f(x, y, z) dV$  exists.

There are six variations for the triple integral of  $f$  over  $E$ . They are

$$\begin{aligned} \iiint_E f(x, y, z) dx dy dz & \quad \iiint_E f(x, y, z) dx dz dy & \quad \iiint_E f(x, y, z) dy dx dz \\ \iiint_E f(x, y, z) dy dz dx & \quad \iiint_E f(x, y, z) dz dx dy & \quad \iiint_E f(x, y, z) dz dy dx \end{aligned}$$

Fubini's Theorem for triple integrals uses three iterated integrals to find  $\iiint_E f(x, y, z) dV$ .

### THEOREM Fubini's Theorem for Triple Integrals

Let  $f$  be a function of three variables defined over the closed box  $E$ , where  $x_1 \leq x \leq x_2$ ,  $y_1 \leq y \leq y_2$ , and  $z_1 \leq z \leq z_2$ . If  $f$  is continuous on  $E$ , then

$$\iiint_E f(x, y, z) dV = \int_{x_1}^{x_2} \left\{ \int_{y_1}^{y_2} \left[ \int_{z_1}^{z_2} f(x, y, z) dz \right] dy \right\} dx$$

The iterated integral on the right is shown first with respect to  $z$ , then  $y$ , and finally  $x$ . However, the same result is obtained no matter what order is used. To find  $\int_{z_1}^{z_2} f(x, y, z) dz$ , we treat  $x$  and  $y$  as constants and integrate partially with respect to  $z$ . As is the case with iterated double integrals, the braces and brackets are usually omitted.

## 1 Find a Triple Integral Defined over a Closed Box

### EXAMPLE 1 Finding a Triple Integral Defined over a Closed Box

Find  $\iiint_E 4xyz dV$  if  $E$  is the closed box  $0 \leq x \leq 1$ ,  $0 \leq y \leq 2$ , and  $0 \leq z \leq 3$  shown in Figure 42.

**Solution** Since  $f(x, y, z) = 4xyz$  is continuous on  $E$ , we use Fubini's Theorem for triple integrals.

$$\begin{aligned} \iiint_E 4xyz dV &= \int_0^1 \int_0^2 \int_0^3 4xyz dz dy dx = \int_0^1 \int_0^2 4xy \left[ \frac{z^2}{2} \right]_0^3 dy dx \\ &= \int_0^1 \int_0^2 18xy dy dx = \int_0^1 18x \left[ \frac{y^2}{2} \right]_0^2 dx \\ &= \int_0^1 36x dx = [18x^2]_0^1 = 18 \end{aligned}$$

### NOW WORK Problem 9.

## 2 Find a Triple Integral Defined over a More General Solid

Consider a solid  $E$  in space enclosed on the top by a surface  $z = z_2(x, y)$  and on the bottom by a surface  $z = z_1(x, y)$ , where  $z_1 \leq z_2$  and the functions  $z_1$  and  $z_2$  are continuous. The sides of  $E$  are a cylinder whose intersection with the  $xy$ -plane forms a closed, bounded region  $R$ . See Figure 43. Since the projection of  $E$  onto the  $xy$ -plane results in a closed, bounded region  $R$ , and  $E$  lies between the two surfaces  $z_1$  and  $z_2$ , the solid  $E$  is called **xy-simple**. The next theorem, which we do not prove, provides a way to find triple integrals defined over solids that are  $xy$ -simple.

Figure 42

Figure 43  $E$  is an  $xy$ -simple solid.

**THEOREM Triple Integral over an  $xy$ -Simple Solid**

Let  $E$  be an  $xy$ -simple solid that lies between the two surfaces  $z = z_1(x, y)$  and  $z = z_2(x, y)$ , where  $z_1 \leq z_2$ , and whose projection onto the  $xy$ -plane is a closed, bounded region  $R$ . If  $f$  is a function of three variables that is continuous on  $E$ , then

$$\iiint_E f(x, y, z) \, dV = \iint_R \left[ \int_{z_1(x, y)}^{z_2(x, y)} f(x, y, z) \, dz \right] dA$$

If the region  $R$  is  $x$ -simple, and  $R$  is enclosed by  $y = y_1(x)$ ,  $y = y_2(x)$ ,  $y_1 \leq y_2$ ,  $a \leq x \leq b$ , then

$$\begin{aligned} \iiint_E f(x, y, z) \, dV &= \iint_R \left[ \int_{z_1(x, y)}^{z_2(x, y)} f(x, y, z) \, dz \right] dA \\ &= \int_a^b \int_{y_1(x)}^{y_2(x)} \int_{z_1(x, y)}^{z_2(x, y)} f(x, y, z) \, dz \, dy \, dx \end{aligned}$$

If the region  $R$  is  $y$ -simple, and  $R$  is enclosed by  $x = x_1(y)$ ,  $x = x_2(y)$ ,  $x_1 \leq x_2$ ,  $c \leq y \leq d$ , then

$$\begin{aligned} \iiint_E f(x, y, z) \, dV &= \iint_R \left[ \int_{z_1(x, y)}^{z_2(x, y)} f(x, y, z) \, dz \right] dA \\ &= \int_c^d \int_{x_1(y)}^{x_2(y)} \int_{z_1(x, y)}^{z_2(x, y)} f(x, y, z) \, dz \, dx \, dy \end{aligned}$$

Figure 44

**EXAMPLE 2 Finding a Triple Integral Defined over an  $xy$ -Simple Solid**

Find the triple integral  $\iiint_E 4x \, dV$  over the tetrahedron formed by the coordinate planes and the plane  $2x + 3y + 4z = 12$ .

**Solution** The solid  $E$  is shown in Figure 44(a). A typical plane section of  $E$  using a plane perpendicular to the  $x$ -axis reveals that the upper surface is  $z = z_2(x, y) = \frac{1}{4}(12 - 2x - 3y)$  and the lower surface is  $z = z_1(x, y) = 0$ . So,  $E$  is  $xy$ -simple. The region  $R$  in the  $xy$ -plane is the triangle enclosed by the  $x$ -axis, the  $y$ -axis, and the line  $y = \frac{1}{3}(12 - 2x) = 4 - \frac{2x}{3}$ , as shown in Figure 44(b). The triangle  $R$  is both  $x$ -simple and  $y$ -simple. If we treat it as an  $x$ -simple region, so that  $R$  is given by  $y = 0$ ,  $y = 4 - \frac{2x}{3}$ , and  $0 \leq x \leq 6$ , we have

$$\begin{aligned} \iiint_E 4x \, dV &= \int_a^b \int_{y_1(x)}^{y_2(x)} \int_{z_1(x, y)}^{z_2(x, y)} 4x \, dz \, dy \, dx \\ &= \int_0^6 \int_0^{4-2x/3} \int_0^{(1/4)(12-2x-3y)} 4x \, dz \, dy \, dx \\ &= \int_0^6 \int_0^{4-2x/3} 4x [z]_0^{(1/4)(12-2x-3y)} \, dy \, dx = \int_0^6 \int_0^{4-2x/3} 4x \left( \frac{12-2x-3y}{4} \right) \, dy \, dx \\ &= \int_0^6 \int_0^{4-2x/3} (12x - 2x^2 - 3xy) \, dy \, dx = \int_0^6 \left[ (12x - 2x^2)y - 3x \frac{y^2}{2} \right]_0^{4-2x/3} \, dx \\ &= \int_0^6 \left( 24x - 8x^2 + \frac{2}{3}x^3 \right) \, dx = \left[ 12x^2 - \frac{8}{3}x^3 + \frac{1}{6}x^4 \right]_0^6 = 72 \end{aligned}$$

**NOW WORK** Problems 11 and 21.

### 3 Find the Volume of a Solid

If  $z = f(x, y) = 1$  on  $R$ , the double integral  $\iint_R f(x, y) dA = \iint_R dA$  is numerically equal to the area of the region  $R$ . If  $f(x, y, z) = 1$  on  $E$ , then the triple integral  $\iiint_E f(x, y, z) dV = \iiint_E dV$  equals (numerically) the volume of the solid  $E$ . That is,

$$\text{Volume } V \text{ of a solid } E: \quad V = \iiint_E dV$$

Figure 45

**NOTE** Alternatively, we could use a CAS to find the integral or we could use the trigonometric substitution

$$x = 2 \sin \theta, \quad -\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}.$$

#### EXAMPLE 3 Finding the Volume of a Solid

Find the volume  $V$  of the solid  $E$  in the first octant that is enclosed by the paraboloid  $z = 16 - 4x^2 - y^2$  and the  $xy$ -plane.

**Solution** Figure 45(a) shows the solid  $E$ , which is  $xy$ -simple. The upper surface is the paraboloid  $z = z_2(x, y) = 16 - 4x^2 - y^2$  and the lower surface is the plane  $z = z_1(x, y) = 0$ . The region  $R$  in the  $xy$ -plane is enclosed by the  $x$ -axis, the  $y$ -axis, and part of the ellipse  $4x^2 + y^2 = 16$ ,  $x \geq 0$ ,  $y \geq 0$ . The region  $R$  is both  $x$ -simple and  $y$ -simple. We choose to use the iterated integral for an  $x$ -simple region, so that  $0 \leq y \leq \sqrt{16 - 4x^2}$  and  $0 \leq x \leq 2$ . See Figure 45(b). The volume  $V$  of  $E$  is given by

$$\begin{aligned} V &= \iiint_E dV = \int_a^b \int_{y_1(x)}^{y_2(x)} \int_{z_1(x, y)}^{z_2(x, y)} dz dy dx = \int_0^2 \int_0^{\sqrt{16-4x^2}} \int_0^{16-4x^2-y^2} dz dy dx \\ &= \int_0^2 \int_0^{\sqrt{16-4x^2}} (16 - 4x^2 - y^2) dy dx = \int_0^2 \left[ (16 - 4x^2)y - \frac{y^3}{3} \right]_0^{\sqrt{16-4x^2}} dx \\ &= \int_0^2 \left( (16 - 4x^2)^{3/2} - \frac{(16 - 4x^2)^{3/2}}{3} \right) dx = \frac{16}{3} \int_0^2 (4 - x^2)^{3/2} dx \end{aligned}$$

We use the Table of Integrals, Integral 69 with  $a = 2$ . Then

$$\begin{aligned} V &= \frac{16}{3} \int_0^2 (4 - x^2)^{3/2} dx = \frac{16}{3} \left[ \frac{x}{4} (4 - x^2)^{3/2} + \frac{3x}{2} \sqrt{4 - x^2} + 6 \sin^{-1} \frac{x}{2} \right]_0^2 \\ &= \frac{16}{3} (6) \left( \frac{\pi}{2} \right) = 16\pi \end{aligned}$$

#### NOW WORK Problem 35.

### 4 Find the Mass, Center of Mass, and Moments of Inertia of a Solid

Triple integrals can be used to find the mass, center of mass, and moments of inertia of solids. The formulas are obtained in a manner similar to those using double integrals, so we only state them here.

The **mass**  $M$  of a solid  $E$  of volume  $V$  with mass density  $\rho = \rho(x, y, z)$  that is continuous in  $E$  is given by

$$M = \iiint_E \rho(x, y, z) dV$$

The **moments of the solid about the coordinate planes** are

$$M_{xy} = \iiint_E z\rho(x, y, z) dV \quad M_{xz} = \iiint_E y\rho(x, y, z) dV \quad M_{yz} = \iiint_E x\rho(x, y, z) dV$$

The **center of mass of the solid** is the point  $(\bar{x}, \bar{y}, \bar{z})$  whose coordinates are given by

$$\bar{x} = \frac{M_{yz}}{M} = \frac{\int_E x \rho(x, y, z) dV}{\int_E \rho(x, y, z) dV} \quad \bar{y} = \frac{M_{xz}}{M} = \frac{\int_E y \rho(x, y, z) dV}{\int_E \rho(x, y, z) dV} \quad \bar{z} = \frac{M_{xy}}{M} = \frac{\int_E z \rho(x, y, z) dV}{\int_E \rho(x, y, z) dV}$$

The **moment of inertia about an axis**  $a$  is

$$I_a = \int_E r^2 \rho(x, y, z) dV$$

where  $r$  is the distance from the point  $(x, y, z)$  of the solid to the axis  $a$  about which the moment is to be found.

### **EXAMPLE 4** Finding the Mass and Center of Mass of a Solid

- (a) Find the mass  $M$  of a solid in the shape of a tetrahedron cut from the first octant by the plane  $x + y + z = 1$  if the mass density  $\rho = \rho(x, y, z)$  is proportional to the distance from the  $yz$ -plane.
- (b) Find the center of mass  $(\bar{x}, \bar{y}, \bar{z})$  of the tetrahedron.

**Solution** Figure 46(a) shows the solid  $E$  that is  $xy$ -simple. It is enclosed by the surfaces  $z = z_1(x, y) = 0$  and  $z = z_2(x, y) = 1 - x - y$ , and its projection onto the  $xy$ -plane is the closed, bounded  $x$ -simple region  $R$  defined by the lines  $y = 0$  and  $y = 1 - x$ , where  $0 \leq x \leq 1$ . See Figure 46(b).

(a) Since the mass density  $\rho = \rho(x, y, z)$  is proportional to the distance from the  $yz$ -plane, we have  $\rho(x, y, z) = kx$ , where  $k$  is the constant of proportionality. Then the mass  $M$  is

$$M = \iiint_E \rho(x, y, z) dV = \iiint_E kx dV = k \int_0^1 \int_0^{1-x} \int_0^{1-x-y} x dz dy dx$$

Using a CAS,  $M = \frac{k}{24}$ .

(b) The center of mass  $(\bar{x}, \bar{y}, \bar{z})$  is

$$\begin{aligned} \bar{x} &= \frac{\iiint_E x \rho(x, y, z) dV}{M} = \frac{\iiint_E x kx dV}{\frac{k}{24}} = 24 \iiint_E x^2 dV \\ &= 24 \int_0^1 \int_0^{1-x} \int_0^{1-x-y} x^2 dz dy dx \end{aligned}$$

Using a CAS,  $\bar{x} = \frac{2}{5}$ .

$$\bar{y} = \frac{\iiint_E y \rho(x, y, z) dV}{M} = \frac{\iiint_E y kx dV}{\frac{k}{24}} = 24 \int_0^1 \int_0^{1-x} \int_0^{1-x-y} xy dz dy dx$$

Figure 46

Using a CAS,  $\bar{y} = \frac{1}{5}$ .

$$\bar{z} = \frac{\iiint_E z\rho(x, y, z) dV}{M} = \frac{\iiint_E zkx dV}{\frac{k}{24}} = 24 \int_0^1 \int_0^{1-x} \int_0^{1-x-y} xz dz dy dx$$

Using a CAS  $\bar{z} = \frac{1}{5}$ .

The center of mass of the tetrahedron is located at the point  $\left(\frac{2}{5}, \frac{1}{5}, \frac{1}{5}\right)$ . ■

**NOTE** The integrals in (a) and (b) can be found by hand, but the integration is somewhat tedious.

**NOW WORK** Problem 43.

### Finding the Moment of Inertia About the $z$ -axis of a Solid

#### EXAMPLE 5

Find the moment of inertia about the  $z$ -axis of the homogeneous solid of mass density  $\rho$  in the first octant enclosed by the surface  $z = 4xy$  and the planes  $z = 0$ ,  $x = 3$ , and  $y = 2$ .

**Solution** The moment of inertia about the  $z$ -axis is

$$I_z = \iiint_E r^2 \rho dV$$

where  $r = \sqrt{x^2 + y^2}$  is the distance of the point  $(x, y, z)$  from the  $z$ -axis.

Figure 47(a) shows the solid  $E$ , which is  $xy$ -simple. The upper surface is  $z = z_2(x, y) = 4xy$  and the lower surface is the plane  $z = z_1(x, y) = 0$ . The region  $R$  in the  $xy$ -plane is enclosed by the  $x$ -axis, the  $y$ -axis, the line  $x = 3$ , and the line  $y = 2$ , as shown in Figure 47(b). The region  $R$  is both  $x$ -simple and  $y$ -simple.

Figure 47

Figure 48 An  $xz$ -simple solid;  $R$  lies in the  $xz$ -plane.

$$\begin{aligned} I_z &= \iiint_E (x^2 + y^2) \rho dV = \rho \int_0^3 \int_0^2 \int_0^{4xy} (x^2 + y^2) dz dy dx \\ &= \rho \int_0^3 \int_0^2 [z(x^2 + y^2)]_0^{4xy} dy dx = \rho \int_0^3 \int_0^2 (4x^3y + 4xy^3) dy dx \\ &= \rho \int_0^3 [2x^3y^2 + xy^4]_0^2 dx \\ &= \rho \int_0^3 (8x^3 + 16x) dx = \rho [2x^4 + 8x^2]_0^3 = \rho(162 + 72) = 234\rho \end{aligned}$$

**NOW WORK** Problem 47.

### 5 Find a Triple Integral Defined over $xz$ -Simple and $yz$ -Simple Solids

Triple integrals on certain types of regions in space are best found by integrating first with respect to  $x$  or  $y$  rather than  $z$ .

Suppose a solid  $E$  in space is enclosed by the two surfaces  $y = y_1(x, z)$  and  $y = y_2(x, z)$ , where the functions  $y_1$  and  $y_2$  are continuous and  $y_1 \leq y_2$ . If the projection of  $E$  onto the  $xz$ -plane is a closed, bounded region  $R$ , then  $E$  is called an  **$xz$ -simple solid**. See Figure 48.

**Figure 49** A  $yz$ -simple solid;  $R$  lies in the  $yz$ -plane.

**Figure 50**

**NOTE**  $\int_{-2}^2 \sqrt{4-y^2} dy$  equals the area of a semi-circle of radius 2, namely  $2\pi$ .

### THEOREM Triple Integral over an $xz$ -Simple Solid

If  $f$  is a function of three variables that is continuous on an  $xz$ -simple solid  $E$ , then

$$\iiint_E f(x, y, z) dV = \iint_R \left[ \int_{y_1(x, z)}^{y_2(x, z)} f(x, y, z) dy \right] dA$$

Similarly, suppose a solid  $E$  in space is enclosed by the two surfaces  $x = x_1(y, z)$  and  $x = x_2(y, z)$ , where the functions  $x_1$  and  $x_2$  are continuous and  $x_1 \leq x_2$ . If the projection of  $E$  onto the  $yz$ -plane is a closed, bounded region  $R$ , then  $E$  is called a  **$yz$ -simple solid**. See Figure 49.

### THEOREM Triple Integral over an $yz$ -Simple Solid

If  $f$  is a function of three variables that is continuous on a  $yz$ -simple solid  $E$ , then

$$\iiint_E f(x, y, z) dV = \iint_R \left[ \int_{x_1(y, z)}^{x_2(y, z)} f(x, y, z) dx \right] dA$$

### EXAMPLE 6 Finding the Volume of a Solid That Is $yz$ -simple

Find the volume  $V$  of the solid  $E$  that is enclosed by the cylinder  $y^2 + z^2 = 4$ , and the planes  $x = 0$ ,  $z = 0$ , and  $x + z = 5$ .

**Solution** Figure 50(a) shows that the solid  $E$  is  $yz$ -simple. The front surface is the plane  $x_2(y, z) = 5 - z$  and the back surface is the plane  $x_1(y, z) = 0$ . The region  $R$  in the  $yz$ -plane is enclosed by the  $y$ -axis and the semi-circle  $z = \sqrt{4 - y^2}$ ; it is  $y$ -simple. So,  $0 \leq z \leq \sqrt{4 - y^2}$  and  $-2 \leq y \leq 2$ . See Figure 50(b). The volume  $V$  of  $E$  is given by

$$\begin{aligned} V &= \iiint_E dV = \iint_R \left[ \int_{x_1(y, z)}^{x_2(y, z)} dx \right] dz dy = \int_{-2}^2 \int_0^{\sqrt{4-y^2}} \int_0^{5-z} dx dz dy \\ &= \int_{-2}^2 \int_0^{\sqrt{4-y^2}} (5 - z) dz dy = \int_{-2}^2 \left[ 5z - \frac{z^2}{2} \right]_0^{\sqrt{4-y^2}} dy \\ &= \int_{-2}^2 \left( 5\sqrt{4-y^2} - \frac{4-y^2}{2} \right) dy \\ &= 5 \int_{-2}^2 \sqrt{4-y^2} dy - \int_{-2}^2 \left( 2 - \frac{y^2}{2} \right) dy \\ &= 5(2\pi) - \left[ 2y - \frac{y^3}{6} \right]_{-2}^2 = 10\pi - \frac{16}{3} \end{aligned}$$

**NOW WORK** Example 2 treating  $E$  as an  $xz$ -simple region.

## 14.6 Assess Your Understanding

### Concepts and Vocabulary

- True or False** A solid  $E$  in space is called  $xy$ -simple if it is enclosed on the top by a surface  $z = z_2(x, y)$  and on the bottom by a surface  $z = z_1(x, y)$ , where  $z_1 \leq z_2$  and  $z_1$  and  $z_2$  are continuous, and the sides of  $E$  are a cylinder whose intersection with the  $xy$ -plane forms a closed, bounded region  $R$ .
- True or False** The region  $R$  resulting from the projection onto the  $xy$ -plane of an  $xy$ -simple solid  $E$  is both  $x$ -simple and  $y$ -simple.

3. **True or False** The mass  $M$  of a solid with a mass density  $\rho = \rho(x, y, z)$  that is continuous in a region  $E$  of volume  $V$  is given by  $M = \iiint_E \rho(x, y, z) dV$ .
4. **True or False** The triple integral  $\iiint_E dV$  can be interpreted geometrically as the area of the region  $R$  that is the projection of  $E$  onto the  $xy$ -plane.

### Skill Building

In Problems 5–10, find each triple integral.

5.  $\iiint_E xy^2 dV$ ,  
 $E$  is the closed box  $0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 4$ .
6.  $\iiint_E x^2 yz dV$ ,  
 $E$  is the closed box  $0 \leq x \leq 2, 0 \leq y \leq 1, 0 \leq z \leq 2$ .
7.  $\iiint_E (x^2 + y^2 + z^2) dV$ ,  
 $E$  is the closed box  $0 \leq x \leq 1, 0 \leq y \leq 1, 0 \leq z \leq 1$ .
8.  $\iiint_E (x^2 - y^2 + z^2) dV$ ,  
 $E$  is the closed box  $0 \leq x \leq 1, 0 \leq y \leq 2, 0 \leq z \leq 1$ .
9.  $\iiint_E e^z \sin x \cos y dV$ ,  
 $E$  is the closed box  $0 \leq x \leq \frac{\pi}{2}, 0 \leq y \leq \frac{\pi}{2}, 0 \leq z \leq 1$ .
10.  $\iiint_E e^{-z} \cos x \cos y dV$ ,  
 $E$  is the closed box  $0 \leq x \leq \frac{\pi}{2}, 0 \leq y \leq \frac{\pi}{2}, 0 \leq z \leq 1$ .

In Problems 11–18, find each iterated triple integral.

11.  $\int_0^2 \int_0^{2-3x} \int_0^{x+y} x dz dy dx$
12.  $\int_0^1 \int_0^{-x} \int_0^{2x+y} z dz dy dx$
13.  $\int_0^3 \int_z^{z+2} \int_y^{y+z} (2x+1) dx dy dz$
14.  $\int_0^2 \int_y^{y+2} \int_y^{x+y} (4z-1) dz dx dy$
15.  $\int_0^2 \int_0^1 \int_0^y e^x dx dy dz$
16.  $\int_1^2 \int_0^z \int_0^{\sqrt{y}} x e^{x^2} dx dy dz$
17.  $\int_0^{\pi/2} \int_y^{\pi/2} \int_0^{xy} \sin \frac{z}{y} dz dx dy$
18.  $\int_0^{\pi/2} \int_x^{\pi/2} \int_0^{xy} \cos \frac{z}{x} dz dy dx$

In Problems 19–24, find  $\iiint_E xy dV$ .

19.  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = 5 - x - y$ , whose projection onto the  $xy$ -plane is the region enclosed by the rectangle  $0 \leq x \leq 1$  and  $0 \leq y \leq 3$ .
20.  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = 16 - x^2 - y^2$ , whose projection onto the  $xy$ -plane is the region enclosed by the rectangle  $0 \leq x \leq 2$  and  $0 \leq y \leq 1$ .

21.  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = xy$ , whose projection onto the  $xy$ -plane is the region enclosed by the triangle with vertices  $(0, 0, 0)$ ,  $(0, 1, 0)$ , and  $(1, 0, 0)$ .
22.  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = x^2 + y^2$ , whose projection onto the  $xy$ -plane is the region enclosed by the triangle with vertices  $(0, 0, 0)$ ,  $(1, 0, 0)$ , and  $(0, 2, 0)$ .
23.  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = 3 - x - y$ , whose projection onto the  $xy$ -plane is the region enclosed by the triangle with vertices  $(0, 0, 0)$ ,  $(1, 1, 0)$ , and  $(1, -1, 0)$ .
24.  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = 3 + 2y$ , whose projection onto the  $xy$ -plane is the region enclosed by the triangle with vertices  $(-1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(2, 0, 0)$ .

In Problems 25 and 26, use a CAS to approximate each integral.

- CAS** 25.  $\int_0^1 \int_1^{x^2} \int_0^{\sqrt{x}} y e^x dz dy dx$
- CAS** 26.  $\int_3^4 \int_2^3 \int_0^1 \ln(x^2 + y^2 + z^2) dx dy dz$

### Applications and Extensions

In Problems 27–30, find each triple integral.

27.  $\iiint_E x dV$ , if  $E$  is the solid enclosed by the tetrahedron having vertices at  $(0, 0, 0)$ ,  $(1, 1, 0)$ ,  $(1, 0, 0)$ ,  $(1, 0, 1)$ .
28.  $\iiint_E (x^2 + z^2) dV$ , if  $E$  is the solid enclosed by the tetrahedron having vertices at  $(0, 0, 0)$ ,  $(1, 1, 0)$ ,  $(1, 0, 0)$ ,  $(1, 0, 1)$ .
29.  $\iiint_E (xy + 3y) dV$ , if  $E$  is the solid enclosed by the cylinder  $x^2 + y^2 = 9$  and the planes  $x + z = 3$ ,  $y = 0$ , and  $z = 0$ .
30.  $\iiint_E xyz dV$ , if  $E$  is the solid enclosed by the cylinders  $x^2 + y^2 = 1$  and  $x^2 + z^2 = 1$ . See the figure.

In Problems 31–34, (a) describe the solid whose volume is given by each integral.

**CAS** (b) Graph the solid.

31.  $\int_{-2}^2 \int_0^{\sqrt{4-y^2}} \int_0^1 dz dx dy$
32.  $\int_0^2 \int_0^{\sqrt{4-y^2}} \int_0^{4-x^2-y^2} dz dx dy$
33.  $\int_0^1 \int_0^{x^2} \int_0^y dz dy dx$
34.  $\int_0^1 \int_{y^2}^1 \int_0^{1-x} dz dx dy$

35. **Volume of a Solid** Find the volume  $V$  of the solid enclosed by  $y^2 = z$ ,  $x = 0$ , and  $x = y - z$ .

- 36. Volume of a Solid** Find the volume  $V$  of the solid enclosed by  $z = 4 - y^2$ ,  $z = 9 - x$ ,  $x = 0$ , and  $z = 0$ .
- 37.** Set up, but do not find,  $\iiint_E xy \, dV$ , where  $E$  is the solid enclosed by the surfaces  $z = 1 - \frac{x}{2} - y$  and  $z = 3 - x - y$ , whose projection onto the  $xy$ -plane is the region enclosed by the circle  $x^2 + y^2 = 1$ .
- 38.** Set up, but do not find,  $\iiint_E xy \, dV$ , where  $E$  is the solid enclosed by the surfaces  $z = 0$  and  $z = x^2 + y$ , whose projection onto the  $xy$ -plane is the region enclosed by the circle  $x^2 + y^2 = 4$ .

In Problems 39–41, set up, but do not find, the triple integral that equals the volume of the solid.

- 39.** Enclosed by  $z = x^2 + y^2$  and  $z = 16 - x^2 - y^2$ .
- 40.** Enclosed by  $z = x^2 + y^2$  and  $z = 2 - x$ .
- 41.** Enclosed by  $z^2 = 4x$  and  $x^2 + y^2 = 2x$ .

**CAS** **42. Volume**

- (a) Find the volume  $V$  of the solid enclosed by  $x^2 + 2y^2 = 1$  and the planes  $z = x + 1$  and  $z = 4$ .
- (b) Graph the solid.

- 43. Mass** Find the mass  $M$  of an object in the shape of a cube of edge  $a$  if its mass density is proportional to the square of the distance from one corner.

- 44. Mass** Set up, but do not find, the integral that equals the mass  $M$  of an object in the shape of a right circular cylinder of height  $h$  and radius  $a$ , if its mass density is proportional to the square of the distance from the axis of the cylinder.

- 45. Mass** Set up, but do not find, the integral that equals the mass  $M$  of an object in the shape of a tetrahedron cut from the first octant by the plane  $x + y + z = 1$ , as shown in the figure, if its mass density is proportional to the product of the distances from the three coordinate planes.

- CAS** **46. Mass** A cylindrical bar of radius  $R$  and length  $2L$  is positioned with its axis along the  $x$ -axis and its center of mass at the origin. The mass density of the bar is given by  $\rho(x, y, z) = kz^2$ . Show that the mass  $M$  of the bar is  $M = \frac{1}{2}\pi k R^4 L$ .

- 47. Moments of Inertia** Set up the integrals that equal the moments of inertia  $I_x$  and  $I_y$  for the solid region enclosed by the hemisphere  $z = \sqrt{9 - x^2 - y^2}$  and the  $xy$ -plane, if the mass density is proportional to the distance from the  $xy$ -plane.

- 48.** Set up, but do not find, the integral of the function  $f(x, y, z) = x^2 yz$  over the solid enclosed by the cone  $3x^2 + 3y^2 = z^2$ ,  $z \geq 0$ , and the plane  $z = 3$ .

In Problems 49 and 50, for each solid  $E$ , express the triple integral  $\iiint_E f(x, y, z) \, dV$  as an iterated integral in six different ways.

- 49.**  $E$  is the solid enclosed by the coordinate planes and the plane  $x + 2y + 3z = 6$ .

- 50.**  $E$  is the solid enclosed by the coordinate planes and the plane  $x + y + z = 3$ .

- 51. Volume of an Ellipsoid** Show that the volume of the ellipsoid  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  is  $\frac{4}{3}\pi abc$ . (Assume that  $a$ ,  $b$ , and  $c$  are positive.) What does this formula reduce to if  $a = b = c$ ?

### Challenge Problems

- 52. Volume of a Solid** Find the volume of the solid in the first octant enclosed by the coordinate planes,  $a^2 y = b(a^2 - x^2)$  and  $a^2 z = c(a^2 - x^2)$ ,  $a > 0$ ,  $b > 0$ ,  $c > 0$ .

- 53. Volume of a Solid** Find the volume  $V$  of the region enclosed by  $z = 0$ ,  $z = 1 - x^2$ , and  $z = 1 - y^2$ .

- 54. Average Value of a Function** The average value of  $f$  over a region  $R$  that is not necessarily rectangular is defined to be the number  $\frac{1}{A} \iint_R f(x, y) \, dA$ .

- (a) In single variable calculus the average value of a function  $f$  over the closed interval  $[a, b]$  is defined to be the number

$$\frac{1}{b-a} \int_a^b f(x) \, dx. \text{ In what sense is this a special case of the above definition of the average value of } f \text{ over } R?$$

- (b) Let  $w = f(x, y, z)$  be integrable over a solid  $S$  in space. What definition would you give for the average value of  $f$  over  $S$ ?

- 55.** Show that the following integrals represent the same volume. Do not find the integrals.

(a)  $4 \int_0^4 \int_0^{\sqrt{16-x^2}} \int_{(x^2+y^2)/4}^4 dz \, dy \, dx$

(b)  $4 \int_0^4 \int_0^{2\sqrt{z}} \int_0^{\sqrt{4z-x^2}} dy \, dx \, dz$

(c)  $4 \int_0^4 \int_{y^2/4}^4 \int_0^{\sqrt{4z-y^2}} dx \, dz \, dy$

- 56.** Show that:

$$\int_a^b \int_a^z \int_a^y f(x) \, dx \, dy \, dz = \int_a^b \frac{(b-x)^2}{2} f(x) \, dx$$

## 14.7 Triple Integrals Using Cylindrical Coordinates

Figure 51

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Convert rectangular coordinates to cylindrical coordinates (p. 950)
- 2 Find a triple integral using cylindrical coordinates (p. 951)

We have seen that there are instances where it is easier to find a double integral using polar coordinates than to find it using rectangular coordinates. For triple integrals, we give two alternatives to integration in rectangular coordinates: One uses *cylindrical coordinates* and the other uses *spherical coordinates* (Section 14.8).

### 1 Convert Rectangular Coordinates to Cylindrical Coordinates

If the rectangular coordinates of a point  $P$  in three-dimensional space are  $(x, y, z)$  and if  $(r, \theta, 0)$  are the polar coordinates for the projection of  $P$  onto the  $xy$ -plane, then the point  $P$  can be located by the ordered triple  $(r, \theta, z)$ , called the **cylindrical coordinates of the point  $P$** .

Figure 51 shows how to graph a point  $P = (r, \theta, z)$ . The algebraic relationship between the cylindrical coordinates  $(r, \theta, z)$  and the rectangular coordinates  $(x, y, z)$  of a point  $P$  is given by the formulas

$$x = r \cos \theta \quad y = r \sin \theta \quad z = z$$

### Converting Between Cylindrical Coordinates and Rectangular Coordinates

#### EXAMPLE 1

- Find the rectangular coordinates of a point  $P$  whose cylindrical coordinates are  $\left(6, \frac{\pi}{3}, -2\right)$ .
- Find the cylindrical coordinates of a point  $P$  whose rectangular coordinates are  $(\sqrt{3}, 1, 5)$ .

**Solution** (a) We use the equations  $x = r \cos \theta$  and  $y = r \sin \theta$  with  $r = 6$  and  $\theta = \frac{\pi}{3}$ . Then

$$x = 6 \cos \frac{\pi}{3} = 3 \quad y = 6 \sin \frac{\pi}{3} = 3\sqrt{3} \quad z = -2$$

In rectangular coordinates,  $P = (3, 3\sqrt{3}, -2)$ .

- (b) In cylindrical coordinates  $r = \sqrt{x^2 + y^2} = \sqrt{3 + 1} = 2$ . Then  $\cos \theta = \frac{x}{r} = \frac{\sqrt{3}}{2}$  and  $\sin \theta = \frac{y}{r} = \frac{1}{2}$  so  $\theta = \frac{\pi}{6}$ . Since  $z$  remains the same, the point  $P$  in cylindrical coordinates is  $(r, \theta, z) = \left(2, \frac{\pi}{6}, 5\right)$ . ■

**NOW WORK** Problems 5 and 13.

**NOTE** The numbers  $r$ ,  $\theta$ , and  $z$  are called cylindrical coordinates because if  $r$  is a constant, then the surface traced out by the set of points  $(r, \theta, z)$  is a cylinder.

Table 1 lists the equations of several surfaces expressed in rectangular coordinates and in cylindrical coordinates. Figure 52 illustrates the surfaces.

TABLE 1

| Surface                 | Rectangular             | Cylindrical                                            |
|-------------------------|-------------------------|--------------------------------------------------------|
| (a) Half-Plane          | $y = x \tan k$          | $\theta = k, \quad -\frac{\pi}{2} < k < \frac{\pi}{2}$ |
| (b) Plane               | $z = k$                 | $z = k$                                                |
| (c) Cylinder            | $x^2 + y^2 = a^2$       | $r = a, \quad a > 0$                                   |
| (d) Sphere              | $x^2 + y^2 + z^2 = R^2$ | $r^2 + z^2 = R^2$                                      |
| (e) Circular cone       | $x^2 + y^2 = a^2 z^2$   | $r = az, \quad a > 0$                                  |
| (f) Circular paraboloid | $x^2 + y^2 = az$        | $r^2 = az, \quad a > 0$                                |

Figure 52

Triple integrals that have symmetry about an axis, particularly integrals involving cylinders or cones whose axes are aligned with the  $z$ -axis, are often easier to find using cylindrical coordinates.

## 2 Find a Triple Integral Using Cylindrical Coordinates

Consider a wedge-shaped solid enclosed by two planes passing through the  $z$ -axis ( $\theta = \theta_1$  and  $\theta = \theta_2$ ), two concentric circular cylinders centered about the  $z$ -axis ( $r = r_1$  and  $r = r_2$ ), and two parallel planes perpendicular to the  $z$ -axis ( $z = z_1$  and  $z = z_2$ ), as shown in Figure 53. The projection of the wedge-shaped solid onto the  $xy$ -plane is a polar subregion whose area  $\Delta A$  is

$$\begin{aligned}\Delta A &= \text{outer sector} - \text{inner sector} = \frac{1}{2}r_2^2\Delta\theta - \frac{1}{2}r_1^2\Delta\theta \\ &= \frac{1}{2}(r_2^2 - r_1^2)\Delta\theta = \frac{1}{2}(r_2 + r_1)(r_2 - r_1)\Delta\theta = \bar{r}\Delta r\Delta\theta\end{aligned}$$

where  $\bar{r} = \frac{r_1 + r_2}{2}$ ,  $\Delta r = r_2 - r_1$ , and  $\Delta\theta = \theta_2 - \theta_1$ . The volume  $\Delta V$  of the wedge is  $\Delta V = \Delta A \Delta z = \bar{r} \Delta r \Delta\theta \Delta z$ . The differential  $dV$  of volume  $V$  in cylindrical coordinates is

$$dV = r \, dr \, d\theta \, dz$$

Figure 53

**NEED TO REVIEW?** The area of a sector of a circle is discussed in Appendix A.4, p. A-27.

Figure 54

Now consider a solid  $E$ . We partition  $E$  into wedge-shaped subsolids by passing planes and cylinders through  $E$ . After discarding all subsolids that do not lie entirely in  $E$ , there will be  $n$  subsolids remaining. The shaded portion of Figure 54 illustrates a typical subsolid, denoted by  $E_i$ . The norm  $\|P\|$  of the partition is the length of the longest diagonal of the largest subsolid.

Now suppose  $f$  is a function of the cylindrical coordinates  $r$ ,  $\theta$ , and  $z$ . Let  $(\bar{r}_i, \bar{\theta}_i, \bar{z}_i)$  be the center of  $E_i$ , and evaluate  $f(\bar{r}_i, \bar{\theta}_i, \bar{z}_i)$ . Then form the sums

$$\sum_{i=1}^n f(\bar{r}_i, \bar{\theta}_i, \bar{z}_i) \bar{r}_i \Delta r_i \Delta\theta_i \Delta z_i$$

It can be shown that if  $f$  is continuous on  $E$ , then these sums have a limit as the norm  $\|P\|$  approaches 0. We define the triple integral as this limit.

$$\iiint_E f(r, \theta, z) \, dV = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n f(\bar{r}_i, \bar{\theta}_i, \bar{z}_i) \bar{r}_i \Delta r_i \Delta\theta_i \Delta z_i$$

That is,

$$\iiint_E f(r, \theta, z) \, dV = \iiint_E f(r, \theta, z) \, r \, dr \, d\theta \, dz$$

Sometimes a triple integral can be found using an iterated integral.

**NOTE** The integrand contains a factor of  $r$  because in cylindrical coordinates the differential  $dV$  of volume is  $dV = r \, dr \, d\theta \, dz$ .

### THEOREM Sufficient Condition for Using an Iterated Integral

Suppose a solid  $E$  is enclosed by the surfaces  $z = z_1(r, \theta)$  and  $z = z_2(r, \theta)$ , where the functions  $z_1$  and  $z_2$  are continuous and  $0 \leq z_1 \leq z_2$ . Suppose the projection of  $E$  onto the  $r\theta$ -plane is a closed, bounded region  $R$ . If the function  $f$  of three variables is continuous on  $E$ , then

$$\iiint_E f(r, \theta, z) \, dV = \iint_R \left[ \int_{z_1(r, \theta)}^{z_2(r, \theta)} f(r, \theta, z) \, dz \right] r \, dr \, d\theta$$

To find the value of the inside integral  $\int_{z_1(r, \theta)}^{z_2(r, \theta)} f(r, \theta, z) \, dz$ , we treat  $r$  and  $\theta$  as constants and integrate partially with respect to  $z$ .

Suppose the region  $R$  is enclosed by the rays  $\theta = \theta_1$  and  $\theta = \theta_2$ , and the curves  $r = r_1(\theta)$  and  $r = r_2(\theta)$ , where  $0 \leq r_1 \leq r_2$ . If the functions  $r_1$  and  $r_2$  are continuous for  $\theta_1 \leq \theta \leq \theta_2$ , then

$$\iiint_E f(r, \theta, z) \, dV = \iint_R \int_{z_1(r, \theta)}^{z_2(r, \theta)} f(r, \theta, z) \, dz \, r \, dr \, d\theta = \int_{\theta_1}^{\theta_2} \left\{ \int_{r_1(\theta)}^{r_2(\theta)} \left[ \int_{z_1(r, \theta)}^{z_2(r, \theta)} f(r, \theta, z) \, dz \right] r \, dr \right\} d\theta$$

Five other orders for the iteration are possible; our choice depends on  $E$ . As before, the braces and the brackets are usually omitted.

### EXAMPLE 2 Finding a Triple Integral Using Cylindrical Coordinates

Give a geometric interpretation of the triple integral

$$\int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_0^{2\sqrt{1-x^2-y^2}} dz \, dy \, dx$$

Then use cylindrical coordinates to find the triple integral.

**Solution** The solid  $E$  of integration and its projection onto the  $xy$ -plane can be described by the inequalities

$$0 \leq z \leq 2\sqrt{1-x^2-y^2} \quad -\sqrt{1-x^2} \leq y \leq \sqrt{1-x^2} \quad -1 \leq x \leq 1$$

The limits of integration on  $z$  are  $z = 0$  and  $z = 2\sqrt{1-x^2-y^2} = \sqrt{4-4x^2-4y^2}$  or, equivalently,  $z^2 = 4-4x^2-4y^2$ ,  $z \geq 0$ . We can interpret the integral as the volume of a solid  $E$  that is the upper half of the ellipsoid  $4x^2 + 4y^2 + z^2 = 4$ ,  $z \geq 0$ , as shown in Figure 55. From the  $x$  and  $y$  limits of integration, the projection onto the  $xy$ -plane is the region  $R$  enclosed by the circle  $x^2 + y^2 = 1$ .

To find the integral, we convert the rectangular coordinates to cylindrical coordinates. Then

$$z = 2\sqrt{1-x^2-y^2} = 2\sqrt{1-(x^2+y^2)} = 2\sqrt{1-r^2}$$

The projection onto the  $xy$ -plane is the region enclosed by the circle  $x^2 + y^2 = 1$ . So in cylindrical coordinates, we have

$$0 \leq z \leq 2\sqrt{1-r^2} \quad 0 \leq r \leq 1 \quad 0 \leq \theta \leq 2\pi$$

Then

$$\begin{aligned} \int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_0^{2\sqrt{1-x^2-y^2}} dz \, dy \, dx &= \int_0^{2\pi} \int_0^1 \int_0^{2\sqrt{1-r^2}} dz \, r \, dr \, d\theta \\ &= \int_0^{2\pi} \int_0^1 [z]_0^{2\sqrt{1-r^2}} r \, dr \, d\theta = \int_0^{2\pi} \int_0^1 2r\sqrt{1-r^2} \, dr \, d\theta \\ &= \int_0^{2\pi} \left[ -\frac{2}{3}(1-r^2)^{3/2} \right]_0^1 d\theta = \frac{2}{3} \int_0^{2\pi} d\theta = \frac{4\pi}{3} \end{aligned}$$

Figure 55

The value of the triple integral  $\frac{4\pi}{3}$  equals the volume  $V$  of the solid. That is,

$$V = \frac{4\pi}{3} \text{ cubic units}$$

**NOW WORK** Problem 19.

**EXAMPLE 3** Finding the Volume of a Solid Using Cylindrical Coordinates

Find the volume of the solid enclosed by the hemisphere  $x^2 + y^2 + z^2 = 4$ ,  $z \geq 0$ , and the cylinder  $(x - 1)^2 + y^2 = 1$ .

**Solution** Figure 56(a) shows the hemisphere and the part of the cylinder whose volume we seek.

Because  $x^2 + y^2$  appears in the equation of both the hemisphere and cylinder, we use cylindrical coordinates. The equation of the hemisphere is

Rectangular Coordinates:  $x^2 + y^2 + z^2 = 4$ ,  $z \geq 0$

Cylindrical Coordinates:  $r^2 + z^2 = 4$ ,  $z \geq 0$ , or equivalently,  $z = \sqrt{4 - r^2}$

The equation of the region in the  $xy$ -plane above which the surface lies is given by:

Rectangular Coordinates:  $(x - 1)^2 + y^2 = 1$

$$x^2 + y^2 = 2x$$

Cylindrical Coordinates:  $r^2 = 2(r \cos \theta)$   $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$   
 $r = 2 \cos \theta$

See Figure 56(b).

The solid  $E$  whose volume we seek is given by  $0 \leq z \leq \sqrt{4 - r^2}$ ,  $0 \leq r \leq 2 \cos \theta$ , and  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ . The volume  $V$  of the solid is

$$\begin{aligned} V &= \iiint_E dV = \iiint_E r \, dr \, d\theta \, dz = 2 \int_0^{\pi/2} \int_0^{2 \cos \theta} \int_0^{\sqrt{4-r^2}} r \, dz \, dr \, d\theta \\ &= 2 \int_0^{\pi/2} \int_0^{2 \cos \theta} r [z]_0^{\sqrt{4-r^2}} \, dr \, d\theta = 2 \int_0^{\pi/2} \int_0^{2 \cos \theta} r(4-r^2)^{1/2} \, dr \, d\theta \\ &= - \int_0^{\pi/2} \left[ \frac{2}{3} (4-r^2)^{3/2} \right]_0^{2 \cos \theta} d\theta \\ &= \frac{2}{3} \int_0^{\pi/2} [8 - (4 - 4 \cos^2 \theta)^{3/2}] d\theta = \frac{16}{3} \int_0^{\pi/2} (1 - \sin^3 \theta) d\theta \\ &= \frac{8\pi}{3} - \frac{32}{9} \text{ cubic units} \end{aligned}$$

**NOW WORK** Problems 27 and 33.

**EXAMPLE 4** Finding the Moment of Inertia of a Solid

Find the moment of inertia about the  $z$ -axis of a homogeneous solid  $E$  of mass density  $\rho$  enclosed by the paraboloid  $z = 1 - x^2 - y^2$  and the  $xy$ -plane.

**Solution** In cylindrical coordinates, the solid  $E$  is enclosed on the top by the paraboloid  $z = 1 - x^2 - y^2 = 1 - r^2$  and on the bottom by  $z = 0$ . In the  $xy$ -plane, the region is bounded by the circle  $x^2 + y^2 = 1$ . So, we have

$$0 \leq \theta \leq 2\pi \quad 0 \leq r \leq 1 \quad 0 \leq z \leq 1 - r^2$$

Figure 56

The moment of inertia  $I_z$  about the  $z$ -axis is

$$\begin{aligned} I_z &= \iiint_E r^2 \rho \, dV = \rho \iiint_E r^2 r \, dr \, d\theta \, dz = \rho \int_0^{2\pi} \int_0^1 \int_0^{1-r^2} r^3 \, dz \, dr \, d\theta \\ &= \rho \int_0^{2\pi} \int_0^1 r^3 (1-r^2) \, dr \, d\theta = \rho \int_0^{2\pi} \left[ \frac{r^4}{4} - \frac{r^6}{6} \right]_0^1 d\theta = \rho \int_0^{2\pi} \frac{1}{12} d\theta = \frac{\pi}{6} \rho \quad \blacksquare \end{aligned}$$

**NOW WORK** Problem 43.

**CAS** **EXAMPLE 5** Finding the Moment of Inertia of a Sphere

Find the moment of inertia of a homogeneous solid  $E$  in the shape of a sphere of radius 2 about a diameter.

- (a) Set up the integral to find the moment of inertia of the sphere about a diameter.  
 (b) Use a CAS to find the moment of inertia from (a).

**Solution** (a) Let  $\rho$  denote the constant mass density of the sphere of radius 2. We position the sphere so that its center is at the origin. The equation of the sphere is then  $x^2 + y^2 + z^2 = 4$ , or, in cylindrical coordinates,  $r^2 + z^2 = 4$ . If we use the  $z$ -axis as the diameter, the moment of inertia about a diameter is given by the moment of inertia  $I_z$  about the  $z$ -axis. Then

$$I_z = \iiint_E r^2 \rho \, dV = \rho \int_0^{2\pi} \int_0^2 \int_{-\sqrt{4-r^2}}^{\sqrt{4-r^2}} r^3 \, dz \, dr \, d\theta$$

- (b) We use a CAS to find

$$I_z = \rho \int_0^{2\pi} \int_0^2 \int_{-\sqrt{4-r^2}}^{\sqrt{4-r^2}} r^3 \, dz \, dr \, d\theta = \frac{256\pi\rho}{15} \quad \blacksquare$$

## 14.7 Assess Your Understanding

### Concepts and Vocabulary

- To convert a point  $P = (x, y, z)$  from rectangular coordinates to cylindrical coordinates  $(r, \theta, z)$ , use the equations:  
 $x =$  \_\_\_\_\_,  $y =$  \_\_\_\_\_, and  $z =$  \_\_\_\_\_.
- Expressed in cylindrical coordinates, the circular cone  $x^2 + y^2 = 4z^2$  has the form \_\_\_\_\_.
- In cylindrical coordinates  $(r, \theta, z)$ , the differential  $dV$  of volume is \_\_\_\_\_.
- True or False* In cylindrical coordinates,  $\iiint_E r \, dr \, d\theta \, dz$  equals the volume of the solid  $E$ .

8.  $(2, -2, 4)$       9.  $(2, 0, 4)$       10.  $\left(-1, 0, \frac{1}{2}\right)$

11.  $(0, 3, 4)$       12.  $(0, 1, -3)$

In Problems 13–18, find the rectangular coordinates  $(x, y, z)$  of each point with the given cylindrical coordinates.

13.  $\left(2, \frac{\pi}{6}, -5\right)$       14.  $\left(4, \frac{\pi}{3}, 3\right)$       15.  $(1, 0, 8)$   
 16.  $\left(4, \frac{\pi}{6}, 2\right)$       17.  $\left(2, \frac{\pi}{2}, 0\right)$       18.  $\left(-3, \frac{\pi}{2}, 1\right)$

### Skill Building

In Problems 5–12, find the cylindrical coordinates  $(r, \theta, z)$  of each point with the given rectangular coordinates.

5.  $(-\sqrt{3}, -1, -5)$       6.  $(-1, \sqrt{3}, 4)$       7.  $(1, 1, \sqrt{2})$

In Problems 19–22, give a geometric interpretation of each triple integral.

19.  $\int_{-1}^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_0^{\sqrt{1-x^2-z^2}} dy \, dz \, dx$

$$20. \int_0^1 \int_0^{\sqrt{1-z^2}} \int_0^{\sqrt{1-y^2-z^2}} dx dy dz$$

$$21. \int_0^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} \int_0^{\sqrt{x^2+y^2}} dz dy dx$$

$$22. \int_0^3 \int_{-\sqrt{9-x^2}}^{\sqrt{9-x^2}} \int_0^{\sqrt{x^2+z^2}} dy dz dx$$

In Problems 23–26, find each iterated integral.

$$23. \int_{\pi/6}^{\pi/2} \int_0^3 \int_0^{r \sin \theta} r \csc^3 \theta dz dr d\theta$$

$$24. \int_{\pi/6}^{\pi/2} \int_0^1 \int_0^{\sin \theta} r \cos \theta \sin \theta dz dr d\theta$$

$$25. \int_0^{\pi/3} \int_0^1 \int_0^{e^{-1}} r dz dr d\theta$$

$$26. \int_0^{\pi/3} \int_0^{\sin \theta} \int_0^{r \sin \theta} r dz dr d\theta$$

In Problems 27–32, find each triple integral by converting to cylindrical coordinates.

$$27. \iiint_E dV, \text{ where } E \text{ is the solid enclosed by the planes } z = 1 \text{ and } z = 4, \text{ and the cylinders } x^2 + y^2 = 1 \text{ and } x^2 + y^2 = 9.$$

$$28. \iiint_E dV, \text{ where } E \text{ is the solid enclosed by the } xy\text{-plane, } z = 3, \text{ and the cylinder } x^2 + y^2 = 4.$$

$$29. \iiint_E y dV, \text{ where } E \text{ is the solid enclosed by the planes } z = 1 \text{ and } z = x + 3, \text{ and the cylinders } x^2 + y^2 = 1 \text{ and } x^2 + y^2 = 4.$$

$$30. \iiint_E x dV, \text{ where } E \text{ is the solid enclosed by the planes } z = 0 \text{ and } z = x, \text{ and the cylinder } x^2 + y^2 = 9.$$

$$31. \iiint_E xy dV, \text{ where } E \text{ is the solid enclosed by the surfaces } z = 1 - x - y \text{ and } z = 3 - x - y, \text{ whose projection onto the } xy\text{-plane is the circle } x^2 + y^2 = 1.$$

$$32. \iiint_E xy dV, \text{ where } E \text{ is the solid enclosed by the surfaces } z = 0 \text{ and } z = x^2 + y^2, \text{ whose projection onto the } xy\text{-plane is the circle } x^2 + y^2 = 4.$$

$$36. \text{Volume} \quad \text{Find the volume } V \text{ of the solid enclosed by } z = x^2 + y^2 \text{ and } z = 2 - x.$$

$$37. \text{Volume} \quad \text{Find the volume } V \text{ of the solid enclosed by } z^2 = 4x \text{ and } x^2 + y^2 = 2x.$$

$$38. \text{Mass} \quad \text{Find the mass of a homogeneous solid of mass density } \rho \text{ in the shape of a sphere of radius } a.$$

$$39. \text{Mass} \quad \text{Find the mass of a solid in the shape of a sphere of radius } a, \text{ if the mass density } \rho \text{ is proportional to the square of the distance from the center.}$$

$$40. \text{Mass} \quad \text{Find the mass } M \text{ of an object in the shape of a right circular cylinder of height } h \text{ and radius } a, \text{ if its mass density is proportional to the square of the distance from the axis of the cylinder.}$$

$$41. \text{Moments of Inertia} \quad \text{Find the moments of inertia } I_x \text{ and } I_y \text{ for the solid region enclosed by the hemisphere } z = \sqrt{9 - x^2 - y^2} \text{ and the } xy\text{-plane, if the mass density is proportional to the distance from the } xy\text{-plane.}$$

$$42. \text{Center of Mass} \quad \text{Find the center of mass of a homogeneous solid in the first octant enclosed by the surface } z = xy \text{ and the cylinder } x^2 + y^2 = 4.$$

$$43. \text{Center of Mass} \quad \text{Find the center of mass of a homogeneous solid enclosed by the surface } x^2 + y^2 = 4z \text{ and the plane } z = 2.$$

$$44. \text{Center of Mass} \quad \text{Find the center of mass of a homogeneous solid enclosed by the inside of the sphere } x^2 + y^2 + z^2 = 12 \text{ and above the paraboloid } z = x^2 + y^2.$$

$$45. \text{Center of Mass} \quad \text{Find the center of mass of a homogeneous solid enclosed by the paraboloid } z = x^2 + y^2 \text{ and the plane } z = 4.$$

$$46. \text{Center of Mass} \quad \text{Use cylindrical coordinates to find the mass of the homogeneous solid bounded on the sides by } x^2 + y^2 = 1, \text{ on the bottom by the } xy\text{-plane, and on the top by } x^2 + y^2 + z^2 = 2.$$

$$47. \text{Joint Between Two Rods} \quad \text{Find the mass of the intersection of two rods with constant mass density } \rho \text{ that is formed by the cylinders } x^2 + y^2 = 1 \text{ and } x^2 + z^2 = 1.$$

**CAS** 48. **Volume of a Mountain** The height of a mountain (in km) can be approximated by  $z = 5.3e^{-(x^2+y^2)}$ .

(a) Sketch the mountain over the region  $x^2 + y^2 \leq 4$ .

(b) Find the volume of the mountain over the region  $x^2 + y^2 \leq 4$ .

## Applications and Extensions

$$33. \text{Volume} \quad \text{Find the volume of the solid enclosed by the intersection of the sphere } x^2 + y^2 + z^2 = 9 \text{ and the cylinder } x^2 + y^2 = 2.$$

$$34. \text{Volume} \quad \text{Find the volume of the solid enclosed by the intersection of the sphere } x^2 + y^2 + z^2 = 4 \text{ and the cylinder } x^2 + y^2 = 2x.$$

$$35. \text{Volume} \quad \text{Find the volume } V \text{ of the solid enclosed by } z = x^2 + y^2 \text{ and } z = 16 - x^2 - y^2.$$

In Problems 49 and 50, each integral is given in cylindrical coordinates. Express each integral in rectangular coordinates. Do not integrate.

$$49. \int_0^{2\pi} \int_0^4 \int_{-r}^{\sqrt{16-r^2}} z^2 r^5 \cos^4 \theta dz dr d\theta$$

$$50. \int_0^{\pi/2} \int_0^2 \int_{-r^2}^9 z^2 r^4 \sin^4 \theta dz dr d\theta$$

## Challenge Problems

**51. Volume** A circular hole of radius  $r$  is drilled through a sphere of radius  $R > r$ , as shown in the figure.

- (a) Find  $r$  in terms of  $R$  so that the hole removes exactly half of the volume of the sphere. (Hint: set up a volume integral in cylindrical coordinates for the hole.)

- (b) Find  $r$  rounded to three decimal places if  $R = 10$  cm.

**52. Volume** Find the volume enclosed on the top by the sphere  $x^2 + y^2 + z^2 = 5$  and on the bottom by the paraboloid  $x^2 + y^2 = 4z$ .

**53. Volume of a Joint** Two pipes intersect at right angles as shown in the figure. Find the inner radius  $r$  of the pipes to ensure the volume of the intersecting joint is  $10 \text{ m}^3$ .

## 14.8 Triple Integrals Using Spherical Coordinates

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Convert rectangular coordinates to spherical coordinates (p. 956)
- 2 Find a triple integral using spherical coordinates (p. 958)

As we have seen in Section 14.7, there are times when it is easier to find a triple integral using an alternate coordinate system. When a triple integral involves all or a portion of a sphere centered at the origin or all or a portion of a cone, converting the problem to *spherical coordinates* often reduces the effort needed to find the integral.

### 1 Convert Rectangular Coordinates to Spherical Coordinates

Suppose  $P$  is a point in space. If  $P$  is not at the origin, we define the three numbers  $\rho$ ,  $\theta$ , and  $\phi$  as:

- $\rho = |OP|$  is the distance from the origin to the point  $P$ .
- $\theta$  is the angle between the positive  $x$ -axis and  $OP_1$ , where  $P_1$  is the projection of  $P$  onto the  $xy$ -plane.
- $\phi$ ,  $0 \leq \phi \leq \pi$ , is the angle between the positive  $z$ -axis and the line segment  $OP$ .

The ordered triple  $(\rho, \theta, \phi)$  is called the **spherical coordinates** of the point  $P$ . See Figure 57(a).

The algebraic relationship between the spherical coordinates  $(\rho, \theta, \phi)$  of a point  $P$  and the rectangular coordinates  $(x, y, z)$  of the point  $P$  is found using the congruent triangles  $OQP$  and  $OP_1P$  as shown in Figure 57(b).

Since

$$x = r \cos \theta \quad y = r \sin \theta \quad r = \rho \sin \phi \quad z = \rho \cos \phi$$

it follows that

$$\boxed{x = \rho \sin \phi \cos \theta \quad y = \rho \sin \phi \sin \theta \quad z = \rho \cos \phi} \quad (1)$$

These equations are used to convert spherical coordinates  $(\rho, \theta, \phi)$  to rectangular coordinates  $(x, y, z)$ .

Using the distance formula and the equations (1), we obtain

$$\boxed{\rho = \sqrt{x^2 + y^2 + z^2} \quad \tan \theta = \frac{y}{x} \quad \cos \phi = \frac{z}{\rho} \quad x \neq 0} \quad (2)$$

These equations are used to convert rectangular coordinates to spherical coordinates.

Figure 57

**EXAMPLE 1** Converting Spherical Coordinates

If the spherical coordinates of a point  $P$  are  $\left(4, \frac{\pi}{6}, \frac{2\pi}{3}\right)$ , find the rectangular coordinates of  $P$ .

**Solution** We use the equations (1) to convert spherical coordinates to rectangular coordinates. Then

$$x = \rho \sin \phi \cos \theta = 4 \sin \frac{2\pi}{3} \cos \frac{\pi}{6} = 4 \left( \frac{\sqrt{3}}{2} \right) \left( \frac{\sqrt{3}}{2} \right) = 3 \quad \rho = 4; \theta = \frac{\pi}{6}, \phi = \frac{2\pi}{3}$$

$$y = \rho \sin \phi \sin \theta = 4 \sin \frac{2\pi}{3} \sin \frac{\pi}{6} = 4 \left( \frac{\sqrt{3}}{2} \right) \left( \frac{1}{2} \right) = \sqrt{3}$$

$$z = \rho \cos \phi = 4 \cos \frac{2\pi}{3} = 4 \left( -\frac{1}{2} \right) = -2$$

The rectangular coordinates of  $P$  are  $(3, \sqrt{3}, -2)$ . ■

**NOW WORK** Problem 7.**EXAMPLE 2** Converting Rectangular Coordinates to Spherical Coordinates

If the rectangular coordinates of a point  $P$  are  $(1, \sqrt{3}, -2)$ , find the spherical coordinates of  $P$ .

**Solution** We use the equations (2) to convert rectangular coordinates to spherical coordinates. Then

$$\rho = \sqrt{x^2 + y^2 + z^2} = \sqrt{1 + 3 + 4} = \sqrt{8} = 2\sqrt{2}$$

$$\tan \theta = \frac{y}{x} = \frac{\sqrt{3}}{1}, \text{ so } \theta = \tan^{-1} \sqrt{3} = \frac{\pi}{3}$$

$$\cos \phi = \frac{z}{\rho} = \frac{-2}{2\sqrt{2}} = -\frac{\sqrt{2}}{2}, \text{ so } \phi = \cos^{-1} \left( -\frac{\sqrt{2}}{2} \right) = \frac{3\pi}{4}$$

The spherical coordinates of  $P$  are  $\left(2\sqrt{2}, \frac{\pi}{3}, \frac{3\pi}{4}\right)$ . ■

**NOW WORK** Problem 9.

**NOTE** Points  $(\rho, \theta, \phi)$  are called spherical coordinates because the surface formed when  $\rho = a$ , where  $a > 0$  is a constant, is a sphere.

Spherical coordinates are useful in problems involving spheres, vertical planes, and cones because their spherical coordinate equations are relatively simple. See Table 2.

**TABLE 2**

| Surface    | Equation in spherical coordinates                     |
|------------|-------------------------------------------------------|
| Sphere     | $\rho = a \quad a > 0$                                |
| Half-cone  | $\phi = a \quad 0 < a < \pi, a \neq \frac{\pi}{2}$    |
| Half-plane | $\theta = a \quad -\frac{\pi}{2} < a < \frac{\pi}{2}$ |

These surfaces are illustrated in Figure 58 on page 958. The half-cone defined by  $\phi = a$ , where  $0 < a < \pi$  and  $a \neq \frac{\pi}{2}$ , is generated by revolving a ray with its initial point at the origin and forming an angle  $a$  about the  $z$ -axis.

Figure 58

## 2 Find a Triple Integral Using Spherical Coordinates

Let  $(\rho, \theta, \phi)$  be the spherical coordinates of a point, and let  $E$  be a solid in space. Partition  $E$  into wedges by drawing concentric spheres centered at the origin, vertical planes through the  $z$ -axis, and circular cones with their vertex at the origin and axis along the  $z$ -axis. Discard any wedge that does not lie entirely in  $E$ . Let  $n$  denote the number of wedges that lie entirely in  $E$ . The norm  $\|P\|$  of the partition is the length of the longest diagonal of the  $n$  wedges.

We calculate the volume  $\Delta V_i$  of a typical wedge  $E_i$  by treating it as if it were a rectangular parallelepiped, as shown in Figure 59. Then there is a point  $(\bar{\rho}_i, \bar{\theta}_i, \bar{\phi}_i)$  in  $E_i$  for which

$$\Delta V_i = lwh = (\bar{\rho}_i \sin \bar{\phi}_i \Delta \theta_i)(\Delta \rho_i)(\bar{\rho}_i \Delta \phi_i) = \bar{\rho}_i^2 \sin \bar{\phi}_i \Delta \rho_i \Delta \theta_i \Delta \phi_i$$

We evaluate the function  $f$  at the point  $(\bar{\rho}_i, \bar{\theta}_i, \bar{\phi}_i)$  in each  $E_i$ , obtaining  $f(\bar{\rho}_i, \bar{\theta}_i, \bar{\phi}_i)$ . Then we form the sums

$$\sum_{i=1}^n f(\bar{\rho}_i, \bar{\theta}_i, \bar{\phi}_i) \bar{\rho}_i^2 \sin \bar{\phi}_i \Delta \rho_i \Delta \theta_i \Delta \phi_i$$

It can be shown that if  $f$  is continuous on  $E$ , then the limit of the above sums, as the norm  $\|P\|$  approaches 0, exists. We define the triple integral of  $f$  over  $E$  as this limit.

$$\iiint_E f(\rho, \theta, \phi) dV = \lim_{\|P\| \rightarrow 0} \sum_{i=1}^n f(\bar{\rho}_i, \bar{\theta}_i, \bar{\phi}_i) \bar{\rho}_i^2 \sin \bar{\phi}_i \Delta \rho_i \Delta \theta_i \Delta \phi_i = \iiint_E f(\rho, \theta, \phi) \rho^2 \sin \phi d\rho d\theta d\phi$$

**NOTE** Notice that the integrand contains the factor  $\rho^2 \sin \phi$  because in spherical coordinates the differential  $dV$  of the volume  $V$  is  $dV = \rho^2 \sin \phi d\rho d\theta d\phi$ .

### EXAMPLE 3 Finding a Triple Integral Using Spherical Coordinates

Use spherical coordinates to find the integral

$$\iiint_E z dx dy dz$$

where  $E$  is the solid defined by the inequalities

$$0 \leq \sqrt{x^2 + y^2} \leq z \quad 0 \leq x^2 + y^2 + z^2 \leq 1$$

**Solution** We convert the rectangular coordinates to spherical coordinates to obtain  $E$  in spherical coordinates. Since  $\rho = \sqrt{x^2 + y^2 + z^2}$  and  $x^2 + y^2 + z^2 \leq 1$ , we have  $0 \leq \rho \leq 1$ . This is the upper half of a spherical solid of radius 1. Next, the surface  $z = \sqrt{x^2 + y^2}$  (which is a half-cone) can be written  $x^2 + y^2 = z^2$ . The cross section of this cone with the  $xz$ -plane is the pair of lines  $z^2 = x^2$  or  $z = \pm x$ , each forming an angle  $\phi = \frac{\pi}{4}$  with the positive  $z$ -axis. See Figure 60.

Figure 59

Figure 60

Since  $z = \rho \cos \phi$ , the integral becomes

$$\begin{aligned}
 \iiint_E z \, dx \, dy \, dz &= \iiint_E \rho \cos \phi \cdot \rho^2 \sin \phi \, d\rho \, d\phi \, d\theta \\
 &= \int_0^{2\pi} \int_0^{\pi/4} \int_0^1 \rho^3 \sin \phi \cos \phi \, d\rho \, d\phi \, d\theta \\
 &= \int_0^{2\pi} \int_0^{\pi/4} \left[ \int_0^1 \rho^3 \, d\rho \right] \sin \phi \cos \phi \, d\phi \, d\theta = \int_0^{2\pi} \int_0^{\pi/4} \frac{1}{4} \sin \phi \cos \phi \, d\phi \, d\theta \\
 &= \frac{1}{4} \int_0^{2\pi} \left[ \int_0^{\pi/4} \sin \phi \cos \phi \, d\phi \right] d\theta = \frac{1}{4} \int_0^{2\pi} \left[ \int_1^{\sqrt{2}/2} -u \, du \right] d\theta \\
 &\quad \text{where } u = \cos \phi, \, du = -\sin \phi \, d\phi \\
 &\quad \text{when } \phi = 0, u = 1, \text{ when } \phi = \frac{\pi}{4}, u = \frac{\sqrt{2}}{2} \\
 &= \frac{1}{4} \int_0^{2\pi} \left[ -\frac{u^2}{2} \right]_1^{\sqrt{2}/2} d\theta = \frac{1}{4} \int_0^{2\pi} \left( -\frac{1}{4} + \frac{1}{2} \right) d\theta = \frac{1}{16} \int_0^{2\pi} d\theta = \frac{\pi}{8} \quad \blacksquare
 \end{aligned}$$

**NOW WORK** Problems 21 and 25.

#### EXAMPLE 4 Finding the Volume of a Solid Using Spherical Coordinates

Find the volume of the solid that is removed from a hemisphere of radius 1 when it is cut by a cone that makes an angle of  $30^\circ$  with the positive  $z$ -axis.

**Solution** Figure 61 shows the part of the hemisphere cut by the cone, namely, the volume under the sphere and inside the cone. The upper surface is the hemisphere of radius  $r = 1$ ; the lower surface is the  $xy$ -plane ( $z = 0$ ). The angle  $\theta$  ranges from 0 to  $2\pi$  and  $\phi$  ranges from 0 to  $\frac{\pi}{6}$ .

$$0 \leq \rho \leq 1 \quad 0 \leq \theta \leq 2\pi \quad 0 \leq \phi \leq \frac{\pi}{6}$$

Then the volume  $V$  of the solid is

$$\begin{aligned}
 V &= \iiint_E \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi = \int_0^{\pi/6} \int_0^{2\pi} \int_0^1 \rho^2 \sin \phi \, d\rho \, d\theta \, d\phi \\
 &= \int_0^{\pi/6} \int_0^{2\pi} \left[ \int_0^1 \rho^2 \, d\rho \right] \sin \phi \, d\theta \, d\phi \\
 &= \int_0^{\pi/6} \int_0^{2\pi} \left[ \frac{\rho^3}{3} \right]_0^1 d\theta \sin \phi \, d\phi = \int_0^{\pi/6} \left[ \int_0^{2\pi} \frac{1}{3} d\theta \right] \sin \phi \, d\phi \\
 &= \frac{2\pi}{3} \int_0^{\pi/6} \sin \phi \, d\phi = \frac{2\pi}{3} (-\cos \phi) \Big|_0^{\pi/6} = \frac{2\pi}{3} \left( 1 - \frac{\sqrt{3}}{2} \right) \quad \blacksquare
 \end{aligned}$$

**NOW WORK** Problem 33.

#### EXAMPLE 5 Finding the Mass of a Sphere

Find the mass  $M$  of a sphere if its mass density  $\delta$  is proportional to the distance from the center of the sphere.

**Solution** Let  $a$  be the radius of the sphere, and position the sphere so that its center is at the origin. In spherical coordinates, the equation of the sphere is  $\rho = a$ . The

Figure 61

**NOTE** Since  $\rho$  is used as a spherical coordinate, we use  $\delta$  to represent the mass density.

mass density  $\delta$  of the sphere is  $\delta = k\rho$ , where  $k$  is the constant of proportionality. The mass  $M$  is

$$\begin{aligned}
 M &= \iiint_E \delta \, dV = \iiint_E k\rho^2 \sin \phi \, d\rho \, d\phi \, d\theta = k \iiint_E \rho^3 \sin \phi \, d\rho \, d\phi \, d\theta \\
 &= k \int_0^{2\pi} \int_0^\pi \left[ \int_0^a \rho^3 \, d\rho \right] \sin \phi \, d\phi \, d\theta \\
 &= k \int_0^{2\pi} \int_0^\pi \left[ \frac{\rho^4}{4} \right]_0^a \sin \phi \, d\phi \, d\theta = \frac{ka^4}{4} \int_0^{2\pi} \left[ \int_0^\pi \sin \phi \, d\phi \right] d\theta \\
 &= \frac{ka^4}{4} \int_0^{2\pi} [-\cos \phi]_0^\pi d\theta \\
 &= \frac{ka^4}{2} \int_0^{2\pi} d\theta = k\pi a^4
 \end{aligned}$$

### NOW WORK Problem 37.

### Spherical Coordinates in Navigation

If we assume that the surface of Earth is spherical, there is a simple relationship between the spherical coordinates we have defined and the system of latitude and longitude measurements used in geography.

The origin is placed at the center of Earth and the  $z$ -axis is chosen to be the diameter through the North and South Poles. See Figure 62(a). The equator is then the great circle in the  $xy$ -plane. The  $x$ -axis is chosen so that the  $xz$ -plane passes through the Greenwich Observatory near London.

The longitude for a point  $P$  on the surface of Earth is then the angle we have called  $\theta$ , except that degree measure is used and east and west are measured from the great circle through the poles and Greenwich. Greenwich has longitude  $0^\circ$ .

The latitude for a point on the surface of Earth north of the equator is  $90^\circ - \phi$ ; latitude is measured from the equator rather than from the North Pole. For a point on Earth south of the equator, the latitude is  $\phi - 90^\circ$ . Points on the equator have  $\phi = 90^\circ$  and latitude  $0^\circ$ . For the North Pole, we write  $\phi = 0^\circ$  and north latitude  $90^\circ$ ; for the South Pole, we write  $\phi = 180^\circ$  and south latitude  $90^\circ$ .

### EXAMPLE 6 Finding Longitude and Latitude in Spherical Coordinates

Greenwich, England, has a longitude of  $0^\circ$  and an approximate latitude of  $51.5^\circ$  N. If  $R_E = 3960$  miles is used for the radius of the Earth and degrees are used to measure angles instead of radians, then the spherical coordinates for Greenwich, England, are  $(3960, 0^\circ, 38.5^\circ)$ . See Figure 62(b), where the angle  $ECG = 51.5^\circ$ . ■

Figure 62

## 14.8 Assess Your Understanding

### Concepts and Vocabulary

- In spherical coordinates, the number  $\rho$  equals the distance from the \_\_\_\_\_ to the point  $P$ .
- In spherical coordinates,  $\phi$  is the angle between the positive \_\_\_\_\_ and the line segment  $OP$ .
- True or False** To change spherical coordinates  $(\rho, \theta, \phi)$  to rectangular coordinates, use the equations  $x = \rho \sin \phi \cos \theta$ ,  $y = \rho \sin \phi \sin \theta$ , and  $z = \rho \cos \phi$ .

- True or False** In spherical coordinates  $(\rho, \theta, \phi)$ ,  $\rho = \sqrt{x^2 + y^2 + z^2}$ , where  $(x, y, z)$  are the rectangular coordinates of the point  $P$ .
- What is the differential  $dV$  of the volume  $V$  in spherical coordinates?
- In spherical coordinates, the surface described by the equation  $\rho = a$ , where  $a > 0$  is a constant, is a(n) \_\_\_\_\_.

## Skill Building

In Problems 7 and 8, fill in the missing coordinates. The three ordered triples represent the rectangular  $(x, y, z)$ , cylindrical  $(r, \theta, z)$ , and spherical coordinates  $(\rho, \theta, \phi)$ , respectively, of some point in space.

| 7. | $(x, y, z)$ | $(r, \theta, z)$               | $(\rho, \theta, \phi)$  |
|----|-------------|--------------------------------|-------------------------|
|    | $(1, -, -)$ | $(-, -, \frac{-2\sqrt{3}}{3})$ | $(-, \frac{\pi}{6}, -)$ |

| 8. | $(x, y, z)$         | $(r, \theta, z)$   | $(\rho, \theta, \phi)$  |
|----|---------------------|--------------------|-------------------------|
|    | $(-, -, 2\sqrt{2})$ | $(\sqrt{8}, -, -)$ | $(-, \frac{\pi}{6}, -)$ |

In Problems 9–16, convert each point given in rectangular coordinates to spherical coordinates.

9.  $(-\sqrt{2}, -\sqrt{2}, 2\sqrt{3})$     10.  $(-1, \sqrt{3}, 2)$     11.  $(1, 1, \sqrt{2})$   
 12.  $(1, -\sqrt{3}, -2)$     13.  $(1, 2, 3)$     14.  $(1, -1, \sqrt{2})$   
 15.  $(0, 3\sqrt{3}, 3)$     16.  $(-5\sqrt{3}, 5, 0)$

In Problems 17–20, find each iterated integral.

17.  $\int_0^{\pi/2} \int_0^{\sin \phi} \int_0^{\pi/4} \rho^2 \sin \phi \, d\theta \, d\rho \, d\phi$   
 18.  $\int_0^{\pi/2} \int_0^{\pi/2} \int_0^{\sin \phi} \rho^2 \sin \phi \cos \phi \, d\rho \, d\theta \, d\phi$   
 19.  $\int_0^{2\pi} \int_0^{\pi/4} \int_0^{\sec \phi} \rho^2 \sin^2 \phi \, d\rho \, d\phi \, d\theta$   
 20.  $\int_0^{\pi/4} \int_0^{\cos \phi} \int_0^{2\pi} \rho^2 \sin \phi \, d\theta \, d\rho \, d\phi$

In Problems 21–24, use spherical coordinates to find each triple integral.

21.  $\int_{-2}^2 \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} \int_2^{2+\sqrt{4-x^2-y^2}} y \, dz \, dx \, dy$   
 22.  $\int_{-3}^3 \int_{-\sqrt{9-x^2}}^{\sqrt{9-x^2}} \int_{-\sqrt{9-x^2-y^2}}^{\sqrt{9-x^2-y^2}} (x^2 z + y^2 z + z^3) \, dz \, dy \, dx$   
 23.  $\int_0^1 \int_0^{\sqrt{1-y^2}} \int_{\sqrt{x^2+y^2}}^{\sqrt{1-x^2-y^2}} (x^2 + y^2 + z^2)^{3/2} \, dz \, dx \, dy$   
 24.  $\int_0^1 \int_0^{\sqrt{1-y^2}} \int_0^{\sqrt{1-x^2-y^2}} e^{(x^2+y^2+z^2)^{3/2}} \, dz \, dx \, dy$

## Applications and Extensions

25. Use spherical coordinates to integrate  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$  over the solid above the cone  $z = -\sqrt{3x^2 + 3y^2}$  and inside the sphere  $x^2 + y^2 + z^2 = 4$ .  
 26. Use spherical coordinates to integrate  $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$  over the solid between the spheres  $x^2 + y^2 + z^2 = 1$  and  $x^2 + y^2 + z^2 = 4$ .

In Problems 27 and 28, use either cylindrical or spherical coordinates to find each triple integral.

27.  $\int_0^2 \int_0^2 \int_0^{\sqrt{4-x^2}} \sqrt{x^2 + y^2} \, dy \, dx \, dz$   
 28.  $\int_0^2 \int_0^{\sqrt{4-y^2}} \int_0^{\sqrt{4-x^2-y^2}} \frac{2z}{\sqrt{x^2 + y^2}} \, dz \, dx \, dy$

In Problems 29 and 30, set up the triple integral  $\iiint_E f(x, y, z) \, dV$  for  $E$  in rectangular, cylindrical, and spherical coordinates.

29.  $E$  is a sphere of radius  $a$  with its center at the origin.  
 30.  $E$  is the solid inside the cylinder  $x^2 + y^2 = 4$  and inside the sphere  $x^2 + y^2 + z^2 = 9$ .

The integrals in Problems 31 and 32 are given in spherical coordinates. Express each integral using rectangular coordinates. Do not find the integral.

31.  $\int_0^\pi \int_{3\pi/4}^\pi \int_0^4 \rho^5 \cos \phi \sin \phi \, d\rho \, d\phi \, d\theta$   
 32.  $\int_{\pi/2}^{3\pi/2} \int_{\pi/2}^\pi \int_0^2 \frac{\rho^4 \sin \phi \cos \phi}{\rho^2 + 3} \, d\rho \, d\phi \, d\theta$

33. **Volume** Use spherical coordinates to find the volumes of the two solids obtained when the hemisphere,  $z = \sqrt{25 - x^2 - y^2}$ , is sliced by the plane  $x = 2$ .  
 34. **Volume** Find the volume of the solid enclosed on the outside by the sphere  $\rho = 2$  and on the inside by the surface  $\rho = 1 + \cos \phi$ .  
 35. **Volume** Find the volume cut from the sphere  $\rho = a$  by the cone  $\phi = \alpha$ .  
 36. **Mass** Use spherical coordinates to find the mass of the solid in the first octant between the spheres  $x^2 + y^2 + z^2 = a^2$  and  $x^2 + y^2 + z^2 = b^2$ , where  $a > b$ , if the mass density at any point is inversely proportional to its distance from the origin.  
 37. **Mass** Find the mass of a ball of radius  $a$  if the mass density of the sphere is proportional to the square of the distance from its center.  
 38. **Mass** A solid occupies the region  $\sqrt{x^2 + y^2} \leq z \leq 1$  and has mass density  $\delta(x, y, z) = z\sqrt{x^2 + y^2 + z^2}$ . Find its mass.  
 39. **Center of Mass** Find the center of mass of a solid hemisphere of radius  $a$  if the mass density is proportional to the distance from the center.  
 40. **Center of Mass** Find the center of mass of a solid hemisphere if the mass density is proportional to the distance from the axis of symmetry.  
 41. **Center of Mass** Find the center of mass of a homogeneous solid enclosed from above by the sphere  $x^2 + y^2 + z^2 = 9$  and from below by the half-cone  $z = \sqrt{x^2 + y^2}$ .  
 42. **Center of Mass** Find the center of mass of a homogeneous solid in the shape of the wedge bounded by  $x^2 + y^2 = 16$ ,  $z = 2y$ ,  $y \geq 0$ ,  $z \geq 0$ .  
 43. **Moment of Inertia** Find the moment of inertia of a homogeneous solid in the shape of a sphere of radius 2 about a diameter.

- 44. Moment of Inertia** Show that the moment of inertia of a homogeneous solid in the shape of a sphere of radius  $a$  about a diameter is  $I = \frac{8}{15}a^5\pi$ .
- 45. Centroid** Use spherical coordinates to find the centroid of a hemisphere of radius  $a$ , whose base is on the  $xy$ -plane.
- 46. Gravitational Force** The magnitude of the resultant gravitational force  $F$  of a solid hemisphere  $E$  of radius  $a$  and constant mass density  $\delta$  on a unit mass particle situated at the center of the base of the hemisphere is given by the triple integral

$$F = k\delta \iiint_E \frac{\cos \phi}{\rho^2} dV$$

where the center of the sphere is at the origin. Find the force  $F$ .

- 47. Modeling an Asteroid—I** On December 12, 2011, the Cassini mission spacecraft made its closest approach to the **asteroid Dione**. As with the planets, Dione is denser inside than at the surface because gravity compresses the matter. Suppose on Dione the density at the center is  $2.50 \text{ g/cm}^3 = 2500 \text{ kg/m}^3$ ,

the density at the surface is  $1.25 \text{ g/cm}^3 = 1250 \text{ kg/m}^3$ , and the radius is 560 km. Model the density  $D$  as  $D = D_0 e^{-k\rho}$ , where  $\rho$  is the distance from the center and  $k$  is a constant to be determined.

- (a) Using this model, find  $k$  and  $D_0$ .
- (b) Use this model to find the mass of Dione. Test the reasonableness of the model by comparing the calculated mass with the measured mass, which is  $1.095 \times 10^{21} \text{ kg}$ .
- 48. Modeling an Asteroid—II** Refer to Problem 47. Instead of an exponential function, model the density of Dione as a linear decrease in density from  $2.50 \text{ g/cm}^3$  at the center of Dione to  $1.25 \text{ g/cm}^3$  at its surface. Find the mass of Dione using this model and compare it with the measured value ( $1.05 \times 10^{21} \text{ kg}$ ).

### Challenge Problem

- 49. Volume** A **spherical cap** is a portion of height  $h$  of a sphere of radius  $R$ . See the figure. Using a triple integral and an appropriate coordinate system, show that the volume of the cap is  $V = \frac{1}{3}\pi h^2(3R - h)$ .

## 14.9 Change of Variables Using Jacobians

**OBJECTIVES** When you finish this section, you should be able to:

- 1** Find a Jacobian in two variables (p. 963)
- 2** Change the variables of a double integral using a Jacobian (p. 964)
- 3** Change the variables of a triple integral using a Jacobian (p. 965)

We often find a single integral,  $\int_a^b f(x) dx$  using the method of substitution. To use substitution, we let  $x = g(u)$ . Then  $dx = g'(u) du$ , and

$$\int_a^b f(x) dx = \int_c^d f(g(u))g'(u) du$$

where  $a = g(c)$  and  $b = g(d)$ . In making this substitution, the variable  $x$  is replaced by  $g(u)$ , and the factor  $g'(u)$  is introduced into the integrand.

Sometimes it is easier to find a double integral,  $\iint_R f(x, y) dA$  by changing the variables  $x$  and  $y$  to the polar coordinates  $r$  and  $\theta$ , by letting  $x = r \cos \theta$ ,  $y = r \sin \theta$ , and  $dA = r dr d\theta$ . Then

$$\iint_R f(x, y) dA = \iint_{R^\#} f(r \cos \theta, r \sin \theta) r dr d\theta$$

where  $R^\#$  is the region  $R$  expressed in polar coordinates. In changing the variables from rectangular coordinates to polar coordinates, the factor  $r$  is introduced into the integrand on the right.

When finding a triple integral  $\iiint_E f(x, y, z) dV$ , we discussed two types of change of variables: Sometimes the variables  $x$ ,  $y$ , and  $z$  were changed to cylindrical coordinates; other times the variables were changed to spherical coordinates.

Using cylindrical coordinates  $(r, \theta, z)$ , we get

$$\iiint_E f(x, y, z) dV = \iiint_{E^\#} f(r \cos \theta, r \sin \theta, z) r dr d\theta dz$$

where  $E^\#$  is the solid  $E$  expressed in cylindrical coordinates. In converting from rectangular coordinates to cylindrical coordinates, the factor  $r$  is introduced into the integrand on the right.

Using spherical coordinates  $(\rho, \theta, \phi)$ , we have

$$\iiint_E f(x, y, z) dV = \iiint_{E^\#} f(\rho \sin \phi \cos \theta, \rho \sin \phi \sin \theta, \rho \cos \phi) \rho^2 \sin \phi d\rho d\theta d\phi$$

where  $E^\#$  is the solid  $E$  expressed in spherical coordinates. In this conversion, a factor of  $\rho^2 \sin \phi$  is introduced into the integrand on the right.

In general, when the variables of an integral are changed, a factor, called the *Jacobian*, is introduced into the resulting integrand.

**NOTE** In making a change in variables, the functions  $g_1$  and  $g_2$  are one-to-one.

### DEFINITION Jacobian: Two Variables

For a change of variables from  $x, y$  to  $u, v$  given by

$$x = g_1(u, v) \quad y = g_2(u, v)$$

the **Jacobian of  $x$  and  $y$  with respect to  $u$  and  $v$**  is

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u}$$

**NEED TO REVIEW?** Determinants are discussed in Section 10.5, p. 725.

**ORIGINS** Jacobians are named after the German mathematician Carl Gustav Jacobi (1804–1851). Jacobi was a child prodigy. By age 12, he had met the entrance requirements for university admission. He studied mathematics, Latin, and Greek and became a professor at the University of Königsberg. Although he worked with functional determinants, he is most noted for his work with elliptic functions. Jacobi died of smallpox at age 46.

## 1 Find a Jacobian in Two Variables

### EXAMPLE 1 Finding a Jacobian

Show that in changing from rectangular coordinates  $(x, y)$  to polar coordinates  $(r, \theta)$ , the Jacobian of  $x$  and  $y$  with respect to  $r$  and  $\theta$  is  $r$ .

**Solution** To change the variables from rectangular to polar coordinates, we use the equations

$$x = r \cos \theta \quad y = r \sin \theta$$

The partial derivatives are

$$\frac{\partial x}{\partial r} = \cos \theta \quad \frac{\partial x}{\partial \theta} = -r \sin \theta \quad \frac{\partial y}{\partial r} = \sin \theta \quad \frac{\partial y}{\partial \theta} = r \cos \theta$$

The Jacobian of  $x, y$  with respect to  $r, \theta$  is

$$\begin{aligned} \frac{\partial(x, y)}{\partial(r, \theta)} &= \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} = \begin{vmatrix} \cos \theta & -r \sin \theta \\ \sin \theta & r \cos \theta \end{vmatrix} = \cos \theta \cdot r \cos \theta - \sin \theta(-r \sin \theta) \\ &= r \cos^2 \theta + r \sin^2 \theta = r \end{aligned}$$

**NOW WORK** Problem 9.

## 2 Change the Variables of a Double Integral Using a Jacobian

In changing variables to find a double integral, we make use of the following result, which we state without proof:

### THEOREM Change in the Variables in a Double Integral

Suppose  $R$  is a closed, bounded region of the  $xy$ -plane and  $R^\#$  is a closed, bounded region of the  $uv$ -plane, where each point in  $R$  corresponds to one and only one point in  $R^\#$  when the change of variables  $x = g_1(u, v)$ ,  $y = g_2(u, v)$  is made. If:

- $f$  is continuous on  $R$ ,
- $g_1$  and  $g_2$  have continuous partial derivatives on  $R^\#$ , and
- the Jacobian  $\frac{\partial(x, y)}{\partial(u, v)} \neq 0$  on  $R^\#$ ,

then

$$\iint_R f(x, y) dA = \iint_{R^\#} f(g_1(u, v), g_2(u, v)) \left| \frac{\partial(x, y)}{\partial(u, v)} \right| du dv$$

Notice that in the integral on the right, the absolute value of the Jacobian is introduced as a factor.

Changing variables can simplify the integration of  $\iint_R f(x, y) dA$  in two ways: either by simplifying the region  $R$  or by simplifying the integrand  $f(x, y)$ .

### EXAMPLE 2 Using a Jacobian in a Double Integral

Find  $\iint_R y dA$ , where  $R$  is the region enclosed by the lines  $2x + y = 0$ ,  $2x + y = 3$ ,  $x - y = 0$ , and  $x - y = 2$ .

**Solution** We use the change of variables  $u = 2x + y$  and  $v = x - y$ . Then the lines  $2x + y = 0$  and  $2x + y = 3$  in the  $xy$ -plane correspond to the lines  $u = 0$  and  $u = 3$  in the  $uv$ -plane. The lines  $x - y = 0$  and  $x - y = 2$  in the  $xy$ -plane correspond to the lines  $v = 0$  and  $v = 2$  in the  $uv$ -plane. As Figure 63 shows, the region  $R$  in the  $xy$ -plane is a parallelogram and the region  $R^\#$  in the  $uv$ -plane is a rectangle.

To find the Jacobian, we need to express  $x$  and  $y$  as functions of  $u$  and  $v$ . We can achieve this by solving the system of equations  $\begin{cases} u = 2x + y \\ v = x - y \end{cases}$  for  $x$  and  $y$ . Then

$$x = \frac{u + v}{3} \quad y = \frac{u - 2v}{3}$$

The Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \frac{1}{3} & \frac{1}{3} \\ \frac{1}{3} & -\frac{2}{3} \end{vmatrix} = -\frac{2}{9} - \frac{1}{9} = -\frac{1}{3}$$

Using this change of variables, the integral  $\iint_R y dA$  becomes

$$\begin{aligned} \iint_R y dA &= \iint_{R^\#} \frac{u - 2v}{3} \cdot \left| -\frac{1}{3} \right| du dv = \int_0^2 \int_0^3 \frac{1}{9} (u - 2v) du dv = \frac{1}{9} \int_0^2 \left[ \frac{u^2}{2} - 2uv \right]_0^3 dv \\ &= \frac{1}{9} \int_0^2 \left( \frac{9}{2} - 6v \right) dv = \frac{1}{9} \left[ \frac{9v}{2} - 3v^2 \right]_0^2 = \frac{1}{9} (9 - 12) = -\frac{1}{3} \end{aligned}$$

Figure 63

**EXAMPLE 3** Using a Jacobian in a Double Integral

Find

$$\iint_R (x + y) \sin(x - y) \, dA$$

where  $R$  is the region enclosed by  $y = x$ ,  $y = x - 2$ ,  $y = -x$ , and  $y = -x + 1$ .

**Solution** The integrand  $(x + y) \sin(x - y)$  suggests changing the variables to  $u = x + y$  and  $v = x - y$ . Then the lines  $x - y = 0$ ,  $x - y = 2$ ,  $x + y = 0$ , and  $x + y = 1$  in the  $xy$ -plane define the region  $R$ , and the lines  $v = 0$ ,  $v = 2$ ,  $u = 0$ , and  $u = 1$  in the  $uv$ -plane define the region  $R^\#$ . See Figure 64. We solve the system of equations

$$\begin{cases} u = x + y \\ v = x - y \end{cases} \text{ for } x \text{ and } y, \text{ and obtain}$$

$$x = \frac{u + v}{2} \quad y = \frac{u - v}{2}$$

Using these equations, the Jacobian is

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{1}{2} & \frac{1}{2} \\ \frac{1}{2} & -\frac{1}{2} \end{vmatrix} = -\frac{1}{4} - \frac{1}{4} = -\frac{1}{2}$$

The integral under this change of variables becomes

$$\begin{aligned} \iint_R (x + y) \sin(x - y) \, dA &= \iint_{R^\#} u \sin v \cdot \left| -\frac{1}{2} \right| \, du \, dv = \frac{1}{2} \int_0^1 \int_0^2 u \sin v \, dv \, du \\ &= \frac{1}{2} \int_0^1 [u(-\cos v)]_0^2 \, du = \frac{1}{2} (1 - \cos 2) \int_0^1 u \, du \\ &= \frac{1}{4} (1 - \cos 2) \end{aligned}$$

(a)

(b)

Figure 64

**NOW WORK** Problem 23.**3 Change the Variables of a Triple Integral Using a Jacobian**

In space, the Jacobian is defined as follows.

**DEFINITION** Jacobian: Three VariablesFor a change of variables from  $x, y, z$  to  $u, v, w$  given by

$$x = g_1(u, v, w) \quad y = g_2(u, v, w) \quad z = g_3(u, v, w)$$

the **Jacobian of  $x, y$ , and  $z$  with respect to  $u, v$ , and  $w$**  is given by

$$\frac{\partial(x, y, z)}{\partial(u, v, w)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix}$$

**NOW WORK** Problem 13.

In changing the variables of a triple integral, we use the following result:

**THEOREM** Change in the Variables in a Triple Integral

Suppose  $E$  is a closed, bounded solid of  $xyz$ -space and  $E^\#$  is a closed, bounded solid of  $uvw$ -space, where each point in  $E$  corresponds to one and only one point in  $E^\#$  when the change of variables  $x = g_1(u, v, w)$ ,  $y = g_2(u, v, w)$ , and  $z = g_3(u, v, w)$  is made. If:

- $f$  is continuous on  $E$ ,
- $g_1$ ,  $g_2$ , and  $g_3$  have continuous partial derivatives on  $E^\#$ , and
- the Jacobian  $\frac{\partial(x, y, z)}{\partial(u, v, w)} \neq 0$  on  $E^\#$ , then

$$\iiint_E f(x, y, z) dV = \iiint_{E^\#} f(g_1(u, v, w), g_2(u, v, w), g_3(u, v, w)) \left| \frac{\partial(x, y, z)}{\partial(u, v, w)} \right| du dv dw$$

Again notice that in the integral on the right, the absolute value of the Jacobian is introduced as a factor.

**EXAMPLE 4** Using a Jacobian in a Triple Integral

Find  $\iiint_E y dV$ , where  $E$  is the solid enclosed by the planes  $2x + y = 0$ ,  $2x + y = 3$ ,  $x - z = 0$ ,  $x - z = 2$ ,  $z = 0$ , and  $z = 4$ .

**Solution** The solid  $E$  is the slanted parallelepiped shown in Figure 65(a). The change of variables  $u = 2x + y$ ,  $v = x - z$ , and  $w = z$  transforms  $E$  into the rectangular parallelepiped  $E^\#$  shown in Figure 65(b).  $E^\#$  is the solid enclosed by the planes  $u = 0$ ,  $u = 3$ ,  $v = 0$ ,  $v = 2$ , and  $w = 0$ ,  $w = 4$ .

We solve the system of equations  $\begin{cases} u = 2x + y \\ v = x - z \\ w = z \end{cases}$  for  $x$ ,  $y$ , and  $z$  and obtain

$$x = v + w \quad y = u - 2x = u - 2(v + w) = u - 2v - 2w \quad z = w$$

The Jacobian is

$$\frac{\partial(x, y, z)}{\partial(u, v, w)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix} = \begin{vmatrix} 0 & 1 & 1 \\ 1 & -2 & -2 \\ 0 & 0 & 1 \end{vmatrix} = -1$$

The integral  $\iiint_E y dV$  under this change of variables becomes

$$\begin{aligned} \iiint_E y dV &= \iiint_{E^\#} (u - 2v - 2w) \left| \frac{\partial(x, y, z)}{\partial(u, v, w)} \right| du dv dw = \int_0^4 \int_0^2 \int_0^3 (u - 2v - 2w) du dv dw \\ &= \int_0^4 \int_0^2 \left[ \frac{u^2}{2} - 2vu - 2wu \right]_0^3 dv dw = \int_0^4 \int_0^2 \left( \frac{9}{2} - 6v - 6w \right) dv dw \\ &= \int_0^4 \left[ \frac{9}{2}v - 3v^2 - 6wv \right]_0^2 dw = \int_0^4 (9 - 12 - 12w) dw = \int_0^4 (-3 - 12w) dw \\ &= [-3w - 6w^2]_0^4 = -12 - 96 = -108 \end{aligned}$$

**NOW WORK** Problem 25.

Figure 65

## 14.9 Assess Your Understanding

### Concepts and Vocabulary

- For a change of variables from  $x$  and  $y$  to  $u$  and  $v$  given by  $x = g_1(u, v)$  and  $y = g_2(u, v)$ , the Jacobian is the determinant \_\_\_\_\_.
- True or False** When introducing a Jacobian into an integral because of a change of variables, the absolute value of the Jacobian is used.

### Skill Building

In Problems 3–10, find the Jacobian  $\frac{\partial(x, y)}{\partial(u, v)}$  for each change of variables from  $(x, y)$  to  $(u, v)$ .

- $x = u + v, \quad y = u - v$
- $x = u + 5, \quad y = v - 7$
- $x = 4u - v, \quad y = 3u + \frac{1}{2}v$
- $x = u^2 - v^2, \quad y = u^2 + v^2$
- $x = \frac{u}{v}, \quad y = u + v$
- $x = e^u \cos v, \quad y = e^u \sin v$
- $x = ve^u, \quad y = ue^{-v}$
- $x = u \cos v, \quad y = v \sin u$

In Problems 11–16, find the Jacobian  $\frac{\partial(x, y, z)}{\partial(u, v, w)}$  for each change of variables from  $(x, y, z)$  to  $(u, v, w)$ .

- $x = u + v + w, \quad y = u + v - w, \quad z = u - v - w$
- $x = 2u + v + w, \quad y = u + v - w, \quad z = u - v$
- $x = u + v, \quad y = v - w, \quad z = u - w$
- $x = u + v + w, \quad y = u + v, \quad z = w$
- $x = u, \quad y = v^2, \quad z = w^3$
- $x = 3(u + v), \quad y = u - w, \quad z = u^2 - w^2$

- Area** Find the area of the region  $R$  enclosed by  $y = 4\sqrt{1 - \frac{x^2}{9}}$  and  $y = 0$ , using the change of variables  $u = \frac{x}{3}$  and  $v = \frac{y}{2}$ .

- Area** Find the area of the region  $R$  enclosed by  $xy = 1$ ,  $xy = 3$ ,  $y = x$ , and  $y = 3x$  using the change of variables  $u = x$  and  $v = xy$ . See the figure.

In Problems 19–22:

- Graph the region  $R$  in the  $xy$ -plane.
- Graph the region  $R^\#$  in the  $uv$ -plane.
- Find the Jacobian  $\frac{\partial(x, y)}{\partial(u, v)}$ .
- Change the variables and find the integral.

- $\iint_R x \, dA$ , where  $R$  is the region enclosed by  $2x - y = 0$ ,  $2x - y = 4$ ,  $x + y = 0$ , and  $x + y = 3$ . Use the change of variables  $u = 2x - y$  and  $v = x + y$ .

- $\iint_R (x^2 + y^2) \, dA$ , where  $R$  is the region enclosed by  $2x - y = 1$ ,  $2x - y = 3$ ,  $x + y = 1$ , and  $x + y = 2$ . Use the change of variables  $u = 2x - y$  and  $v = x + y$ .
- $\iint_R xy \, dA$ , where  $R$  is the triangular region whose vertices are  $(-1, 1)$ ,  $(1, 1)$ , and  $(0, 0)$ . Use the change of variables  $u = x + y$  and  $v = x - y$ .
- $\iint_R (x + y) \sin(x - y) \, dA$ , where  $R$  is the triangular region whose vertices are  $(-1, 1)$ ,  $(1, 1)$ , and  $(0, 0)$ . Use the change of variables  $u = x + y$  and  $v = x - y$ .

In Problems 23–26, find each integral.

- $\iint_R (3x - 2y) \, dA$ , where  $R$  is the region enclosed by the ellipse  $9x^2 + 16y^2 = 144$ . Change the variables using  $u = \frac{x}{4}$  and  $v = \frac{y}{3}$ .
- $\iint_R (x^2 - y) \, dA$ , where  $R$  is the region enclosed by the ellipse  $9x^2 + 16y^2 = 144$ . Change the variables using  $u = \frac{x}{4}$  and  $v = \frac{y}{3}$ .
- $\iiint_E (x + 1) \, dV$ , where  $E$  is the solid enclosed by the ellipsoid  $\frac{x^2}{4} + \frac{y^2}{4} + \frac{z^2}{9} = 1$ . Change the variables using  $u = \frac{x}{2}$ ,  $v = \frac{y}{2}$ , and  $w = \frac{z}{3}$ .
- $\iiint_E (x + 2y) \, dV$ , where  $E$  is the solid enclosed by the ellipsoid  $\frac{x^2}{9} + \frac{y^2}{4} + z^2 = 1$ . Change the variables using  $u = \frac{x}{3}$ ,  $v = \frac{y}{2}$ , and  $w = z$ .

### Applications and Extensions

In Problems 27–30, for each integral:

- Graph the region  $R$ .
  - Choose a change of variables from  $(x, y)$  to  $(u, v)$ . Graph the new region in the  $uv$ -plane.
  - Write each integral using the new variables.
  - Find each integral.
- $\iint_R x^2 y \, dA$ , where  $R$  is the region enclosed by the lines  $2x - 3y = 0$ ,  $2x - 3y = 1$ ,  $x + 2y = 0$ , and  $x + 2y = 3$ .
  - $\iint_R x \, dA$ , where  $R$  is the region enclosed by the ellipse  $\frac{x^2}{9} + \frac{y^2}{16} = 1$ .
  - $\iint_R x \cos(xy) \, dA$ , where  $R$  is the region enclosed by  $xy = 1$ ,  $xy = 3$ ,  $x = 1$ , and  $x = 3$ .
  - $\iint_R ye^{xy} \, dA$ , where  $R$  is the region enclosed by  $xy = 1$ ,  $xy = 3$ ,  $x = 1$ , and  $x = 3$ .
  - Area** Use a change of variables to find the area of the region  $R$  enclosed by the lines  $y = 3x$ ,  $y - 3x = 2$ ,  $2y + x = 0$ , and  $y = -\frac{1}{2}x + 5$ .

**32. Area** Use a change of variables to find the area of the region  $R$  enclosed by the lines  $x + y = 1$ ,  $x + y = -3$ ,  $y = 2x$ , and  $y = 2x + 4$ .

**33. Volume** Use a change of variables to find the volume  $V$  of the solid  $E$  enclosed by the planes  $x + 2y = 0$ ,  $x + 2y = 3$ ,  $y - z = 0$ ,  $y - z = 2$ ,  $z = 0$ , and  $z = 6$ .

**34. Volume** Use a change of variables to find the volume  $V$  of the solid  $E$  enclosed by the planes  $x - y = 0$ ,  $x - y = 3$ ,  $z - 2x = 0$ ,  $z - 2x = 4$ ,  $z = 1$ , and  $z = 5$ .

**35. Volume** Find the volume of the solid  $E$  enclosed by the paraboloid  $z = 9 - x^2 - 9y^2$  and the plane  $z = 1$ , given the change of variables  $x = 3u \cos v$ ,  $y = u \sin v$ , and  $z = w$ . See the figure.

**36. Volume** Find the volume of the solid  $E$  enclosed by the ellipsoid  $\frac{x^2}{4} + \frac{y^2}{9} + z^2 = 1$  above the  $xy$ -plane, given the change of variables  $u = \frac{x}{2}$ ,  $v = \frac{y}{3}$ , and  $w = z$ .

**37.** Show that in changing from rectangular coordinates  $(x, y, z)$  to spherical coordinates  $(\rho, \theta, \phi)$ , the triple integral of  $f$  over  $E$  becomes

$$\begin{aligned} \iiint_E f(x, y, z) dV \\ = \iiint_{E^\#} f(\rho \sin \phi \cos \theta, \rho \sin \phi \sin \theta, \rho \cos \phi) \rho^2 \sin \phi d\rho d\theta d\phi \end{aligned}$$

### Challenge Problem

**38.** A region  $R$  is enclosed by the graphs of  $xy = 2$ ,  $xy = 5$ ,  $y = \sqrt{x}$ , and  $y = 3\sqrt{x}$ .

- Graph the region  $R$ .
- Use a change of variables that transforms  $R$  into a rectangular region  $R^\#$ .
- Find the area of  $R$ .

## Chapter Review

### THINGS TO KNOW

#### 14.1 The Double Integral over a Rectangular Region

- Partial integration** (p. 906)
- Iterated integrals:** Integrals of the form  $\int_a^b \left[ \int_c^d f(x, y) dy \right] dx$  or  $\int_c^d \left[ \int_a^b f(x, y) dx \right] dy$  (p. 907)
- Fubini's Theorem:** If a function  $z = f(x, y)$  is continuous on the closed rectangular region  $R$  given by  $a \leq x \leq b$  and  $c \leq y \leq d$ , then

$$\begin{aligned} \iint_R f(x, y) dA &= \int_a^b \int_c^d f(x, y) dy dx \\ &= \int_c^d \int_a^b f(x, y) dx dy. \quad (\text{p. 907}) \end{aligned}$$

#### 14.2 The Double Integral over Nonrectangular Regions

- Theorem:** If a function  $z = f(x, y)$  is continuous on a closed, bounded region  $R$ , then the double integral  $\iint_R f(x, y) dA$  exists. (p. 912)
- a  $x$ -simple region** (p. 913)
- a  $y$ -simple region** (p. 915)
- Fubini's Theorem** for an  $x$ -simple region (p. 914)
- Fubini's Theorem** for a  $y$ -simple region (p. 915)
- Properties of double integrals:** (p. 917)
  - $\iint_R [f(x, y) \pm g(x, y)] dA = \iint_R f(x, y) dA \pm \iint_R g(x, y) dA$
  - $\iint_R cf(x, y) dA = c \iint_R f(x, y) dA$ , where  $c$  is a constant

- If  $R$  consists of two subregions,  $R_1$  and  $R_2$ , that have no points in common except for points lying on portions of their common boundary, then

$$\iint_R f(x, y) dA = \iint_{R_1} f(x, y) dA + \iint_{R_2} f(x, y) dA$$

- Volume of a solid:** If  $z = f(x, y) \geq 0$ , then  $\iint_R f(x, y) dA$  can be interpreted as the volume of the solid under the graph of  $z$  and over the region  $R$ . (p. 913)
- Area  $A$  of a region  $R$ :**  $A = \iint_R dA$  (p. 918)

#### 14.3 Double Integrals Using Polar Coordinates

- Differential of area in polar coordinates  $(r, \theta)$ :** (p. 924)  $dA = r dr d\theta$
- Iterated double integral in polar coordinates:** (p. 924)

$$\begin{aligned} \iint_R f(r, \theta) dA &= \int_\alpha^\beta \int_{r_1(\theta)}^{r_2(\theta)} f(r, \theta) r dr d\theta \\ &= \int_\alpha^\beta \int_{r_1(\theta)}^{r_2(\theta)} f(r, \theta) r dr d\theta \end{aligned}$$

- Area  $A$  of a region  $R$  in polar coordinates:** (p. 927)

$$A = \iint_R r dr d\theta$$

- Volume  $V$  of a solid in polar coordinates:** (p. 925)

$$V = \iint_R f(r, \theta) r dr d\theta$$

### 14.4 Center of Mass; Moment of Inertia

- **Mass density:**  $\rho = \rho(x, y)$  (p. 929)
- **Mass of a lamina:**  $M = \iint_R \rho(x, y) dA$ ,  
where  $\rho = \rho(x, y)$  is the mass density (p. 930)
- **Moment of mass about the  $x$ -axis** (p. 930)
- **Moment of mass about the  $y$ -axis** (p. 930)
- **Center of mass of a lamina  $(\bar{x}, \bar{y})$ :**  $\bar{x} = \frac{M_y}{M}$ ;  $\bar{y} = \frac{M_x}{M}$  (p. 931)
- **Moments of inertia  $I$ :** (p. 933)  $I_x = \iint_R y^2 \rho(x, y) dA$ ;  
 $I_y = \iint_R x^2 \rho(x, y) dA$ ;  $I_O = \iint_R (x^2 + y^2) \rho(x, y) dA$   
 $I_x + I_y = I_O$

### 14.5 Surface Area

- **Surface area  $S$  over a region  $R$ :** (p. 937)

$$S = \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} dA$$

### 14.6 The Triple Integral

- **$xy$ -simple solid  $E$**  (p. 942)
- **Fubini's Theorem for triple integrals** (p. 942)
- **Triple integral over an  $xy$ -simple solid:** (p. 943)

$$\iiint_E f(x, y, z) dV = \iint_R \left[ \int_{z_1(x, y)}^{z_2(x, y)} f(x, y, z) dz \right] dA$$

- **Volume  $V$  of a solid  $E$ :** (p. 944)  $V = \iiint_E dV$

### 14.7 Triple Integrals Using Cylindrical Coordinates

- **Cylindrical coordinates  $(r, \theta, z)$  of a point  $P$ :** (p. 950)  
 $x = r \cos \theta$ ,  $y = r \sin \theta$ ,  $z = z$
- **Differential of volume in cylindrical coordinates  $(r, \theta, z)$ :** (p. 951)

$$dV = r dr d\theta dz$$

### 14.8 Triple Integrals Using Spherical Coordinates

- **Spherical coordinates  $(\rho, \theta, \phi)$  of a point  $P$ :** (p. 956)  
 $x = \rho \sin \phi \cos \theta$ ,  $y = \rho \sin \phi \sin \theta$ ,  $z = \rho \cos \phi$
- **Differential of volume in spherical coordinates  $(\rho, \theta, \phi)$ :** (p. 958)

$$dV = \rho^2 \sin \phi d\rho d\theta d\phi$$

### 14.9 Change of Variables Using Jacobians

- **Jacobian in two variables:** (p. 963)

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \frac{\partial x}{\partial u} \frac{\partial y}{\partial v} - \frac{\partial x}{\partial v} \frac{\partial y}{\partial u}$$

- **Jacobian in three variables:** (p. 965)

$$\frac{\partial(x, y, z)}{\partial(u, v, w)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix}$$

## OBJECTIVES

| Section | You should be able to ...                                                             | Example    | Review Exercises  |
|---------|---------------------------------------------------------------------------------------|------------|-------------------|
| 14.1    | 1 Find Riemann sums of $z = f(x, y)$ over a closed rectangular region (p. 904)        | 1          | 7(a), 7(b)        |
|         | 2 Find the value of a double integral defined on a closed rectangular region (p. 906) | 2, 3, 4    | 1, 2, 7(c), 8, 9  |
|         | 3 Find the volume under a surface and over a rectangular region (p. 908)              | 5          | 10, 11            |
| 14.2    | 1 Use Fubini's Theorem for an $x$ -simple region (p. 914)                             | 1          | 3–6, 13           |
|         | 2 Use Fubini's Theorem for a $y$ -simple region (p. 916)                              | 2, 3       | 3–6, 13, 14, 54   |
|         | 3 Work with properties of double integrals (p. 917)                                   | 4, 5       | 12                |
|         | 4 Use double integrals to find area and volume (p. 918)                               | 6, 7, 8    | 15–18, 20         |
| 14.3    | 1 Find a double integral using polar coordinates (p. 924)                             | 1, 2, 3    | 19, 52            |
|         | 2 Find area and volume using polar coordinates (p. 925)                               | 4, 5, 6    | 21, 22            |
| 14.4    | 1 Find the mass and center of mass of a lamina (p. 929)                               | 1, 2       | 23–25             |
|         | 2 Find moments of inertia (p. 933)                                                    | 3          | 26                |
| 14.5    | 1 Find the surface area that lies above a region $R$ (p. 938)                         | 1, 2, 3    | 27–29             |
| 14.6    | 1 Find a triple integral defined over a closed box (p. 942)                           | 1          | 30                |
|         | 2 Find a triple integral defined over a more general solid (p. 942)                   | 2          | 31, 32            |
|         | 3 Find the volume of a solid (p. 944)                                                 | 3          | 15–17, 35, 36     |
|         | 4 Find the mass, center of mass, and moments of inertia of a solid (p. 944)           | 4, 5       | 62                |
|         | 5 Find a triple integral defined over $xz$ -simple and $yz$ -simple solids (p. 946)   | 6          | 33                |
| 14.7    | 1 Convert rectangular coordinates to cylindrical coordinates (p. 950)                 | 1          | 37(a)–40(a)       |
|         | 2 Find a triple integral using cylindrical coordinates (p. 951)                       | 2, 3, 4, 5 | 43–45, 47–51, 53  |
| 14.8    | 1 Convert rectangular coordinates to spherical coordinates (p. 956)                   | 1, 2       | 37(b)–40(b)       |
|         | 2 Find a triple integral using spherical coordinates (p. 958)                         | 3, 4, 5, 6 | 34, 41, 42, 46–51 |
| 14.9    | 1 Find a Jacobian in two variables (p. 963)                                           | 1          | 55, 56            |
|         | 2 Change the variables of a double integral using a Jacobian (p. 964)                 | 2, 3       | 58–60             |
|         | 3 Change the variables of a triple integral using a Jacobian (p. 965)                 | 4          | 57, 61            |

## REVIEW EXERCISES

- Find  $\int_0^1 \int_1^e \frac{y}{x} dx dy$ .
- Find  $\int_1^3 \int_3^6 (x^2 + y^2) dy dx$ .
- Find  $\int_0^1 \int_y^1 ye^{-x^3} dx dy$ .
- Find  $\int_0^1 \int_0^{\sqrt{1+x^2}} \frac{1}{x^2 + y^2 + 1} dy dx$ .
- Find  $\int_0^{\pi/4} \int_0^{\tan x} \sec x dy dx$
- Find  $\int_0^1 \int_{-x}^x e^{x+y} dy dx$
- Let  $R$  be the square region  $0 \leq x \leq 4$ ,  $-2 \leq y \leq 2$  in the  $xy$ -plane, and suppose that  $f(x, y) = x + 2y$ .
  - Partition  $R$  into four squares of equal area and evaluate  $f$  at the midpoint of each square. Find the corresponding Riemann sum of  $f$  over  $R$ .
  - Using the same partition as in (a), but evaluating  $f$  at an appropriate point of each square, determine the largest possible Riemann sum and the smallest. What is the average of these values?
  - What is the actual value of  $\iint_R f(x, y) dA$ ?
- Find  $\iint_R xe^y dA$  if  $R$  is the closed rectangular region defined by  $0 \leq x \leq 2$  and  $0 \leq y \leq 1$ .
- Find  $\iint_R \sin x \cos y dA$  if  $R$  is the closed rectangular region defined by  $0 \leq x \leq \frac{\pi}{2}$  and  $0 \leq y \leq \frac{\pi}{3}$ .
- Volume** Find the volume  $V$  under the surface  $z = f(x, y) = e^x \cos y$  over the rectangular region  $R$  defined by  $0 \leq x \leq 1$  and  $0 \leq y \leq \frac{\pi}{2}$ .
- Volume** Find the volume  $V$  under the surface  $z = f(x, y) = 2x^2 + y^2$  over the rectangular region  $R$  defined by  $0 \leq x \leq 2$  and  $0 \leq y \leq 1$ .
- The functions  $f$  and  $g$  are continuous on a closed, bounded region  $R$ , and  $\iint_R f(x, y) dA = -2$ ,  $\iint_R g(x, y) dA = 3$ . Use the properties of double integrals to find each double integral.
  - $\iint_R 2[f(x, y) + 3g(x, y)] dA$
  - $\iint_R [g(x, y) - 2f(x, y)] dA$
- Find  $\iint_R x \sin(y^3) dA$ , where  $R$  is the region enclosed by the triangle with vertices  $(0, 0)$ ,  $(0, 2)$ , and  $(2, 2)$ .
- Find  $\iint_R (x + y) dA$ , where  $R$  is the region enclosed by  $y = x$  and  $y^2 = 2 - x$ .
- Volume** Find the volume of the tetrahedron enclosed by the coordinate planes and the plane  $2x + y + 3z = 6$ .
- Volume** Find the volume of the ellipsoid  $4x^2 + y^2 + \frac{z^2}{4} = 1$ .
- Volume** Find the volume of the solid in the first octant enclosed by the coordinate planes,  $4y = 3(4 - x^2)$  and  $4z = 4 - x^2$ .
- Area** Use a double integral to find the area enclosed by the parabola  $y^2 = 16x$  and the line  $y = 4x - 8$ .
- Find  $\iint_R \sin \theta dA$ , where  $R$  is the region enclosed by the rays  $\theta = 0$  and  $\theta = \pi/6$  and the circle  $r = 6 \sin \theta$ .
- Area** Use a double integral to find the first-quadrant area enclosed by  $y^2 = x^3$  and  $y = x$ .
- Area** Use a double integral and polar coordinates to find the area of the circle  $r = 2 \cos \theta$ .
- Area** Find the first-quadrant area outside  $r = 2a$  and inside  $r = 4a \cos \theta$  by using polar coordinates.
- Mass** Find the mass of a lamina in the shape of a right triangle of height 6 and base 4 if the mass density is proportional to the square of the distance from the vertex at the right angle.
- Center of Mass** Find the center of mass of the homogeneous lamina enclosed by  $3x^2 = y$  and  $y = 3x$ .
- Center of Mass** Find the center of mass of the homogeneous lamina enclosed by  $4x = y^2$ ,  $y = 0$ , and  $x = 4$ .
- Moments of Inertia** Use double integration to find the moments of inertia for a homogeneous lamina in the shape of the ellipse  $2x^2 + 9y^2 = 18$ .
- Surface Area** Find the area of the first-octant portion of the plane  $\frac{x}{2} + y + \frac{z}{3} = 1$ .
- Surface Area** Find the surface area of the paraboloid  $z = x^2 + y^2$  below the plane  $z = 1$ .
- Surface Area** Find the surface area of the cone  $x^2 + y^2 = 3z^2$  that lies inside the cylinder  $x^2 + y^2 = 4y$ .
- Find  $\iiint_E e^z \cos x dV$ , where  $E$  is the solid enclosed by  $0 \leq x \leq \frac{\pi}{2}$ ,  $0 \leq y \leq 2$ ,  $0 \leq z \leq 1$ .
- Find  $\int_0^1 \int_0^{2-3x} \int_0^{2y} x^2 dz dy dx$ .
- Find  $\iiint_E ye^x dV$ , where  $E$  is the solid enclosed by  $0 \leq x \leq 1$ ,  $0 \leq y \leq 1$ ,  $y \leq z \leq y^2$ .
- Find  $\iiint_E xyz dV$ , where  $E$  is the solid enclosed by  $x = 0$  and  $x = 2 - y - z$  whose projection onto the  $yz$ -plane is the region enclosed by the rectangle  $0 \leq y \leq 1$  and  $0 \leq z \leq 2$ .
- Center of Mass** Find the center of mass and the moments of inertia  $I_x$  and  $I_y$  of the homogeneous hemispherical shell  $0 \leq a \leq r \leq b$ ,  $0 \leq \phi \leq \frac{\pi}{2}$ .
- Volume** Find the volume in the first octant of the paraboloid  $x^2 + y^2 + z = 9$ .
- Volume** Find the volume in the first octant enclosed by  $y = 0$ ,  $z = 0$ ,  $x + y = 2$ ,  $x + 2y = 6$ , and  $y^2 + z^2 = 4$ .

In Problems 37–40:

- Convert each point given in rectangular coordinates to cylindrical coordinates.
- Convert each point given in rectangular coordinates to spherical coordinates.

37.  $(3, 0, 4)$

38.  $(-2\sqrt{2}, 2\sqrt{2}, 3)$

39.  $(-1, 1, -2)$

40.  $(1, \sqrt{3}, 4)$

**41. Volume** Use spherical coordinates with triple integrals to find the volume between the spheres  $x^2 + y^2 + z^2 = 4$  and  $x^2 + y^2 + z^2 = 1$ .

**42. Volume** Find the volume cut from the sphere  $\rho = 4$  by the cone  $\phi = \frac{\pi}{4}$ .

**43.** Use cylindrical coordinates to find

$$\int_0^2 \int_0^{\sqrt{4-x^2}} \int_0^{\sqrt{4-x^2-y^2}} \frac{z}{\sqrt{x^2+y^2}} dz dy dx$$

**44. Volume** Use cylindrical coordinates to find the volume in the first octant inside the cylinder  $r = 1$  and below the plane  $3x + 2y + 6z = 6$ .

**45.** Use cylindrical coordinates to find

$$\int_0^a \int_0^{\sqrt{a^2-x^2}} \int_0^{\sqrt{a^2-x^2-y^2}} dz dy dx$$

**46.** Use spherical coordinates to find the iterated integral given in Problem 45.

*In Problems 47–51, find each integral using either cylindrical or spherical coordinates (whichever is more convenient).*

**47.** 
$$\int_{-2}^2 \int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}} \int_0^{\sqrt{16-x^2-y^2}} dz dx dy$$

**48.** 
$$\int_0^1 \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \int_{\sqrt{x^2+y^2}}^{\sqrt{2-x^2-y^2}} dz dy dx$$

**49.** 
$$\int_{-\sqrt{2}}^{\sqrt{2}} \int_{-\sqrt{2-x^2}}^{\sqrt{2-x^2}} \int_0^4 (x^2 + y^2) z dz dy dx$$

**50.** 
$$\int_0^1 \int_0^1 \int_0^{\sqrt{1-x^2}} dy dx dz$$

**51.** 
$$\int_0^a \int_0^{\sqrt{a^2-x^2}} \int_{h\sqrt{x^2+y^2}}^{\sqrt{a^2-x^2-y^2}} dz dy dx$$

*In Problems 52–54, find each integral.*

**52.** 
$$\int_0^1 \int_0^{\sqrt{1-x^2}} (x^2 + y^2)^{3/2} dy dx$$

**53.** 
$$\int_{-1}^1 \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \int_{\sqrt{x^2+y^2}}^{\sqrt{2-x^2-y^2}} dz dx dy$$

**54.** 
$$\int_0^1 \int_y^1 (x^2 + 1)^{2/3} dx dy$$

*In Problems 55–57, find the Jacobian for each change of variables.*

**55.**  $x = e^{u+v}, \quad y = e^{v-u}$

**56.**  $x = u + 3v, \quad y = 2u - v$

**57.**  $x = u^2, \quad y = 3v, \quad \text{and } z = u + v$

**58.** Find  $\iint_R y^2 dx dy$ , where the region  $R$  is enclosed by  $x - 2y = 1$ ,  $x - 2y = 3$ ,  $2x + 3y = 1$ , and  $2x + 3y = 2$ , using the change of variables  $u = x - 2y$  and  $v = 2x + 3y$ .

**59.** Find  $\iint_R (x + y)^3 dx dy$ , where the region  $R$  is enclosed by the lines  $x + y = 2$ ,  $x + y = 5$ ,  $x - 2y = -1$ , and  $x - 2y = 3$ , using the change of variables  $u = x + y$  and  $v = x - 2y$ .

**60.** Find  $\iint_R xy dx dy$ , where  $R$  is the region enclosed by  $2x + y = 0$ ,  $2x + y = 3$ ,  $x - y = 0$ , and  $x - y = 2$ .

**61.** Find  $\iiint_E xz^2 dx dy dz$ , where  $E$  is the solid enclosed by the

ellipsoid  $\frac{x^2}{4} + \frac{y^2}{9} + z^2 = 1$ , using the change of variables  $u = \frac{x}{2}, v = \frac{y}{3}, \text{ and } w = z$ .

**62. Mass** A solid in the first octant enclosed by the surface  $z = xy$ , the  $xy$ -plane, and the cylinder whose intersection with the  $xy$ -plane forms a triangle with vertices  $(0, 0, 0)$ ,  $(2, 0, 0)$ , and  $(0, 1, 0)$  has mass density  $\rho = x + y$ . Find the mass of the solid.

## CHAPTER 14 PROJECT

### The Mass of Stars

The mass of a star is distributed throughout its volume and can be described by its density  $\delta^*$  measured in  $\text{kg/m}^3$ . However, while solids often have constant density, the density of a star varies with respect to position within the star's volume. A triple integral

can then be used to find the mass  $M$  of the star provided its density function is known. We examine several possible density functions for stars. Because stars are almost spherical, we use spherical coordinates and position the sphere so that its center is at the origin.

1. Show that the mass  $M$  of a solid enclosed by a sphere of radius  $R$  m and constant density  $\delta$  is given by  $M = \frac{4}{3}\pi R^3 \delta$ .

While we can model the shape of a star as a sphere, its density  $\delta$  is not constant. Gravitational forces between the gaseous particles in the star cause the density to be greatest near the center of the star, to become less dense further from its center, and to eventually become zero at the edge of the star. There are various ways to model the density  $\delta$  of a star as a function of the radial distance  $\rho$  from the star's center.

Here, we examine three of these models and use each to determine the mass  $M$  of a star. For each these models,  $R$  is the radius of the star,  $\delta_0$  is a constant, and  $\rho$  is the radial distance from the center of the star.

\*The widely accepted symbol for density is  $\rho$  and the symbol for the radial distance from the center of a star is  $r$ . Because we use  $\rho$  as a spherical coordinate, we use  $\delta$  for the density and  $\rho$  for the radial distance in this project.

The **linear density model** is given by

$$\delta(\rho) = \delta_0 \left(1 - \frac{\rho}{R}\right)$$

2. Show that the linear density model satisfies the condition that the density at the edge of the star is 0.
3. Show also that in the linear density model the constant  $\delta_0$  equals the density at the center of the star.
4. Find the mass  $M$  of a star that obeys the linear density model.

The **quadratic density model** is given by

$$\delta(\rho) = \delta_0 \left[1 - \left(\frac{\rho}{R}\right)^2\right]$$

5. Show that the quadratic density model satisfies the condition that the density at the edge of the star is 0.
6. Show also that in the quadratic density model the constant  $\delta_0$  equals the density at the center of the star.
7. Find the mass  $M$  of a star that obeys the quadratic density model.

A third model for the density involves an exponential decrease in mass density. In this **exponential density model** the density  $\delta = \delta(\rho)$  of a star is given by

$$\delta(\rho) = \delta_0 [e^{(1-\rho/R)} - 1]$$

8. Show that this exponential density model satisfies the condition that the density at the edge of the star is 0.
9. Show that the density at the center of a star modeled by the exponential model is  $\delta_0(e - 1) \text{ kg/m}^3$ .
10. Find the mass  $M$  of a star that obeys the exponential model.
11. Using each of the three models, integrate over a volume with radius  $\rho < R$  to find an expression for the mass of the star contained within a region of radius  $\rho$  about its center. Compare how the mass of a star differs in each of these models at a fixed radial distance  $\rho_0$ . This is a way to see how the mass within the interior of the star grows as the radial distance from the center increases.

It should not be a surprise that the structure of a real star is vastly more complicated than the models above indicate.

The mass of a star at any radial distance  $\rho$  is governed by the differential equation of mass conservation,

$$\frac{d}{d\rho} M(\rho) = 4\pi\rho^2\delta(\rho)$$

The balance of gas pressure  $P$ , which tends to blow the star apart, and gravity, which in the absence of pressure would make the star collapse, gives us the differential equation of hydrostatic equilibrium

$$\frac{dP}{d\rho} = -G \frac{M(\rho)\delta}{\rho^2}$$

To these equations we add an equation for the conservation of energy, and an equation that governs the energy transport from the center to the surface. These form a set of four basic coupled differential equations which, for a given stellar mass and composition of elements, can be integrated numerically to give the run of pressure, temperature, mass and energy distribution through the star. As Figure 66 indicates, there are other complicating factors.

Figure 66

Source: Brian Chaboyer, Dartmouth College

Through literally hundreds of years of careful observation, increasingly sophisticated understanding of the relevant physics, and more and more powerful mathematical techniques, astronomers now have a fairly complete understanding of stellar structure and evolution. It continues as an active area of research, and is one of the beautiful triumphs of mathematics.

## Modeling a Tornado

Most people who live in the wide stretch of land between the Appalachian Mountains in the east and Rockies in the west are familiar with intense supercell thunderstorms and the tornadoes they produce. Though tornadoes are known to form in every state, and on every continent (with the exception of Antarctica), the unique geographical and meteorological characteristics of Tornado Alley make it an ideal breeding ground for these violent rotating columns of air. Warm moist air from the south is forced upward by fast moving cold, low pressure systems from the north and west and mixes with cold, drier air at higher altitudes, producing strong shearing winds that begin to rotate in a counterclockwise direction. As the wind increases it sucks up more moist air, forming a funnel-like vortex.

Climatologists and meteorologists are working to develop mathematical models to predict tornadoes and to better understand their behavior. And though several models have been proposed, no single reliable mathematical model exists.

**CHAPTER 15 PROJECT** The Chapter Project on page 1056 investigates a model for measuring the wind in a tornado.

**V**ector calculus is the culmination of what we have learned throughout the course. Those of you who are studying engineering or science will find the theory and methods of vector calculus rich in engineering applications. For example, line integrals can be used to find the work done by a variable vector force and to find the mass of a curved wire that has variable density. Surface integrals are used to measure the flow of a fluid across a surface.

We also discuss three important theorems that simplify integration and generalize the Fundamental Theorem of Calculus.

## 15.1 Vector Fields

**OBJECTIVE** When you finish this section, you should be able to:

**1 Describe a vector field (p. 974)**

Figure 1 Velocity field of a river.

Suppose you are studying the motion of a fluid such as water or air. The fluid is composed of a multitude of moving particles. At any instant of time  $t$ , each particle is at a given point and is moving with a particular velocity  $\mathbf{v}(t)$ . If we assign a velocity vector to each particle at time  $t$  and take a picture at that instant, then the snapshot of all the vectors at this time  $t$  forms a *vector field*. Figure 1 shows a possible vector field for the velocity of water in a river as it flows around a bend.

In Chapter 11, we discussed vector functions,  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ . A vector function associates a vector  $\mathbf{r}$  to a real number  $t$ . A *vector field* is a function that associates a vector to a point in the plane or to a point in space. That is, a vector field is a function whose domain is a set of points in the plane or in space and whose range is a set of vectors.

### DEFINITION Vector Field

Let  $P = P(x, y)$  and  $Q = Q(x, y)$  be functions of two variables defined on a subset  $R$  of the  $xy$ -plane. A **vector field  $\mathbf{F}$  over  $R$**  is defined as the function

$$\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$$

Let  $P = P(x, y, z)$ ,  $Q = Q(x, y, z)$ , and  $R = R(x, y, z)$  be functions of three variables defined on a subset  $E$  of space. A **vector field  $\mathbf{F}$  over  $E$**  is defined as the function

$$\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$$

The vector field  $\mathbf{F} = \mathbf{F}(x, y)$  consists of vectors in the plane with initial points at  $(x, y)$ . In general, it is not possible to draw a vector for each point  $(x, y)$  in the domain, so a representative set of vectors (arrows) are drawn. See Figure 2(a).

Similarly, the vector field  $\mathbf{F} = \mathbf{F}(x, y, z)$  consists of vectors in space with initial points at  $(x, y, z)$ . See Figure 2(b).

### 1 Describe a Vector Field

#### EXAMPLE 1 Describing a Vector Field in the Plane

Describe the vector field  $\mathbf{F} = \mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$  by drawing some of the vectors  $\mathbf{F}$ .

**Solution** We begin by making a table of vectors. We do this by choosing points  $(x, y)$  and finding the values of  $\mathbf{F}$ .

|                    |               |                |                |               |                              |                              |                             |                             |
|--------------------|---------------|----------------|----------------|---------------|------------------------------|------------------------------|-----------------------------|-----------------------------|
| $(x, y)$           | (2, 0)        | (0, 2)         | (-2, 0)        | (0, -2)       | (3, 3)                       | (-3, 3)                      | (-3, -3)                    | (3, -3)                     |
| $\mathbf{F}(x, y)$ | $2\mathbf{j}$ | $-2\mathbf{i}$ | $-2\mathbf{j}$ | $2\mathbf{i}$ | $-3\mathbf{i} + 3\mathbf{j}$ | $-3\mathbf{i} - 3\mathbf{j}$ | $3\mathbf{i} - 3\mathbf{j}$ | $3\mathbf{i} + 3\mathbf{j}$ |

Figure 3 illustrates the vectors from the table. Notice that each vector in the field is tangent to a circle centered at the origin, and the direction of the vectors indicates that the field is rotating counterclockwise. This field might represent the motion of a wheel spinning on an axle, with each vector equal to the velocity at a point of the wheel. ■

(a)

(b)

Figure 2

Figure 3

**NOW WORK** Problem 7.

Figure 4

**EXAMPLE 2** Describing a Vector Field in Space

Describe the vector field  $\mathbf{F} = \mathbf{F}(x, y, z) = y\mathbf{j}$  by drawing some of the vectors  $\mathbf{F}$ .

**Solution** Several vectors from the vector field are listed in the table below.

| $(x, y, z)$           | $(0, 0, 0)$  | $(0, 1, 1)$  | $(0, 1, 2)$  | $(0, -1, -1)$ | $(1, -1, 0)$  | $(1, 3, 1)$   | $(1, -2, -1)$  |
|-----------------------|--------------|--------------|--------------|---------------|---------------|---------------|----------------|
| $\mathbf{F}(x, y, z)$ | $\mathbf{0}$ | $\mathbf{j}$ | $\mathbf{j}$ | $-\mathbf{j}$ | $-\mathbf{j}$ | $3\mathbf{j}$ | $-2\mathbf{j}$ |

Each vector in the vector field  $\mathbf{F}$  is parallel to the  $y$ -axis. The magnitude of the vector equals  $|y|$  and is proportional to the distance of the vector from the  $xz$ -plane. See Figure 4. ■

**NOW WORK** Problem 13.

The vector fields in Examples 1 and 2 were relatively easy to graph by hand. But this is not true for most vector fields, particularly for vector fields in space. There is graphing technology, often found in computer algebra systems, however, with the capability of drawing vector fields. If you have technology available, use it to visualize the vector fields in the text, and to experiment with graphing vector fields. See Figure 5 for some examples.

Figure 5

Figure 6

Figure 7

**EXAMPLE 3** Describing a Vector Field—Blood Flow

An example of a **velocity field** arises in describing the flow of a fluid through a pipe or the flow of blood through an artery. At each point inside the pipe (or the artery), a vector is defined that represents the velocity of the flow. See Figure 6. The magnitude of each vector represents the speed of the fluid's flow. Notice that the speed of blood flow is slower near the artery wall and is faster near the center of the artery and that the speed increases where the artery is contracted. ■

**EXAMPLE 4** Describing a Vector Field—Newton's Law of Gravitation

A **gravitational field** is defined by the vector field

$$\mathbf{F} = \mathbf{F}(x, y, z) = -\frac{GmM}{x^2 + y^2 + z^2}\mathbf{u}$$

where  $m$  and  $M$  are the masses of two objects, one located at the origin  $(0, 0, 0)$  and the other at the point  $(x, y, z)$ ;  $G$  is the gravitational constant; and  $\mathbf{u}$  is a unit vector in the direction from  $(0, 0, 0)$  to  $(x, y, z)$ . Here,  $\mathbf{F}$  is the force of attraction between the two objects. The force vectors  $\mathbf{F}$  are directed from the object at  $(x, y, z)$  toward the object at  $(0, 0, 0)$ . Figure 7 illustrates a gravitational field. ■

**EXAMPLE 5** Describing a Vector Field—Coulomb's Law

An **electric force field** is defined by the vector field

$$\mathbf{F} = \mathbf{F}(x, y, z) = \frac{\varepsilon q Q}{x^2 + y^2 + z^2} \mathbf{u}$$

where  $\varepsilon$  is a positive constant that depends on the units being used;  $q$  and  $Q$  are the charges of two objects, one located at the origin  $(0, 0, 0)$  and the other at the point  $(x, y, z)$ ; and  $\mathbf{u}$  is the unit vector in the direction from  $(0, 0, 0)$  to  $(x, y, z)$ . Here,  $\mathbf{F}$  is the electric force exerted by the charge at  $(0, 0, 0)$  on the charge at  $(x, y, z)$ . For like charges, we have  $qQ > 0$  and the force  $\mathbf{F}$  is **repulsive**. For unlike charges, we have  $qQ < 0$  and the force  $\mathbf{F}$  is **attractive**. ■

Recall that the gradient  $\nabla f$  of a function  $f = f(x, y)$  in the plane is the vector

$$\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j}$$

and the gradient  $\nabla f$  of a function  $w = f(x, y, z)$  in space is the vector

$$\nabla f(x, y, z) = f_x(x, y, z)\mathbf{i} + f_y(x, y, z)\mathbf{j} + f_z(x, y, z)\mathbf{k}$$

We see that the gradient  $\nabla f$  of a function  $f$  is a vector field, called the **gradient vector field**.

**EXAMPLE 6** Describing a Gradient Vector Field

- (a) Find the gradient vector field of  $f(x, y) = x^2 + 4y^2$  and graph it by drawing some of the vectors  $\nabla f$ .  
 (b) Graph the level curves  $f(x, y) = c$ , for  $c = 0, 1, 4$ , and  $16$ .

**Solution** (a) The gradient of  $f$  is  $\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} = 2x\mathbf{i} + 8y\mathbf{j}$ . The graph of the gradient vector field is shown in Figure 8.

(b) Figure 9(a) illustrates the level curves of the elliptic paraboloid  $f(x, y) = x^2 + 4y^2 = c$  for  $c = 0, 1, 4$ , and  $16$ . Compare the level curves with the gradient vector field illustrated in Figure 8. Notice that the gradient vectors are orthogonal to the level curves, as shown in Figure 9(b).

Figure 8  $\nabla f = 2x\mathbf{i} + 8y\mathbf{j}$

DF Figure 9

## 15.1 Assess Your Understanding

### Concepts and Vocabulary

1. A(n) \_\_\_\_\_ is a function that associates a vector to a point in the plane or to a point in space.
2. **True or False** Let  $P = P(x, y, z)$ ,  $Q = Q(x, y, z)$ , and  $R = R(x, y, z)$  be functions of three variables defined on a subset

$E$  of space. A **vector field over  $E$**  is defined as the function  $\mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$ .

3. The domain of the vector field  $\mathbf{F} = \mathbf{F}(x, y)$  is a set of points  $(x, y)$  in the plane, and the range of  $\mathbf{F}$  is a set of \_\_\_\_\_ in the plane.

4. **True or False** The gradient of a function  $f$  is an example of a vector field.

### Skill Building

In Problems 5–14, describe each vector field by drawing some of its vectors.

5.  $\mathbf{F} = \mathbf{F}(x, y) = x\mathbf{i} + y\mathbf{j}$       6.  $\mathbf{F} = \mathbf{F}(x, y) = x\mathbf{i} - y\mathbf{j}$   
 7.  $\mathbf{F} = \mathbf{F}(x, y) = \mathbf{i} + x\mathbf{j}$       8.  $\mathbf{F} = \mathbf{F}(x, y) = y\mathbf{i} - \mathbf{j}$   
 9.  $\mathbf{F} = \mathbf{F}(x, y) = \mathbf{i}$       10.  $\mathbf{F} = \mathbf{F}(x, y) = -\mathbf{j}$   
 11.  $\mathbf{F} = \mathbf{F}(x, y) = \mathbf{i} + \mathbf{j}$       12.  $\mathbf{F} = \mathbf{F}(x, y) = -\mathbf{i} + \mathbf{j}$   
 13.  $\mathbf{F} = \mathbf{F}(x, y, z) = z\mathbf{k}$       14.  $\mathbf{F} = \mathbf{F}(x, y, z) = x\mathbf{i}$

**CAS** In Problems 15 and 16, use graphing technology to represent each vector field. Then describe the vector field.

15.  $\mathbf{F} = \mathbf{F}(x, y, z) = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$   
 16.  $\mathbf{F} = \mathbf{F}(x, y, z) = -\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$

### Applications and Extensions

In Problems 17–20, find the gradient vector field of each function  $f$ .

17.  $f(x, y) = x \sin y + \cos y$       18.  $f(x, y) = xe^y$   
 19.  $f(x, y, z) = x^2y + xy + y^2z$       20.  $f(x, y, z) = x^2y + xyz^2$

21. (a) Show that the vector field from Example 1,  $\mathbf{F} = \mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$ , is a set of vectors tangent to circles centered at the origin.

(b) Confirm that the magnitude of each vector equals the radius of the circle.

22. **Gravitational Potential Energy** The gravitational field  $\mathbf{g}$  due to a very small object of mass  $m$  kg that is  $r$  meters (m) from a large object is given by  $\mathbf{g} = -\frac{Gm}{r^3}\mathbf{r}$ , where  $G = 6.67 \times 10^{-11} \text{ N m}^2/\text{kg}^2$  and  $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ . Show that the gravitational field is a gradient vector field. That is, show that  $\mathbf{g} = -\nabla u$ , where  $u = -\frac{Gm}{r}$ . The scalar function  $u$  is called the **gravitational potential** due to the mass  $m$ .

## 15.2 Line Integrals

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Define a line integral in the plane (p. 977)
- 2 Find the value of a line integral along a smooth curve (p. 979)
- 3 Find line integrals of the form  $\int_C f(x, y) dx$  and  $\int_C f(x, y) dy$  (p. 981)
- 4 Find line integrals along a piecewise-smooth curve (p. 984)
- 5 Find the value of a line integral in space (p. 985)

**NEED TO REVIEW?** Smooth curves are discussed in Section 9.2, pp. 647–648.

The value of a definite integral  $\int_a^b f(x) dx$  is determined by the values of the function  $f$  on the closed interval  $[a, b]$ . (See Chapter 5.) The value of a double integral  $\iint_R f(x, y) dA$  is determined by the values of  $f$  on a closed, bounded region  $R$  of the  $xy$ -plane, and the value of a triple integral  $\iiint_E f(x, y, z) dV$  is determined by the values of  $f$  on a closed, bounded solid  $E$  in space. (See Chapter 14.)

In this section, we define a *line integral*. The value of a line integral is determined by the values of a function  $f$  along a smooth curve  $C$ . A physical application that uses a line integral is the problem of finding the mass of a long thin piece of wire of variable density, whose shape is described by a curve  $C$ .

### 1 Define a Line Integral in the Plane

Let  $C$  be a smooth curve whose parametric equations are given by

$$x = x(t) \quad y = y(t) \quad a \leq t \leq b$$

See Figure 10. As  $t$  increases from  $a$  to  $b$ , the corresponding points  $(x(t), y(t))$  trace out the curve  $C$  from the point  $A = (x(a), y(a))$  to the point  $B = (x(b), y(b))$ ; that is, the orientation of  $C$  is from  $A$  to  $B$ . Let  $z = f(x, y)$  be a function that is defined on some region containing the curve  $C$ .

Figure 10  $x = x(t)$ ,  $y = y(t)$ ,  $a \leq t \leq b$

Figure 11

We partition the closed interval  $[a, b]$  into  $n$  subintervals:

$$[a, t_1], [t_1, t_2], \dots, [t_{i-1}, t_i], \dots, [t_{n-1}, b]$$

and denote the length of each subinterval by  $\Delta t_1, \Delta t_2, \dots, \Delta t_i, \dots, \Delta t_n$ . Then corresponding to each number  $a = t_0, t_1, \dots, t_i, \dots, t_n = b$  of the partition, there is a succession of points  $P_0, P_1, \dots, P_i, \dots, P_n$  on the curve  $C$ . These points partition the curve  $C$  into  $n$  subarcs of lengths  $\Delta s_1, \Delta s_2, \Delta s_3, \dots, \Delta s_i, \dots, \Delta s_n$ , as shown in Figure 11. We define the **norm**  $\|\Delta\|$  of the partition to be the length of the subarc with the largest arc length.

Now we pick a number  $t_i^*$  in each subinterval  $[t_{i-1}, t_i]$ ,  $i = 1, 2, \dots, n$ , and let  $P_i^* = (x_i^*, y_i^*)$  be the point in the  $i$ th subarc corresponding to the number  $t_i^*$ . We form the sums

$$\sum_{i=1}^n f(x_i^*, y_i^*) \Delta s_i$$

These sums depend on both the choice of the partition of  $[a, b]$  and the choice of  $P_i^*$ . If all such sums can be made as close as we please to a number  $L$  by choosing partitions whose norms are sufficiently close to 0, then  $L$  is the limit of these sums as  $\|\Delta\|$  approaches 0

and we write  $L = \lim_{\|\Delta\| \rightarrow 0} \sum_{i=1}^n f(x_i^*, y_i^*) \Delta s_i$ .

### DEFINITION Line Integral of $f$ Along $C$

Let  $C$  be a smooth curve defined by the parametric equations  $x = x(t)$  and  $y = y(t)$ ,  $a \leq t \leq b$ . Let  $z = f(x, y)$  be a function defined on some region containing  $C$ . The **line integral of  $f$  along  $C$**  from  $t = a$  to  $t = b$  is

$$\int_C f(x, y) ds = \lim_{\|\Delta\| \rightarrow 0} \sum_{i=1}^n f(x_i^*, y_i^*) \Delta s_i$$

provided this limit exists.

The line integral  $\int_C f(x, y) ds$  is the sum of the values of  $z = f(x, y)$  as  $C$  is traversed from  $t = a$  to  $t = b$ . See Figure 12.

We state without proof a method for finding the value of a line integral when the function  $f$  is continuous on some region that contains  $C$ .

### THEOREM The Value of a Line Integral

Let  $C$  be a smooth curve defined by the parametric equations

$$x = x(t) \quad y = y(t) \quad a \leq t \leq b$$

Let  $z = f(x, y)$  be a function that is continuous on some region that contains the curve  $C$ . Then the line integral of  $f$  along  $C$  from  $t = a$  to  $t = b$  exists and

$$\int_C f(x, y) ds = \int_a^b f(x(t), y(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt \quad (1)$$

Equation (1) is the result of substituting the parametric equations  $x = x(t)$  and  $y = y(t)$  of  $C$  for  $x$  and  $y$  in  $f$  and using the arc length formula for the differential  $ds$ . This result expresses the fact that when a function is continuous on a region containing a smooth curve, then the line integral can be found using techniques for finding definite integrals.

**NOTE** If  $f(x, y) = 1$ , the line integral of  $f$  along  $C$  is the arc length of  $C$  from  $t = a$  to  $t = b$ .

**NEED TO REVIEW?** Arc length is discussed in Section 9.2, pp. 651–653.

Figure 12  $C$  lies in the domain of  $f$ .

## 2 Find the Value of a Line Integral Along a Smooth Curve

### EXAMPLE 1 Finding the Value of a Line Integral Along a Smooth Curve

Find  $\int_C y \, ds$  if  $C$  is the curve defined by the parametric equations  $x(t) = t$  and  $y(t) = \sqrt{t}$ ,  $2 \leq t \leq 6$

**Solution** The curve  $C$  is smooth and is part of the graph of  $y = \sqrt{x}$ , from  $(2, \sqrt{2})$  to  $(6, \sqrt{6})$ , as shown in Figure 13.

The differential  $ds$  of arc length along  $C$  is given by

$$ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

Since  $\frac{dx}{dt} = 1$  and  $\frac{dy}{dt} = \frac{1}{2\sqrt{t}}$ , we have

$$ds = \sqrt{1^2 + \left(\frac{1}{2\sqrt{t}}\right)^2} dt = \sqrt{1 + \frac{1}{4t}} dt = \sqrt{\frac{4t+1}{4t}} dt = \frac{\sqrt{4t+1}}{2\sqrt{t}} dt$$

Now we use formula (1).

$$\int_C y \, ds = \int_2^6 \sqrt{t} \frac{\sqrt{4t+1}}{2\sqrt{t}} dt = \frac{1}{2} \int_2^6 \sqrt{4t+1} \, dt = \frac{1}{2} \left[ \frac{(4t+1)^{3/2}}{4 \cdot \frac{3}{2}} \right]_2^6 = \frac{49}{6} \quad \blacksquare$$

### NOW WORK Problem 9.

It can be shown that the value of the line integral along a smooth curve  $C$  *does not* depend on the parametric representation of the curve; any pair of parametric equations with the same orientation satisfying the assumptions of the Value of a Line Integral Theorem will give the same value.

### EXAMPLE 2 Finding the Value of a Line Integral

Find

$$\int_C (x^2 + y) \, ds$$

if  $C$  is the line segment from  $(0, 0)$  to  $(1, 2)$  and  $C$  is expressed using the parametric equations:

- (a)  $x(t) = t$  and  $y(t) = 2t$ ,  $0 \leq t \leq 1$
- (b)  $x(t) = \sin t$  and  $y(t) = 2 \sin t$ ,  $0 \leq t \leq \frac{\pi}{2}$

**Solution** The two sets of parametric equations in (a) and (b) are just different ways of representing a part of the line  $y = 2x$  from  $(0, 0)$  to  $(1, 2)$ , as shown in Figure 14.

(a) For  $x(t) = t$  and  $y(t) = 2t$ , we have  $\frac{dx}{dt} = 1$  and  $\frac{dy}{dt} = 2$ . The differential  $ds$  of the arc length  $s$  is  $ds = \sqrt{1^2 + 2^2} dt = \sqrt{5} \, dt$ . Then

$$\int_C (x^2 + y) \, ds = \int_0^1 (t^2 + 2t) \sqrt{5} \, dt = \sqrt{5} \left( \frac{t^3}{3} + t^2 \right) \Big|_0^1 = \frac{4\sqrt{5}}{3}$$

Figure 13  $x(t) = t$ ,  $y(t) = \sqrt{t}$ ,  $2 \leq t \leq 6$

Figure 14  $y = 2x$  from  $(0, 0)$  to  $(1, 2)$

(b) For  $x(t) = \sin t$  and  $y(t) = 2 \sin t$ , we have  $\frac{dx}{dt} = \cos t$  and  $\frac{dy}{dt} = 2 \cos t$ . Since  $\cos t \geq 0$  on  $0 \leq t \leq \frac{\pi}{2}$ , the differential  $ds$  of the arc length  $s$  is

$$ds = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt = \sqrt{\cos^2 t + 4 \cos^2 t} dt = \sqrt{5 \cos^2 t} dt = \sqrt{5} \cos t dt$$

Then

$$\begin{aligned} \int_C (x^2 + y) ds &= \int_0^{\pi/2} (\sin^2 t + 2 \sin t) \sqrt{5} \cos t dt = \sqrt{5} \int_0^{\pi/2} (\sin^2 t + 2 \sin t) \cos t dt \\ &\quad \begin{matrix} \uparrow \\ x = \sin t \\ y = 2 \sin t \end{matrix} \\ &= \sqrt{5} \left[ \frac{\sin^3 t}{3} + \sin^2 t \right]_0^{\pi/2} = \frac{4\sqrt{5}}{3} \end{aligned}$$

the same value found in (a). ■

### NOW WORK Problem 21.

Figure 15  $\Delta M_i \approx \rho(x_i^*, y_i^*) \Delta s_i$

The mass of a long thin wire of variable density, whose shape is described by a smooth curve  $C$ , can be found using a line integral. Suppose  $C$  is a smooth curve defined by the parametric equations  $x = x(t)$ ,  $y = y(t)$ , for  $a \leq t \leq b$ . Suppose the variable mass density (mass per unit length) at the point  $(x, y)$  on  $C$  is  $\rho = \rho(x, y)$ , where  $\rho$  is continuous on some region containing  $C$ . We partition  $[a, b]$  into  $n$  subintervals  $[t_{i-1}, t_i]$ , for  $i = 1, 2, \dots, n$ . In each subinterval  $[t_{i-1}, t_i]$ , we choose a number  $t_i^*$ , as shown in Figure 15. Then the mass  $\Delta M_i$  of the corresponding short piece of wire between  $(x_{i-1}, y_{i-1})$  and  $(x_i, y_i)$  is  $\Delta M_i \approx \rho(x_i^*, y_i^*) \Delta s_i$ , where  $\Delta s_i$  is the length of the short piece of wire and  $(x_i^*, y_i^*)$  is the point corresponding to  $t_i^*$ . We define the norm  $\|\Delta\|$  of the partition to be largest length  $\Delta s_i$ . The sums

$$\sum_{i=1}^n \Delta M_i = \sum_{i=1}^n \rho(x_i^*, y_i^*) \Delta s_i$$

over all the subintervals approximate the mass  $M$  of the wire. By taking the limit of these sums as the norm  $\|\Delta\|$  approaches 0, we obtain the **mass**  $M$  of the wire

$$M = \int_C \rho(x, y) ds \quad (2)$$

### EXAMPLE 3 Finding the Mass of a Wire with Variable Density

Find the mass  $M$  of a thin piece of wire in the shape of a semicircle  $x = 2 \cos t$ ,  $y = 2 \sin t$ ,  $0 \leq t \leq \pi$ , if the variable density of the wire is  $\rho(x, y) = y + 2$ .

**Solution** Using (2), we find that the mass  $M$  of the wire is

$$\begin{aligned} M &= \int_C \rho(x, y) ds = \int_C (y + 2) ds = \int_0^\pi (y + 2) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt \\ &= \int_0^\pi (2 \sin t + 2) \sqrt{(-2 \sin t)^2 + (2 \cos t)^2} dt \quad \frac{dx}{dt} = -2 \sin t; \frac{dy}{dt} = 2 \cos t \\ &= \int_0^\pi 4(\sin t + 1) dt = 4[-\cos t + t]_0^\pi = 4[\pi + 2] \end{aligned}$$

### NOW WORK Problem 67.

Line integrals also have a geometric application. In Figure 16, the surface  $z = f(x, y)$  lies above the  $xy$ -plane, so  $f(x, y) \geq 0$ . Suppose  $C$  is a smooth curve that lies in the  $xy$ -plane within the domain of  $f$ . If we draw lines parallel to the  $z$ -axis, from  $C$  to the surface, the result is a cylinder, and its area is called the **lateral surface area of the cylinder**.

DF Figure 16 Lateral surface area

Figure 17

**EXAMPLE 4** Finding the Lateral Surface Area of a Cylinder

Find the lateral surface area  $A$  of the cylinder that lies above the  $xy$ -plane, below the surface  $z = f(x, y) = x$ , and formed by lines parallel to the  $z$ -axis that intersect the curve  $y = x^2$ ,  $0 \leq x \leq 2$ .

**Solution** Figure 17 illustrates the cylinder. Along  $C$ ,  $y = x^2$ , the differential  $ds$  of arc length is

$$ds = \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx = \sqrt{1 + 4x^2} dx$$

$\uparrow$   
 $\frac{dy}{dx} = 2x$

The lateral surface area  $A$  of the cylinder is

$$\begin{aligned} A &= \int_C f(x, y) ds = \int_C x ds = \int_0^2 x \sqrt{1 + 4x^2} dx && \text{Let } u = 1 + 4x^2; \text{ then } du = 8x dx \text{ or } x dx = \frac{1}{8} du. \\ &&& \text{When } x = 0, u = 1; \text{ when } x = 2, u = 17. \\ &= \int_1^{17} \frac{1}{8} \sqrt{u} du = \left[ \frac{1}{4} \frac{u^{3/2}}{3} \right]_1^{17} = \frac{17\sqrt{17} - 1}{12} \end{aligned}$$

**NOW WORK** Problem 55.

### 3 Find Line Integrals of the Form $\int_C f(x, y) dx$ and $\int_C f(x, y) dy$

Consider a function  $f$  of two variables  $x$  and  $y$ . When we introduced partial derivatives, we said that the partial derivative  $f_x(x, y)$  of a function  $z = f(x, y)$  is found by treating  $y$  as a constant ( $\Delta y = 0$ ) and differentiating  $z = f(x, y)$  with respect to  $x$ ; similarly,  $f_y(x, y)$  is found by holding  $x$  fixed ( $\Delta x = 0$ ) and differentiating  $f$  with respect to  $y$ .

For a line integral  $\int_C f(x, y) ds$ , the differential  $ds$  of arc length along the smooth curve  $C$  is  $(ds)^2 = (dx)^2 + (dy)^2$ . If we treat  $y$  as a constant, then  $dy = 0$ ,  $ds = dx$ , and we have the **line integral along  $C$  with respect to  $x$** ,  $\int_C f(x, y) dx$ . Similarly, if  $x$  is treated as a constant, then  $dx = 0$ ,  $ds = dy$ , and we have the **line integral along  $C$  with respect to  $y$** ,  $\int_C f(x, y) dy$ .

These line integrals can be expressed as definite integrals if  $C$  is a smooth curve and if the function  $f$  is continuous on a region that contains  $C$ .

**THEOREM** The Value of a Line Integral Along  $C$  with Respect to  $x$  or  $y$ 

Let  $C$  be a smooth curve defined by the parametric equations

$$x = x(t) \quad y = y(t) \quad a \leq t \leq b$$

Let  $f = f(x, y)$  be a function that is continuous on some region that contains the curve  $C$ . Then the **line integral of  $f$  along  $C$  with respect to  $x$**  is given by

$$\int_C f(x, y) dx = \int_a^b f(x(t), y(t)) x'(t) dt \quad (3)$$

and the **line integral of  $f$  along  $C$  with respect to  $y$**  is given by

$$\int_C f(x, y) dy = \int_a^b f(x(t), y(t)) y'(t) dt \quad (4)$$

In general, each of these line integrals has a different value.

### EXAMPLE 5 Finding a Line Integral Along $C$ with Respect to $x$ and with Respect to $y$

Find

$$\int_C (x - 3y) dx \quad \text{and} \quad \int_C (x - 3y) dy$$

if  $C$  is the part of the parabola  $x = y^2$  that joins the points  $(1, 1)$  and  $(4, 2)$ .

**Solution** The function  $f(x, y) = x - 3y$  is continuous, and  $C$  is a smooth curve everywhere in the plane. So, we can use the formulas (3) and (4). Using the parametric equations of the curve  $C$ ,  $x = t^2$  and  $y = t$ ,  $1 \leq t \leq 2$ , we find  $dx = 2t dt$  and  $dy = dt$ . Then

$$\begin{aligned} \int_C (x - 3y) dx &= \int_1^2 (t^2 - 3t) 2t dt = 2 \int_1^2 (t^3 - 3t^2) dt = -\frac{13}{2} \\ \int_C (x - 3y) dy &= \int_1^2 (t^2 - 3t) dt = -\frac{13}{6} \end{aligned}$$

#### NOW WORK Problem 25.

It is not always necessary to use parametric equations for  $C$  when finding the value of the line integral of a function  $f$ . For example, if a smooth curve  $C$  is given by the rectangular equation  $y = g(x)$ ,  $a \leq x \leq b$ , then parametric equations of  $C$  are

$$x = t \quad y = g(t) \quad a \leq t \leq b$$

Since  $dx = dt$  and  $dy = g'(t) dt$ , we have

$$\begin{aligned} \int_C f(x, y) dx &= \int_a^b f(t, g(t)) dt = \int_a^b f(x, g(x)) dx \\ \int_C f(x, y) dy &= \int_a^b f(t, g(t)) g'(t) dt = \int_a^b f(x, g(x)) g'(x) dx \end{aligned}$$

For example, consider the curve  $C$  in Example 5.  $C$  has the rectangular equation  $y = \sqrt{x}$ ,  $1 \leq x \leq 4$ . Then

$$\begin{aligned} \int_C (x - 3y) dx &= \int_1^4 (x - 3\sqrt{x}) dx = -\frac{13}{2} \\ &\quad \uparrow \\ &\quad y = \sqrt{x} \\ \int_C (x - 3y) dy &= \int_1^4 (x - 3\sqrt{x}) \left( \frac{1}{2\sqrt{x}} \right) dx = -\frac{13}{6} \\ &\quad \uparrow \\ &\quad y = \sqrt{x} \\ &\quad dy = \frac{1}{2\sqrt{x}} dx \end{aligned}$$

In many applications, we combine the two line integrals  $\int_C P(x, y) dx$  and  $\int_C Q(x, y) dy$  using the notation  $\int_C (P dx + Q dy)$ .

#### DEFINITION Line Integral $\int_C (P dx + Q dy)$ Along a Smooth Curve $C$

Let  $C$  denote a smooth curve, and let  $P = P(x, y)$  and  $Q = Q(x, y)$  be functions of two variables that are continuous on some region containing  $C$ . The **line integral of  $P dx + Q dy$  along  $C$**  is defined as

$$\int_C (P dx + Q dy) = \int_C P(x, y) dx + \int_C Q(x, y) dy$$

### EXAMPLE 6 Finding a Line Integral of the Form $\int_C (P dx + Q dy)$

Find the line integral  $\int_C (y^2 dx - x^2 dy)$  along

$C_1$ : The parabola  $y = x^2$  joining the two points  $(0, 0)$  and  $(2, 4)$

$C_2$ : The line  $y = 2x$  joining the two points  $(0, 0)$  and  $(2, 4)$

**Solution** The curves  $C_1$  and  $C_2$  are smooth, and the functions  $P(x, y) = y^2$  and  $Q(x, y) = -x^2$  are continuous in the  $xy$ -plane.

Along  $C_1$ , parametric equations for the parabola are  $x(t) = t$ ,  $y(t) = t^2$ . Then  $dx = dt$  and  $dy = 2t dt$ , so

$$\begin{aligned}\int_{C_1} (y^2 dx - x^2 dy) &= \int_{C_1} y^2 dx - \int_{C_1} x^2 dy = \int_0^2 (t^2)^2 dt - \int_0^2 t^2 (2t dt) \\ &= \int_0^2 t^4 dt - 2 \int_0^2 t^3 dt = \left[ \frac{t^5}{5} \right]_0^2 - \left[ \frac{2t^4}{4} \right]_0^2 = -\frac{8}{5}\end{aligned}$$

Along  $C_2$ , parametric equations for the line segment are  $x(t) = t$ ,  $y(t) = 2t$ . Then  $dx = dt$  and  $dy = 2 dt$ , so

$$\begin{aligned}\int_{C_2} (y^2 dx - x^2 dy) &= \int_{C_2} y^2 dx - \int_{C_2} x^2 dy = \int_0^2 (2t)^2 dt - \int_0^2 t^2 (2 dt) \\ &= \left[ \frac{4t^3}{3} \right]_0^2 - \left[ \frac{2t^3}{3} \right]_0^2 = \frac{16}{3}\end{aligned}$$

Figure 18

Figure 18 shows the curves  $C_1$  and  $C_2$  joining the points  $(0, 0)$  and  $(2, 4)$ .

### NOW WORK Problem 29.

Observe that the value of the line integral in Example 6 depends on the curve  $C$  over which the integration takes place. In the next section, we investigate conditions under which the value of the integral is independent of the curve taken, that is, conditions under which the value of the integral depends only on the endpoints of the curve.

The orientation of the curve  $C$  also plays a role in the value of a line integral over  $C$ . If  $C$  is a smooth curve, then  $-C$  is the same curve but with the reverse orientation. Then

$$\int_C (P dx + Q dy) = - \int_{-C} (P dx + Q dy)$$

That is, reversing the orientation of the curve  $C$  alters the value of the line integral by a factor of  $-1$ . See Figure 19.

The line integral  $\int_C (P dx + Q dy)$  can be written compactly using vectors. Suppose

$$\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$$

is a vector field that is continuous on some region containing the smooth curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$ ,  $a \leq t \leq b$ . Then  $d\mathbf{r} = dx\mathbf{i} + dy\mathbf{j}$  and the dot product  $\mathbf{F} \cdot d\mathbf{r}$  is

$$\mathbf{F} \cdot d\mathbf{r} = [P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}] \cdot [dx\mathbf{i} + dy\mathbf{j}] = P(x, y) dx + Q(x, y) dy$$

So,

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$$

**NEED TO REVIEW?** The dot product is discussed in Section 10.4, pp. 715–716.

DF Figure 19

### EXAMPLE 7 Finding a Line Integral of the Form $\int_C \mathbf{F} \cdot d\mathbf{r}$

Find

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

if  $\mathbf{F}(x, y) = x\mathbf{i} + xy\mathbf{j}$  and the curve  $C$  is traced out by the vector function  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$ ,  $0 \leq t \leq 2$ .

**Solution** Parametric equations of the curve  $C$  are

$$x(t) = t \quad y(t) = t^2 \quad 0 \leq t \leq 2$$

So,

$$\mathbf{F} = x\mathbf{i} + xy\mathbf{j} = t\mathbf{i} + (t)(t^2)\mathbf{j} = t\mathbf{i} + t^3\mathbf{j}$$

and

$$d\mathbf{r} = \frac{d\mathbf{r}}{dt} dt = \frac{d}{dt}(t\mathbf{i} + t^2\mathbf{j}) dt = (\mathbf{i} + 2t\mathbf{j}) dt$$

Then

$$\mathbf{F} \cdot d\mathbf{r} = (t\mathbf{i} + t^3\mathbf{j}) \cdot (\mathbf{i} + 2t\mathbf{j}) dt = (t + 2t^4) dt$$

so that

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_0^2 (t + 2t^4) dt = \frac{74}{5}$$

### NOW WORK Problem 47.

## 4 Find Line Integrals Along a Piecewise-Smooth Curve

The definition of a line integral of  $f$  along  $C$  assumes that  $C$  is a smooth curve. That is, the parametric equations  $x(t)$  and  $y(t)$  defining  $C$  have derivatives  $\frac{dx}{dt}$  and  $\frac{dy}{dt}$  that are continuous and are never simultaneously 0 on  $a \leq t \leq b$ . If a curve  $C$  is not smooth, but consists of a finite number of smooth curves, say,  $C_1, C_2, \dots, C_n$ ,  $n \geq 2$ , that are joined together end to end, then  $C$  is a **piecewise-smooth curve**. Figure 20 shows two piecewise-smooth curves.

Figure 20 Two piecewise-smooth curves.

### DEFINITION Line Integral $\int_C (P dx + Q dy)$ Along a Piecewise-Smooth Curve $C$

Let  $C$  be a piecewise-smooth curve consisting of  $n \geq 2$  smooth curves  $C_1, C_2, \dots, C_n$ . Let  $P = P(x, y)$  and  $Q = Q(x, y)$  be functions of two variables that are each continuous on some region containing  $C$ . The **line integral**  $\int_C (P dx + Q dy)$  along  $C$  is defined as

$$\int_C (P dx + Q dy) = \int_{C_1} (P dx + Q dy) + \int_{C_2} (P dx + Q dy) + \cdots + \int_{C_n} (P dx + Q dy)$$

If  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j}$  and  $C$  is traced out by  $\mathbf{r} = \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$ ,  $a \leq t \leq b$ , then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} + \int_{C_2} \mathbf{F} \cdot d\mathbf{r} + \cdots + \int_{C_n} \mathbf{F} \cdot d\mathbf{r}$$

Figure 21

**EXAMPLE 8** Finding a Line Integral Along a Piecewise-Smooth Curve

Find  $\int_C (xy \, dx + x^2 \, dy)$  along the piecewise-smooth curve  $C$  illustrated in Figure 21.

**Solution** The values of the line integral along each of the smooth curves  $C_1$ ,  $C_2$ ,  $C_3$ , and  $C_4$  are

$$C_1: \quad y = \frac{1}{3}x, \quad dy = \frac{1}{3}dx; \quad 0 \leq x \leq 3$$

$$\int_{C_1} (xy \, dx + x^2 \, dy) = \int_0^3 \left[ x \left( \frac{1}{3}x \right) dx + x^2 \frac{1}{3} dx \right] = 6$$

$$C_2: \quad x = 3, \quad dx = 0; \quad 1 \leq y \leq 2$$

$$\int_{C_2} (xy \, dx + x^2 \, dy) = \int_1^2 9 \, dy = 9$$

$$C_3: \quad y = 2, \quad dy = 0; \quad \text{Watch the orientation here: } x \text{ varies from 3 to 2.}$$

$$\int_{C_3} (xy \, dx + x^2 \, dy) = \int_3^2 2x \, dx = [x^2]_3^2 = -5$$

$$C_4: \quad y = x, \quad dy = dx; \quad \text{Watch the orientation here: } x \text{ varies from 2 to 0.}$$

$$\int_{C_4} (xy \, dx + x^2 \, dy) = \int_2^0 (x^2 \, dx + x^2 \, dx) = 2 \int_2^0 x^2 \, dx = -\frac{16}{3}$$

Then

$$\int_C (xy \, dx + x^2 \, dy) = 6 + 9 - 5 - \frac{16}{3} = \frac{14}{3}$$

**NOW WORK** Problem 39.**5 Find the Value of a Line Integral in Space**

The definition of a line integral in space is similar to that of a line integral in the plane. We state without proof the main results needed to find the value of line integrals in space.

**THEOREM** The Value of a Line Integral in Space

Let  $C$  be a smooth curve in space defined by the parametric equations

$$x = x(t) \quad y = y(t) \quad z = z(t) \quad a \leq t \leq b$$

Let  $w = f(x, y, z)$  be a function that is continuous on some solid that contains the smooth curve  $C$ . Then the line integral of  $f$  along  $C$  from  $t = a$  to  $t = b$  exists and

$$\int_C f(x, y, z) \, ds = \int_a^b f(x(t), y(t), z(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} \, dt \quad (5)$$

Observe that if  $w = f(x, y, z) = 1$ , then

$$\int_C f(x, y, z) \, ds = \int_C ds = \text{arc length of } C \text{ from } a \text{ to } b$$

similar to plane curves.

Suppose  $C$  is a smooth curve in space defined by the parametric equations

$$x = x(t) \quad y = y(t) \quad z = z(t) \quad a \leq t \leq b$$

In space, we have line integrals along  $C$  with respect to  $x$ , with respect to  $y$ , and with respect to  $z$ . If  $P(x, y, z)$ ,  $Q(x, y, z)$ , and  $R(x, y, z)$  are functions that are continuous

on some solid in space containing  $C$ , then

$$\begin{aligned}\int_C P(x, y, z) dx &= \int_a^b P(x(t), y(t), z(t)) x'(t) dt \\ \int_C Q(x, y, z) dy &= \int_a^b Q(x(t), y(t), z(t)) y'(t) dt \\ \int_C R(x, y, z) dz &= \int_a^b R(x(t), y(t), z(t)) z'(t) dt \\ \int_C (P dx + Q dy + R dz) &= \int_C P dx + \int_C Q dy + \int_C R dz\end{aligned}$$

If  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  is a vector field that is continuous on some solid containing the smooth curve  $C: \mathbf{r} = \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ ,  $a \leq t \leq b$ , then the line integral of  $\mathbf{F} \cdot \mathbf{r}$  is

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy + R dz)$$

A curve  $C$  in space is piecewise-smooth if it consists of a finite number of smooth curves  $C_1, C_2, \dots, C_n$ ,  $n \geq 2$ , that are joined together end to end. If  $C: \mathbf{r} = \mathbf{r}(t)$  is piecewise-smooth and if  $\mathbf{F} = \mathbf{F}(x, y, z)$  is a vector field that is continuous on some solid containing  $C$ , then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} + \int_{C_2} \mathbf{F} \cdot d\mathbf{r} + \cdots + \int_{C_n} \mathbf{F} \cdot d\mathbf{r}$$

### EXAMPLE 9 Finding a Line Integral in Space

Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$  if

$$\mathbf{F}(x, y, z) = xy^2\mathbf{i} + x^2z\mathbf{j} - (y - x)\mathbf{k}$$

and the curve  $C$  is traced out by  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$ ,  $0 \leq t \leq 1$ .

**Solution** Parametric equations of the curve  $C$  are

$$x = t \quad y = t^2 \quad z = t^3 \quad 0 \leq t \leq 1$$

So,

$$\mathbf{F} = xy^2\mathbf{i} + x^2z\mathbf{j} - (y - x)\mathbf{k} = t^5\mathbf{i} + t^5\mathbf{j} - (t^2 - t)\mathbf{k}$$

and

$$d\mathbf{r} = \frac{d\mathbf{r}}{dt} dt = (\mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}) dt$$

Then

$$\begin{aligned}\mathbf{F} \cdot d\mathbf{r} &= [t^5\mathbf{i} + t^5\mathbf{j} - (t^2 - t)\mathbf{k}] \cdot (\mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}) dt = [t^5 + 2t^6 - 3t^2(t^2 - t)] dt \\ &= (2t^6 + t^5 - 3t^4 + 3t^3) dt\end{aligned}$$

so that

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_0^1 (2t^6 + t^5 - 3t^4 + 3t^3) dt = \frac{253}{420}$$

### NOW WORK Problem 51.

Sections 15.3–15.5 primarily treat line integrals in the plane. We continue the study of line integrals in space in Section 15.9.

## 15.2 Assess Your Understanding

### Concepts and Vocabulary

- True or False** A line integral  $\int_C f(x, y) ds$  is equal to a definite integral if  $C$  is a smooth curve defined on  $[a, b]$ , and if the function  $f$  is continuous on some region that contains the curve  $C$ .
- If  $C$  is a smooth curve defined by the parametric equations  $x = x(t)$  and  $y = y(t)$ ,  $a \leq t \leq b$ , and  $f$  is a function that is continuous on some region that contains the curve  $C$ , then the line integral of  $f$  along  $C$  from  $t = a$  to  $t = b$  exists and is given by  $\int_C f(x, y) ds = \int_a^b \underline{\hspace{2cm}} dt$ .
- True or False** The value  $\int_C f(x, y) ds$  depends on the choice of the parametric equations used to represent the smooth curve  $C$ .
- If the variable mass density of a wire at a point  $(x, y)$  is  $\rho(x, y)$ , then the mass  $M$  of the wire can be found using the line integral  $\underline{\hspace{2cm}}$ , where  $C$  is the curve representing the shape of the wire.
- True or False**  $\int_C (P dx + Q dy) = \int_C (P dx - Q dy)$
- True or False** A piecewise-smooth curve  $C$  consists of a finite number of smooth curves that are joined together end to end.
- If a piecewise-smooth curve  $C$  consists of smooth curves  $C_1, C_2, \dots, C_n$ ,  $n \geq 2$ , then  $\int_C (P dx + Q dy) = \underline{\hspace{2cm}}$ .
- True or False** Suppose  $C$  is a smooth curve defined by the parametric equations  $x = x(t)$ ,  $y = y(t)$ , and  $z = z(t)$ ,  $a \leq t \leq b$ , and  $P(x, y, z)$ ,  $Q(x, y, z)$ , and  $R(x, y, z)$  are functions that are continuous on some solid in space containing  $C$ , then  $\int_C P(x, y, z) dx = \int_a^b P(x(t), y(t), z(t))x'(t) dt$ .

### Skill Building

In Problems 9–14, find each line integral for the given smooth curve  $C$ .

- $\int_C x^2 y ds$ ;  $C: x = \cos t, y = \cos t, 0 \leq t \leq \frac{\pi}{2}$
- $\int_C (y - x^2) ds$ ;  $C: x = t, y = 3t, 0 \leq t \leq 1$
- $\int_C xy ds$ ;  $C: x = t^2, y = 4t, 0 \leq t \leq 2$
- $\int_C x ds$ ;  $C: x = t, y = 3t^2, 0 \leq t \leq 1$
- $\int_C \frac{y}{2x^2 - y^2} ds$ ;  $C: x = t, y = t, 1 \leq t \leq 5$
- $\int_C \frac{x^2}{x^3 + y^3} ds$ ;  $C: x = 3t, y = 4t, 1 \leq t \leq 2$
- Find  $\int_C 2y ds$ , where  $C$  is the curve  $y = \frac{1}{2}x^3$  joining  $(0, 0)$  to  $(2, 4)$ .
- Find  $\int_C x ds$ , where  $C$  is the curve  $x = 5y^3$  joining  $(0, 0)$  to  $(5, 1)$ .
- Find  $\int_C (xy + 1) ds$ , where  $C$  is the curve  $\mathbf{r}(t) = \sin t \mathbf{i} + \cos t \mathbf{j}$ ,  $0 \leq t \leq \pi$ .
- Find  $\int_C xy^2 ds$ , where  $C$  is the curve  $\mathbf{r}(t) = 3 \cos t \mathbf{i} + \sin t \mathbf{j}$ ,  $0 \leq t \leq \frac{\pi}{2}$ .

In Problems 19–22, find each line integral along the two given curves  $C_1$  and  $C_2$ .

- $\int_C (x + y^2) ds$ 
  - $C_1: x = t, y = t, 0 \leq t \leq 1$
  - $C_2: x = \sin t, y = \sin t, 0 \leq t \leq \frac{\pi}{2}$
- $\int_C (x + y) ds$ 
  - $C_1: x = t, y = 3t, 0 \leq t \leq 1$
  - $C_2: x = \sin(2t), y = 3 \sin(2t), 0 \leq t \leq \frac{\pi}{2}$
- $\int_C (x + e^y) ds$ 
  - $C_1: x = 1 - t, y = t, 0 \leq t \leq 1$
  - $C_2: x = \cos t, y = 1 - \cos t, 0 \leq t \leq \frac{\pi}{2}$
- $\int_C x e^{x^2} ds$ 
  - $C_1: x = t + 1, y = t, 0 \leq t \leq 1$
  - $C_2: x = 1 + \sin t, y = \sin t, 0 \leq t \leq \frac{\pi}{2}$

In Problems 23–26, find the line integral with respect to  $x$  and with respect to  $y$  for each function  $f(x, y)$  along the given curve  $C$ .

- $f(x, y) = 2x + y^2$  along the line  $y = 3 - x$  from  $(0, 3)$  to  $(3, 0)$ .
- $f(x, y) = x e^y$  along the line  $2x - y = 1$  from  $(0, -1)$  to  $(1, 1)$ .
- $f(x, y) = x e^y$  along the curve  $C$  traced out by  $x = e^{2y}$  from  $(1, 0)$  to  $(e^2, 1)$ .
- $f(x, y) = x^2 y$  along the parabola  $x = 2y^2$  from  $(0, 0)$  to  $(2\pi, \sqrt{\pi})$ .
- Find  $\int_C (x^2 y dx + xy dy)$  along the curve  $C: x^2 + y^2 = 1$  from  $(1, 0)$  to  $(0, 1)$  using the following parametric equations:
  - $x = \cos t, y = \sin t, 0 \leq t \leq \frac{\pi}{2}$
  - $x = \sqrt{1 - y^2}, 0 \leq y \leq 1$
- Find  $\int_C (xy dx + xy^2 dy)$  along the curve  $C: x^2 + y^2 = 9$  from  $(3, 0)$  to  $(-3, 0)$  traced out by the parametric equations:
  - $x = 3 \cos t, y = 3 \sin t, 0 \leq t \leq \pi$
  - $y = \sqrt{9 - x^2}, -3 \leq x \leq 3$
- Find  $\int_C [y^2 dx + (xy - x^2) dy]$  along each of the given curves from  $(0, 0)$  to  $(1, 3)$ :
  - $C$  is the line  $y = 3x$ .
  - $C$  is the parabola  $y^2 = 9x$ .
- Find  $\int_C [(x^2 + y^2) dx + 3x^2 y dy]$  along each of the given curves from  $(-2, 4)$  to  $(2, 4)$ :
  - $C$  is the parabola  $y = x^2$ .
  - $C$  is the line  $y = 4$ .

In Problems 31–34, find  $\int_C [(x+2y)dx + (2x+y)dy]$  along each curve  $C$ .

31.  $C$  is the curve  $y = x^2$  from  $(0, 0)$  to  $(1, 1)$ .

32.  $C$  is the curve  $y = x^3$  from  $(0, 0)$  to  $(1, 1)$ .

33.  $C$  is the curve  $x = \cos t$ ,  $y = \sin t$ ,  $0 \leq t \leq \frac{\pi}{2}$ .

34.  $C$  is the curve  $x = 1 - t$ ,  $y = t$ ,  $0 \leq t \leq 1$ .

In Problems 35–38, find  $\int_C x ds$  along each piecewise-smooth curve  $C$ .

39. Find  $\int_C [(x \cos y)dx - (y \sin x)dy]$ , where  $C$  consists of line segments connecting the points  $(0, 0)$ ,  $(1, 0)$ ,  $(1, 1)$ , and  $(0, 1)$ , in that order.

40. Find  $\int_C [(x \sin y)dx - (y \cos x)dy]$ , where  $C$  consists of line segments connecting the points  $(0, 0)$ ,  $(0, 1)$ ,  $(1, 1)$ , and  $(1, 0)$ , in that order.

41. Find  $\int_C (yz dx + xz dy + xy dz)$ , where  $C$  consists of line segments connecting the points  $(0, 0, 0)$ ,  $(1, 0, 0)$ ,  $(1, 1, 0)$ , and  $(1, 1, 1)$ , in that order.

42. Find  $\int_C [yz dx + (y + zx)dy + xz dz]$ , where  $C$  consists of line segments connecting the points  $(0, 0, 0)$ ,  $(1, 0, 0)$ ,  $(1, 2, 0)$ , and  $(1, 2, 1)$ , in that order.

In Problems 43–46, find  $\int_C [y dx + (x - 16y) dy]$  along each of the given curves from  $(2, 0)$  to  $(0, 4)$ .

43. The line segment joining the two points

44. The parabola  $y = 4 - x^2$

45. The line segment from  $(2, 0)$  to  $(2, 2)$ , followed by the line segment from  $(2, 2)$  to  $(0, 4)$ .

46. The parabola  $y = 4 - x^2$  from  $(2, 0)$  to  $(1, 3)$ , followed by the line segment from  $(1, 3)$  to  $(0, 4)$ .

In Problems 47–50, for each vector field  $\mathbf{F}$  and curve  $C: \mathbf{r} = \mathbf{r}(t)$ , find  $\int_C \mathbf{F} \cdot d\mathbf{r}$ .

47.  $\mathbf{F}(x, y) = (x + 2y)\mathbf{i} + (2x + y)\mathbf{j}$ ;  
 $C$  is the curve  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$ ,  $0 \leq t \leq 1$ .

48.  $\mathbf{F}(x, y) = x^2\mathbf{i} + xy\mathbf{j}$   
 $C$  is the curve  $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$ ,  $0 \leq t \leq \pi$ .

49.  $\mathbf{F}(x, y, z) = xy\mathbf{i} + x^2z\mathbf{j} + xyz\mathbf{k}$   
 $C$  is the curve  $\mathbf{r}(t) = e^t\mathbf{i} + e^{-t}\mathbf{j} + t^2\mathbf{k}$ ,  $0 \leq t \leq 1$ .

50.  $\mathbf{F}(x, y, z) = y\mathbf{i} + x^2y\mathbf{j} + xz\mathbf{k}$   
 $C$  is the curve  $\mathbf{r}(t) = e^{2t}\mathbf{i} + e^t\mathbf{j} + t\mathbf{k}$ ,  $0 \leq t \leq 1$ .

In Problems 51–54, for each curve  $C$ , find  $\int_C \mathbf{F} \cdot d\mathbf{r}$  if  $\mathbf{F}(x, y, z) = xy\mathbf{i} - y\mathbf{j} + z\mathbf{k}$ .

51.  $C$  is the line segment from  $(0, 0, 0)$  to  $(1, 0, 0)$ .

52.  $C$  is the line segment from  $(1, 0, 0)$  to  $(1, 2, 0)$ .

53.  $C$  is the line segment from  $(1, 2, 0)$  to  $(1, 2, 3)$ .

54.  $C$  is the line segment from  $(0, 0, 0)$  to  $(1, 2, 3)$ .

In Problems 55–58 find the lateral surface area  $A$  of the cylinder that lies above the  $xy$ -plane and below the surface  $z = f(x, y)$  and is formed by lines parallel to the  $z$ -axis and intersecting  $C$ .

55.  $z = f(x, y) = 1 - x^2$ ;  $C: x = \sin t$ ,  $y = \cos t$ ,  $0 \leq t \leq 2\pi$

56.  $z = f(x, y) = 1 - y^2$ ;  $C: x = \sin t$ ,  $y = \cos t$ ,  $0 \leq t \leq 2\pi$

57.  $z = f(x, y) = 2xy$ ;  $C: y = \sqrt{1 - x^2}$ ,  $0 \leq x \leq 1$

58.  $z = f(x, y) = x + y$ ;  $C: y = \sqrt{1 - x^2}$ ,  $0 \leq x \leq 1$

## Applications and Extensions

59. Find  $\int_C \frac{ds}{x^2 + y^2 + z^2}$ , where  $C$  is the helix  $x = a \cos t$ ,  $y = a \sin t$ ,  $z = bt$ ,  $0 \leq t \leq 1$ .

60. Find  $\int_C (y^n dx + x^n dy)$ , where  $C$  is the ellipse  $x = a \sin t$ ,  $y = b \cos t$ ,  $0 \leq t \leq 2\pi$ , and  $n \geq 1$  is an integer.

61. Find  $\int_C y^2 ds$ , where  $C$  is the first arch of the cycloid  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ .

62. Find  $\int_C \sqrt{x^2 + y^2} ds$ , where  $C$  is the curve  $x = a(\cos t + t \sin t)$ ,  $y = a(\sin t - t \cos t)$ ,  $0 \leq t \leq 2\pi$ ,  $a > 0$ .

63. Find  $\int_C (z dx + x dy + y dz)$ , where  $C$  is the circular helix  $x = a \cos t$ ,  $y = a \sin t$ ,  $z = t$ ,  $0 \leq t \leq 2\pi$ .

64. Find  $\int_C [xz dx + (y + z) dy + x dz]$ , where  $C$  is the curve  $x = e^t$ ,  $y = e^{-t}$ ,  $z = e^{2t}$  from  $t = 0$  to  $t = 1$ .

**Mass of a Wire** In Problems 65 and 66, find the mass  $M$  of a thin wire in the shape of the curve  $C$  whose variable mass density is  $\rho$ .

65.  $C: y = x^2$ ,  $1 \leq x \leq 2$ ;  $\rho = \rho(x, y) = 4x$

66.  $C: x = 3 \sin t$ ,  $y = 3 \cos t$ ,  $0 \leq t \leq \frac{\pi}{2}$ ;  
 $\rho = \rho(x, y) = x + y + 1$

67. **Mass of a Wire** Find the mass of a thin wire in the shape of a parabola  $x = 2t^2$ ,  $y = t$ ,  $-2 \leq t \leq 3$ , if the variable mass density of the wire is  $\rho(x, y) = 3x$ .

68. **Mass of a Wire** Find the mass of a thin wire in the shape of a parabola  $x = t$ ,  $y = t^2 - 1$ ,  $0 \leq t \leq 3$ , if the variable mass density of the wire is  $\rho(x, y) = x(y + 1)$ .

69. **Mass of a Wire** A spring is made of a thin wire twisted into the shape of a circular helix  $x = 2 \cos t$ ,  $y = 2 \sin t$ ,  $z = t$ . Find the mass of two turns of the spring if the wire has constant mass density  $\rho$ .

**70. Mass of a Wire** A spring is made of a thin wire twisted into the shape of a circular helix  $x = 3 \sin t$ ,  $y = 3 \cos t$ ,  $z = t$ . Find the mass of two turns of the spring if the wire has variable mass density  $\rho(x, y, z) = z + 2$ .

**71. Mass of a Wire in Space** Write a formula similar to  $M = \int_C \rho(x, y) ds$  for the mass of a thin wire in the shape of a smooth space curve  $C$  whose variable mass density is  $\rho = \rho(x, y, z)$ .

In Problems 72–74, use the formula developed in Problem 71 to find the mass of each wire.

**72. Mass of a Wire in Space** The thin wire is in the shape of the helix  $C: x = 2 \cos t$ ,  $y = 2 \sin t$ ,  $z = 5t$ ,  $0 \leq t \leq 2\pi$ , whose mass density is  $\rho(x, y, z) = k$ , a constant.

**73. Mass of a Wire in Space** The thin wire is in the shape of a helix  $C: x = 3 \cos t$ ,  $y = 3 \sin t$ ,  $z = 4t$ ,  $0 \leq t \leq 2\pi$ , whose variable mass density is  $\rho(x, y, z) = 2 + z$ .

**74. Mass of a Wire in Space** The thin wire is in the shape of a helix  $C: x = 2 \cos t$ ,  $y = 2 \sin t$ ,  $z = 5t$ ,  $0 \leq t \leq 2\pi$ , if the mass density is proportional to the square of the distance from the origin.

**75. Lateral Surface Area** Derive the formula  $A = 2\pi Rh$  for the surface area of a right circular cylinder using the line integral  $\int_C f(x, y) ds$ , where  $z = f(x, y) = h$ ,  $h > 0$ , and  $C$  is the circle  $x^2 + y^2 = R^2$ .

**76.** Let  $C_1$  be the curve  $x = \cos \theta$ ,  $y = \sin \theta$ ,  $0 \leq \theta \leq 4\pi$ , and let  $C_2$  be the curve  $x = \cos t^2$ ,  $y = \sin t^2$ ,  $0 \leq t \leq 2\sqrt{\pi}$ . For  $P(x, y) = x^3 y$  and  $Q(x, y) = y^2 x$ , show that  $\int_{C_1} (P dx + Q dy) = \int_{C_2} (P dx + Q dy)$ . Explain why this is so.

### Challenge Problems

**77.** Find  $\int_C (x + y) ds$ , where  $C$  is the curve  $x = t$ ,  $y = \frac{3t^2}{\sqrt{2}}$ ,  $0 \leq t \leq 1$ .

**78. Center of Mass** Find the center of mass of a homogeneous wire in the shape of the hypocycloid

(a)  $x = a \cos^3 t$ ,  $y = a \sin^3 t$ ,  $0 \leq t \leq \frac{\pi}{2}$

(b)  $x = a \cos^3 t$ ,  $y = a \sin^3 t$ ,  $0 \leq t \leq 2\pi$

**79.** Suppose the line integral of  $f(x, y)$  along the curve  $C$  exists.

(a) Use the Mean Value Theorem to derive the formula

$$\int_C f(x, y) ds = \int_a^b f(x(t), y(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

(b) Apply the formula in (a) to the quantity

$$S(t) = \int_a^t \sqrt{(x')^2 + (y')^2} du, \text{ where } S'(t_0) \text{ is the length of the portion of the curve traced out as } t \text{ moves from } a \text{ to } t_0.$$

**80.** It follows from Problem 79 that the value of a line integral of a function along a smooth curve, given the hypotheses of the theorem, is independent of the parameterization. Why? In particular, if  $x$  and  $y$  are differentiable functions of the arc length as one moves along the curve, describe what form the integral

$$\int_C f(x, y) ds = \int_a^b f(x(t), y(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$

takes when  $s$  is used as the parameter.

**81.** We have seen two kinds of line integrals:  $\int_C (P dx + Q dy)$  and  $\int_C f ds$ . These are closely connected.

(a) If  $C$  is expressed using arc length as the parameter, show that  $\int_C (P dx + Q dy)$  can be written in the form  $\int_C f ds$ .

(b) If the arc length  $s$  along  $C$  can be expressed as a function of  $x$  and  $y$ , show that  $\int_C f ds$  can be written in the form  $\int_C (P dx + Q dy)$ . For example,

$$\int_C (x + y^2) ds = \int_C \left[ \frac{x^2 + xy^2}{\sqrt{x^2 + y^2}} dx + \frac{xy + y^3}{\sqrt{x^2 + y^2}} dy \right]$$

where  $C$  is the curve  $x = t$ ,  $y = t$ , for  $0 \leq t \leq 1$ .

## 15.3 Fundamental Theorem of Line Integrals

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Identify a conservative vector field and its potential function (p. 990)
- 2 Use the Fundamental Theorem of Line Integrals (p. 991)
- 3 Reconstruct a function from its gradient: Finding the potential function for a conservative vector field (p. 995)
- 4 Determine whether a vector field is conservative (p. 996)

In Example 6 of Section 15.2, we found a line integral along two different curves with common endpoints and obtained two different values. But there are situations where the curve connecting the two endpoints does not affect the value of the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$ ; that is, the line integral is *independent of the path*. As it turns out, if the vector field  $\mathbf{F}$  is *conservative*, then  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is independent of the path.

**DEFINITION** Conservative Vector Field; Potential Function

$\mathbf{F}$  is a **conservative vector field** if  $\mathbf{F}$  is the gradient of some function  $f$  that has continuous first-order partial derivatives. That is,  $\mathbf{F}$  is a conservative vector field if

$$\mathbf{F} = \nabla f$$

The function  $f$  is called a **potential function** for  $\mathbf{F}$ .

**NEED TO REVIEW?** The gradient is discussed in Section 13.1, pp. 866–871.

## 1 Identify a Conservative Vector Field and Its Potential Function

### EXAMPLE 1 Identifying a Conservative Vector Field and Its Potential Function

$\mathbf{F}(x, y) = 2xy\mathbf{i} + x^2\mathbf{j}$  is a conservative vector field, since  $\mathbf{F}$  is the gradient of the function  $f(x, y) = x^2y$ . That is,

$$\nabla f(x, y) = f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} = 2xy\mathbf{i} + x^2\mathbf{j} = \mathbf{F}(x, y)$$

The function  $f(x, y) = x^2y$  is the potential function for  $\mathbf{F}$ . ■

The next result provides a direct way to find the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  when  $\mathbf{F}$  is a conservative vector field.

**THEOREM** Fundamental Theorem of Line Integrals

Let  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a vector field, where the functions  $P(x, y)$  and  $Q(x, y)$  are continuous on some open region  $R$  containing the points  $(x_0, y_0)$  and  $(x_1, y_1)$ . Let  $C$  be a piecewise-smooth curve beginning at the point  $(x_0, y_0)$  and ending at the point  $(x_1, y_1)$  that lies entirely in  $R$ . If  $\mathbf{F}$  is a conservative vector field on  $R$ , that is, if  $\mathbf{F}$  is the gradient of some function  $f$  so that

$$\mathbf{F}(x, y) = \nabla f(x, y)$$

throughout  $R$ , then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \nabla f \cdot d\mathbf{r} = \int_{(x_0, y_0)}^{(x_1, y_1)} \mathbf{F} \cdot d\mathbf{r} = [f(x, y)]_{(x_0, y_0)}^{(x_1, y_1)} = f(x_1, y_1) - f(x_0, y_0)$$

$$\int_C (P dx + Q dy) = \int_{(x_0, y_0)}^{(x_1, y_1)} (P dx + Q dy) = [f(x, y)]_{(x_0, y_0)}^{(x_1, y_1)} = f(x_1, y_1) - f(x_0, y_0)$$

**Proof** This proof is for a smooth curve  $C$ . (The proof for a piecewise-smooth curve is obtained by considering one piece of the curve at a time.) Let  $x = x(t)$  and  $y = y(t)$ ,  $a \leq t \leq b$ , be parametric equations of a smooth curve  $C$ . The initial point and endpoint of  $C$  can then be written as

$$(x_0, y_0) = (x(a), y(a)) \quad \text{and} \quad (x_1, y_1) = (x(b), y(b))$$

Since  $\mathbf{F} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field, then  $\mathbf{F} = \nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j}$

for some function  $f$ . Since  $\mathbf{F} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$ , it follows that  $P(x, y) = \frac{\partial f}{\partial x}$  and

$Q(x, y) = \frac{\partial f}{\partial y}$ . Then

$$\begin{aligned}
 \int_C (P dx + Q dy) &= \int_C \left( \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy \right) = \int_a^b \left( \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} \right) dt \\
 &= \int_a^b \frac{d}{dt} [f(x(t), y(t))] dt \quad \text{Use the Chain Rule I: } \frac{d}{dt} f(x(t), y(t)) = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}. \\
 &= [f(x(t), y(t))]_{t=a}^{t=b} \quad \text{Use the Fundamental Theorem of Calculus.} \\
 &= f(x(b), y(b)) - f(x(a), y(a)) = f(x_1, y_1) - f(x_0, y_0)
 \end{aligned}$$

Figure 22

In the Fundamental Theorem of Line Integrals, the value of the line integral *depends only on the endpoints*  $(x_0, y_0)$  and  $(x_1, y_1)$  of the curve  $C$ . This means that the value of the line integral does not change if  $C$  is replaced by any other piecewise-smooth curve in  $R$ , provided the new curve connects  $(x_0, y_0)$  and  $(x_1, y_1)$ . Figure 22 illustrates this for two curves  $C_1$  and  $C_2$  joining  $A = (x_0, y_0)$  and  $B = (x_1, y_1)$ . As a result, line integrals  $\int_C \mathbf{F} \cdot d\mathbf{r}$  for which the conditions of the Fundamental Theorem of Line Integral are met are said to be **independent of the path**. In other words, for a conservative vector field  $\mathbf{F}$ , the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  has the same value no matter what path  $C$  is taken from  $A = (x_0, y_0)$  to  $B = (x_1, y_1)$ . To summarize:

If  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j} = \nabla f$ , then:

- $\int_C (P dx + Q dy) = f(x_1, y_1) - f(x_0, y_0)$  for any piecewise-smooth curve  $C$  joining  $A$  and  $B$ .
- $\int_{C_1} (P dx + Q dy) = \int_{C_2} (P dx + Q dy)$  for any piecewise-smooth curves  $C_1$  and  $C_2$  joining  $A$  and  $B$ .

## 2 Use the Fundamental Theorem of Line Integrals

### EXAMPLE 2 Using the Fundamental Theorem of Line Integrals

$\mathbf{F} = \mathbf{F}(x, y) = (2xy + 24x)\mathbf{i} + (x^2 + 16)\mathbf{j}$  is a conservative vector field, since  $\mathbf{F}$  is the gradient of  $f(x, y) = x^2y + 12x^2 + 16y$ . Use this fact to find

$$\int_C [(2xy + 24x) dx + (x^2 + 16) dy]$$

where  $C$  is any piecewise-smooth curve joining the points  $(1, 1)$  and  $(2, 4)$ .

**Solution** We use two methods to find  $\int_C [(2xy + 24x) dx + (x^2 + 16) dy]$ .

**Method I** uses the potential function  $f(x, y) = x^2y + 12x^2 + 16y$  whose gradient is

$$\nabla f = (2xy + 24x)\mathbf{i} + (x^2 + 16)\mathbf{j} = \mathbf{F}(x, y)$$

and the Fundamental Theorem of Line Integrals.

$$\int_C [(2xy + 24x) dx + (x^2 + 16) dy] = [f(x, y)]_{(1,1)}^{(2,4)} = f(2, 4) - f(1, 1)$$

$$= [(2^2)(4) + 12(2^2) + 16(4)] - [(1^2)(1) + 12(1^2) + 16(1)] = 99$$

**Method II** uses the fact that the given line integral is independent of the path, so it can be integrated along *any* piecewise-smooth curve joining  $(1, 1)$  and  $(2, 4)$ . We choose the path shown in Figure 23 since it makes the integration easy. So, along  $C_1$ ,  $dy = 0$ ,

Figure 23

and along  $C_2$ ,  $dx = 0$ . Then

$$\begin{aligned}\int_C [(2xy + 24x) dx + (x^2 + 16) dy] &= \int_{C_1} [(2xy + 24x) dx + (x^2 + 16) dy] \\ &\quad + \int_{C_2} [(2xy + 24x) dx + (x^2 + 16) dy] \\ &= \int_1^2 (2x + 24x) dx + \int_1^4 (4 + 16) dy = 39 + 60 = 99 \quad \blacksquare\end{aligned}$$

Method I is easier to use than Method II, but this is because the potential function  $f$  of  $\mathbf{F}$  is given. If the potential function  $f$  had not been given, then we would have had to find it before using Method I. We discuss how to do this shortly.

### NOW WORK Problem 19.

So, to find the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$ , where  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j}$  is a conservative vector field, either of the methods outlined in Example 2 can be used.

#### Finding $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$ for a Conservative Vector Field

**Method I:** Use the Fundamental Theorem of Line Integrals directly. That is, if  $\mathbf{F} = \nabla f$ ,

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy) = f(x_1, y_1) - f(x_0, y_0)$$

**Method II:** Use the fact that  $\int_C (P dx + Q dy)$  is independent of the path and select some suitable path joining the endpoints of  $C$  that makes finding the line integral easy.

Care must be taken when using Method II. For example, suppose we are asked to find

$$\int_C \frac{-y dx + x dy}{x^2}$$

along the curve  $C$  joining the points  $(1, -1)$  and  $(4, 2)$ .  $\left[ \mathbf{F} = \mathbf{F}(x, y) = \frac{-y\mathbf{i} + x\mathbf{j}}{x^2} \right]$  is a conservative vector field since  $\mathbf{F}$  is the gradient of the function  $f(x, y) = \frac{y}{x}$ . To use Method II to find the line integral, we cannot choose a path (such as  $x = y^2$ ) that intersects the  $y$ -axis, because  $P = -\frac{y}{x^2}$  and  $Q = \frac{1}{x}$  are not defined at  $x = 0$ . But any path that lies entirely in the first and fourth quadrants can be used. See Figure 24.

A special case of the Fundamental Theorem of Line Integrals occurs when  $C$  is a **closed curve**, that is, when the initial point  $(x_0, y_0)$  equals the terminal point  $(x_1, y_1)$ . Then  $f(x_1, y_1) = f(x_0, y_0)$  and the value of the line integral is

$$\int_C (P dx + Q dy) = f(x_1, y_1) - f(x_0, y_0) = 0$$

#### COROLLARY Value of a Line Integral over a Closed Curve

Suppose  $\mathbf{F}$  is a conservative vector field on some open region  $R$ , and  $C$  is a closed, piecewise-smooth curve that lies entirely in  $R$ . Then

$$\boxed{\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy) = 0}$$

Figure 24

**EXAMPLE 3** Finding a Line Integral over a Closed Curve

$\mathbf{F} = \mathbf{F}(x, y) = \frac{-y\mathbf{i} + x\mathbf{j}}{x^2 + y^2}$  is the gradient of  $f(x, y) = \tan^{-1} \frac{y}{x}$ ,  $x \neq 0$ , since

$$\nabla f = \frac{\partial}{\partial x} \tan^{-1} \frac{y}{x} \mathbf{i} + \frac{\partial}{\partial y} \tan^{-1} \frac{y}{x} \mathbf{j} = \frac{\frac{-y}{x^2}}{1 + \frac{y^2}{x^2}} \mathbf{i} + \frac{\frac{1}{x}}{1 + \frac{y^2}{x^2}} \mathbf{j} = \frac{-y\mathbf{i} + x\mathbf{j}}{x^2 + y^2}$$

So,  $\mathbf{F}$  is a conservative vector field on any region  $R$  that contains no points on the  $y$ -axis ( $x = 0$ ). Then by the corollary

$$\int_C \mathbf{F} \cdot d\mathbf{r} = 0$$

along any closed, piecewise-smooth curve  $C$  that does not cross or touch the  $y$ -axis. ■

**NOW WORK** Problem 27.**The Converse of the Fundamental Theorem of Line Integrals**

An open region  $R$  is **connected** if any two points in  $R$  can be joined by a piecewise-smooth curve  $C$  that lies entirely in  $R$ . Figure 25(a) and 25(b) illustrate the idea of a connected region. In these two figures, any two points of  $R$  can be joined by a piecewise-smooth curve that lies entirely in  $R$ , so  $R$  is connected. In Figure 25(c) and 25(d),  $R$  is not connected, since the points  $A$  and  $B$  cannot be joined by a curve that lies entirely in  $R$ .

**Figure 25**

From the Fundamental Theorem of Line Integrals, if  $\mathbf{F}$  is a conservative vector field on an open region  $R$ , then  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is independent of the path taken in  $R$ . If  $R$  is connected, then the converse of the Fundamental Theorem of Line Integrals is also true.

**NOTE** The converse of the conditional statement "If  $p$ , then  $q$ " is "If  $q$ , then  $p$ ."

**THEOREM The Converse of the Fundamental Theorem of Line Integrals**

Let  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a vector field, where the functions  $P(x, y)$  and  $Q(x, y)$  are continuous on an open, connected region  $R$  containing the point  $(x_0, y_0)$ . If the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$  for every piecewise-smooth curve  $C$  in  $R$ , is independent of the path, then the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  defines a function  $f(x, y)$  such that  $\nabla f = \mathbf{F}$ . In other words,  $\mathbf{F}$  is a conservative vector field on  $R$ .

**Proof** Suppose  $\int_C (P dx + Q dy)$  has the same value for every piecewise-smooth curve  $C$  in  $R$  that joins  $(x_0, y_0)$  to  $(x, y)$ . That is, suppose  $\int_C (P dx + Q dy)$  is independent of the path. If  $C$  is any piecewise-smooth curve in  $R$  joining a fixed point  $(x_0, y_0)$  to an arbitrary point  $(x, y)$ , the line integral  $\int_C (P dx + Q dy)$  defines a function  $f$  that depends only on  $(x, y)$  and not on  $C$ . And, we can define

$$f(x, y) = \int_{(x_0, y_0)}^{(x, y)} (P dx + Q dy)$$

Figure 26

Since any piecewise-smooth curve  $C$  that lies entirely in  $R$  is allowed, we choose two paths, one in which a horizontal line segment is used, and another in which a vertical line segment is used. As Figure 26 illustrates:

$C_1$ : Consists of a piecewise-smooth curve joining  $(x_0, y_0)$  to  $(x_1, y)$  plus a horizontal line segment joining  $(x_1, y)$  to  $(x, y)$ .

$C_2$ : Consists of a piecewise-smooth curve joining  $(x_0, y_0)$  to  $(x, y_1)$  plus a vertical line segment joining  $(x, y_1)$  to  $(x, y)$ .

For path  $C_1$ ,

$$f(x, y) = \int_{(x_0, y_0)}^{(x, y)} (P dx + Q dy) = \int_{(x_0, y_0)}^{(x_1, y)} (P dx + Q dy) + \int_{(x_1, y)}^{(x, y)} (P dx + Q dy)$$

The first integral on the right is a function of  $y$  alone, since  $x_0$  and  $x_1$  are constants. So, its partial derivative with respect to  $x$  equals 0. That is,

$$\frac{\partial}{\partial x} \int_{(x_0, y_0)}^{(x_1, y)} (P dx + Q dy) = 0$$

In the second integral on the right, the value of  $y$  is the same in both the lower and upper limits of integration, so it follows that  $dy = 0$ . That is,

$$\frac{\partial}{\partial x} \int_{(x_1, y)}^{(x, y)} (P dx + Q dy) = \frac{\partial}{\partial x} \int_{x_1}^x [P dx + 0] = P(x, y)$$

Combining these two results, we find

$$\frac{\partial}{\partial x} f(x, y) = \frac{\partial}{\partial x} \int_{(x_0, y_0)}^{(x_1, y)} (P dx + Q dy) + \frac{\partial}{\partial x} \int_{(x_1, y)}^{(x, y)} (P dx + Q dy) = P(x, y)$$

For path  $C_2$ ,

$$f(x, y) = \int_{(x_0, y_0)}^{(x, y_1)} (P dx + Q dy) + \int_{(x, y_1)}^{(x, y)} (P dx + Q dy)$$

The first integral on the right is a function of  $x$  alone, since  $y_0$  and  $y_1$  are constants. So, the partial derivative with respect to  $y$  equals 0. That is,

$$\frac{\partial}{\partial y} \int_{(x_0, y_0)}^{(x, y_1)} (P dx + Q dy) = 0$$

In the second integral on the right, the value of  $x$  is the same in both the lower and upper limits of integration, so it follows that  $dx = 0$ . That is,

$$\frac{\partial}{\partial y} \int_{(x, y_1)}^{(x, y)} (P dx + Q dy) = \frac{\partial}{\partial y} \int_{y_1}^y [0 + Q(x, y) dy] = Q(x, y)$$

Combining these two results, we find

$$\frac{\partial}{\partial y} f(x, y) = \frac{\partial}{\partial y} \int_{(x_0, y_0)}^{(x, y_1)} (P dx + Q dy) + \frac{\partial}{\partial y} \int_{(x, y_1)}^{(x, y)} (P dx + Q dy) = Q(x, y)$$

Finally, since  $\frac{\partial}{\partial x} f(x, y) = P(x, y)$  and  $\frac{\partial}{\partial y} f(x, y) = Q(x, y)$ , we have

$$\nabla f = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} = P(x, y) \mathbf{i} + Q(x, y) \mathbf{j} = \mathbf{F}$$

That is, the vector field  $\mathbf{F}$  is conservative. ■

### 3 Reconstruct a Function from Its Gradient: finding the Potential Function for a Conservative Vector Field

Suppose  $\mathbf{F} = \mathbf{F}(x, y)$  is a conservative vector field. Then there is a potential function  $f$  so that  $\nabla f = \mathbf{F}$ . The proof of the converse of the Fundamental Theorem of Line Integrals provides a way of finding the potential function  $f$  when its gradient  $\nabla f = \mathbf{F}$  is known. This is called **reconstructing a function from its gradient**.

#### EXAMPLE 4 Finding a Potential Function for a Conservative Vector Field

If it is known that

$$\mathbf{F} = \mathbf{F}(x, y) = (6xy + y^3) \mathbf{i} + (3x^2 + 3xy^2) \mathbf{j}$$

is a conservative vector field, find a potential function  $f$  for  $\mathbf{F}$ .

**Solution** We seek a function  $f(x, y)$  for which

$$\nabla f = \mathbf{F} = (6xy + y^3) \mathbf{i} + (3x^2 + 3xy^2) \mathbf{j}$$

Let

$$P(x, y) = 6xy + y^3 \quad \text{and} \quad Q(x, y) = 3x^2 + 3xy^2$$

Since

$$\nabla f = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} = P(x, y) \mathbf{i} + Q(x, y) \mathbf{j}$$

we have

$$\frac{\partial f}{\partial x} = 6xy + y^3 \quad \text{and} \quad \frac{\partial f}{\partial y} = 3x^2 + 3xy^2 \quad (1)$$

Now integrate the left equation partially with respect to  $x$ .

$$f(x, y) = \int (6xy + y^3) dx = 3x^2y + xy^3 + h(y)$$

where the “constant of integration,”  $h(y)$ , is a function of  $y$ .

Next differentiate  $f$  with respect to  $y$ :

$$\frac{\partial f}{\partial y} = 3x^2 + 3xy^2 + h'(y)$$

From (1), we have

$$\frac{\partial f}{\partial y} = 3x^2 + 3xy^2$$

So,  $h'(y) = 0$  or  $h(y) = K$ , where  $K$  is a constant. A potential function  $f$  for  $\mathbf{F}$  is

$$f(x, y) = 3x^2y + xy^3 + K \quad \blacksquare$$

#### NOW WORK Problem 29.

You can verify that  $f$  is a potential function for  $\mathbf{F}$  by finding the gradient of  $f$ :

$$\nabla f = \frac{\partial f}{\partial x} \mathbf{i} + \frac{\partial f}{\partial y} \mathbf{j} = (6xy + y^3) \mathbf{i} + (3x^2 + 3xy^2) \mathbf{j} = \mathbf{F}(x, y)$$

If we had chosen to integrate  $\frac{\partial f}{\partial y} = 3x^2 + 3xy^2$  partially with respect to  $y$ , we would have obtained

$$f(x, y) = 3x^2y + xy^3 + k(x)$$

where the “constant of integration,”  $k(x)$ , is a function of  $x$ . Then

$$\frac{\partial f}{\partial x} = 6xy + y^3 = 6xy + y^3 + k'(x)$$

So,  $k'(x) = 0$  or  $k(x) = K$ , a constant, and

$$f(x, y) = 3x^2y + xy^3 + K$$

as before.

#### 4 Determine Whether a Vector Field Is Conservative

As the solution to Example 4 illustrates, if  $\mathbf{F}$  is known to be a conservative vector field, then we can find its potential function  $f$ . But how do we determine if  $\mathbf{F}$  is a conservative vector field? Before giving the theorem, we need some definitions.

##### DEFINITION Closed Curve; Simple Curve

Let  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , trace out a piecewise-smooth curve  $C$ .

- $C$  is **closed** if  $\mathbf{r}(a) = \mathbf{r}(b)$ .
- $C$  is **simple** if it does not intersect itself for  $a < t < b$ .

**IN WORDS** A curve  $C$  is closed if its initial point and its terminal point coincide.

See Figure 27.

Figure 27

##### DEFINITION Simply Connected

Let  $R$  denote a set of points in the plane. Then  $R$  is called **simply connected** if its boundary consists of a single, simple closed curve, and the interior of any simple closed curve  $C$  in  $R$  contains only points of  $R$ .

Intuitively, a set  $R$  is not simply connected if it has “holes” or if it consists of two or more separate pieces.

Figure 28(a) shows a region  $R$  that has a “hole.” Its boundary consists of two simple closed curves  $C_1$  and  $C_2$ . The curve  $C_3$  is a simple closed curve contained completely in the region, but the interior of  $C_3$  contains points that are not in the region  $R$ , so the region  $R$  is not simply connected.

Figure 28(b) shows a region  $R$  whose boundary consists of one simple closed curve  $C$ . Since the boundary  $C$  of  $R$  and the interior of any simple closed curve  $C$  in  $R$  contains only points in  $R$ , the region is simply connected.

Figure 28(c) shows a region  $R$  whose boundary consists of two simple closed curves  $C_1$  and  $C_2$ , that separate  $R$  into two pieces. So,  $R$  is not a simply connected region.

Figure 28

Now we are ready for the test to determine whether or not a vector field  $\mathbf{F}$  is conservative.

### THEOREM Conservative Vector Field Test

Let  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a vector field, where the functions  $P$  and  $Q$  are continuous on some simply connected, open region  $R$ . Suppose  $\frac{\partial P}{\partial y}$  and  $\frac{\partial Q}{\partial x}$  are also continuous on  $R$ . Then  $\mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field on  $R$  if and only if

$$\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$$

throughout  $R$ .

We only prove that if  $\mathbf{F}$  is a conservative vector field, then  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$ . The proof of the converse is generally found in advanced calculus texts. However, the proof of the converse for a special case is given in Section 15.5. See p. 1013.

**Proof** Suppose that  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field. Then  $\mathbf{F}$  is the gradient of some function  $f$ . That is,

$$\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$$

Then

$$\frac{\partial f}{\partial x} = P(x, y) \quad \text{and} \quad \frac{\partial f}{\partial y} = Q(x, y)$$

so that

$$\frac{\partial^2 f}{\partial y \partial x} = \frac{\partial P}{\partial y} \quad \text{and} \quad \frac{\partial^2 f}{\partial x \partial y} = \frac{\partial Q}{\partial x}$$

Since it is assumed that  $\frac{\partial P}{\partial y}$  and  $\frac{\partial Q}{\partial x}$  are continuous in  $R$ , we can use the Equality of Mixed Partial Theorem (page 835), which states that if the first-order partial derivatives and the second-order mixed partial derivatives exist at each point in some disk centered at  $(x_0, y_0)$  and if the mixed partial derivatives are continuous at  $(x_0, y_0)$ , then  $f_{xy}(x_0, y_0) = f_{yx}(x_0, y_0)$ . As a result,

$$\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$$

**EXAMPLE 5** Determining Whether  $\mathbf{F}$  Is a Conservative Vector Field

(a)  $\mathbf{F} = 2xy\mathbf{i} + (x^2 + 1)\mathbf{j}$  is a conservative vector field on the entire  $xy$ -plane since

$$\frac{\partial P}{\partial y} = \frac{\partial}{\partial y}(2xy) = 2x \quad \text{and} \quad \frac{\partial Q}{\partial x} = \frac{\partial}{\partial x}(x^2 + 1) = 2x$$

are equal for any choice of  $(x, y)$ .

(b) The vector field  $\mathbf{F} = \frac{x}{y^2}\mathbf{i} - \frac{x^2}{y^3}\mathbf{j}$  is conservative on any connected region not containing points on the  $x$ -axis ( $y = 0$ ) since

$$\frac{\partial P}{\partial y} = \frac{\partial}{\partial y} \frac{x}{y^2} = -\frac{2x}{y^3} \quad \text{and} \quad \frac{\partial Q}{\partial x} = \frac{\partial}{\partial x} \left( -\frac{x^2}{y^3} \right) = -\frac{2x}{y^3}$$

are equal, provided  $y \neq 0$ . Because  $\mathbf{F} = \frac{x}{y^2}\mathbf{i} - \frac{x^2}{y^3}\mathbf{j}$  is conservative for  $y \neq 0$ , the

line integral  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \left[ \frac{x}{y^2} dx - \frac{x^2}{y^3} dy \right]$  is independent of the path in any simply connected region not containing points on the  $x$ -axis. ■

**NOW WORK** Problem 35.**EXAMPLE 6** Finding a Potential Function for a Conservative Vector Field

(a) Show that the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C [(2xy + 24x) dx + (x^2 + 16) dy]$  is independent of the path.

(b) Find a function  $f$  for which  $\nabla f = (2xy + 24x)\mathbf{i} + (x^2 + 16)\mathbf{j}$ .

(c) Find  $\int_C [(2xy + 24x) dx + (x^2 + 16) dy]$ , where  $C$  is any piecewise-smooth curve joining  $(0, 1)$  to  $(1, 2)$ .

**Solution** (a) Let  $P(x, y) = 2xy + 24x$  and  $Q(x, y) = x^2 + 16$ . Then  $\frac{\partial P}{\partial y} = 2x$  and

$\frac{\partial Q}{\partial x} = 2x$ . Since  $P$ ,  $Q$ ,  $\frac{\partial P}{\partial y}$ , and  $\frac{\partial Q}{\partial x}$  are continuous everywhere in the  $xy$ -plane and

since  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$ , then  $\mathbf{F} = \mathbf{F}(x, y) = (2xy + 24x)\mathbf{i} + (x^2 + 16)\mathbf{j}$  is a conservative

vector field. By the Fundamental Theorem of Line Integrals,  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is independent of the path.

(b) Since  $\mathbf{F} = \mathbf{F}(x, y) = (2xy + 24x)\mathbf{i} + (x^2 + 16)\mathbf{j}$  is a conservative vector field, there is a potential function  $f$  for  $\mathbf{F}$  for which

$$\nabla f = \mathbf{F} = (2xy + 24x)\mathbf{i} + (x^2 + 16)\mathbf{j}$$

Since  $\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j}$ , then

$$\frac{\partial f}{\partial x} = 2xy + 24x \quad \text{and} \quad \frac{\partial f}{\partial y} = x^2 + 16$$

We integrate the first of these partial derivatives partially with respect to  $x$ .

$$f(x, y) = \int (2xy + 24x) dx = x^2y + 12x^2 + h(y)$$

where the “constant of integration,”  $h(y)$ , is a function of  $y$ . Now we differentiate  $f$  with respect to  $y$ , obtaining

$$\frac{\partial f}{\partial y} = \frac{\partial}{\partial y}[x^2y + 12x^2 + h(y)] = x^2 + h'(y)$$

But  $\frac{\partial f}{\partial y} = x^2 + 16$ , so  $h'(y) = 16$ . Now we integrate  $h'$  with respect to  $y$ ; then

$$h(y) = 16y + K$$

where  $K$  is a constant. So,

$$f(x, y) = x^2y + 12x^2 + 16y + K$$

is a potential function for  $\mathbf{F}$ .

(c) Since  $\mathbf{F}$  is independent of the path, we can use the Fundamental Theorem of Line Integrals. Since  $f(x, y) = x^2y + 12x^2 + 16y + K$  and  $\mathbf{F} = \nabla f$ ,

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \nabla f \cdot d\mathbf{r} = [f(x, y)]_{(0,1)}^{(1,2)} = f(1, 2) - f(0, 1) = 46 - 16 = 30$$

for any piecewise-smooth curve  $C$  connecting  $(0, 1)$  to  $(1, 2)$ . ■

### NOW WORK Problem 37.

### EXAMPLE 7 Finding a Potential Function for a Conservative Vector Field

(a) Show that the line integral

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C [(y \cos x + 2xe^y) dx + (\sin x + x^2e^y + 4) dy]$$

is independent of the path.

(b) Find a potential function  $f$  for which

$$\nabla f = (y \cos x + 2xe^y)\mathbf{i} + (\sin x + x^2e^y + 4)\mathbf{j}$$

**Solution** (a) Let  $P(x, y) = y \cos x + 2xe^y$  and  $Q(x, y) = \sin x + x^2e^y + 4$ . Then

$$\frac{\partial P}{\partial y} = \cos x + 2xe^y = \frac{\partial Q}{\partial x}$$

Since  $P$ ,  $Q$ ,  $\frac{\partial P}{\partial y}$ , and  $\frac{\partial Q}{\partial x}$  are continuous everywhere in the  $xy$ -plane, and since

$\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$ , the vector field  $\mathbf{F} = \mathbf{F}(x, y) = (y \cos x + 2xe^y)\mathbf{i} + (\sin x + x^2e^y + 4)\mathbf{j}$  is conservative and  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is independent of the path.

(b) Since  $\mathbf{F}$  is a conservative vector field, there is a potential function  $f$  for  $\mathbf{F}$  for which

$$\nabla f = \mathbf{F} = (y \cos x + 2xe^y)\mathbf{i} + (\sin x + x^2e^y + 4)\mathbf{j}$$

Since  $\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j}$ ,

$$\frac{\partial f}{\partial x} = y \cos x + 2xe^y \quad \text{and} \quad \frac{\partial f}{\partial y} = \sin x + x^2e^y + 4$$

We integrate the function on the right partially with respect to  $y$ . Then

$$f(x, y) = \int (\sin x + x^2e^y + 4) dy = y \sin x + x^2e^y + 4y + k(x)$$

in which the “constant of integration,”  $k(x)$ , is a function of  $x$ . Now we differentiate  $f$  with respect to  $x$  to get

$$\frac{\partial f}{\partial x} = y \cos x + 2xe^y + k'(x)$$

But  $\frac{\partial f}{\partial x} = y \cos x + 2xe^y$ . So,

$$y \cos x + 2xe^y = y \cos x + 2xe^y + k'(x)$$

$$k'(x) = 0$$

Then

$$k(x) = K \quad \text{where } K \text{ is a constant}$$

Therefore,

$$f(x, y) = y \sin x + x^2 e^y + 4y + K$$

is a potential function for  $\mathbf{F}$ . ■

### NOW WORK Problem 49.

### EXAMPLE 8 Determining Whether a Line Integral Is Independent of the Path

Determine if  $\int_C (x^2 y \, dx + xy^2 \, dy)$  is independent of the path anywhere in the plane.

**Solution** Let  $P = x^2 y$  and  $Q = xy^2$ . Then  $\frac{\partial P}{\partial y} = x^2$  and  $\frac{\partial Q}{\partial x} = y^2$ . Since these two functions are not equal (except on the graph of the equation  $x^2 = y^2$ , which is not an open set), the line integral is not independent of the path anywhere in the  $xy$ -plane. ■

The summary below lists the important results obtained so far involving line integrals, independence of path, and conservative vector fields.

## Summary

Let  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a vector field, where  $P$  and  $Q$  are two functions that are continuous on an open, connected region  $R$  containing a piecewise-smooth curve  $C$ .

- $\mathbf{F}$  is a conservative vector field if  $\mathbf{F} = \nabla f$  for a function  $f$  that has continuous first-order partial derivatives.
- If  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j}$  is a conservative vector field, then  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P \, dx + Q \, dy)$  is independent of the path.
- If  $\int_C (P \, dx + Q \, dy)$  is independent of the path and if  $C$  is a closed curve in  $R$ , then  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P \, dx + Q \, dy) = 0$ .

- If  $\int_C (P \, dx + Q \, dy)$  is independent of path, then  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j}$  is a conservative vector field.
- If  $\frac{\partial P}{\partial y}$  and  $\frac{\partial Q}{\partial x}$  are also continuous on  $R$  and if  $R$  is open and simply connected, then  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j}$  is a conservative vector field if and only if  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$ .

## 15.3 Assess Your Understanding

### Concepts and Vocabulary

- True or False** If  $\nabla f = \mathbf{F}$  for some function  $f$  that has continuous first-order partial derivatives, then  $\mathbf{F}$  is a potential function for  $f$ .
- Multiple Choice** If  $\int_{C_1} (P \, dx + Q \, dy) = \int_{C_2} (P \, dx + Q \, dy)$  for any two piecewise-smooth curves  $C_1$  and  $C_2$  with the same end points lying entirely in a region  $R$ , then  $\int_C (P \, dx + Q \, dy)$  is said to be [(a) one-to-one, (b) singular, (c) independent of  $P$  and  $Q$ , (d) independent of the path.]
- True or False** The line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$ , where  $C$  is a piecewise smooth curve and  $\mathbf{F}$  is a conservative vector field, is independent of the path.
- Multiple Choice** Suppose  $\mathbf{F} = \mathbf{F}(x, y)$  is a conservative vector field and  $\nabla f = \mathbf{F}$ . The function  $f$  is called a(n) [(a) gradient function, (b) independent function, (c) potential function, (d) gravity function] for  $\mathbf{F}$ .
- A piecewise-smooth curve  $C$  is \_\_\_\_\_ if its initial point  $(x_0, y_0)$  and its terminal point  $(x_1, y_1)$  are the same.
- If  $\mathbf{F}$  is a conservative vector field on some open region  $R$ , and  $C$  is a closed, piecewise-smooth curve that lies entirely in  $R$ , then  $\int_C \mathbf{F} \cdot d\mathbf{r} = \underline{\hspace{2cm}}$ .
- True or False** An open region  $R$  is connected if there are two points  $(x_1, y_1)$  and  $(x_2, y_2)$  in  $R$  that can be joined by a piecewise-smooth curve  $C$  that lies entirely in  $R$ .
- True or False** The converse of the Fundamental Theorem of Line Integrals is true if the open region  $R$  is connected.
- True or False** Let  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , trace out a piecewise-smooth curve  $C$ . Then  $C$  is closed if there is a least one point where the curve intersects itself.
- True or False** A parabola is a simple curve.
- True or False** A region  $R$  is called simply connected if it is closed.
- Let  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a vector field, where the functions  $P$  and  $Q$  are continuous on some simply connected,

open region  $R$ . Suppose  $\frac{\partial P}{\partial y}$  and  $\frac{\partial Q}{\partial x}$  are also continuous on  $R$ .

Then  $\mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field on  $R$  if and only if \_\_\_\_\_.

### Skill Building

13. Find the line integral  $\int_C (e^x \cos y \, dx - e^x \sin y \, dy)$  for each curve  $C$ :
- (a)  $C$  consists of the line segments from  $(0, \frac{\pi}{3})$  to  $(1, \frac{\pi}{3})$  and from  $(1, \frac{\pi}{3})$  to  $(1, \pi)$ .
- (b)  $C$  consists of the line segment from  $(0, \frac{\pi}{3})$  to  $(1, \pi)$ .
- (c)  $C$  consists of the line segments from  $(0, \frac{\pi}{3})$  to  $(0, \frac{\pi}{2})$  and from  $(0, \frac{\pi}{2})$  to  $(1, \pi)$ .
14. Find the line integral  $\int_C (e^y \cos x \, dx + e^y \sin x \, dy)$  for each curve  $C$ :
- (a)  $C$  consists of the line segment from  $(0, 0)$  to  $(\pi, 1)$ .
- (b)  $C$  consists of the line segments from  $(0, 0)$  to  $(\frac{\pi}{2}, \frac{1}{2})$  and from  $(\frac{\pi}{2}, \frac{1}{2})$  to  $(\pi, 1)$ .
- (c)  $C$  consists of the line segments from  $(0, 0)$  to  $(0, 1)$  and from  $(0, 1)$  to  $(\pi, 1)$ .

In Problems 15–20,  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field since  $\mathbf{F}$  is the gradient of  $f(x, y)$ . Use this fact to find  $\int_C [P(x, y)dx + Q(x, y)dy]$ , where  $C$  is any piecewise smooth curve joining the two given points.

15.  $\int_C [(2x - y)dx + (2y - x)dy]$  from  $(3, -1)$  to  $(5, 4)$ ;  
 $f(x, y) = x^2 - xy + y^2$
16.  $\int_C [(y^2 + 2x)dx + 2xydy]$  from  $(2, 2)$  to  $(-3, 8)$ ;  
 $f(x, y) = xy^2 + x^2$
17.  $\int_C (3x^2y \, dx + x^3 \, dy)$  from  $(0, -1)$  to  $(3, 4)$ ;  $f(x, y) = x^3y$
18.  $\int_C (2xe^{x^2+y^2} \, dx + 2ye^{x^2+y^2} \, dy)$  from  $(0, 0)$  to  $(1, 1)$ ;  
 $f(x, y) = e^{x^2+y^2}$
19.  $\int_C \left( \frac{x}{x^2 + y^2} \, dx + \frac{y}{x^2 + y^2} \, dy \right)$  from  $(3, 4)$  to  $(5, 12)$ ;  
 $f(x, y) = \ln \sqrt{x^2 + y^2}$
20.  $\int_C \left( \frac{x}{\sqrt{x^2 + y^2}} \, dx + \frac{y}{\sqrt{x^2 + y^2}} \, dy \right)$  from  $(0, -4)$  to  $(3, 4)$ ;  
 $f(x, y) = \sqrt{x^2 + y^2}$

In Problems 21–28,  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field. Use this fact to find  $\int_C [P(x, y)dx + Q(x, y)dy]$ , where  $C$  is any piecewise smooth curve joining the two given points.

21.  $\int_C (x^3 \, dx + y^3 \, dy)$  from  $(1, 1)$  to  $(2, 4)$
22.  $\int_C (2x^2 \, dx - 4y \, dy)$  from  $(-1, 2)$  to  $(2, 3)$

23.  $\int_C [(x^2 + y^2) \, dx + (2xy + \sin y) \, dy]$  from  $(0, 0)$  to  $(2, 0)$
24.  $\int_C [(x - \cos y) \, dx + x \sin y \, dy]$  from  $(1, \frac{\pi}{2})$  to  $(2, \pi)$
25.  $\int_C (y^2 e^x \, dx + 2ye^x \, dy)$  from  $(0, 0)$  to  $(\ln 2, 2)$
26.  $\int_C \left[ xe^y \, dx + \frac{1}{2}(x^2 - 4)e^y \, dy \right]$  from  $(0, 0)$  to  $(2, 1)$
27.  $\int_C (ye^x \, dx + e^x \, dy)$  on a closed curve  $C$
28.  $\int_C (y \cos x \, dx + \sin x \, dy)$  on a closed curve  $C$

In Problems 29–32,  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field. Find a potential function  $f$  for  $\mathbf{F}$ .

29.  $\mathbf{F}(x, y) = (5x - 2y + 1)\mathbf{i} + (4 - 2x)\mathbf{j}$
30.  $\mathbf{F}(x, y) = (4xy)\mathbf{i} + (2x^2 + y)\mathbf{j}$
31.  $\mathbf{F}(x, y) = (\ln y + 2x)\mathbf{i} + \left(\frac{x}{y}\right)\mathbf{j}$
32.  $\mathbf{F}(x, y) = (ye^x)\mathbf{i} + e^x \mathbf{j}$

In Problems 33–36, determine whether each vector field  $\mathbf{F}$  is a conservative vector field.

33.  $\mathbf{F}(x, y) = x^2 \mathbf{i} + y^2 \mathbf{j}$
34.  $\mathbf{F}(x, y) = xy\mathbf{i} + xy\mathbf{j}$
35.  $\mathbf{F}(x, y) = xe^y \mathbf{i} + \frac{1}{2}x^2 e^y \mathbf{j}$
36.  $\mathbf{F}(x, y) = (x^2 + y^2)\mathbf{i} + (2xy - \sin y)\mathbf{j}$

In Problems 37–42:

- (a) Show that the line integral  $\int_C (P \, dx + Q \, dy)$  is independent of the path.
- (b) Find a function  $f$  so that  $\nabla f = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$ .
- (c) Find  $\int_C (P \, dx + Q \, dy)$  for the given points.
37.  $\int_C (x \, dx + y \, dy)$ , where  $C$  is a piecewise-smooth curve joining the points  $(1, 3)$  and  $(2, 5)$
38.  $\int_C [2xy \, dx + (x^2 + 1) \, dy]$ , where  $C$  is a piecewise-smooth curve joining the points  $(1, -4)$  and  $(-2, 3)$
39.  $\int_C [(x^2 + 3y) \, dx + 3x \, dy]$ , where  $C$  is a piecewise-smooth curve joining the points  $(1, 2)$  and  $(-3, 5)$
40.  $\int_C [(2x + y + 1) \, dx + (x + 3y + 2) \, dy]$ , where  $C$  is a piecewise-smooth curve joining the points  $(0, 0)$  and  $(1, 2)$
41.  $\int_C [(4x^3 + 20xy^3 - 3y^4) \, dx + (30x^2y^2 - 12xy^3 + 5y^4) \, dy]$ , where  $C$  is a piecewise-smooth curve joining the points  $(0, 0)$  and  $(1, 1)$
42.  $\int_C [(2yx^{-1}) \, dx + (\ln x^2) \, dy]$ , where  $C$  is a piecewise-smooth curve in the first quadrant joining the points  $(1, 1)$  and  $(5, 5)$

In Problems 43–54:

- (a) Show that each line integral  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P \, dx + Q \, dy)$  is independent of the path in the entire  $xy$ -plane.
- (b) Find a potential function  $f$  for  $\mathbf{F}$ .
43.  $\int_C (3x^2y^2 \, dx + 2x^3y \, dy)$
44.  $\int_C [(2x + y) \, dx + (x - 2y) \, dy]$
45.  $\int_C [(x + 3y) \, dx + 3x \, dy]$
46.  $\int_C [(2x + y) \, dx + (2y + x) \, dy]$

47.  $\int_C [(2xy - y^2) dx + (x^2 - 2xy) dy]$
48.  $\int_C [y^2 dx + (2yx - e^y) dy]$
49.  $\int_C [(x^2 - x + y^2) dx - (ye^y - 2xy) dy]$
50.  $\int_C [(3x^2y + xy^2 + e^x) dx + (x^3 + x^2y + \sin y) dy]$
51.  $\int_C [(y \cos x - 2 \sin y) dx - (2x \cos y - \sin x) dy]$
52.  $\int_C [(e^x \sin y + 2y \sin x) dx + (e^x \cos y - 2 \cos x) dy]$
53.  $\int_C [(2x + y \cos x) dx + \sin x dy]$
54.  $\int_C [(\cos y - \cos x) dx + (e^y - x \sin y) dy]$

### Applications and Extensions

55. Show that  $\int_C \left( -\frac{y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy \right)$  is independent of the path in the rectangle  $R$  whose vertices are  $\left( \frac{1}{a}, -a \right), (a, -a),$

$\left( \frac{1}{a}, -\frac{1}{a} \right),$  and  $\left( a, -\frac{1}{a} \right), a > 1.$  Find a potential function  $f$  for  $\mathbf{F}.$

56. Given the constant vector  $\mathbf{c}$ , show that  $\nabla(\mathbf{c} \cdot \mathbf{r}) = \mathbf{c}$ , where  $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}.$  Use the result to prove that  $\int_C \mathbf{c} \cdot d\mathbf{r} = 0,$  where  $C$  is any closed piecewise smooth curve in space.
57. Suppose that  $\mathbf{F}(x, y)$  is a force field directed toward the origin with magnitude inversely proportional to the square of the distance from the origin. (Such “inverse square law” forces are common in nature. See Examples 4 and 5 in Section 15.1, pp. 975–976.)
- (a) Show that  $\mathbf{F}$  is a conservative vector field.
- (b) Find a potential function  $f$  for  $\mathbf{F}.$
58. Suppose  $f$  and  $g$  are differentiable functions of one variable. Show that  $\int_C [f(x) dx + g(y) dy] = 0,$  where  $C$  is any circle in the  $xy$ -plane.

### Challenge Problem

59. Let  $f$  and  $g$  have continuous partial derivatives in a plane region  $R,$  and let  $C$  be a piecewise-smooth curve in  $R$  going from  $A$  to  $B.$  Show that

$$\int_C f \nabla g \cdot d\mathbf{r} = f(B)g(B) - f(A)g(A) - \int_C g \nabla f \cdot d\mathbf{r}$$

## 15.4 An Application of Line Integrals: Work

**OBJECTIVE** When you finish this section, you should be able to:

### 1 Compute work (p. 1003)

An important application of a line integral is to work. Recall that **work** is the energy transferred to or from an object by a force acting on the object.

Let's review what we already know about work:

- **Constant force:** The work  $W$  done by a *constant* force  $F$  in moving an object a distance  $s$  along a straight line in the direction of  $F$  is defined to be

$$W = Fs$$

When the force  $F$  acts in the same direction as the motion, the work done is positive; if the force  $F$  acts in a direction opposite to the motion, the work is negative.

- **Variable force:** In Chapter 6, the definition of work was generalized to the case where the force  $F$  is variable. The work  $W$  done by a variable force  $F = F(x)$  acting in the direction of the motion of an object as that object moves along a straight line from  $x = a$  to  $x = b$  is

$$W = \int_a^b F(x) dx$$

- **Constant vector force:** In Chapter 10, we investigated the work  $W$  done by a constant force vector  $\mathbf{F}$  acting on an object as that object moves in the direction of

a vector  $\mathbf{r}$  for a distance  $\|\mathbf{r}\|$  and found that

$$W = \mathbf{F} \cdot \mathbf{r}$$

- **Variable vector force:** Now we investigate the work done by a vector field  $\mathbf{F}$  (called a **force field**) acting on an object as that object moves along a smooth curve  $C$  from the point  $A$  on  $C$  to the point  $B$  on  $C$ .

Suppose

$$\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$$

is a force field acting on an object at the point  $(x, y)$  in some open, connected set  $R$ . We assume the functions  $P$  and  $Q$  have continuous, first-order partial derivatives at each point in  $R$  and that  $C$  is a smooth curve lying entirely in  $R$ . Finally, suppose  $C$  is defined by the vector function

$$\mathbf{r} = \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} \quad a \leq t \leq b$$

Partition the closed interval  $[a, b]$  into  $n$  subintervals

$$[a, t_1], [t_1, t_2], \dots, [t_{i-1}, t_i], \dots, [t_{n-1}, b]$$

and denote the length of each subinterval by  $\Delta t_1, \Delta t_2, \dots, \Delta t_n$ . Corresponding to each number  $a = t_0, t_1, t_2, \dots, t_n = b$  of the partition, there is a sequence of points  $A = p_0, p_1, \dots, p_n = B$  on the curve  $C$ . These points subdivide the curve into  $n$  subarcs of lengths  $\Delta s_1, \Delta s_2, \dots, \Delta s_n$ , as shown in Figure 29.

The norm  $\|\Delta\|$  of the partition is the largest length of the subarcs  $\Delta s_i$ ,  $i = 1, 2, \dots, n$ . Let  $p_i^* = (x_i^*, y_i^*)$  be a point on the  $i$ th subarc  $p_{i-1}p_i$  of  $C$ . If the norm  $\|\Delta\|$  is small enough, then the work  $W_i$  done by the force field  $\mathbf{F}$  in moving an object along the arc  $p_{i-1}p_i$  can be approximated by the work done by the constant force

$$\mathbf{F}_i^* = \mathbf{F}(x_i^*, y_i^*)$$

in moving the object along the directed line segment  $\Delta \mathbf{r}_i = \overrightarrow{p_{i-1}p_i}$ . Then

$$W_i \approx \mathbf{F}_i^* \cdot \Delta \mathbf{r}_i$$

Figure 29

The total work  $W$  done by  $\mathbf{F}$  along  $C$  from the point  $A$ :  $\mathbf{r} = \mathbf{r}(a)$  to the point  $B$ :  $\mathbf{r} = \mathbf{r}(b)$  is  $W = \lim_{\|\Delta\| \rightarrow 0} \sum_{i=1}^n W_i = \lim_{\|\Delta\| \rightarrow 0} \sum_{i=1}^n \mathbf{F}_i^* \cdot \Delta \mathbf{r}_i$ . This leads to the following definition:

#### DEFINITION Work

Let  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a force field, where the functions  $P$  and  $Q$  are continuous with continuous partial derivatives at each point of an open, connected set  $R$ . Let  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , trace out a piecewise-smooth curve  $C$  lying entirely in  $R$ . The work  $W$  done by the force field  $\mathbf{F}$  in moving an object along  $C$  is defined as

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$$

## 1 Compute Work

### EXAMPLE 1 Computing Work

Find the work done by the force field  $\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$  in moving an object along the half-circle  $C$  traced out by

$$\mathbf{r}(t) = \cos t \mathbf{i} + \sin t \mathbf{j} \quad 0 \leq t \leq \pi$$

Figure 30  $\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$ 

**Solution** On  $C$ ,  $x(t) = \cos t$  and  $y(t) = \sin t$ ,  $0 \leq t \leq \pi$ . Then

$$\mathbf{F}(x(t), y(t)) = -y(t)\mathbf{i} + x(t)\mathbf{j} = -\sin t\mathbf{i} + \cos t\mathbf{j}$$

$$d\mathbf{r}(t) = (-\sin t\mathbf{i} + \cos t\mathbf{j}) dt$$

$$\mathbf{F} \cdot d\mathbf{r} = (\sin^2 t + \cos^2 t) dt = dt$$

The work  $W$  done by  $\mathbf{F}$  is

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = \int_0^\pi dt = \pi$$

See Figure 30 for the force field  $\mathbf{F}(x, y) = -y\mathbf{i} + x\mathbf{j}$  and the curve  $C$ .

### NOW WORK Problem 13.

### Work and Kinetic Energy

The work  $W$  done by a force field  $\mathbf{F}$  in moving an object along a piecewise-smooth curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , is

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = \int_a^b \mathbf{F} \cdot \mathbf{r}'(t) dt$$

Using Newton's Second Law of Motion,  $\mathbf{F} = m\mathbf{r}''(t)$ , where  $\mathbf{r}''(t)$  is the acceleration of the object, we find that work  $W$  can be expressed as

$$\begin{aligned} W &= \int_a^b \mathbf{F} \cdot \mathbf{r}'(t) dt = \int_a^b m\mathbf{r}''(t) \cdot \mathbf{r}'(t) dt = \frac{m}{2} \int_a^b \frac{d}{dt} [\mathbf{r}'(t) \cdot \mathbf{r}'(t)] dt \\ &\quad \begin{matrix} \mathbf{F} = m\mathbf{r}''(t) & \frac{d}{dt} [\mathbf{r}'(t) \cdot \mathbf{r}'(t)] = 2[\mathbf{r}''(t) \cdot \mathbf{r}'(t)] \end{matrix} \\ &= \frac{m}{2} \int_a^b \frac{d}{dt} \|\mathbf{r}'(t)\|^2 dt = \frac{m}{2} \left[ \|\mathbf{r}'(t)\|^2 \right]_a^b \\ &\quad \begin{matrix} \mathbf{r}' \cdot \mathbf{r}' = \|\mathbf{r}'\|^2 \end{matrix} \end{aligned} \quad (1)$$

Kinetic energy  $K$  is the energy of motion. The kinetic energy  $K$  of an object of mass  $m$  that moves along a curve with speed  $\|\mathbf{v}\|$  is given by

$$K = \frac{1}{2} m \|\mathbf{v}\|^2 = \frac{m}{2} \|\mathbf{r}'(t)\|^2 \quad \begin{matrix} \mathbf{v} = \mathbf{r}'(t) \end{matrix} \quad (2)$$

By combining (1) and (2), we obtain

$$W = K(b) - K(a)$$

which relates work  $W$  to kinetic energy  $K$ . In other words,

$$\left[ \begin{array}{l} \text{Work } W \text{ done by a force field } \mathbf{F} \\ \text{in moving an object from } a \text{ to } b \end{array} \right] = [\text{Change in the kinetic energy } K \text{ from } a \text{ to } b]$$

If the curve  $C$  is closed and the force field  $\mathbf{F}$  is conservative, then it follows that

$$\text{Work} = \int_C \mathbf{F} \cdot d\mathbf{r} = 0$$

### THEOREM Work on a Closed Path

In a conservative force field  $\mathbf{F}$ , the work  $W$  done by  $\mathbf{F}$  in moving an object along a closed path is 0. That is, the object returns to its original position with the same kinetic energy it started with.

The work done by a conservative force field  $\mathbf{F}$  is independent of the path. Physicists paraphrase this by saying that, in a conservative force field, work is a function of position and not path.

Gravitational force is an example of a conservative force field. But not all forces  $\mathbf{F}$  are conservative, as we show in Example 2.

### EXAMPLE 2 Showing a Force Field Is Not a Conservative Vector Field

- (a) Show that the force field  $\mathbf{F} = (x + y)\mathbf{i} + (y - x)\mathbf{j}$  is not a conservative vector field.  
 (b) Show that the work  $W$  done by  $\mathbf{F}$  in moving an object is dependent on the path by using two paths starting at the origin  $(0, 0)$  and ending at the point  $(1, 1)$ .

**Solution** (a) Let  $P(x, y) = x + y$  and  $Q(x, y) = y - x$ . Then

$$\frac{\partial P}{\partial y} = \frac{\partial}{\partial y}(x + y) = 1 \quad \text{and} \quad \frac{\partial Q}{\partial x} = \frac{\partial}{\partial x}(y - x) = -1$$

Since  $\frac{\partial P}{\partial y} \neq \frac{\partial Q}{\partial x}$ , the force field  $\mathbf{F}$  is not a conservative vector field.

(b) To show that the work  $W$  done by  $\mathbf{F}$  is dependent on the path, we choose two paths beginning at the origin  $(0, 0)$  and ending at the point  $(1, 1)$ .

For Path 1, we let  $C$  be defined by  $y = x$ , where  $0 \leq x \leq 1$ . That is,  $x(t) = t$ ,  $y(t) = t$ ,  $0 \leq t \leq 1$ . Then  $\mathbf{F}(x(t), y(t)) = 2t\mathbf{i}$ ,  $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j}$ , and  $d\mathbf{r} = (\mathbf{i} + \mathbf{j}) dt$ . So,

$$\mathbf{F} \cdot d\mathbf{r} = 2t dt$$

The work  $W$  done by  $\mathbf{F}$  along  $C$  is

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = \int_0^1 2t dt = [t^2]_0^1 = 1$$

For Path 2, we let  $C$  be the piecewise-smooth curve made up of:

- $C_1$ , which is traced out by  $x(t) = t$ ,  $y(t) = 0$ ,  $0 \leq t \leq 1$ , and
- $C_2$ , which is traced out by  $x(t) = 1$ ,  $y(t) = t$ ,  $0 \leq t \leq 1$ .

For  $C_1$ ,  $\mathbf{F}(x(t), y(t)) = t\mathbf{i} - t\mathbf{j}$ ,  $\mathbf{r}(t) = t\mathbf{i}$ , and  $d\mathbf{r} = \mathbf{i} dt$ . So,

$$\mathbf{F} \cdot d\mathbf{r} = t dt$$

For  $C_2$ ,  $\mathbf{F}(x(t), y(t)) = (1 + t)\mathbf{i} + (t - 1)\mathbf{j}$ ,  $\mathbf{r}(t) = \mathbf{i} + t\mathbf{j}$ , and  $d\mathbf{r} = \mathbf{j} dt$ . So,

$$\mathbf{F} \cdot d\mathbf{r} = (t - 1) dt$$

The work  $W$  done by  $\mathbf{F}$  along Path 2 is

$$W = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} + \int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_0^1 t dt + \int_0^1 (t - 1) dt = 0$$

Since the work done along Path 1 and Path 2 are not equal, the work  $W$  done by the force  $\mathbf{F}$  is dependent on the path. ■

### NOW WORK Problem 21.

**NOTE** Potential energy  $U$  is the energy of position in a system.

### Work and Potential Energy

Suppose an object of mass  $m$  moves along a smooth curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , in a conservative force field  $\mathbf{F} = \mathbf{F}(x, y)$ . The **potential energy**  $U = U(x, y)$  of the object due to  $\mathbf{F}$  is the function  $U$  for which

$$\nabla U = -\mathbf{F}$$

That is,  $U$  is the negative of the potential function for  $\mathbf{F}$ . The work  $W$  done by  $\mathbf{F}$  in moving an object along  $C$  from  $a$  to  $b$  is

$$W = \int_C \mathbf{F} \cdot d\mathbf{r} = - \int_C \nabla U \cdot d\mathbf{r} = -[U(x, y)]_a^b = -[U(\mathbf{r}(b)) - U(\mathbf{r}(a))] = U(\mathbf{r}(a)) - U(\mathbf{r}(b))$$

This equation relates work  $W$  to potential energy  $U$ , as stated below.

|                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $\left[ \begin{array}{l} \text{The work } W \text{ done by a force field } \mathbf{F} \\ \text{in moving an object from } a \text{ to } b \end{array} \right] = \left[ \begin{array}{l} \text{The change in potential energy } U \text{ from } b \text{ to } a \end{array} \right]$ |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Now we can state and prove the *Law of Conservation of Energy*.

### Law of Conservation of Energy

In a conservative force field  $\mathbf{F}$ , the sum of the potential and kinetic energies of an object is constant.

**Proof** The potential energy  $U = U(x, y)$  of an object moving along a curve  $C$  in a conservative field of force  $\mathbf{F}$  obeys

$$\nabla U = -\mathbf{F}(x, y)$$

If an object of mass  $m$  moves along the curve  $C$  traced out by  $\mathbf{r} = \mathbf{r}(t)$ ,  $a \leq t \leq b$ , its kinetic energy  $K$  is

$$K = \frac{1}{2}m \|\mathbf{r}'(t)\|^2 = \frac{1}{2}m[\mathbf{r}'(t) \cdot \mathbf{r}'(t)]$$

Let  $E = E(t)$  equal the sum of the potential and kinetic energies of the object at time  $t$ . Then

$$E(t) = U + K = U(x, y) + \frac{m}{2}[\mathbf{r}'(t) \cdot \mathbf{r}'(t)]$$

We show that  $E$  is constant by showing that  $E'(t) = 0$ :

$$E'(t) = \frac{\partial U}{\partial x} \frac{dx}{dt} + \frac{\partial U}{\partial y} \frac{dy}{dt} + m[\mathbf{r}'(t) \cdot \mathbf{r}''(t)]$$

Use Chain Rule I with  $U$

But

$$\mathbf{r}'(t) = \frac{dx}{dt} \mathbf{i} + \frac{dy}{dt} \mathbf{j} \quad \text{and} \quad \frac{\partial U}{\partial x} \mathbf{i} + \frac{\partial U}{\partial y} \mathbf{j} = \nabla U = -\mathbf{F} = -m\mathbf{r}''(t)$$

$\mathbf{F} = m\mathbf{a}$

So,

$$\frac{\partial U}{\partial x} \frac{dx}{dt} + \frac{\partial U}{\partial y} \frac{dy}{dt} = \nabla U \cdot \mathbf{r}'(t) = -m\mathbf{r}''(t) \cdot \mathbf{r}'(t)$$

Then

$$E'(t) = -m[\mathbf{r}''(t) \cdot \mathbf{r}'(t)] + m[\mathbf{r}'(t) \cdot \mathbf{r}''(t)] = 0$$

That is, the energy  $E$  of the object is constant. ■

## 15.4 Assess Your Understanding

### Concepts and Vocabulary

1. Work is the \_\_\_\_\_ transferred to or from an object by a force acting on the object.
2. *True or False* An interpretation of the line integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is the work done by the force  $\mathbf{F}$  in moving an object along a piecewise-smooth curve  $C$ .

3. *True or False* The work done by a force  $\mathbf{F}$  in moving an object from  $A$  to  $B$  equals the change in the potential energy of the object from  $A$  to  $B$ .
4. *Multiple Choice* In a conservative force field  $\mathbf{F}$ , the work  $W$  done by  $\mathbf{F}$  in moving an object along a closed, piecewise smooth curve  $C$  is [(a) a maximum, (b) a minimum, (c)  $\|\mathbf{F}\|$ , (d) 0].

5. Kinetic energy  $K$  is the energy of \_\_\_\_\_; potential energy  $U$  is the energy of \_\_\_\_\_.
6. **True or False** In a conservative force field  $\mathbf{F}$ , the difference of the potential energy  $U$  and the kinetic energy  $K$  equals 0.

### Skill Building

In Problems 7–16, find the work done by the force field  $\mathbf{F}$  in moving an object along each curve between the indicated points.

7.  $\mathbf{F} = y\mathbf{i} + x\mathbf{j}$  along  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$  from  $t = 0$  to  $t = 1$
8.  $\mathbf{F} = xy\mathbf{i} + y^2\mathbf{j}$  along  $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}$  from  $t = 0$  to  $t = 1$
9.  $\mathbf{F} = (x - 2y)\mathbf{i} + xy\mathbf{j}$  along  $\mathbf{r}(t) = 3\cos t\mathbf{i} + 2\sin t\mathbf{j}$  from  $t = 0$  to  $t = \frac{\pi}{2}$
10.  $\mathbf{F} = x\mathbf{i} - y\mathbf{j}$  along  $\mathbf{r}(t) = \cos t\mathbf{i} + \sin t\mathbf{j}$  from  $t = 0$  to  $t = 2\pi$
11.  $\mathbf{F} = x^2y\mathbf{i} + (x^2 - y^2)\mathbf{j}$  along  $y = 2x^2$  from  $(0, 0)$  to  $(1, 2)$
12.  $\mathbf{F} = y\sin x\mathbf{i} - x\cos y\mathbf{j}$  along  $y = x$  from  $(0, 0)$  to  $(1, 1)$
13.  $\mathbf{F} = (y - x^2)\mathbf{i} + x\mathbf{j}$  along the upper half of the circle  $x^2 + y^2 = 1$  from  $(1, 0)$  to  $(-1, 0)$
14.  $\mathbf{F} = (y - x^2)\mathbf{i} + x\mathbf{j}$  along the line segments joining  $(1, 0)$  to  $(1, 1)$  to  $(-1, 1)$  to  $(-1, 0)$
15.  $\mathbf{F} = y^3\mathbf{i} + x^3\mathbf{j}$  along the ellipse  $\mathbf{r}(t) = a\cos t\mathbf{i} + b\sin t\mathbf{j}$  from  $t = 0$  to  $t = 2\pi$
16.  $\mathbf{F} = -y^2\mathbf{i} + x^2\mathbf{j}$  along the upper half of the ellipse  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  from  $(a, 0)$  to  $(-a, 0)$

In Problems 17–20, find the work done by each force field  $\mathbf{F}$  in moving an object along the curve pictured in each graph.

17.  $\mathbf{F} = 3x\mathbf{i} + 2y\mathbf{j}$

18.  $\mathbf{F} = 2xy\mathbf{i} + xy^2\mathbf{j}$

19.  $\mathbf{F} = e^x y\mathbf{i} + e^x \mathbf{j}$

20.  $\mathbf{F} = e^x \mathbf{i} + 5y\mathbf{j}$

### Applications and Extensions

21. Verify that the force field  $\mathbf{F} = y\mathbf{i} - x\mathbf{j}$  is not a conservative vector field. Show that the integral  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is dependent on the path of

integration by taking two paths in which the starting point is the origin  $(0, 0)$  and the endpoint is  $(1, 1)$ . For one path, take the line  $x = y$ . For the other path, take the  $x$ -axis out to the point  $(1, 0)$  and then the line  $x = 1$  up to the point  $(1, 1)$ .

22. **Work** Find the work done by a variable force  $\mathbf{F}(x, y) = (x^2\mathbf{i} + y\mathbf{j})$  to move an object along  $C$  traced out by the parametric equations  $x = t$ ,  $y = t^2$ ,  $0 \leq t \leq 3$ .
23. **Work** Find the work done by a variable force  $\mathbf{F}(x, y) = (\cos x\mathbf{i} + \sin y\mathbf{j})$  to move an object along the curve  $C$  traced out by the parametric equations  $x = t$ ,  $y = \sqrt{t}$ ,  $0 \leq t \leq \pi$ .
24. **Work** An object moves in a clockwise direction from the origin to the point  $(2a, 0)$  along the upper half of the circle  $(x - a)^2 + y^2 = a^2$  and is acted upon by a force  $\mathbf{F}$  with constant magnitude 3 and with direction  $\mathbf{i} + \mathbf{j}$ . Find the work  $W$  done by this force.
25. **Work** An object moves along the curve  $\mathbf{r}(t) = 64\sqrt{3}t\mathbf{i} + (64t - 16t^2)\mathbf{j}$  from  $t = 0$  to  $t = 4$  and is acted upon by a force  $\mathbf{F}$  whose magnitude is directly proportional to the speed of the object and whose direction is opposite to that of the velocity. Find the work  $W$  done by this force.
26. **Minimizing Work** An object moves from the point  $(0, 0)$  to the point  $(1, 0)$  along the curve  $y = ax(1 - x)$  and is acted upon by a force given by  $\mathbf{F}(x, y) = (y^2 + 1)\mathbf{i} + (x + y)\mathbf{j}$ . Find  $a$  so that the work  $W$  done is a minimum.
27. **Molecular Work** The repelling force between a charged particle  $P$  at the origin and an oppositely charged particle  $Q$  at  $(x, y)$  is

$$\mathbf{F}(x, y) = \frac{x}{(x^2 + y^2)^{3/2}}\mathbf{i} + \frac{y}{(x^2 + y^2)^{3/2}}\mathbf{j}$$

Find the work done by  $\mathbf{F}$  as  $Q$  moves along the line segment from  $(1, 0)$  to  $(-1, 2)$ .

28. **Work** Find the work  $W$  done by the force field  $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + \mathbf{k}$  in moving an object along the helix  $\mathbf{r} = \mathbf{r}(t) = \sin t\mathbf{i} + \cos t\mathbf{j} + t\mathbf{k}$ ,  $0 \leq t \leq \pi$ .
29. **Work** Find the work  $W$  done by the force field  $\mathbf{F}(x, y, z) = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$  in moving an object along the helix  $\mathbf{r} = \mathbf{r}(t) = 2\cos t\mathbf{i} + 2\sin t\mathbf{j} + 2t\mathbf{k}$ ,  $0 \leq t \leq \pi$ .
30. **Work** Suppose sea level is the  $xy$ -plane and the  $z$ -axis points upward. Then the gravitational force on an object of mass  $m$  near sea level may be taken to be  $\mathbf{F} = mg\mathbf{k}$ , where  $g$  is the acceleration due to gravity. Show that the work done by gravity on an object moving from  $(x_1, y_1, z_1)$  to  $(x_2, y_2, z_2)$  along any path is  $W = mg(z_2 - z_1)$ .
31. **Work**
- (a) Suppose an object travels through a force field along a path that is always normal to the force. Show that the work done in moving the object from one point to another is 0.
- (b) Why does it follow that the gravitational field of the earth does no work on a satellite in circular orbit?

32. **Work** Show that if the work done by a force  $\mathbf{F}(x, y)$  in moving an object along any piecewise-smooth, closed curve in an open set  $S$  in the plane is 0, then the work done by  $\mathbf{F}$  in moving an object from a point  $A$  to a point  $B$  in  $S$  is independent of the piecewise-smooth path chosen.

## Challenge Problem

## 33. Escape Speed

- (a) Show that the minimum speed needed to escape from the surface of a planet of mass  $M$  in kilograms and radius  $R$  in

meters is  $v_{esc} = \sqrt{\frac{2GM}{R}}$ , where  $G = 6.67 \times 10^{-11} \text{ N m}^2/\text{kg}^2$ .

This speed is called the **escape speed** for the planet.

(Hint: Use the relationship between kinetic energy  $K$  and the work  $W$  done by a force  $\mathbf{F}$ .)

- (b) Find the escape speed for Earth (in kilometers per second) using  $M_{\text{Earth}} = 5.97 \times 10^{24} \text{ kg}$  and  $R_{\text{Earth}} = 6.38 \times 10^6 \text{ m}$ .
- (c) Find the escape speed for Mars (in kilometers per second) using  $M_{\text{Mars}} = 6.42 \times 10^{23} \text{ kg}$  and  $R_{\text{Mars}} = 3.40 \times 10^6 \text{ m}$ .
- (d) Find the escape speed for the Sun (in kilometers per second) using  $M_{\text{Sun}} = 1.99 \times 10^{30} \text{ kg}$  and  $R_{\text{Sun}} = 6.96 \times 10^8 \text{ m}$ .

## 15.5 Green's Theorem

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Use Green's Theorem to find a line integral (p. 1009)
- 2 Use Green's Theorem to find area (p. 1010)
- 3 Use Green's Theorem with Multiply-Connected Regions (p. 1011)

**ORIGINS** George Green (1793–1841) was a miller and self-taught mathematician who also worked with applications in electricity, magnetism, and fluid flow.

**Figure 31**  $R$  lies to the left of  $C$  as the curve is traversed.

**RECALL** A region  $R$  is closed if it contains all its boundary points.

In this section, we investigate an amazing theorem, known as *Green's Theorem*, that relates the value of a line integral along a simple closed curve  $C$  in the plane to a double integral over the region  $R$  enclosed by  $C$ .

Green's Theorem may be stated in several ways, but the most common form is the following:

$$\oint_C (P dx + Q dy) = \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy$$

The plane curve  $C$  is the boundary of the region  $R$ , and the symbol  $\oint$  indicates that the simple closed curve  $C$  is to be traversed in a counterclockwise direction. That is, the region  $R$  always lies to the left as one moves along the curve, as shown in Figure 31.

The equality  $\oint_C (P dx + Q dy) = \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy$  requires two

assumptions:

- The functions  $P$  and  $Q$  have continuous first-order partial derivatives at each point in the region  $R$ .
- The curve  $C$  is a piecewise-smooth, simple closed curve, and the region  $R$  is both simply connected and closed.

The advantage of using Green's Theorem is that it can be used to transform line integrals into double integrals and vice versa, allowing us the opportunity to find the easier of the two.

**THEOREM** Green's Theorem

Let  $C$  be a piecewise-smooth, simple closed curve with a counter clockwise orientation and let  $R$  be the simply connected, closed region consisting of  $C$  and its interior. Let the functions  $P$  and  $Q$  have continuous first-order partial derivatives on some open region that contains  $R$ . Then

$$\oint_C (P dx + Q dy) = \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy$$

where the line integral is taken around  $C$  in the counterclockwise direction.

We prove Green's Theorem only for regions that are both  $x$ -simple and  $y$ -simple.

**NEED TO REVIEW?**  $x$ -simple and  $y$ -simple regions are discussed in Section 14.2, pp. 913 and 915.

Figure 32

**Proof** It is sufficient to show that

$$\oint_C P(x, y) dx = - \iint_R \frac{\partial P}{\partial y} dx dy \quad \text{and} \quad \oint_C Q(x, y) dy = \iint_R \frac{\partial Q}{\partial x} dx dy$$

since the result follows from adding these two equations.

Suppose the region  $R$  is both  $x$ -simple and  $y$ -simple. Then since it is  $x$ -simple as shown in Figure 32, the boundary of  $R$  consists of two smooth curves,  $C_1: y = g_1(x)$  and  $C_2: y = g_2(x)$ , where  $g_1(x) \leq g_2(x)$ ,  $a \leq x \leq b$ .

To show  $\oint_C P(x, y) dx = - \iint_R \frac{\partial P}{\partial y} dx dy$ , we begin with the double integral.

Since  $R$  is  $x$ -simple, by Fubini's Theorem, we have

$$\begin{aligned} - \iint_R \frac{\partial P}{\partial y} dx dy &= - \int_a^b \left[ \int_{g_1(x)}^{g_2(x)} \frac{\partial P}{\partial y} dy \right] dx = - \int_a^b [P(x, y)]_{g_1(x)}^{g_2(x)} dx \\ &= - \int_a^b [P(x, g_2(x)) - P(x, g_1(x))] dx = \int_a^b P(x, g_1(x)) dx + \int_b^a P(x, g_2(x)) dx \\ &= \int_{C_1} P(x, y) dx + \int_{C_2} P(x, y) dx = \oint_C P(x, y) dx \end{aligned}$$

To show  $\oint_C Q(x, y) dy = \iint_R \frac{\partial Q}{\partial x} dx dy$ , use the fact that the region  $R$  is also

$y$ -simple. The derivation is left as an exercise (Problem 49). ■

## 1 Use Green's Theorem to Find a Line Integral

### EXAMPLE 1 Finding a Line Integral Using Green's Theorem

Use Green's Theorem to find the line integral

$$\oint_C [(-2xy + y^2) dx + x^2 dy]$$

where  $C$  is the boundary of the region  $R$  enclosed by  $y = 4x$  and  $y = 2x^2$ .

**Solution** Figure 33 illustrates the curve  $C$  and the region  $R$ .  $C$  is a piecewise-smooth closed curve and  $R$  is both simply connected and closed. We let

$$P(x, y) = -2xy + y^2 \quad \text{and} \quad Q(x, y) = x^2$$

Since  $P$  and  $Q$  have continuous first-order partial derivatives in  $R$ , we use Green's Theorem. Then

$$\begin{aligned} \oint_C (P dx + Q dy) &= \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy \\ \oint_C [(-2xy + y^2) dx + x^2 dy] &= \iint_R \left[ \frac{\partial}{\partial x} (x^2) - \frac{\partial}{\partial y} (-2xy + y^2) \right] dx dy \\ &= \iint_R (4x - 2y) dx dy = \int_0^2 \int_{2x^2}^{4x} (4x - 2y) dy dx \\ &= \int_0^2 [4xy - y^2]_{2x^2}^{4x} dx = \int_0^2 [(16x^2 - 16x^2) - (8x^3 - 4x^4)] dx \\ &= \left[ -2x^4 + \frac{4}{5}x^5 \right]_0^2 = -32 + \frac{128}{5} = \frac{-32}{5} \end{aligned}$$

■

Figure 33

**NEED TO REVIEW?** Fubini's Theorems are discussed in Sections 14.2, pp. 913–915.

The solution found in Example 1 can be verified by finding the line integral directly. Let  $C_1$  be the curve traced out by  $y = 2x^2$ ,  $0 \leq x \leq 2$ , and let  $C_2$  be the curve traced out by  $y = 4x$ , from 2 to 0. Then

$$\begin{aligned}\oint_C [(-2xy + y^2) dx + x^2 dy] &= \int_{C_1} [(-2xy + y^2) dx + x^2 dy] + \int_{C_2} [(-2xy + y^2) dx + x^2 dy] \\ &= \int_0^2 [(-4t^3 + 4t^4) dt + 4t^3 dt] \quad \begin{array}{l} C_1 : x = t, y = 2t^2, 0 \leq t \leq 2 \\ C_2 : x = t, y = 4t; \text{ from } t = 2 \text{ to } t = 0 \end{array} \\ &\quad + \int_2^0 [(-8t^2 + 16t^2) dt + 4t^2 dt] \\ &= \left[ 4\frac{t^5}{5} \right]_0^2 + 12 \left[ \frac{t^3}{3} \right]_2^0 = \frac{128}{5} - 32 = -\frac{32}{5}\end{aligned}$$

The next example shows that Green's Theorem can be helpful in finding line integrals that are difficult or impossible to find using the techniques of Section 15.2.

### EXAMPLE 2 Finding a Line Integral Using Green's Theorem

Use Green's Theorem to find the line integral

$$\oint_C [(e^{-x^2} + y^2) dx + (\ln y - x^2) dy]$$

where  $C$  is the square illustrated in Figure 34.

**Solution** Recall that  $\int e^{-x^2} dx$  cannot be expressed in terms of elementary functions, so finding the integral directly is impossible. Since both the curve  $C$  and the region  $R$  enclosed by  $C$  satisfy the conditions of Green's Theorem, we use it to find the line integral.

If  $P(x, y) = e^{-x^2} + y^2$  and  $Q(x, y) = \ln y - x^2$  then  $\frac{\partial P}{\partial y} = 2y$  and  $\frac{\partial Q}{\partial x} = -2x$ . Since

$P$  and  $Q$  have continuous first-order derivatives in  $R$ , by Green's Theorem, We have

$$\begin{aligned}\oint_C [(e^{-x^2} + y^2) dx + (\ln y - x^2) dy] &= \iint_R (-2x - 2y) dx dy \\ &= -2 \int_1^2 \int_0^1 (x + y) dx dy = -2 \int_1^2 \left[ \frac{x^2}{2} + xy \right]_0^1 dy \\ &\quad \uparrow \text{R is y-simple} \\ &= -2 \int_1^2 \left( \frac{1}{2} + y \right) dy = -2 \left[ \frac{1}{2}y + \frac{y^2}{2} \right]_1^2 = -4\end{aligned}$$

### NOW WORK Problem 11.

In Example 2, Green's Theorem was used to convert a line integral into a double integral because the line integral could not be found. Green's Theorem is also used to convert double integrals to line integrals when the line integral is easier to integrate. This is often true when finding area.

## 2 Use Green's Theorem to Find Area

Green's Theorem can be used to express the area  $A$  of a region  $R$  enclosed by a piecewise-smooth, simple closed curve  $C$  as a line integral.

### THEOREM Green's Theorem for Area

If  $C$  is a piecewise-smooth, simple closed curve with a counterclockwise orientation, then the area  $A$  of the simply connected closed region  $R$  enclosed by  $C$  is given by

$$A = \frac{1}{2} \oint_C (-y dx + x dy) \quad (1)$$

Figure 34

**Proof** In Green's Theorem, let  $P = P(x, y) = -y$  and  $Q = Q(x, y) = x$ . Then

$$\oint_C (-y \, dx + x \, dy) = \iint_R \left[ \frac{\partial}{\partial x}(x) - \frac{\partial}{\partial y}(-y) \right] dx \, dy = \iint_R 2 \, dx \, dy = 2A \quad \blacksquare$$

**RECALL**  $\iint_R dx \, dy$  equals the area of the region  $R$ .

In Problem 50, you are asked to show that the area  $A$  can also be expressed by the formulas

$$A = \oint_C x \, dy \quad \text{and} \quad A = \oint_C (-y) \, dx$$

### EXAMPLE 3 Using Green's Theorem to Find Area

Use Green's Theorem to find the area of the region enclosed by the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad a > 0 \quad b > 0$$

**Solution** We express the ellipse using the parametric equations  $x = a \cos t$ ,  $y = b \sin t$ ,  $0 \leq t \leq 2\pi$ . Then  $dx = -a \sin t \, dt$  and  $dy = b \cos t \, dt$ . Now we use (1) to find the area.

$$\begin{aligned} A &= \frac{1}{2} \oint_C (-y \, dx + x \, dy) = \frac{1}{2} \int_0^{2\pi} [-b \sin t (-a \sin t \, dt) + a \cos t (b \cos t \, dt)] \\ &= \frac{1}{2} \int_0^{2\pi} ab(\sin^2 t + \cos^2 t) \, dt = \frac{1}{2}(ab) \int_0^{2\pi} dt = \frac{1}{2}ab(2\pi) = \pi ab \quad \blacksquare \end{aligned}$$

**Figure 35**  $R$  is not simply connected, but is multiply-connected.

**NOW WORK** Problem 25.

### 3 Use Green's Theorem with Multiply-Connected Regions

For Green's Theorem to hold, the double integral is found over a simply connected, closed region  $R$  formed by a piecewise-smooth, simple closed curve  $C$  and its interior. We now consider Green's Theorem for *multiply-connected regions*.

A **multiply-connected region** is any connected region that is not simply connected. We can think of a multiply connected region as a connected region with holes. See Figure 35.

#### THEOREM Green's Theorem for Multiply-Connected Regions

Let  $C_1, C_2, \dots, C_n$  be  $n$  piecewise-smooth, simple closed curves for which:

- No two curves  $C_i$  and  $C_j$ ,  $i \neq j$ ,  $i, j = 1, 2, \dots, n$ , intersect.
- Each of the curves  $C_i$ ,  $i = 1, 2, \dots, n$  lies in the interior of a piecewise-smooth, simple closed curve  $C$ .
- Any curve  $C_i$  is exterior to every curve  $C_j$ ,  $i \neq j$ ,  $i, j = 1, 2, \dots, n$ .

Let  $R$  denote the region consisting of the interior of  $C$  and its boundary, less the interior of each of the curves  $C_1, C_2, \dots, C_n$ . Let functions  $P$  and  $Q$  have continuous first-order partial derivatives throughout  $R$ . Then

$$\iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx \, dy = \oint_C (P \, dx + Q \, dy) - \sum_{i=1}^n \oint_{C_i} (P \, dx + Q \, dy)$$

We give the idea of the proof for  $n = 1$ . As shown in Figure 36, the curve  $C_1$  is a circle contained within the larger circle  $C$ .

**Proof** We construct line segments  $\overline{AB}$  and  $\overline{ED}$  that join the curves  $C$  and  $C_1$ . This decomposes  $R$  into two regions  $R_1$  and  $R_2$ , with boundaries  $\Gamma_1$  and  $\Gamma_2$ , respectively.

**Figure 36**

Since  $R_1$  and  $R_2$  each satisfy the conditions of Green's Theorem, we have

$$\begin{aligned} \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy &= \iint_{R_1} \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy + \iint_{R_2} \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy \\ &= \oint_{\Gamma_1} (P dx + Q dy) + \oint_{\Gamma_2} (P dx + Q dy) \\ &= \left[ \int_{DA} (P dx + Q dy) + \int_{AB} (P dx + Q dy) + \int_{BE} (P dx + Q dy) + \int_{ED} (P dx + Q dy) \right] \\ &\quad + \left[ \int_{DE} (P dx + Q dy) + \int_{EB} (P dx + Q dy) + \int_{BA} (P dx + Q dy) + \int_{AD} (P dx + Q dy) \right] \end{aligned}$$

Along the line segments  $\overline{AB}$  and  $\overline{ED}$ ,

$$\int_{\overline{AB}} (P dx + Q dy) = - \int_{\overline{BA}} (P dx + Q dy) \quad \text{and} \quad \int_{\overline{ED}} (P dx + Q dy) = - \int_{\overline{DE}} (P dx + Q dy)$$

So,

$$\begin{aligned} \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy &= \oint_C (P dx + Q dy) + \oint_{-C_1} (P dx + Q dy) \\ &= \oint_C (P dx + Q dy) - \oint_{C_1} (P dx + Q dy) \end{aligned}$$

The next theorem is an important consequence of Green's Theorem for Multiply Connected Regions.

### THEOREM

Let  $P$  and  $Q$  be functions that have continuous first-order partial derivatives throughout an open, connected set  $R$ . Let  $C_1$  and  $C_2$  denote two piecewise-smooth, simple closed curves, each lying entirely in  $R$ . Suppose the curve  $C_1$  can be obtained by continuously deforming the curve  $C_2$  so that all the intermediate deformed curves lie entirely in  $R$ .

If  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$  throughout  $R$ , then

$$\boxed{\int_{C_1} (P dx + Q dy) = \int_{C_2} (P dx + Q dy)}$$

The significance of this theorem is that it allows us, under the conditions of the theorem, to replace a line integral over a simple closed curve  $C_1$  that is difficult to find with an easier line integral over the path  $C_2$ .

Figure 37 illustrates a set  $R$  satisfying the conditions of the theorem, which can be restated informally as follows: If  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$  throughout  $R$ , then the value of a line integral along a piecewise-smooth, simple closed curve equals the value of the same line integral along any other piecewise-smooth, simple closed curve that is obtained by continuously deforming the original curve, provided all the intermediate deformed curves lie entirely in  $R$ .

Figure 37

### EXAMPLE 4 Using Green's Theorem to Find a Line Integral

Find  $\oint_C \left( \frac{-y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy \right)$  if:

- $C$  is the curve  $x^{2/3} + y^{2/3} = 1$ , whose orientation is counterclockwise.
- $C$  is any piecewise-smooth, simple closed curve not containing the origin in its interior.

**Solution** For  $P = \frac{-y}{x^2 + y^2}$  and  $Q = \frac{x}{x^2 + y^2}$ , we have

$$\frac{\partial P}{\partial y} = \frac{y^2 - x^2}{(x^2 + y^2)^2} \quad \text{and} \quad \frac{\partial Q}{\partial x} = \frac{y^2 - x^2}{(x^2 + y^2)^2}$$

Notice that, except at the point  $(0, 0)$ , the partial derivatives  $\frac{\partial P}{\partial y}$  and  $\frac{\partial Q}{\partial x}$  are continuous.

(a) It is difficult to find the line integral along  $C$ . Moreover, because  $x^{2/3} + y^{2/3} = 1$  contains the point  $(0, 0)$  in its interior, we cannot use Green's Theorem as we did in

Example 2 to change the line integral to a double integral. However, since  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$  throughout  $R$ , we can use a different curve that leads to an easier line integral. For example, suppose we replace  $x^{2/3} + y^{2/3} = 1$  by the unit circle  $C_1: x^2 + y^2 = 1$ , noting that the conditions required for  $\int_C (P dx + Q dy)$  to equal  $\int_{C_1} (P dx + Q dy)$  are met. See Figure 38.

On  $C_1$ ,  $x = \cos \theta$ ,  $y = \sin \theta$ ,  $0 \leq \theta \leq 2\pi$ . Then  $dx = -\sin \theta d\theta$ ,  $dy = \cos \theta d\theta$ , and

$$\begin{aligned} \oint_C \left( \frac{-y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy \right) &= \oint_{C_1} \left( \frac{-y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy \right) \\ &= \int_0^{2\pi} (\sin^2 \theta + \cos^2 \theta) d\theta = 2\pi \end{aligned}$$

(b) In this case, the interior of the curve  $C$  does not contain the origin. Since

$$\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$$

in the simply connected region  $R$  enclosed by  $C$ , it follows that  $\mathbf{F} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field. Since  $C$  is closed,

$$\oint_C \left( \frac{-y}{x^2 + y^2} dx + \frac{x}{x^2 + y^2} dy \right) = \oint_C \mathbf{F} \cdot d\mathbf{r} = 0$$

### NOW WORK Problem 23.

### Application of Green's Theorem to Conservative Vector Fields

In Section 15.3, we proved the following result: If  $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  is a conservative vector field and the components  $P$  and  $Q$  have continuous first-order partial derivatives on an open, connected region  $R$ , then  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$  throughout  $R$ .

We now use Green's Theorem to prove that if  $R$  is a simply connected region, then the converse is also true.

### THEOREM Converse of the Conservative Vector Field Theorem

Let  $\mathbf{F} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  be a vector field whose components  $P$  and  $Q$  have continuous first-order partial derivatives throughout an open, simply connected region  $R$ . If  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$  throughout  $R$ , then  $\mathbf{F}$  is a conservative vector field.

To show that  $\mathbf{F}$  is a conservative vector field, we only need to show that for any curve  $C$  in  $R$ ,  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$  is independent of the path. That is,  $\int_C \mathbf{F} \cdot d\mathbf{r}$  has the same value for any two piecewise-smooth curves joining a fixed point  $A$  in  $R$  to an arbitrary point  $(x, y)$  in  $R$ .

Figure 38

**Proof** Let  $C_1$  and  $C_2$  be two piecewise-smooth curves in  $R$  joining  $A$  to  $(x, y)$ . Assume that these curves do not intersect or coincide except at  $A$  and  $(x, y)$ .<sup>\*</sup> The curves  $C_1$  and  $C_2$  form the boundary of a region  $D$  that is a subset of  $R$ , since  $R$  is simply connected. See Figure 39.

**NEED TO REVIEW?** The properties of double integrals are discussed in Section 14.2, pp. 917–918.

Figure 39

Since the conditions for Green's Theorem are satisfied on the region  $D$ , we have

$$\begin{aligned} \iint_D \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy &= \int_{C_2 + (-C_1)} (P dx + Q dy) \\ &= \int_{C_2} (P dx + Q dy) + \int_{-C_1} (P dx + Q dy) \\ &= \int_{C_2} (P dx + Q dy) - \int_{C_1} (P dx + Q dy) \end{aligned}$$

Since  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$  throughout  $R$ , then  $\iint_D \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy = 0$ .

Therefore,

$$\int_{C_1} (P dx + Q dy) = \int_{C_2} (P dx + Q dy)$$

showing that the line integral is independent of the path, and  $\mathbf{F}$  is conservative. ■

<sup>\*</sup>This assumption may be relaxed so that the curves  $C_1$  and  $C_2$  may sometimes intersect or even coincide in  $R$ .

## 15.5 Assess Your Understanding

### Concepts and Vocabulary

- Green's Theorem relates the value of a(n) \_\_\_\_\_ integral along a simple closed piecewise smooth curve  $C$  to the value of a(n) \_\_\_\_\_ integral over the simply connected closed region  $R$  enclosed by  $C$ .
- If the assumptions of Green's Theorem are met, then  $\oint_C (P(x, y) dx + Q(x, y) dy) = \iint_R (\text{_____}) dx dy$ .
- True or False** The symbol  $\oint_C$  indicates that a simple closed curve  $C$  is to be traversed in a clockwise direction.
- If  $C$  is a piecewise-smooth, simple closed curve, then  $\frac{1}{2} \oint_C (-y dx + x dy)$  equals the \_\_\_\_\_ of the closed simply connected region  $R$  enclosed by  $C$ .

### Skill Building

In Problems 5–10, use Green's Theorem to find each line integral. In each case, assume that  $C$  is the perimeter of the rectangle with vertices  $(0, 0)$ ,  $(4, 0)$ ,  $(4, 3)$ ,  $(0, 3)$ , and that the orientation of  $C$  is counterclockwise.

- $\oint_C y dx$
- $\oint_C x dy$
- $\oint_C [xy dx + (x + y) dy]$
- $\oint_C (3y dx - 2x dy)$
- $\oint_C (xy^2 dx + x^2 y dy)$
- $\oint_C [y \sin(xy) dx + x \sin(xy) dy]$

In Problems 11–14, use Green's Theorem to find each line integral. In each problem, assume that  $C$  is the unit circle  $x^2 + y^2 = 1$ , and that the orientation of  $C$  is counterclockwise.

- $\oint_C (-x^2 y dx + y^2 x dy)$
- $\oint_C [y(x^2 + y^2) dx - x(x^2 + y^2) dy]$
- $\oint_C [(x^2 - y^3) dx + (x^2 + y^2) dy]$
- $\oint_C [(xy^3 + \sin x) dx + (x^2 y^2 + 4x) dy]$

In Problems 15–20, use Green's Theorem to find each line integral. In each problem,  $C$  is to be traversed in the counterclockwise direction.

- $\oint_C [(x^2 + y) dx + (x - y^2) dy]$ , where  $C$  is the boundary of the region  $R$  bounded by  $y = x^{3/2}$ , the  $x$ -axis, and  $x = 1$
- $\oint_C [(4x^2 - 8y^2) dx + (y - 6xy) dy]$ , where  $C$  is the boundary of the region  $R$  bounded by  $y = \sqrt{x}$  and  $y = x^2$
- $\oint_C [(x^3 - x^2 y) dx + xy^2 dy]$ , where  $C$  is the boundary of the region  $R$  bounded by  $y = x^2$  and  $x = y^2$
- $\oint_C [(x^2 - y^2) dx + xy dy]$ , where  $C$  is the boundary of the region  $R$  bounded by  $x = y^2$  and  $x = 1$
- $\oint_C \left[ \frac{1}{y} dx + \frac{1}{x} dy \right]$ , where  $C$  is the boundary of the region  $R$  bounded by  $y = 1$ ,  $x = 9$ , and  $y = \sqrt{x}$

20.  $\oint_C (x^2 y \, dx - y^2 x \, dy)$ , where  $C$  is the boundary of the region  $R$  bounded by  $y = \sqrt{a^2 - x^2}$  and  $y = 0$

In Problems 21–24, find  $\oint_C \frac{y \, dx - x \, dy}{x^2 + y^2}$  about the indicated curve  $C$ .

21.  $C: x^2 + y^2 = 4$       22.  $C: (x - 2)^2 + (y + 3)^2 = 1$   
 23.  $C: x^2 + 4y^2 = 4$       24.  $C: 3x^2 + 6y^2 = 4$

**Area** In Problems 25–32, use Green's Theorem to find the area of each region.

25. Bounded by  $y = x^2$  and  $y = x + 2$   
 26. Bounded by  $y = x^2 - 1$  and  $y = 0$   
 27. Bounded by  $y = x^3$  and  $y = x^2$   
 28. Bounded by  $y = 2\sqrt{x}$  and  $y = \frac{x^2}{4}$   
 29. Bounded by  $y = \frac{1}{\sqrt{x-1}}$ ,  $y = 0$ ,  $x = 2$ , and  $x = 5$   
 30. Bounded by  $y = x^{3/2}$  and  $y = x$   
 31. Bounded by the line  $x + y = 3$  and the hyperbola  $xy = 2$   
 32. Bounded by the hyperbola  $xy = \sqrt{3}$  and the circle  $x^2 + y^2 = 4$ , in the first quadrant only

### Applications and Extensions

33. **Area** Find the area under one arch of the cycloid  $\mathbf{r}(t) = [2\pi t - \sin(2\pi t)] \mathbf{i} + [1 - \cos(2\pi t)] \mathbf{j}$ ,  $0 \leq t \leq 1$ .  
 34. **Area** Find the area enclosed by the hypocycloid  $x^{2/3} + y^{2/3} = 1$ . (Hint: Use the parametric equations  $x = \cos^3 t$ ,  $y = \sin^3 t$ .)  
 35. A **folium of Descartes** is given by the parametric equations  $x(t) = \frac{6t}{1+t^3}$ ,  $y(t) = \frac{6t^2}{1+t^3}$ . Use Green's Theorem to show that the area  $A$  enclosed by the loop of this folium of Descartes is 6.

In Problems 36–40, use the formulas from Problem 52 to find the center of mass of each region.

36. The region bounded by the  $x$ -axis and the semi-circle  $y = \sqrt{4 - x^2}$   
 37. The region bounded by the parabola  $y = x^2$  and the line  $y = 1$   
 38. The region bounded by the triangle with vertices at  $(0, 0)$ ,  $(1, 0)$ , and  $(0, 1)$   
 39. The region bounded by the trapezoid with vertices at  $(0, 0)$ ,  $(1, 0)$ ,  $(1, 2)$ , and  $(0, 1)$   
 40. The region bounded by the coordinate axes and the hypocycloid  $x = a \cos^3 t$ ,  $y = a \sin^3 t$ ,  $0 \leq t \leq \frac{\pi}{2}$   
 41. **Work** Use Green's Theorem to find the work done by the variable force  $\mathbf{F}(x, y) = x\mathbf{i} + y^2\mathbf{j}$  in moving an object along the curve  $x(t) = t$ ,  $y(t) = t^2$ ,  $0 \leq t \leq 4$ , and then returning to the point  $(0, 0)$  along the line  $x(t) = t$ ,  $y(t) = 4t$ .  
 42. **Work** Use Green's Theorem to find the work done by the variable force  $\mathbf{F}(x, y) = (e^x + 2y)\mathbf{i} + (e^y - x)\mathbf{j}$  in moving an object along the closed path  $x^2 + y^2 = 9$ .

43. Find  $\oint_C \left\{ [\ln(1 + x^2) - x^2 \cos y] \, dx + \left( \frac{x^3}{3} \cos y + e^{\cos y} \right) \, dy \right\}$ , where  $C$  is the boundary of the region enclosed by  $y = x^3$ ,  $x = 1$ , and the  $x$ -axis.  
 44. Find  $\oint_C [y^3 \, dx - x^3 \, dy]$ , where  $C$  is the boundary of the multiply-connected region  $1 \leq x^2 + y^2 \leq 9$  and  $C$  is traversed in the counter-clockwise direction.

In Problems 45–48, explain why each line integral is equal to 0.

45.  $\oint_C (xe^{x^2+y^2} \, dx + ye^{x^2+y^2} \, dy)$ , where  $C$  is any piecewise-smooth, simple closed curve in the plane  
 46.  $\oint_C [e^{xy}(xy + 1) \, dx + x^2 e^{xy} \, dy]$ , where  $C$  is any piecewise-smooth, simple closed curve in the plane  
 47.  $\oint_C (e^x \sin y \, dx + e^x \cos y \, dy)$ , where  $C$  is any piecewise-smooth, simple closed curve in the plane  
 48.  $\oint_C \left[ \frac{x \, dx}{(x^2 + y^2)^{1/2}} + \frac{y \, dy}{(x^2 + y^2)^{1/2}} \right]$ , where  $C$  is any piecewise-smooth, simple closed curve not containing the origin in its interior

49. **Green's Theorem** Complete the proof of Green's Theorem for  $x$ -simple and  $y$ -simple regions by showing

$$\oint_C Q(x, y) \, dy = \iint_R \frac{\partial Q}{\partial x} \, dx \, dy.$$

50. Use Green's Theorem for finding the area  $A$  of the region  $R$  enclosed by simple closed piecewise smooth curve  $C$  to show that  $A = \oint_C x \, dy$  and  $A = \oint_C (-y) \, dx$ .  
 51. Consider the integral  $\int_C \frac{y \, dx - x \, dy}{(x^2 + y^2)^{3/2}}$ . For which simple closed, piecewise-smooth curves  $C$  can Green's Theorem be applied to transform this line integral to a double integral?

### Challenge Problems

52. **Center of Mass** A homogeneous lamina occupies a region in the  $xy$ -plane with boundary  $C$  (oriented counterclockwise). Show that its center of mass has the coordinates given below, where  $A$  is the area of the region.

$$\bar{x} = \frac{1}{2A} \oint_C x^2 \, dy \quad \bar{y} = \frac{-1}{2A} \oint_C y^2 \, dx$$

53. **Moment of Inertia** Use Problem 52 to show that the moment of inertia about the origin is

$$I_o = \frac{1}{3} \oint_C (x^3 \, dy - y^3 \, dx)$$

(Assume that the mass density of the lamina is 1.)

54. Let  $R$  be a simply connected closed region in the  $xy$ -plane, and let  $R'$  be a simply connected closed region in the  $st$ -plane. Suppose  $x = x(s, t)$  and  $y = y(s, t)$  are differentiable and that, as  $(s, t)$  is allowed to vary throughout  $R'$ ,  $(x, y)$  varies throughout  $R$  in a one-to-one correspondence. Suppose further that  $R$  has boundary  $C$ , which is a piecewise-smooth closed curve, and  $R'$  has boundary  $C'$ , which is a piecewise-smooth closed curve. Finally, suppose that as  $(s, t)$  moves along  $C'$ ,  $(x(s, t), y(s, t))$

moves along  $C$ . Show that

$$\iint_R dx \, dy = \iint_{R'} |(x_s y_t - x_t y_s)| \, ds \, dt$$

[Hint: Using  $\iint_R dx \, dy = \frac{1}{2} \oint_C (x \, dy - y \, dx)$ , write the integral

on the right in terms of  $s$  and  $t$ . Then apply Green's Theorem to the resulting integral, which will have the form  $\oint_{C'} (P \, ds + Q \, dt)$ .]

**55. Transformation of a Double Integral** Let  $\phi(x, y)$  be continuous and let  $P(x, y) = -\int \phi(x, y) \, dy$  and  $Q(x, y) = \int \phi(x, y) \, dx$ . Generalize the result of Problem 54 using  $P$  and  $Q$  to show that

$$\iint_R \phi(x, y) \, dx \, dy = \iint_{R'} \phi(x(s, t), y(s, t)) |x_s y_t - x_t y_s| \, ds \, dt$$

Go through a similar process as in Problem 54, using Green's Theorem on the integral  $\oint_C P \, dx + Q \, dy$ .

## 15.6 Parametric Surfaces

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Describe surfaces defined parametrically (p. 1017)
- 2 Find a parametric representation of a surface (p. 1018)
- 3 Find equations for a tangent plane and a normal line (p. 1022)
- 4 Find the surface area of a parametrized surface (p. 1023)

In Chapter P, we observed that the graph of an explicitly defined function  $y = f(x)$  satisfies the Vertical-line Test. We also saw that some graphs, such as circles, do not pass the Vertical-line Test. The equations of such graphs may be defined implicitly as  $F(x, y) = 0$ . Then in Chapters 9 and 12, we found that parametric equations  $x = x(t)$ ,  $y = y(t)$  and vector-valued functions  $\mathbf{r} = \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j}$ , where  $a \leq t \leq b$ , allow us to represent a curve in a plane that is not necessarily the graph of function. Similarly, parametric equations  $x = x(t)$ ,  $y = y(t)$ ,  $z = z(t)$  and vector functions  $\mathbf{r} = \mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$ , where  $a \leq t \leq b$ , represent curves in space.

In this section, we define parametric equations and vector-valued functions that represent surfaces in space. Since a surface in space requires two independent variables, the parametric representation of a surface involves two parameters,  $u$  and  $v$ .

### DEFINITION Parametric Surface

Suppose

$$x = x(u, v) \quad y = y(u, v) \quad z = z(u, v)$$

are functions of two variables that are defined on a region  $R$  in the  $uv$ -plane. Also suppose that the functions are continuous and one-to-one\* on the interior of  $R$ . Then  $u$  and  $v$  are **parameters**;  $x = x(u, v)$ ,  $y = y(u, v)$ ,  $z = z(u, v)$  are **parametric equations**; and the set of points defined by the parametric equations is a **parametric surface**.

The vector-valued function

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$

is called a **parametrization** of the surface. The region  $R$  is the **parameter domain** of  $\mathbf{r}$ , and the range of  $\mathbf{r}$  is the surface traced out by  $\mathbf{r}$ .

Just as we can graph a function  $z = f(x, y)$  using contour lines or graph a quadric surface using traces, we can graph parametric surfaces using *coordinate curves*.

\*We require the parametrization to be one-to-one on the interior of  $R$  so that the surface does not fold over on itself.

 Figure 40 A wireframe plot of  $S$ .

Figure 41

### DEFINITION Coordinate Curves

Suppose  $S$  is a surface with parametrization  $\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$  and parameter domain  $R$ . Then the curve traced out by  $\mathbf{r} = \mathbf{r}(u, v)$  as  $(u, v)$  ranges over  $R$ , while holding  $v = v_0$  constant,

$$\mathbf{r}(u, v_0) = x(u, v_0)\mathbf{i} + y(u, v_0)\mathbf{j} + z(u, v_0)\mathbf{k}$$

is called a  **$u$ -coordinate curve**.

Similarly, the curve traced out as  $(u, v)$  ranges over  $R$ , while holding  $u = u_0$  constant,

$$\mathbf{r}(u_0, v) = x(u_0, v)\mathbf{i} + y(u_0, v)\mathbf{j} + z(u_0, v)\mathbf{k}$$

is called a  **$v$ -coordinate curve**.

Suppose the surface  $S$  is parametrized by  $\mathbf{r} = \mathbf{r}(u, v)$  and parameter domain  $R$ . Then if we hold  $u = u_0$  constant in the  $uv$ -plane, we obtain the vertical line  $u = u_0$ . Similarly, if we hold  $v = v_0$  constant, we obtain a horizontal line  $v = v_0$ . The portions of these lines that are in the interior of the parameter domain  $R$  map to coordinate curves on the surface  $S$ . By sketching several coordinate curves, we obtain a **wireframe** plot of the surface  $S$ , as shown in Figure 40.

## 1 Describe Surfaces Defined Parametrically

### EXAMPLE 1 Describing a Parametric Surface

- (a) Describe the parametric surface  $S$  given by  
 $\mathbf{r}(u, v) = (1 + 2u + v)\mathbf{i} + (u - v)\mathbf{j} + (3 + v)\mathbf{k}$ .  
 (b) Find a rectangular equation for  $S$ .

**Solution** (a) We begin by finding several coordinate curves. We choose to use  $v = 0$ ,  $v = 1$ ,  $u = 0$ , and  $u = 1$ , but any numbers will do.

When  $v = 0$ , the  $u$ -coordinate curve is  $\mathbf{r}(u, 0) = (1 + 2u)\mathbf{i} + u\mathbf{j} + 3\mathbf{k}$ .

When  $v = 1$ , the  $u$ -coordinate curve is  $\mathbf{r}(u, 1) = (2 + 2u)\mathbf{i} + (u - 1)\mathbf{j} + 4\mathbf{k}$ .

When  $u = 0$ , the  $v$ -coordinate curve is  $\mathbf{r}(0, v) = (1 + v)\mathbf{i} - v\mathbf{j} + (3 + v)\mathbf{k}$ .

When  $u = 1$ , the  $v$ -coordinate curve is  $\mathbf{r}(1, v) = (3 + v)\mathbf{i} + (1 - v)\mathbf{j} + (3 + v)\mathbf{k}$ .

The graph of the parametric surface is a plane as shown in Figure 41.

(b) To find a rectangular equation for the surface, we write the components of  $\mathbf{r} = \mathbf{r}(u, v)$  as a system of equations. Since  $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k} = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$ , we have

$$\begin{cases} x = 2u + v + 1 & (1) \\ y = u - v & (2) \\ z = v + 3 & (3) \end{cases}$$

If we eliminate  $u$  and  $v$  from this system, we will have an expression involving  $x$ ,  $y$ , and  $z$ . We eliminate  $v$  by adding equations (1) and (2) and equations (2) and (3).

$$x + y = 3u + 1 \quad (4) \text{ Add (1) and (2).}$$

$$y + z = u + 3 \quad (5) \text{ Add (2) and (3).}$$

Now we eliminate  $u$ :

$$x + y = 3u + 1 \quad (4)$$

$$\frac{-3y - 3z = -3u - 9}{x - 2y - 3z = -8} \quad \text{Multiply (5) by } -3.$$

$$x - 2y - 3z = -8 \quad \text{Add.}$$

This is the equation of a plane whose normal vector is  $\mathbf{i} - 2\mathbf{j} - 3\mathbf{k}$ . ■

In Example 1, there were no restrictions on the parameters  $u$  and  $v$ , so the parametric surface  $S$  is the entire plane. By restricting the parameter domain, we can define a half-plane or a parallelogram. For some surfaces, such as the one in Example 2, the parameter domain is restricted by the nature of the surface.

### EXAMPLE 2 Describing a Parametric Surface

Describe the parametric surface  $S$  parametrized by

$$\mathbf{r}(u, v) = (3 + \cos v) \cos u \mathbf{i} + (3 + \cos v) \sin u \mathbf{j} + \sin v \mathbf{k}$$

where  $0 \leq u \leq 2\pi$  and  $0 \leq v \leq 2\pi$ .

**Solution** We begin by finding some  $u$ -coordinate curves. Since the parametrization involves trigonometric functions, we choose  $0, \frac{\pi}{2}, \pi,$  and  $\frac{3\pi}{2}$ . Then the  $u$ -coordinate curves are

$$\mathbf{r}(u, 0) = 4 \cos u \mathbf{i} + 4 \sin u \mathbf{j} \quad \mathbf{r}\left(u, \frac{\pi}{2}\right) = 3 \cos u \mathbf{i} + 3 \sin u \mathbf{j} + \mathbf{k}$$

$$\mathbf{r}(u, \pi) = 2 \cos u \mathbf{i} + 2 \sin u \mathbf{j} \quad \mathbf{r}\left(u, \frac{3\pi}{2}\right) = 3 \cos u \mathbf{i} + 3 \sin u \mathbf{j} - \mathbf{k}$$

We identify the graphs of each of these curves by using parametric equations. For example, for  $\mathbf{r}(u, 0)$ , we have  $x = 4 \cos u$ ,  $y = 4 \sin u$ , and

$$x^2 + y^2 = (4 \cos u)^2 + (4 \sin u)^2 = 4^2(\cos^2 u + \sin^2 u) = 4^2$$

a circle of radius 4 centered at the origin. Similarly,  $\mathbf{r} = \mathbf{r}(u, \pi)$  is a circle of radius 2 centered at the origin. The graphs of  $\mathbf{r}\left(u, \frac{\pi}{2}\right)$  and  $\mathbf{r}\left(u, \frac{3\pi}{2}\right)$  are both circles of radius 3,

but the center of  $\mathbf{r} = \mathbf{r}\left(u, \frac{\pi}{2}\right)$  is at  $(0, 0, 1)$  and the center of  $\mathbf{r} = \mathbf{r}\left(u, \frac{3\pi}{2}\right)$  is at  $(0, 0, -1)$ . Do you see why? See the blue circles in Figure 42.

Using  $0, \frac{\pi}{2}, \pi,$  and  $\frac{3\pi}{2}$  for  $u$ , we obtain the  $v$ -coordinate curves:

$$\mathbf{r}(0, v) = (3 + \cos v) \mathbf{i} + \sin v \mathbf{k} \quad \mathbf{r}\left(\frac{\pi}{2}, v\right) = (3 + \cos v) \mathbf{j} + \sin v \mathbf{k}$$

$$\mathbf{r}(\pi, v) = -(3 + \cos v) \mathbf{i} + \sin v \mathbf{k} \quad \mathbf{r}\left(\frac{3\pi}{2}, v\right) = -(3 + \cos v) \mathbf{j} + \sin v \mathbf{k}$$

Again, we identify the graphs of these curves as circles. Each graph is a circle of radius 1, but the centers of the circles  $\mathbf{r} = \mathbf{r}(0, v)$ ,  $\mathbf{r} = \mathbf{r}(\pi, v)$ ,  $\mathbf{r} = \mathbf{r}\left(\frac{\pi}{2}, v\right)$ , and  $\mathbf{r} = \mathbf{r}\left(\frac{3\pi}{2}, v\right)$  are  $(3, 0, 0)$ ,  $(-3, 0, 0)$ ,  $(0, 3, 0)$ , and  $(0, -3, 0)$ , respectively. See the red circles in Figure 42.

The surface  $S$  is a torus. This particular torus results from revolving a circle of radius 1 about a circle of radius 3 centered at the origin. ■

Figure 42 A torus centered at the origin.

**NEED TO REVIEW?** A torus is discussed in Section 6.8, pp. 464.

**NEED TO REVIEW?** Finding parametric representations of functions of one variable is discussed in Section 9.1, pp. 641–642.

### NOW WORK Problem 5.

## 2 Find a Parametric Representation of a Surface

Suppose we know the implicit equation  $F(x, y, z) = 0$  of a surface. If this equation can be solved explicitly for one of the variables, then the function has a natural parametrization. For example, if  $z = f(x, y)$ , then  $x = u$ ,  $y = v$ , and  $z = f(u, v)$  parametrizes the surface. So, if a surface can be described by an equation explicitly solved for one coordinate in terms of the other two, we can use these two coordinates as parameters and obtain a parametrization.

**EXAMPLE 3** Representing a Surface Parametrically

Find a parametrization of the surface  $S$  given by

$$x + y^2 + z = 5 \quad 0 \leq x \leq 1 \quad -1 \leq y \leq 1$$

**Solution** We begin by expressing  $S$  as an explicit function of  $x$  and  $y$ .

$$z = f(x, y) = 5 - x - y^2$$

Since  $z$  is a function of  $x$  and  $y$ , we let  $x = u$  and  $y = v$ . Then the parametric equations of  $S$  are

$$x = u \quad y = v \quad z = 5 - u - v^2$$

Using these parametric equations, we obtain

$$\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + (5 - u - v^2)\mathbf{k} \quad 0 \leq u \leq 1 \quad -1 \leq v \leq 1$$

The graph of the surface  $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + (5 - u - v^2)\mathbf{k}$ ,  $0 \leq u \leq 1$  and  $-1 \leq v \leq 1$ , is shown in Figure 43.

Alternatively, in Example 3, we could solve for  $x$  and get  $x = 5 - z - y^2$ . Then using  $u = y$  and  $v = z$ , we obtain

$$\mathbf{r}(u, v) = (5 - v - u^2)\mathbf{i} + u\mathbf{j} + v\mathbf{k}$$

However, in this case, finding the bounds for  $u$  and  $v$  is not as straightforward. Setting  $x = 0$  and  $x = 1$  yields  $z = 5 - y^2$  and  $z = 4 - y^2$ , and so  $4 - u^2 \leq v \leq 5 - u^2$  and  $-1 \leq u \leq 1$ .

**Figure 43**  $\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + (5 - u - v^2)\mathbf{k}$ ,  $0 \leq u \leq 1$ ,  $-1 \leq v \leq 1$

**NOW WORK** Problem 9.

**EXAMPLE 4** Parametrizing a Sphere

Find a parametrization for a sphere  $S$  of radius 2 centered at the origin.

**Solution** The equation of the sphere,  $x^2 + y^2 + z^2 = 4$ , in rectangular coordinates cannot be expressed explicitly as a function of two of its variables. However, in spherical coordinates, the sphere has the explicit equation  $\rho = 2$ . So if we use the spherical coordinates  $\theta$  and  $\phi$  as parameters, then parametric equations of the sphere are given by

$$x = 2 \cos \theta \sin \phi \quad y = 2 \sin \theta \sin \phi \quad z = 2 \cos \phi$$

$$x = \rho \cos \theta \sin \phi, y = \rho \sin \theta \sin \phi, z = \rho \cos \phi, \rho = 2$$

and a parametrization of  $S$  is

$$\mathbf{r}(\theta, \phi) = 2 \cos \theta \sin \phi \mathbf{i} + 2 \sin \theta \sin \phi \mathbf{j} + 2 \cos \phi \mathbf{k}$$

where  $0 \leq \theta \leq 2\pi$  and  $0 \leq \phi \leq \pi$ . ■

**Figure 44** The sphere of radius 2 centered at the origin.

The sphere  $\rho = 2$  is shown in Figure 44. Notice the coordinate curves (latitude and longitude lines) on the sphere.

**NOW WORK** Problems 11 and 27.

Different parametrizations of the same surface each produce the same graph but may have different coordinate curves.

### EXAMPLE 5 Parametrizing a Cone Using Different Coordinate Systems

Find a parametrization of the surface  $S$  defined by the cone

$$z = \sqrt{3x^2 + 3y^2} \quad x^2 + y^2 \leq 16$$

- (a) Using rectangular coordinates.
- (b) Using cylindrical coordinates.
- (c) Using spherical coordinates.

**Solution (a)** The equation is given in rectangular coordinates and is written explicitly as a function  $z = f(x, y)$ . So, we define  $x = u$ ,  $y = v$ ,  $z = \sqrt{3u^2 + 3v^2}$ . Then a parametrization of the cone is

$$\mathbf{r}(u, v) = u\mathbf{i} + v\mathbf{j} + \sqrt{3u^2 + 3v^2}\mathbf{k} \quad u^2 + v^2 \leq 16$$

**NEED TO REVIEW?** Cylindrical coordinates are discussed in Section 14.7, pp. 950–954.

- (b) In cylindrical coordinates, the cone is given by

$$z = \sqrt{3x^2 + 3y^2} = \sqrt{3}\sqrt{(r \cos \theta)^2 + (r \sin \theta)^2} = \sqrt{3}\sqrt{r^2} = \sqrt{3}r$$

where  $z$  is expressed explicitly in terms of  $r$  and  $\theta$ . So if we use  $r$  and  $\theta$  as parameters, then a parametrization of the cone is

$$\mathbf{r}(r, \theta) = r \cos \theta \mathbf{i} + r \sin \theta \mathbf{j} + \sqrt{3}r \mathbf{k} \quad 0 \leq r \leq 4 \quad 0 \leq \theta \leq 2\pi$$

$\uparrow$   
 $x = r \cos \theta, y = r \sin \theta, z = \sqrt{3}r$

- (c) In spherical coordinates, the equation of a half cone, where  $z \geq 0$ , is  $\phi = a$ ,  $0 < a < \frac{\pi}{2}$ . We use Figure 45 to find  $a$ .

$$\tan \phi = \frac{r}{z} = \frac{r}{\sqrt{3}r} = \frac{1}{\sqrt{3}} \quad z = \sqrt{3}r$$

$$\phi = \tan^{-1} \frac{1}{\sqrt{3}} = \frac{\pi}{6} = a$$

Using  $\rho$  and  $\theta$  as parameters, parametric equations for the cone in spherical coordinates are

$$\begin{array}{lll} x = \frac{\rho}{2} \cos \theta & y = \frac{\rho}{2} \sin \theta & z = \frac{\sqrt{3}}{2} \rho \\ \uparrow & \uparrow & \uparrow \\ \sin \frac{\pi}{6} = \frac{1}{2} & \sin \frac{\pi}{6} = \frac{1}{2} & \cos \frac{\pi}{6} = \frac{\sqrt{3}}{2} \end{array}$$

Now we find the parameter domain. Since

$$z^2 = 3x^2 + 3y^2 \text{ and } \rho^2 = x^2 + y^2 + z^2 = x^2 + y^2 + \underbrace{(3x^2 + 3y^2)}_{z^2} = 4x^2 + 4y^2$$

we have

$$0 \leq \rho^2 = 4(x^2 + y^2) \leq 4 \cdot 16 = 64, \text{ or equivalently, } 0 \leq \rho \leq 8.$$

The parameter domain of the cone is  $0 \leq \rho \leq 8$  and  $0 \leq \theta \leq 2\pi$ . Then a parametrization of the cone is

$$\mathbf{r}(\rho, \theta) = \frac{\rho}{2} \cos \theta \mathbf{i} + \frac{\rho}{2} \sin \theta \mathbf{j} + \frac{\sqrt{3}}{2} \rho \mathbf{k} \quad 0 \leq \rho \leq 8 \quad 0 \leq \theta \leq 2\pi$$

Figure 45

Figure 46

The graphs of the three parametrizations of the cone  $z = \sqrt{3x^2 + 3y^2}$ ,  $x^2 + y^2 \leq 16$  are shown in Figure 46.

Notice that although the three graphs are identical, the parametrizations are not. The cylindrical and spherical parametrizations are different, but both result in coordinate curves that are rays and circles. The rectangular parametrization results in coordinate curves that are hyperbolas. Notice also that the parameter domains of the cylindrical and spherical parametrizations are rectangular regions, but the parameter domain of the rectangular parametrization is a disk. Because of this, the cylindrical and spherical parametrizations are easier to work with.

### NOW WORK Problem 33.

Now that we have seen how to parametrize a surface  $S$ , we return to a basic problem of calculus—the tangent problem. If a surface  $S$  is parametrized by the vector function  $\mathbf{r} = \mathbf{r}(u, v)$ , consider the tangent plane to  $S$  at a point  $P_0 = \mathbf{r}(u_0, v_0)$  on the surface.

The coordinate curves  $\mathbf{r} = \mathbf{r}(u, v_0)$  and  $\mathbf{r} = \mathbf{r}(u_0, v)$  both lie on the surface  $S$  and intersect at the point  $P_0 = \mathbf{r}(u_0, v_0)$ . Then the partial derivative

$$\mathbf{r}_u(u_0, v_0) = \frac{\partial}{\partial u}x(u_0, v_0)\mathbf{i} + \frac{\partial}{\partial u}y(u_0, v_0)\mathbf{j} + \frac{\partial}{\partial u}z(u_0, v_0)\mathbf{k}$$

provided it exists, is a tangent vector to the  $u$ -coordinate curve at  $P_0$ .

Similarly, the partial derivative

$$\mathbf{r}_v(u_0, v_0) = \frac{\partial}{\partial v}x(u_0, v_0)\mathbf{i} + \frac{\partial}{\partial v}y(u_0, v_0)\mathbf{j} + \frac{\partial}{\partial v}z(u_0, v_0)\mathbf{k}$$

provided it exists, is a tangent vector to the  $v$ -coordinate curve at  $P_0$ .

To obtain a formula for the tangent plane to a surface  $S$ , we require  $\mathbf{r} = \mathbf{r}(u, v)$  to have certain properties.

### DEFINITION Smooth Parametrization

A parametrization  $\mathbf{r} = \mathbf{r}(u, v)$  is called a **smooth parametrization** if

- $\mathbf{r}$  is continuous and has continuous partial derivatives in the parameter domain  $R$ , and
- $\mathbf{r}_u \times \mathbf{r}_v \neq \mathbf{0}$  in  $R$ .

A surface  $S$  that can be given a smooth parametrization is called a **smooth surface**.

A smooth surface has a tangent plane at every point. If  $S$  is a smooth surface, then the tangent plane to  $S$  at a point  $P_0 = \mathbf{r}(u_0, v_0)$  is the plane containing the tangent vectors  $\mathbf{r}_u(u_0, v_0)$  and  $\mathbf{r}_v(u_0, v_0)$ . Also, the vector  $\mathbf{r}_u \times \mathbf{r}_v$  is normal to the tangent plane. See Figure 47.

**NEED TO REVIEW?** Tangent vectors to a curve are discussed in 11.2, pp. 767–769.

DF Figure 47

### 3 Find Equations for a Tangent Plane and a Normal Line

#### EXAMPLE 6 Finding a Tangent Plane and a Normal Line

- (a) Find an equation of the tangent plane to the surface  $S$  parametrized by  $\mathbf{r} = \mathbf{r}(u, v) = 3u\mathbf{i} + (6 - u^2 - v^2)\mathbf{j} + 2v\mathbf{k}$  at the point  $(-3, 1, 4)$ .  
 (b) Find an equation of the normal line to the tangent plane at  $(-3, 1, 4)$ .

**Solution** (1) We begin by finding the values of the parameters at the point  $(-3, 1, 4)$ . That is, we solve the system of equations

$$\begin{cases} 3u = -3 & (1) \\ 6 - u^2 - v^2 = 1 & (2) \\ 2v = 4 & (3) \end{cases}$$

From (1) we find  $u = -1$ , and from (3) we find  $v = 2$ . [Checking, we find these values also satisfy (2).]

We now find the tangent vectors  $\mathbf{r}_u$  and  $\mathbf{r}_v$ .

$$\begin{aligned} \mathbf{r}_u &= \frac{\partial}{\partial u}(3u)\mathbf{i} + \frac{\partial}{\partial u}(6 - u^2 - v^2)\mathbf{j} + \frac{\partial}{\partial u}(2v)\mathbf{k} = 3\mathbf{i} - 2u\mathbf{j} & \mathbf{r}_u(-1, 2) &= 3\mathbf{i} + 2\mathbf{j} \\ \mathbf{r}_v &= \frac{\partial}{\partial v}(3u)\mathbf{i} + \frac{\partial}{\partial v}(6 - u^2 - v^2)\mathbf{j} + \frac{\partial}{\partial v}(2v)\mathbf{k} = -2v\mathbf{j} + 2\mathbf{k} & \mathbf{r}_v(-1, 2) &= -4\mathbf{j} + 2\mathbf{k} \end{aligned}$$

The normal vector  $\mathbf{n}$  to the tangent plane at  $(-3, 1, 4)$  is

$$\mathbf{n} = \mathbf{r}_u(-1, 2) \times \mathbf{r}_v(-1, 2) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & 2 & 0 \\ 0 & -4 & 2 \end{vmatrix} = 4\mathbf{i} - 6\mathbf{j} - 12\mathbf{k}$$

An equation of the tangent plane is

$$4(x + 3) - 6(y - 1) - 12(z - 4) = 0 \quad \text{or equivalently} \quad 4x - 6y - 12z = -66$$

- (b) The normal line to the tangent plane contains the point  $(-3, 1, 4)$  and is parallel to the vector  $\mathbf{n} = 4\mathbf{i} - 6\mathbf{j} - 12\mathbf{k}$ . A parametrization of the normal line is

$$\mathbf{r}(t) = (-3 + 4t)\mathbf{i} + (1 - 6t)\mathbf{j} + (4 - 12t)\mathbf{k}$$

See Figure 48.

#### NOW WORK Problem 13.

#### EXAMPLE 7 Finding a Tangent Plane and a Normal Line

A surface  $S$  is defined by  $x^2 + z^2 = 25$  and  $0 \leq y \leq 10$ .

- (a) Find a smooth parametrization for  $S$ .  
 (b) Find an equation of the tangent plane to  $S$  at the point  $(-3, 5, 4)$ .  
 (c) Find an equation of the normal line to the tangent plane at  $(-3, 5, 4)$ .

**Solution** (a) Since  $S$  is a circular cylinder, we choose a parametrization that uses a variation of cylindrical coordinates. If  $x = r \cos \theta$ ,  $y = y$ , and  $z = r \sin \theta$ , then  $x^2 + z^2 = r^2 = 25$ , or equivalently,  $r = 5$ . Then parametric equations for the cylinder are

$$x = 5 \cos \theta \quad y = y \quad z = 5 \sin \theta$$

and a parametrization of  $S$  is

$$\mathbf{r}(\theta, y) = 5 \cos \theta \mathbf{i} + y\mathbf{j} + 5 \sin \theta \mathbf{k}$$

where the parameter domain is  $0 \leq \theta \leq 2\pi$  and  $0 \leq y \leq 10$ .

Figure 48 The tangent plane to  $S$  at  $(-3, 1, 4)$ .

**DF Figure 49** The tangent plane  $\mathbf{r}(\theta, y) = 5 \cos \theta \mathbf{i} + y\mathbf{j} + 5 \sin \theta \mathbf{k}$  at the point  $(-3, 5, 4)$ .

To determine whether this is a smooth parametrization, we find the partial derivatives of  $\mathbf{r} = \mathbf{r}(\theta, y)$ .

$$\mathbf{r}_\theta(\theta, y) = -5 \sin \theta \mathbf{i} + 5 \cos \theta \mathbf{k} \quad \mathbf{r}_y(\theta, y) = \mathbf{j}$$

Each of these is continuous. Now

$$\mathbf{r}_\theta \times \mathbf{r}_y = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -5 \sin \theta & 0 & 5 \cos \theta \\ 0 & 1 & 0 \end{vmatrix} = -5 \cos \theta \mathbf{i} - 5 \sin \theta \mathbf{k}$$

Since  $\|\mathbf{r}_\theta \times \mathbf{r}_y\| = \|-5 \cos \theta \mathbf{i} - 5 \sin \theta \mathbf{k}\| = \sqrt{25 \cos^2 \theta + 25 \sin^2 \theta} = 5$ , then  $\mathbf{r}_\theta \times \mathbf{r}_y \neq \mathbf{0}$ . So,  $\mathbf{r} = \mathbf{r}(\theta, y)$  is a smooth parametrization, and  $S$  is a smooth surface.

(b) At the point  $(-3, 5, 4)$ , we have  $5 \cos \theta = -3$ ,  $y = 5$ , and  $5 \sin \theta = 4$ . Then the normal vector  $\mathbf{n}$  to the plane at  $(-3, 5, 4)$  is  $\mathbf{r}_\theta \times \mathbf{r}_y = -5 \left(-\frac{3}{5}\right) \mathbf{i} - 5 \left(\frac{4}{5}\right) \mathbf{k} = 3\mathbf{i} - 4\mathbf{k}$ . An equation of the tangent plane is

$$3(x + 3) - 4(z - 4) = 0 \quad \text{or equivalently} \quad 3x - 4z = -25$$

(c) The normal line to the tangent plane contains the point  $(-3, 5, 4)$  and is parallel to  $3\mathbf{i} - 4\mathbf{k}$ . A parametrization of the normal line is  $\mathbf{r}(t) = (-3 + 3t)\mathbf{i} + 5\mathbf{j} + (4 - 4t)\mathbf{k}$ . See Figure 49.

## 4 Find the Surface Area of a Parametrized Surface

In Section 14.5, we developed the formula

$$S = \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} \, dA$$

**NOTE** Whenever a surface  $S$  has a smooth parametrization, we can find its surface area using a double integral.

for the surface area of a function  $z = f(x, y) \geq 0$  defined on a closed, bounded region  $R$ . Here, we investigate how to find the surface area of more general parametric surfaces.

Suppose the smooth surface  $S$  has the parametrization

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$

and its parameter domain  $R$  is a closed, bounded region of the  $uv$ -plane. Then following our usual practice, we partition the region  $R$  into subrectangles using lines parallel to the  $u$ -axis and the  $v$ -axis and discarding any subrectangles not lying entirely in  $R$ . Suppose we are left with  $n$  subrectangles  $R_k$ ,  $k = 1, 2, \dots, n$ , with width  $\Delta u_k$  and height  $\Delta v_k$ . The area of the subrectangle  $R_k$  is  $\Delta A_k = \Delta u_k \Delta v_k$ .

The  $k$ th subrectangle  $R_k$  is formed by the lines  $u = u_k$ ,  $u = u_k + \Delta u_k$ ,  $v = v_k$ , and  $v = v_k + \Delta v_k$ . We define the norm  $\|P\|$  as the length of the largest diagonal of the subrectangles. The portions of the lines forming the edges of the subrectangle  $R_k$  map to portions of their corresponding coordinate curves on the surface  $S$ . That is, each subrectangle  $R_k$  maps into a closed, curved **patch**  $S_k$  on  $S$ . See Figure 50. We now choose a point  $(u_k^*, v_k^*)$  in each subrectangle.

In a small enough region, a smooth surface can be approximated by its tangent planes. So, the area of  $S_k$  can be approximated using part of the tangent plane at  $\mathbf{r} = \mathbf{r}(u_k^*, v_k^*)$ , or more specifically,  $S_k$  can be approximated by the parallelogram formed by the vectors  $\mathbf{r}_u(u_k^*, v_k^*) \Delta u_k$  and  $\mathbf{r}_v(u_k^*, v_k^*) \Delta v_k$  (tangents to the coordinate curves). See Figure 51 on page 1024. The area of this parallelogram is

$$\Delta S_k = \|\mathbf{r}_u(u_k^*, v_k^*) \times \mathbf{r}_v(u_k^*, v_k^*)\| \Delta A_k = \|\mathbf{r}_u(u_k^*, v_k^*) \times \mathbf{r}_v(u_k^*, v_k^*)\| \Delta u_k \Delta v_k$$

Then the **surface area differential**  $dS$  is

$$dS = \|\mathbf{r}_u(u, v) \times \mathbf{r}_v(u, v)\| \, dA = \|\mathbf{r}_u(u, v) \times \mathbf{r}_v(u, v)\| \, du \, dv$$

**Figure 50** The subrectangle  $R_k$  maps onto patch  $S_k$ .

Figure 51

Since for each  $k$ ,  $\Delta S_k$  approximates the surface area of  $S_k$ , then the sum

$$\sum_{k=1}^n \Delta S_k = \sum_{k=1}^n \|\mathbf{r}_u(u_k^*, v_k^*) \times \mathbf{r}_v(u_k^*, v_k^*)\| \Delta u_k \Delta v_k$$

approximates the surface area of  $S$ . Since  $\mathbf{r} = \mathbf{r}(u, v)$  is a smooth parametrization,

$\lim_{\|P\| \rightarrow 0} \sum_{k=1}^n \Delta S_k$  exists and equals the surface area of  $S$ .

$$\boxed{\text{Surface area of } S = \iint_R dS = \iint_R \|\mathbf{r}_u \times \mathbf{r}_v\| \, du \, dv} \quad (1)$$

In the special case that  $S$  is the graph of a function  $z = f(x, y)$  and we use the parametrization,  $x = x$ ,  $y = y$ , and  $z = f(x, y)$ , we obtain

$$dS = \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} \, dx \, dy$$

and the formula for surface area

$$S = \iint_R \sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1} \, dx \, dy$$

from Section 14.5.

### EXAMPLE 8 Finding the Surface Area of a Torus

Find the surface area of the torus parametrized by

$$\mathbf{r}(u, v) = (3 + \cos v) \cos u \, \mathbf{i} + (3 + \cos v) \sin u \, \mathbf{j} + \sin v \, \mathbf{k}$$

where  $0 \leq u \leq 2\pi$  and  $0 \leq v \leq 2\pi$ .

**Solution** This is the torus graphed in Figure 42 on page 1018. To use formula (1) to find the area of a parametrized surface, we need to find the partial derivatives of  $\mathbf{r} = \mathbf{r}(u, v)$ .

$$\mathbf{r}_u(u, v) = (3 + \cos v) (-\sin u) \, \mathbf{i} + (3 + \cos v) \cos u \, \mathbf{j}$$

$$\mathbf{r}_v(u, v) = (-\sin v) \cos u \, \mathbf{i} - \sin v \sin u \, \mathbf{j} + \cos v \, \mathbf{k}$$

Next we find the cross product:

$$\begin{aligned} \mathbf{r}_u \times \mathbf{r}_v &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -(3 + \cos v) \sin u & (3 + \cos v) \cos u & 0 \\ -\sin v \cos u & -\sin v \sin u & \cos v \end{vmatrix} \\ &= (3 + \cos v) (\cos u \cos v \, \mathbf{i} + \sin u \cos v \, \mathbf{j} + \sin v \, \mathbf{k}) \end{aligned}$$

Then

$$\begin{aligned} \|\mathbf{r}_u \times \mathbf{r}_v\| &= \sqrt{(3 + \cos v)^2 (\cos^2 u \cos^2 v + \sin^2 u \cos^2 v + \sin^2 v)} \\ &= (3 + \cos v) \sqrt{\cos^2 v (\cos^2 u + \sin^2 u) + \sin^2 v} = (3 + \cos v) \sqrt{\cos^2 v + \sin^2 v} \\ &= 3 + \cos v \end{aligned}$$

Now using formula (1), the surface area of  $S$  is

$$\begin{aligned} \iint_R (3 + \cos v) \, du \, dv &= \int_0^{2\pi} \int_0^{2\pi} (3 + \cos v) \, dv \, du = \int_0^{2\pi} [3v + \sin v]_0^{2\pi} \, du \\ &= \int_0^{2\pi} 6\pi \, du = 12\pi^2 \end{aligned}$$

**NOW WORK** Problem 17.

## 15.6 Assess Your Understanding

### Concepts and Vocabulary

- Multiple Choice** A smooth surface has a [(a) normal plane, (b) tangent plane, (c) coordinate plane] at each point.
- Multiple Choice** Suppose  $x = x(u, v)$ ,  $y = y(u, v)$ ,  $z = z(u, v)$  are functions defined on a region  $R$  in the  $uv$ -plane. The set of points defined by  $(x, y, z) = (x(u, v), y(u, v), z(u, v))$  is called a(n) [(a) real surface, (b) uniform surface, (c) parametric surface].
- Multiple Choice** The parametric equations  $x = 5 \cos(u) \sin(v)$ ,  $y = 5 \sin(u) \sin(v)$ ,  $z = 5 \cos(v)$  define a [(a) plane, (b) circle, (c) sphere, (d) cylinder, (e) paraboloid].
- Multiple Choice** The parametrization  $\mathbf{r}(u, v) = (1 - u + 2v)\mathbf{i} + 5u\mathbf{j} + (2u + 3v - 7)\mathbf{k}$  parametrizes a [(a) plane, (b) sphere, (c) line, (d) cylinder, (e) hyperboloid].

### Skill Building

In Problems 5–8:

- Identify the coordinate curves for  $u = 0$  and  $v = 0$  of each parametrization  $\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$ .
  - Find a rectangular equation for each parametric surface.
- $x(u, v) = u - 5v$ ,  $y(u, v) = 2u$ ,  $z(u, v) = -u + v + 1$
  - $x(u, v) = u$ ,  $y(u, v) = v$ ,  $z(u, v) = 9 - u^2 - v^2$
  - $x(u, v) = u \cos v$ ,  $y(u, v) = u \sin v$ ,  $z(u, v) = u$ ;  $0 \leq u \leq 2$ ,  $0 \leq v \leq \pi$
  - $x(u, v) = \cos u \sin v$ ,  $y(u, v) = \sin u \sin v$ ,  $z(u, v) = \cos v$ ;  $0 \leq u \leq 2\pi$ ,  $0 \leq v \leq \frac{\pi}{2}$

In Problems 9–12, find a parametrization for each surface.

- The part of the plane  $z = 4 - x - 2y$  that lies in the first octant
- The part of the surface  $z = e^{-x^2+y^2}$  that lies inside the cylinder  $x^2 + y^2 = 4$
- The part of the surface  $z = \sin(x^2y)$  that lies above the region bounded by the graphs of  $y = x + 2$  and  $y = x^2$
- The part of the surface  $y + e^{xz} = 5$  that lies inside the cylinder  $x^2 + z^2 = 1$

In Problems 13–16:

- Find an equation of the tangent plane to each surface at the given point.
  - Find an equation of the normal line to the tangent plane at the point.
- $\mathbf{r}(u, v) = (3u + 2v)\mathbf{i} + 5u^3\mathbf{j} + v^2\mathbf{k}$  at  $(7, 5, 4)$
  - $\mathbf{r}(u, v) = (3u - v)\mathbf{i} + (2 - u - v)\mathbf{j} + (1 + 3v)\mathbf{k}$  at  $(11, 1, -5)$
  - $\mathbf{r}(u, v) = u\mathbf{i} + u \cos v\mathbf{j} + u \sin v\mathbf{k}$  at  $\left(5, \frac{5\sqrt{2}}{2}, \frac{5\sqrt{2}}{2}\right)$

16.  $\mathbf{r}(u, v) = (3 \cos u \sin v + 1)\mathbf{i} + (2 \sin u \sin v - 1)\mathbf{j} + \cos v\mathbf{k}$   
at  $\left(1, 0, \frac{\sqrt{3}}{2}\right)$

In Problems 17–22, find the surface area of each surface  $S$ .

- $S$  is parameterized by  $\mathbf{r}(u, v) = u \cos v\mathbf{i} + u^3\mathbf{j} + u \sin v\mathbf{k}$ ,  $0 \leq u \leq 1$ ,  $-\pi \leq v \leq \pi$ .
- $S$  is parameterized by  $\mathbf{r}(u, v) = (3u^2 + v)\mathbf{i} + u^2\mathbf{j} + (v - u^2)\mathbf{k}$ ,  $0 \leq u \leq 2$ ,  $-1 \leq v \leq 1$ .
- $S$  is the part of the plane  $2x - y + 4z = 3$  that lies inside the cylinder  $(x - 2)^2 + y^2 = 4$ .
- $S$  is the part of the paraboloid  $z = 4 - x^2 - y^2$  that lies above the  $xy$ -plane.
- $S$  is the part of the sphere  $x^2 + y^2 + z^2 = 16$  that lies above the plane  $z = 2$ .
- $S$  is the frustum of the cone  $z = 3\sqrt{x^2 + y^2}$  that lies between  $z = 3$  and  $z = 6$ .

In Problems 23–28, match each parametrization with its parametric surface.

- $\mathbf{r}(u, v) = u \cos v\mathbf{i} + u \sin v\mathbf{j} - u\mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $0 \leq v \leq 2\pi$
- $\mathbf{r}(u, v) = u^3\mathbf{i} + u \sin v\mathbf{j} + u \cos v\mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $0 \leq v \leq 2\pi$
- $\mathbf{r}(u, v) = u \sin v\mathbf{i} + u \cos v\mathbf{j} + u\mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $0 \leq v \leq 2\pi$
- $\mathbf{r}(u, v) = u\mathbf{i} + 4 \sin v\mathbf{j} + 4 \cos v\mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $0 \leq v \leq 2\pi$
- $\mathbf{r}(u, v) = u \cos v\mathbf{i} + u \sin v\mathbf{j} - u^3\mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $0 \leq v \leq 2\pi$
- $\mathbf{r}(u, v) = v\mathbf{i} + v^3\mathbf{j} + u\mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $-4 \leq v \leq 4$

## Applications and Extensions

29. Parametrize the part of the cylinder  $x^2 + y^2 = 16$  that lies above the  $xy$ -plane and below  $z = 3$ .

30. Parametrize the sphere  $x^2 + y^2 + z^2 = 25$ .

31. Part of the paraboloid  $z = 9 - x^2 - y^2$  lies inside the cylinder  $(x - 1)^2 + y^2 = 1$ .

(a) Parametrize the surface using rectangular coordinates.

(b) Parametrize the surface using cylindrical coordinates.

32. Parametrize the **lumpy sphere**

$$x^2 + y^2 + z^2 = 3\sqrt{x^2 + y^2 + z^2} + z.$$

(Hint: Use spherical coordinates.)

In Problems 33 and 34, parametrize each surface:

(a) Using rectangular coordinates.

(b) Using cylindrical coordinates.

(c) Using spherical coordinates.

Give bounds for the parameters, if necessary.

33. The part of the sphere  $x^2 + y^2 + z^2 = 4$  lying in the first octant

34. The plane  $x - \sqrt{3}y = 0$ , where  $x \geq 0$ ,  $y \geq 0$

35. **Tangent Plane to a Torus**

(a) Find the tangent plane to the torus parametrized by

$$\mathbf{r}(u, v) = \cos u(3 + \cos v)\mathbf{i} + \sin u(3 + \cos v)\mathbf{j} + \sin v\mathbf{k}$$

$$\text{the point } \left( \frac{3\sqrt{2}}{2}, \frac{3\sqrt{2}}{2}, 1 \right)$$

(b) Find an equation of the normal line to the tangent plane at the same point.

36. **Surface Area** Find the surface area  $S$  of the torus parametrized by  $\mathbf{r}(u, v) = (2 + \cos v)\cos u\mathbf{i} + (2 + \cos v)\sin u\mathbf{j} + \sin v\mathbf{k}$ ,  $0 \leq u \leq 2\pi$ ,  $0 \leq v \leq 2\pi$ .

37. **Surface Area** Find the surface area  $S$  of the **helicoid** parametrized by  $\mathbf{r}(u, v) = u \cos(2v)\mathbf{i} + u \sin(2v)\mathbf{j} + v\mathbf{k}$ ,  $0 \leq u \leq 1$ ,  $0 \leq v \leq 2\pi$ .

**CAS** 38. **Surface Area** Find the surface area  $S$  of the Möbius strip parametrized by

$$\mathbf{r}(u, v) = \left( 2 \cos u + v \cos \frac{u}{2} \right) \mathbf{i} + \left( 2 \sin u + v \cos \frac{u}{2} \right) \mathbf{j} - v \sin \frac{u}{2} \mathbf{k}, \quad 0 \leq u \leq 2\pi, \quad -0.5 \leq v \leq 0.5.$$

39. **Ellipsoid**

(a) Find a parametrization of the ellipsoid  $x^2 + \frac{y^2}{9} + \frac{z^2}{4} = 1$ .  
(Hint: Use modified spherical coordinates.)

**CAS** (b) Graph the parametrized surface.

(c) Set up, but do not find, the double integral for the surface area of the parametrized ellipsoid.

**CAS** 40. **Helicoid**

(a) Graph the helicoid defined by the parametric equations  $x = u \cos(2v)$ ,  $y = u \sin(2v)$ ,  $z = v$ ,  $0 \leq u \leq 3$  and  $0 \leq v \leq 2\pi$ .

(b) Parametrize the helicoid

(c) Find an equation of the tangent plane to the helicoid at the point  $\left( \frac{1}{3}, \pi \right)$ .

(d) Find an equation of the normal line to the tangent plane at the point  $\left( \frac{1}{3}, \pi \right)$ .

**CAS** 41. **Dini's Surface**

(a) Graph **Dini's surface** defined by the parametric equations

$$x = 6 \cos u \sin v \quad y = 6 \sin u \sin v,$$

$$z = 6 \left[ \cos v + \ln \left( \tan \frac{v}{2} \right) \right] + u$$

$$0.01 \leq v \leq 1 \text{ and } 0 \leq u \leq 6\pi.$$

(b) Find an equation of the tangent plane to Dini's surface at the point  $\left( \frac{\pi}{3}, \frac{\pi}{4} \right)$ .

(c) Find an equation of the normal line to the tangent plane at the point  $\left( \frac{\pi}{3}, \frac{\pi}{4} \right)$ .

## Challenge Problems

42. Suppose  $\triangle ABC$  is a triangle with vertices  $A = (a_1, a_2, a_3)$ ,  $B = (b_1, b_2, b_3)$ , and  $C = (c_1, c_2, c_3)$ . Parametrize  $\triangle ABC$ .

43. **Torus** A torus is formed by rotating a circle about another circle.

(a) Parametrize the torus obtained by rotating a circle of radius  $a > 0$  about a circle of radius  $b > 0$ .

(b) Find an implicit rectangular equation for the torus.

44. **Surface Area** Find the surface area of  $S$  that is the part of the cylinder  $(x - 1)^2 + y^2 = 1$  outside the sphere  $x^2 + y^2 + z^2 = 4$ , above the  $xy$ -plane, and below  $z = 1$ .

45. **An Archimedean Ratio** Suppose  $C$  is a right circular cone,  $S$  is an upper hemisphere, and  $L$  is a right circular cylinder. Suppose that all three surfaces have radii  $r$  and the heights  $h$  of the cone and the cylinder are  $r$ . Archimedes was able to show that the ratio of the surface areas among these surfaces is 1:2:3. Show this by parametrizing each of these surfaces and deriving the formulas for their surface areas.

46. **Hyperboloid of One Sheet**

(a) Use hyperbolic functions to parametrize the hyperboloid of one sheet:  $x^2 + y^2 - z^2 = c$ ,  $c > 0$ .

**CAS** (b) Graph the parametric surface for  $c = 1$ .

47. **Hyperboloid of Two Sheets**

(a) Use hyperbolic functions to parametrize the sheet where  $x > 0$  in the hyperboloid of two sheets:  $\frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$ .

**CAS** (b) Graph the parametric surface for  $a = 1$ ,  $b = 2$ ,  $c = 3$ .

## 15.7 Surface and Flux Integrals

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find a surface integral using a double integral (p. 1027)
- 2 Determine the orientation of a surface (p. 1030)
- 3 Find the flux of a vector field across a surface (p. 1033)

Application: Electric Flux

Surface integrals are similar to line integrals, but the integration takes place on a surface instead of along a curve.

Suppose the smooth surface  $S$  has the parametrization

$$\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$$

and its parameter domain  $R$  is a closed, bounded region of the  $uv$ -plane. Then following our usual practice, we partition a rectangular region containing  $R$  into subrectangles using lines parallel to the  $u$ -axis and the  $v$ -axis and discard any subrectangles not lying entirely in  $R$ . Suppose we are left with  $n$  subrectangles  $R_k$ ,  $k = 1, 2, \dots, n$ , with width  $\Delta u_k$  and height  $\Delta v_k$ . The area of the subrectangle  $R_k$  is  $\Delta A_k = \Delta u_k \Delta v_k$ .

The  $k$ th subrectangle  $R_k$  is formed by the lines  $u = u_k$ ,  $u = u_k + \Delta u_k$ ,  $v = v_k$ , and  $v = v_k + \Delta v_k$ . The portions of the lines forming the edges of the subrectangle  $R_k$  map to portions of their corresponding coordinate curves on the surface  $S$ . That is, each subrectangle  $R_k$  maps into a closed curved **patch**  $S_k$  on  $S$  whose area is  $\Delta S_k$ . We define the norm  $\|\Delta\|$  to be the largest area  $\Delta S_k$ . We now choose a point  $P_k = (u_k^*, v_k^*)$  in each subrectangle.

Let  $w = F(x, y, z)$  be a function that is defined over a solid in space containing the surface  $S$ . We evaluate  $F$  at the point  $(x(u_k^*, v_k^*), y(u_k^*, v_k^*), z(u_k^*, v_k^*))$  on  $S_k$  and form the product  $F(x(u_k^*, v_k^*), y(u_k^*, v_k^*), z(u_k^*, v_k^*)) \Delta S_k$ . Now we add obtaining the sums

$$\sum_{k=1}^n F(x(u_k^*, v_k^*), y(u_k^*, v_k^*), z(u_k^*, v_k^*)) \Delta S_k$$

Then we have the following definition.

### DEFINITION Surface Integral

Let  $S$  be a surface defined on a closed, bounded region  $R$  with a smooth parametrization  $\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$ . Also, let  $w = F(x, y, z)$  be defined over a solid containing the surface  $S$ . Then the **surface integral of  $F$  over  $S$**  is defined as

$$\iint_S F(x, y, z) dS = \lim_{\|\Delta\| \rightarrow 0} \sum_{k=1}^n F(x(u_k^*, v_k^*), y(u_k^*, v_k^*), z(u_k^*, v_k^*)) \Delta S_k$$

provided this limit exists.

### 1 Find a Surface Integral Using a Double Integral

When the function  $w = F(x, y, z)$  is continuous on some solid that contains  $S$ , the surface integral of  $F$  over  $S$  can be expressed as a double integral.

### THEOREM A Surface Integral Expressed as a Double Integral

Let  $S$  be a surface defined on a closed, bounded region  $R$  with a smooth parametrization  $\mathbf{r}(u, v) = x(u, v)\mathbf{i} + y(u, v)\mathbf{j} + z(u, v)\mathbf{k}$ . Also, suppose that  $w = F(x, y, z)$  is continuous on a solid containing the surface  $S$ . Then the surface integral of  $F$  over  $S$  is given by

$$\iint_S F(x, y, z) dS = \iint_R F(x(u, v), y(u, v), z(u, v)) \|\mathbf{r}_u \times \mathbf{r}_v\| du dv \quad (1)$$

**Figure 52** The surface  $x^2 + z^2 = 9$ ,  $0 \leq y \leq 2$ .

It is important to note that just as a line integral does not depend on the parametrization used, surface integrals do not depend on the smooth parametrization used in the integration. Also, there are occasions when we want to find a surface integral over a *piecewise-smooth surface*. A **piecewise-smooth surface** is a finite collection of smooth surfaces that intersect only along piecewise-smooth curves. In these cases, just as with line integrals, we integrate over each smooth surface separately and then sum the results.

### EXAMPLE 1 Finding a Surface Integral

Find  $\iint_S ye^{x^2+z^2} dS$ , where  $S$  is the part of the surface of the cylinder  $x^2 + z^2 = 9$  that lies between  $y = 0$  and  $y = 2$ .

**Solution** The surface  $S$  is shown in Figure 52. Since the surface is a piece of a cylinder, we use a variation of cylindrical coordinates to parametrize the surface. Here, we use  $x = r \cos \theta$ ,  $y = y$ , and  $z = r \sin \theta$ . (Do you see why?) Then  $r^2 = x^2 + z^2 = 9$ , so  $r = 3$ . We parametrize the surface  $S$  using

$$\mathbf{r}(\theta, y) = 3 \cos \theta \mathbf{i} + y \mathbf{j} + 3 \sin \theta \mathbf{k}$$

where the parameter domain  $R$  is  $0 \leq \theta \leq 2\pi$  and  $0 \leq y \leq 2$ .

The partial derivatives of  $\mathbf{r}$  are

$$\mathbf{r}_\theta(\theta, y) = -3 \sin \theta \mathbf{i} + 3 \cos \theta \mathbf{k} \quad \text{and} \quad \mathbf{r}_y(\theta, y) = \mathbf{j}$$

and their cross product is

$$\mathbf{r}_\theta \times \mathbf{r}_y = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -3 \sin \theta & 0 & 3 \cos \theta \\ 0 & 1 & 0 \end{vmatrix} = -3 \cos \theta \mathbf{i} - 3 \sin \theta \mathbf{k}$$

Then  $\|\mathbf{r}_\theta \times \mathbf{r}_y\| = \sqrt{9 \cos^2 \theta + 9 \sin^2 \theta} = 3$ . So, we have

$$\begin{aligned} \iint_S ye^{x^2+z^2} dS &= \iint_R ye^9 \|\mathbf{r}_\theta \times \mathbf{r}_y\| d\theta dy = \int_0^2 \int_0^{2\pi} (ye^9) 3 d\theta dy \\ &= 3e^9 \int_0^2 y [\theta]_0^{2\pi} dy = 3e^9 \int_0^2 2\pi y dy = 6\pi e^9 \left[ \frac{y^2}{2} \right]_0^2 = 12\pi e^9 \quad \blacksquare \end{aligned}$$

### NOW WORK Problem 3.

**RECALL** A lamina is a thin, flat sheet of material.

**NEED TO REVIEW?** The center of mass of a lamina with variable density is discussed in Section 14.4, pp. 929–932.

The formulas for finding the center of mass of a lamina can be generalized. The following formulas for the center of mass of a general lamina with variable mass density  $\rho = \rho(x, y, z)$  in the shape of a surface  $S$  result from a derivation similar to that found in Section 14.4 for a flat sheet.

|                               |                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------|
| Mass of $S$ :                 | $M = \iint_S \rho(x, y, z) dS$                                                                      |
| Moment about the $yz$ -plane: | $M_{yz} = \iint_S x\rho(x, y, z) dS$                                                                |
| Moment about the $xz$ -plane: | $M_{xz} = \iint_S y\rho(x, y, z) dS$                                                                |
| Moment about the $xy$ -plane: | $M_{xy} = \iint_S z\rho(x, y, z) dS$                                                                |
| Center of mass:               | $(\bar{x}, \bar{y}, \bar{z}) = \left( \frac{M_{yz}}{M}, \frac{M_{xz}}{M}, \frac{M_{xy}}{M} \right)$ |

Figure 53

**EXAMPLE 2** Finding the Mass of a Lamina

A lamina in the shape of the cone  $z = 6 - \sqrt{x^2 + y^2}$  lies between the planes  $z = 2$  and  $z = 5$ . If the mass density of the lamina is  $\rho(x, y, z) = \sqrt{x^2 + y^2}$ , find the mass  $M$  of the lamina.

**Solution** Figure 53 illustrates the lamina. Using  $x = r \cos \theta$ ,  $y = r \sin \theta$ , and  $z = 6 - \sqrt{x^2 + y^2} = 6 - r$ , we parametrize the surface as

$$\mathbf{r} = \mathbf{r}(r, \theta) = r \cos \theta \mathbf{i} + r \sin \theta \mathbf{j} + (6 - r) \mathbf{k} \quad 0 \leq \theta \leq 2\pi \quad 1 \leq r \leq 4$$

First we find  $\mathbf{r}_r \times \mathbf{r}_\theta$ .

$$\begin{aligned} \mathbf{r}_r \times \mathbf{r}_\theta &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos \theta & \sin \theta & -1 \\ -r \sin \theta & r \cos \theta & 0 \end{vmatrix} = r \cos \theta \mathbf{i} + r \sin \theta \mathbf{j} + (r \cos^2 \theta + r \sin^2 \theta) \mathbf{k} \\ &= r \cos \theta \mathbf{i} + r \sin \theta \mathbf{j} + r \mathbf{k} \end{aligned}$$

$$\|\mathbf{r}_r \times \mathbf{r}_\theta\| = \sqrt{r^2 \cos^2 \theta + r^2 \sin^2 \theta + r^2} = r \sqrt{\cos^2 \theta + \sin^2 \theta + 1} = r \sqrt{1 + 1} = \sqrt{2} r$$

Since the mass density of the lamina is  $\rho(x, y, z) = \sqrt{x^2 + y^2} = r$  and  $dS = \|\mathbf{r}_r \times \mathbf{r}_\theta\| dr d\theta = \sqrt{2} r dr d\theta$ , the mass  $M$  of the lamina is given by

$$\begin{aligned} M &= \iint_S \rho(x, y, z) dS = \iint_R \rho \|\mathbf{r}_r \times \mathbf{r}_\theta\| dr d\theta = \iint_R r(\sqrt{2} r) dr d\theta \\ &= \sqrt{2} \int_0^{2\pi} \int_1^4 r^2 dr d\theta = \sqrt{2} \int_0^{2\pi} \left[ \frac{r^3}{3} \right]_1^4 d\theta = 21\sqrt{2} \int_0^{2\pi} d\theta = 42\sqrt{2} \pi \quad \blacksquare \end{aligned}$$

**NOW WORK** Problem 33.**EXAMPLE 3** Finding the Centroid of a Surface

Find the centroid of the part of the unit sphere that lies in the first octant. See Figure 54.

**Solution** In spherical coordinates, the equation of the unit sphere  $S: x^2 + y^2 + z^2 = 1$  is  $\rho = 1$ . So using  $x = \cos \theta \sin \phi$ ,  $y = \sin \theta \sin \phi$ , and  $z = \cos \phi$ , we obtain the parametrization

$$\mathbf{r} = \mathbf{r}(\theta, \phi) = \cos \theta \sin \phi \mathbf{i} + \sin \theta \sin \phi \mathbf{j} + \cos \phi \mathbf{k}; \quad 0 \leq \theta \leq \frac{\pi}{2}, \quad 0 \leq \phi \leq \frac{\pi}{2}$$

We seek  $\|\mathbf{r}_\theta \times \mathbf{r}_\phi\|$  and  $dS$ . The partial derivatives of  $\mathbf{r} = \mathbf{r}(\theta, \phi)$  are

$$\mathbf{r}_\theta = -\sin \theta \sin \phi \mathbf{i} + \cos \theta \sin \phi \mathbf{j} \quad \mathbf{r}_\phi = \cos \theta \cos \phi \mathbf{i} + \sin \theta \cos \phi \mathbf{j} - \sin \phi \mathbf{k}$$

$$\mathbf{r}_\theta \times \mathbf{r}_\phi = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -\sin \theta \sin \phi & \cos \theta \sin \phi & 0 \\ \cos \theta \cos \phi & \sin \theta \cos \phi & -\sin \phi \end{vmatrix}$$

$$= -\cos \theta \sin^2 \phi \mathbf{i} - \sin \theta \sin^2 \phi \mathbf{j} - \sin \phi \cos \phi \mathbf{k}$$

$$\|\mathbf{r}_\theta \times \mathbf{r}_\phi\| = \sqrt{\cos^2 \theta \sin^4 \phi + \sin^2 \theta \sin^4 \phi + \sin^2 \phi \cos^2 \phi}$$

$$= \sqrt{(\cos^2 \theta + \sin^2 \theta) \sin^4 \phi + \sin^2 \phi \cos^2 \phi}$$

$$= \sqrt{\sin^2 \phi (\sin^2 \phi + \cos^2 \phi)} = \sin \phi$$

$$dS = \|\mathbf{r}_\theta \times \mathbf{r}_\phi\| d\theta d\phi = \sin \phi d\theta d\phi$$

**RECALL** The centroid is the geometric center of a lamina, and it is numerically equivalent to the center of mass of a homogeneous lamina that has mass density  $\rho = 1$ .

Figure 54

Since the surface area  $S$  of a sphere is  $S = 4\pi r^2$ , the surface area of the part of the unit sphere  $r = 1$  in the first octant is  $\frac{1}{8}S = \frac{\pi}{2}$ , so the mass  $M$  is  $\frac{\pi}{2}$ . Because of symmetry,  $\bar{x} = \bar{y} = \bar{z}$ , so we need to find only one moment, say  $M_{xy}$ .

$$\begin{aligned} M_{xy} &= \iint_S z \, dS = \iint_S \cos \phi \, dS = \int_0^{\pi/2} \int_0^{\pi/2} \cos \phi \sin \phi \, d\theta \, d\phi \\ &= \int_0^{\pi/2} \frac{\pi}{2} \cos \phi \sin \phi \, d\phi = \frac{\pi}{2} \left[ \frac{\sin^2 \phi}{2} \right]_0^{\pi/2} = \frac{\pi}{4} \end{aligned}$$

The centroid of the part of the unit sphere in the first octant is

$$(\bar{x}, \bar{y}, \bar{z}) = \left( \frac{M_{yz}}{M}, \frac{M_{xz}}{M}, \frac{M_{xy}}{M} \right) = \left( \frac{1}{2}, \frac{1}{2}, \frac{1}{2} \right)$$

Figure 55

**NEED TO REVIEW?** Unit normal vectors are discussed in Section 11.2, pp. 769–770.

## 2 Determine the Orientation of a Surface

Suppose the surface  $S$  has a tangent plane at each point, except possibly at its boundary points. Then there are two unit normal vectors,  $\mathbf{n}_1$  and  $\mathbf{n}_2$ , where  $\mathbf{n}_1 = -\mathbf{n}_2$ , that can be drawn at each point of  $S$ . See Figure 55.

Suppose it is possible to choose a unit normal vector  $\mathbf{n}$  at each point of the surface  $S$  so that  $\mathbf{n}$  varies continuously over the surface, and as  $\mathbf{n}$  moves around any closed curve on  $S$ ,  $\mathbf{n}$  returns to its original direction, as shown in Figure 56. Such a surface is said to be **orientable**, with the vector  $\mathbf{n}$  providing its **orientation**. As a result, a surface  $S$  that is orientable has two possible orientations, one for  $\mathbf{n}$  and one for  $-\mathbf{n}$ .

Suppose  $S$  has a smooth parametrization  $\mathbf{r} = \mathbf{r}(u, v)$ , and  $(u_0, v_0)$  is in the parameter domain  $R$ . Then the vector  $\mathbf{r}_u(u_0, v_0) \times \mathbf{r}_v(u_0, v_0)$  is normal to the tangent plane at  $\mathbf{r}(u_0, v_0)$ , and the two unit vectors normal to the surface  $S$  are

$$\mathbf{n} = \frac{\mathbf{r}_u \times \mathbf{r}_v}{\|\mathbf{r}_u \times \mathbf{r}_v\|} \quad \text{and} \quad -\mathbf{n} = -\frac{\mathbf{r}_u \times \mathbf{r}_v}{\|\mathbf{r}_u \times \mathbf{r}_v\|} \quad (2)$$

When  $S$  is defined by the graph of a function  $z = f(x, y)$ , then the two orientations can be called *upward* and *downward* depending on the sign of the vector component  $\mathbf{k}$ . For general surfaces, there is no natural choice for *up* and *down*.

Suppose  $F(x, y, z) = z - f(x, y)$ . Then the two unit vectors normal to  $S$  are

$$\mathbf{n} = \frac{\nabla F}{\|\nabla F\|} = \frac{-f_x(x, y)\mathbf{i} - f_y(x, y)\mathbf{j} + \mathbf{k}}{\sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1}} \quad (3)$$

and

$$-\mathbf{n} = \frac{-\nabla F}{\|\nabla F\|} = \frac{f_x(x, y)\mathbf{i} + f_y(x, y)\mathbf{j} - \mathbf{k}}{\sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1}} \quad (4)$$

Figure 56 Two orientations for a surface  $S$ .

**NOTE** When  $F(x, y, z) = z - f(x, y)$ , then  $S$  is the level surface  $F(x, y, z) = 0$ . Level surfaces are discussed in Section 12.1, pp. 812–815.

Since the  $\mathbf{k}$  component of  $\mathbf{n}$  is positive, it points in the upward direction. For this reason,  $\mathbf{n}$  is called the **upward-pointing unit normal vector** of  $S$ . The  $\mathbf{k}$  component of  $-\mathbf{n}$  is negative. So,  $-\mathbf{n}$  is called the **downward-pointing unit normal vector** of  $S$ . Using the two unit vectors, we define the **positive side** or **outside** of  $S$  as the side associated

**Figure 57** The outside of the open surface is the side on which the upward-pointing unit normal vectors  $\mathbf{n}$  originate.

with the upward-pointing unit vector, and the **negative side** or **inside** of  $S$  as the side associated with the downward-pointing unit vector. See Figure 57.

### EXAMPLE 4 Finding the Orientations of a Surface

Find both orientations for the paraboloid defined by  $z = 9 - x^2 - y^2$ ,  $z \geq 0$ .

- (a) Use rectangular coordinates to find the unit normal vectors.
- (b) Parametrize the surface, and then find the unit normal vectors.

**Solution (a)** Since the paraboloid is given by  $f(x, y) = 9 - x^2 - y^2$ ,  $z \geq 0$ , we can use the equations (3) and (4) to find the unit normal vectors. We begin by finding the partial derivatives

$$f_x(x, y) = -2x \quad f_y(x, y) = -2y$$

Then

$$\begin{aligned} \mathbf{n} &= \frac{2x \mathbf{i} + 2y \mathbf{j} + \mathbf{k}}{\sqrt{[-2x]^2 + [-2y]^2 + 1}} = \frac{2x \mathbf{i} + 2y \mathbf{j} + \mathbf{k}}{\sqrt{4x^2 + 4y^2 + 1}} \\ -\mathbf{n} &= \frac{-2x \mathbf{i} - 2y \mathbf{j} - \mathbf{k}}{\sqrt{[-2x]^2 + [-2y]^2 + 1}} = \frac{-2x \mathbf{i} - 2y \mathbf{j} - \mathbf{k}}{\sqrt{4x^2 + 4y^2 + 1}} \end{aligned}$$

Notice that the  $\mathbf{k}$  component of  $\mathbf{n}$  is positive, indicating  $\mathbf{n}$  is the upward-pointing unit normal vector.

(b) We parametrize  $z = 9 - x^2 - y^2$ ,  $z \geq 0$ , using cylindrical coordinates, by defining the parametric equations

$$x = r \cos \theta \quad y = r \sin \theta \quad z = 9 - (x^2 + y^2) = 9 - r^2$$

Then the parametrization is

$$\mathbf{r} = \mathbf{r}(r, \theta) = r \cos \theta \mathbf{i} + r \sin \theta \mathbf{j} + (9 - r^2) \mathbf{k}$$

We seek  $\|\mathbf{r}_r \times \mathbf{r}_\theta\|$ . The partial derivatives of  $\mathbf{r}$  are

$$\begin{aligned} \mathbf{r}_r &= \cos \theta \mathbf{i} + \sin \theta \mathbf{j} - 2r \mathbf{k} & \mathbf{r}_\theta &= -r \sin \theta \mathbf{i} + r \cos \theta \mathbf{j} \\ \mathbf{r}_r \times \mathbf{r}_\theta &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos \theta & \sin \theta & -2r \\ -r \sin \theta & r \cos \theta & 0 \end{vmatrix} = 2r^2 \cos \theta \mathbf{i} + 2r^2 \sin \theta \mathbf{j} + r \mathbf{k} \end{aligned}$$

$$\|\mathbf{r}_r \times \mathbf{r}_\theta\| = \sqrt{4r^4 \cos^2 \theta + 4r^4 \sin^2 \theta + r^2} = \sqrt{4r^4 + r^2} = r\sqrt{4r^2 + 1}$$

The unit normal vectors are

$$\begin{aligned} \mathbf{n} &= \frac{\mathbf{r}_r \times \mathbf{r}_\theta}{\|\mathbf{r}_r \times \mathbf{r}_\theta\|} = \frac{2r^2 \cos \theta \mathbf{i} + 2r^2 \sin \theta \mathbf{j} + r \mathbf{k}}{r\sqrt{4r^2 + 1}} = \frac{2r \cos \theta \mathbf{i} + 2r \sin \theta \mathbf{j} + \mathbf{k}}{\sqrt{4r^2 + 1}} \\ -\mathbf{n} &= \frac{-2r \cos \theta \mathbf{i} - 2r \sin \theta \mathbf{j} - \mathbf{k}}{\sqrt{4r^2 + 1}} \end{aligned}$$

Notice that the unit vectors found in (a) and (b) are equivalent. ■

Figure 58 shows the surface and some of the outer (upward-pointing) unit normal vectors of the paraboloid.

**Figure 58** The outer unit normal vectors of  $z = 9 - x^2 - y^2$ ,  $z \geq 0$ .

### NOW WORK Problem 17.

For a **closed surface**  $S$ , that is, a surface that forms the boundary of a closed, bounded solid  $E$  in space, such as a sphere, we agree that the **positive orientation** of  $S$  has the unit normal vectors  $\mathbf{n}$  to  $S$  pointing away from  $E$  and that the **negative orientation** of  $S$  has the unit normal vectors  $-\mathbf{n}$  to  $S$  pointing inward. For closed surfaces  $S$  with a positive orientation, the unit normal vectors are called **outer unit normal vectors**; for

closed surfaces  $S$  with a negative orientation, the unit normal vectors are called **inner unit normal vectors**.\* See Figure 59.

All curves are orientable, but not all surfaces are orientable. A famous example of a surface that is not orientable is a Möbius strip. See Figure 60. Although it is not immediately apparent, a Möbius strip has only one side and one boundary component. If you were to begin tracing a line on one side of a Möbius strip and continue to follow it once around, you would end on the other side of the strip, that is, the unit normal vector  $\mathbf{n}$  now points in the opposite direction.

**Figure 59**  $S$  is a closed surface. The outer unit normal vectors point away from the surface.

**DF Figure 60** Möbius strip: a nonorientable surface.

**NOTE** A Möbius strip is formed by taking a long rectangular strip of paper, giving one end a half-twist, and attaching the two ends. The Möbius strip is named after the German mathematician August Möbius (1790–1868).

**Figure 61**

### Finding the $\mathbf{k}$ Component of the Outer Unit Normal Vectors of an $xy$ -Simple Surface

#### EXAMPLE 5

Consider the surface  $S$  with positive orientation that forms the boundary of the closed, bounded solid  $E$  shown in Figure 61. Notice that the surface  $S$  can be decomposed into three surfaces,  $S_1$ ,  $S_2$ , and  $S_3$ , and that each of the outer unit normal vectors  $\mathbf{n}_1$ ,  $\mathbf{n}_2$ , and  $\mathbf{n}_3$  of the three surfaces points away from the solid  $E$  enclosed by  $S$ .

Assume the surfaces  $S_1$  and  $S_2$  are defined by the equations

$$S_1: z = f_1(x, y) \quad \text{and} \quad S_2: z = f_2(x, y)$$

where  $f_1(x, y) < f_2(x, y)$  on  $D$ , the functions  $f_1$  and  $f_2$  are continuous on  $D$ , and both  $f_1$  and  $f_2$  have continuous partial derivatives on  $D$ . The surface  $S_3$  is the portion of a cylindrical surface between  $S_1$  and  $S_2$  formed by lines parallel to the  $z$ -axis and along the boundary of  $D$ . The solid  $E$  is enclosed by  $S_2$  on the top,  $S_1$  on the bottom, and the lateral surface  $S_3$  on the sides. A surface  $S$  with these properties is called  **$xy$ -simple**.

Find the  $\mathbf{k}$  component of the outer unit normal vectors of  $S$ .

**Solution** For the top surface  $S_2: z = f_2(x, y)$ , the outer unit normal vector  $\mathbf{n}_2$  is the same as the upward-pointing unit normal vector to  $S_2$ .

$$\mathbf{n}_2 = \frac{-(f_2)_x(x, y)\mathbf{i} - (f_2)_y(x, y)\mathbf{j} + \mathbf{k}}{\sqrt{[(f_2)_x(x, y)]^2 + [(f_2)_y(x, y)]^2 + 1}}$$

The  $\mathbf{k}$  component of  $\mathbf{n}_2$  is given by the direction cosine  $\cos \gamma_2$ , where

$$\cos \gamma_2 = \mathbf{n}_2 \cdot \mathbf{k} = \frac{1}{\sqrt{[(f_2)_x(x, y)]^2 + [(f_2)_y(x, y)]^2 + 1}}$$

**NEED TO REVIEW?** Direction cosines of a vector in space are discussed in Section 10.3, pp. 718–719.

\*Although at first these definitions seem easy, they contain some hidden difficulties. The discussion here and in the next section is limited to simple types of oriented solids  $E$ . A discussion of more general solids is found in metric topology.

For the bottom surface  $S_1: z = f_1(x, y)$ , the outer unit normal vector  $\mathbf{n}_1$  equals the downward-pointing unit normal vector  $-\mathbf{n}$  to  $S_1$ .

$$\mathbf{n}_1 = -\mathbf{n} = \frac{(f_1)_x(x, y)\mathbf{i} + (f_1)_y(x, y)\mathbf{j} - \mathbf{k}}{\sqrt{[(f_1)_x(x, y)]^2 + [(f_1)_y(x, y)]^2 + 1}}$$

The  $\mathbf{k}$  component of  $\mathbf{n}_1$  is given by the direction cosine  $\cos \gamma_1$ , where

$$\cos \gamma_1 = \mathbf{n}_1 \cdot \mathbf{k} = \frac{-1}{\sqrt{[(f_1)_x(x, y)]^2 + [(f_1)_y(x, y)]^2 + 1}}$$

For the lateral surface  $S_3$ , the outer unit normal vector  $\mathbf{n}_3$  is orthogonal to  $\mathbf{k}$  at each point on  $S_3$ . The  $\mathbf{k}$  component of  $\mathbf{n}_3$ , given by the direction cosine,  $\cos \gamma_3$ , is therefore 0. ■

### EXAMPLE 6 Finding the Outer Unit Normal Vectors to a Surface $S$

Find the outer unit normal vectors to the solid  $E$  enclosed by

$$z = f(x, y) = \sqrt{R^2 - x^2 - y^2} \quad \text{and} \quad z = 0 \quad 0 \leq x^2 + y^2 \leq R^2$$

**Solution** The solid  $E$  is the interior of a hemisphere with center at  $(0, 0, 0)$  and radius  $R$  as shown in Figure 62. The surface  $S$  consists of two surfaces,  $S_1$  and  $S_2$ . The bottom surface  $S_1$  and top surface  $S_2$  are defined by

$$S_1: z = 0 \quad \text{and} \quad S_2: z = f(x, y) = \sqrt{R^2 - x^2 - y^2} \quad 0 \leq x^2 + y^2 \leq R^2$$

The outer unit normal vector  $\mathbf{n}_1$  of  $S_1$  is  $-\mathbf{k}$ .

To find the outer unit normal vector  $\mathbf{n}_2$  of  $S_2$ , we find  $f_x(x, y)$  and  $f_y(x, y)$ .

$$f_x(x, y) = \frac{-x}{\sqrt{R^2 - x^2 - y^2}} = \frac{-x}{z} \quad \text{and} \quad f_y(x, y) = \frac{-y}{\sqrt{R^2 - x^2 - y^2}} = \frac{-y}{z}$$

Then

$$\begin{aligned} \mathbf{n}_2 &= \frac{-f_x(x, y)\mathbf{i} - f_y(x, y)\mathbf{j} + \mathbf{k}}{\sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1}} = \frac{\frac{x}{z}\mathbf{i} + \frac{y}{z}\mathbf{j} + \mathbf{k}}{\sqrt{\frac{x^2}{z^2} + \frac{y^2}{z^2} + 1}} \\ &= \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{R} \end{aligned}$$

Figure 62

### NOW WORK Problem 13.

## 3 Find the Flux of a Vector Field Across a Surface

An important application of a surface integral measures the rate of flow of a fluid across a surface  $S$ , also called the **flux across  $S$** . Consider solar winds (protons and electrons flowing out of the Sun) as they strike Earth (a spherical surface). The rate of flow of the solar winds across the surface of Earth is an example of flux.

Suppose  $\mathbf{F} = \mathbf{F}(x, y, z)$  is a vector field that represents the velocity of a fluid, such as air or water, and suppose  $\rho = \rho(x, y, z)$  denotes the variable mass density of the fluid. Then  $\rho\mathbf{F}$  equals the rate of flow (mass per unit time) per unit area of the fluid. Let  $S$  be an orientable surface immersed in the fluid that does not impede its flow. If  $\mathbf{n}$  is a unit normal vector of  $S$ , then  $\rho\mathbf{F} \cdot \mathbf{n}$  equals the rate of flow of fluid in the direction of  $\mathbf{n}$ . See Figure 63.

We seek a formula for the flux across  $S$ , that is, the mass of fluid that flows across  $S$  in a unit of time.

We begin by partitioning  $S$  into  $n$  patches  $S_i$ ,  $i = 1, 2, \dots, n$ , and concentrate on patch  $S_i$  whose area is  $\Delta S_i$ . The mass of fluid per unit time crossing patch  $S_i$  in the

Figure 63

Figure 64

direction of the unit normal  $\mathbf{n}_i$  is approximately

$$\rho \mathbf{F} \cdot \mathbf{n}_i \Delta S_i$$

where  $\mathbf{F}$  is calculated at some point on the patch  $S_i$ . We define the norm  $\|\Delta\|$  of the partition to be the largest area  $\Delta S_i$ . See Figure 64.

Now we form the sums

$$\sum_{i=1}^n \rho \mathbf{F} \cdot \mathbf{n}_i \Delta S_i$$

The **flux of  $\mathbf{F}$  across  $S$** , that is, the mass of fluid flowing across the surface  $S$  in a unit of time in the direction of  $\mathbf{n}$ , is

$$\frac{\text{Mass of fluid}}{\text{Unit time}} = \lim_{\|\Delta\| \rightarrow 0} \sum_{i=1}^n \rho \mathbf{F} \cdot \mathbf{n}_i \Delta S_i = \iint_S \rho \mathbf{F} \cdot \mathbf{n} \, dS$$

provided the limit exists.

### EXAMPLE 7 Finding the Flux of $\mathbf{F}$ Across a Cylinder

A fluid has a constant mass density  $\rho$ . Find the mass of fluid flowing across the cylinder  $x^2 + y^2 = 4$ , where  $0 \leq z \leq 3$ , in a unit of time in the direction outward from the  $z$ -axis, if the velocity of the fluid at any point on the cylinder is  $\mathbf{F} = \mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + 2z\mathbf{k}$ . That is, find the flux of  $\mathbf{F}$  across the cylinder.

**Solution** In cylindrical coordinates  $x^2 + y^2 = r^2 = 4$ , or equivalently,  $r = 2$ , which leads to the parametrization  $\mathbf{r}(\theta, z) = 2\cos\theta\mathbf{i} + 2\sin\theta\mathbf{j} + z\mathbf{k}$ ,  $0 \leq \theta \leq 2\pi$ ,  $0 \leq z \leq 3$ .

We seek  $\|\mathbf{r}_\theta \times \mathbf{r}_z\|$  and  $dS$ . The partial derivatives of  $\mathbf{r}$  are

$$\begin{aligned} \mathbf{r}_\theta &= -2\sin\theta\mathbf{i} + 2\cos\theta\mathbf{j} & \mathbf{r}_z &= \mathbf{k} \\ \mathbf{r}_\theta \times \mathbf{r}_z &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -2\sin\theta & 2\cos\theta & 0 \\ 0 & 0 & 1 \end{vmatrix} = 2\cos\theta\mathbf{i} + 2\sin\theta\mathbf{j} \end{aligned}$$

$$\|\mathbf{r}_\theta \times \mathbf{r}_z\| = \sqrt{4\cos^2\theta + 4\sin^2\theta} = 2$$

$$dS = \|\mathbf{r}_\theta \times \mathbf{r}_z\| \, d\theta \, dz = 2 \, d\theta \, dz$$

Then the unit normal vector  $\mathbf{n}$  is

$$\mathbf{n} = \frac{\mathbf{r}_\theta \times \mathbf{r}_z}{\|\mathbf{r}_\theta \times \mathbf{r}_z\|} = \frac{2\cos\theta\mathbf{i} + 2\sin\theta\mathbf{j}}{2} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$$

These vectors point outward from the surface of the cylinder, so we have the correct orientation. Figure 65 shows the cylinder  $x^2 + y^2 = 4$ , where  $0 \leq z \leq 3$ , and the outer unit normal vectors to the cylinder.

We now write  $\mathbf{F}$  using the parametrization.

$$\mathbf{F} = \mathbf{F}(x, y, z) = \mathbf{F}(\theta, z) = 2\cos\theta\mathbf{i} + 2\sin\theta\mathbf{j} + 2z\mathbf{k}$$

The velocity of the fluid in the direction of  $\mathbf{n}$  is

$$\mathbf{F} \cdot \mathbf{n} = (2\cos\theta\mathbf{i} + 2\sin\theta\mathbf{j} + 2z\mathbf{k}) \cdot (\cos\theta\mathbf{i} + \sin\theta\mathbf{j}) = 2\cos^2\theta + 2\sin^2\theta = 2$$

The mass of fluid flowing across the cylinder  $x^2 + y^2 = 4$  in a unit of time in the direction of  $\mathbf{n}$  is given by

$$\iint_S \rho \mathbf{F} \cdot \mathbf{n} \, dS = \int_0^3 \int_0^{2\pi} (\rho \cdot 2) \, d\theta \, dz = 4\rho \int_0^3 2\pi \, dz = (8\rho\pi) \cdot 3 = 24\rho\pi$$

The flux of  $\mathbf{F}$  across  $S$  is  $24\rho\pi$ . ■

Figure 65  $x^2 + y^2 = 4$ ,  $0 \leq z \leq 3$ , and  $\mathbf{n} = \cos\theta\mathbf{i} + \sin\theta\mathbf{j}$

Figure 66

**EXAMPLE 8** Finding the Flux of  $\mathbf{F}$  Across a Cube

A fluid has constant mass density  $\rho$ . Find the mass per unit time of fluid flowing across the cube enclosed by the planes  $x = 0$ ,  $x = 1$ ,  $y = 0$ ,  $y = 1$ ,  $z = 0$ , and  $z = 1$  in the direction of the outer unit normal vectors if the velocity of the fluid at any point on the cube is  $\mathbf{F} = \mathbf{F}(x, y, z) = 4xz\mathbf{i} - y^2\mathbf{j} + yz\mathbf{k}$ . That is, find the flux of  $\mathbf{F}$  across the cube.

**Solution** Figure 66 shows the cube and its six faces. The mass per unit time of fluid flowing across the cube in the direction of the outer unit normal vector  $\mathbf{n}$  is

$$\iint_S \rho \mathbf{F} \cdot \mathbf{n} \, dS = \rho \iint_S \mathbf{F} \cdot \mathbf{n} \, dS$$

We decompose  $S$  into its six faces and find the surface integral over each one, as shown in Table 1.

**TABLE 1**

| Face         | $\mathbf{n}$ | $\mathbf{F}$  | $\mathbf{F} \cdot \mathbf{n}$                 | $\rho \iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ |
|--------------|--------------|---------------|-----------------------------------------------|--------------------------------------------------|
| $S_1 = ABCO$ | $z = 0$      | $-\mathbf{k}$ | $-y^2\mathbf{j}$                              | 0                                                |
| $S_2 = OAEG$ | $y = 0$      | $-\mathbf{j}$ | $4xz\mathbf{i}$                               | 0                                                |
| $S_3 = OCDG$ | $x = 0$      | $-\mathbf{i}$ | $-y^2\mathbf{j} + yz\mathbf{k}$               | 0                                                |
| $S_4 = ABFE$ | $x = 1$      | $\mathbf{i}$  | $4z\mathbf{i} - y^2\mathbf{j} + yz\mathbf{k}$ | $4z$                                             |
| $S_5 = BCDF$ | $y = 1$      | $\mathbf{j}$  | $4xz\mathbf{i} - \mathbf{j} + z\mathbf{k}$    | $-1$                                             |
| $S_6 = DFEG$ | $z = 1$      | $\mathbf{k}$  | $4x\mathbf{i} - y^2\mathbf{j} + y\mathbf{k}$  | $y$                                              |

The mass per unit time of fluid flowing across the cube is  $0 + 0 + 0 + 2\rho - \rho + \frac{1}{2}\rho = \frac{3}{2}\rho$  ■

**NOW WORK** Problem 23.

The idea of flux, the rate of flow of a fluid across a surface  $S$ , describes many different phenomena. As an example, we consider the flow of electricity across a surface  $S$ .

**Application: Electric Flux**

Suppose  $\mathbf{E}$  is an electric field and  $S$  is a piecewise-smooth surface with orientation  $\mathbf{n}$ . Then the **electric flux**  $\Phi_E$ , the rate at which the electric field passes through  $S$ , is given by

$$\Phi_E = \iint_S \mathbf{E} \cdot \mathbf{n} \, dS$$

Further, suppose we place a point charge of  $q$  coulombs (C) at the origin. Then the corresponding electric field is

$$\mathbf{E} = \left( \frac{q}{4\pi\epsilon_0} \right) \left( \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{3/2}} \right)$$

The field  $\mathbf{E}$  is measured in volts per meter (V/m) and  $\epsilon_0 \approx 8.854 \times 10^{-12} \text{ C}^2/\text{Nm}^2$  is the **permittivity of free space**.

Now suppose  $S_R$  is the sphere  $x^2 + y^2 + z^2 = R^2$ ,  $R > 0$ . If  $F(x, y, z) = x^2 + y^2 + z^2$ , then  $\mathbf{n} = \frac{\nabla F}{\|\nabla F\|} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{R}$  is the outward-pointing unit normal for  $S_R$ . Then

$$\begin{aligned}\mathbf{E} \cdot \mathbf{n} &= \left( \frac{q}{4\pi\epsilon_0} \right) \left( \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{3/2}} \right) \cdot \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{R} \\ &= \left( \frac{q}{4\pi\epsilon_0} \right) \left( \frac{x^2 + y^2 + z^2}{R^3 \cdot R} \right) = \frac{q}{4\pi\epsilon_0} \frac{R^2}{R^4} = \frac{q}{4\pi\epsilon_0 R^2}\end{aligned}$$

Using the fact that the surface area  $S_R$  of a sphere of radius  $R$  is  $4\pi R^2$ , we get

$$\Phi_E = \iint_{S_R} \mathbf{E} \cdot \mathbf{n} \, dS = \iint_{S_R} \frac{q}{4\pi\epsilon_0 R^2} \, dS = \frac{q}{4\pi\epsilon_0 R^2} \iint_{S_R} 1 \, dS = \frac{q}{4\pi\epsilon_0 R^2} \cdot 4\pi R^2 = \frac{q}{\epsilon_0}$$

This means that the electric flux of a point charge  $q$  originating at the center of a sphere is independent of the size of the sphere.

## 15.7 Assess Your Understanding

### Concepts and Vocabulary

- Multiple Choice** If a surface  $S$  has a unit normal vector  $\mathbf{n}$  at each point of the surface that can be chosen so  $\mathbf{n}$  varies continuously over the surface, and as  $\mathbf{n}$  moves around any closed curve on the surface,  $\mathbf{n}$  returns to its original direction, then the surface is said to be [(a) a Möbius strip, (b) integrable, (c) orientable].
- Multiple Choice** If  $\mathbf{F} = \mathbf{F}(x, y, z)$  is a vector field that represents the velocity of a fluid, and  $\rho = \rho(x, y, z)$  is the variable mass density of the fluid, then the surface integral  $\iint_S \rho \mathbf{F} \cdot \mathbf{n} \, dS$  is called the [(a) speed, (b) flux, (c) orientation, (d) acceleration] of  $\mathbf{F}$  across the surface  $S$ .

### Skill Building

In Problems 3–12, find each surface integral.

- $\iint_S (x^2 + y^2) \, dS$ ;  $S: z = f(x, y) = 2x + 3y + 5$ ,  $0 \leq x \leq 1$ ,  $0 \leq y \leq 1$
- $\iint_S x^2 y^2 \, dS$ ;  $S: z = f(x, y) = 3x + 4y + 8$ ,  $0 \leq x \leq 1$ ,  $0 \leq y \leq 1$
- $\iint_S y \, dS$ ;  $S: z = f(x, y) = x + 5y^2$ ,  $0 \leq x \leq 2$ ,  $0 \leq y \leq 1$
- $\iint_S 4x \, dS$ ;  $S: z = f(x, y) = 2x^2 + y$ ,  $0 \leq x \leq 1$ ,  $0 \leq y \leq 2$
- $\iint_S (x + y + z) \, dS$ , where  $S$  is the portion of the plane  $z = x - 3y$  above the region enclosed by  $y = 0$ ,  $x = 1$ , and  $x = 3y$  in the  $xy$ -plane
- $\iint_S x \, dS$ , where  $S$  is the portion of the plane  $x + y + 2z = 4$  above the region enclosed by  $x = 1$ ,  $y = 1$ ,  $x = 0$ , and  $y = 0$
- $\iint_S y \, dS$ , where  $S$  is the portion of the plane  $x + y + z = 2$  inside the cylinder  $x^2 + y^2 = 1$

- $\iint_S yz \, dS$ , where  $S$  is the portion of the plane  $x + 2y + 3z = 6$  in the first octant
- $\iint_S x^2 z \, dS$ , where  $S$  is the surface  $x^2 + y^2 = 1$ ,  $0 \leq z \leq 1$
- $\iint_S (x + y)z \, dS$ , where  $S$  is the surface  $x^2 + y^2 = 9$ ,  $1 \leq z \leq 3$

In Problems 13–16, find the outer unit normal vector to the surface  $S$  defined by  $z = f(x, y)$ .

- $z = f(x, y) = \sqrt{16 - x^2 - y^2}$ ,  $0 \leq x^2 + y^2 \leq 16$
- $z = f(x, y) = \sqrt{1 - x^2 - y^2}$ ,  $0 \leq x^2 + y^2 \leq 1$
- $z = f(x, y) = \sqrt{36 - 9x^2 - 4y^2}$ ,  $0 \leq 9x^2 + 4y^2 \leq 36$
- $z = f(x, y) = \sqrt{4 - x^2 - 4y^2}$ ,  $0 \leq x^2 + 4y^2 \leq 4$

In Problems 17 and 18, find both orientations for each surface.

- $S: \mathbf{r}(u, v) = (u + v)\mathbf{i} + u^2\mathbf{j} + v^2\mathbf{k}$
- $S: \mathbf{r}(u, v) = uv\mathbf{i} + v\mathbf{j} + e^u\mathbf{k}$

**Flux Across a Surface** In Problems 19–26, a fluid with constant mass density  $\rho$  flows across the cube shown in Figure 66. If the velocity of the fluid at any point on the cube is given by  $\mathbf{F}$ , find the flux of  $\mathbf{F}$  across the cube in the direction of the outer unit normal vectors.

- |                                                                  |                                                            |                                  |

| 25. $\mathbf{F} = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$ | 26. $\mathbf{F} = x^2\mathbf{i} + y^2\mathbf{j}$           |                                  |

### Applications and Extensions

**Flux Across a Surface** In Problems 27–30, find  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $\mathbf{n}$  is the outer unit normal of  $S$ .

- $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ , and  $S$  is the surface  $x^2 + y^2 + z^2 = 1$ ,  $z \geq 0$
- $\mathbf{F} = -y\mathbf{i} + x\mathbf{j} + z\mathbf{k}$ , and  $S$  is the surface  $x^2 + y^2 + z^2 = 1$ ,  $z \geq 0$

29.  $\mathbf{F} = (x + y)\mathbf{i} + (2x - z)\mathbf{j} + y\mathbf{k}$ , and  $S$  is the tetrahedron formed by the coordinate planes and the plane  $z + 2x + 2y = 8$
30.  $\mathbf{F} = 2x\mathbf{i} - x^2\mathbf{j} + (z - 2x + 2y)\mathbf{k}$ , and  $S$  is the tetrahedron formed by the coordinate planes and the plane  $2x + 2y + z = 6$

In Problems 31 and 32, find the flux integral  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ , given the oriented surface  $S$  and vector field  $\mathbf{F}$ .

31. The surface  $S$  is parametrized by  $\mathbf{r}(u, v) = uv\mathbf{i} + u^2\mathbf{j} + v\mathbf{k}$ ,  $1 \leq u \leq 2$ ,  $0 \leq v \leq 3$  and the vector field is  $\mathbf{F} = \mathbf{F}(x, y, z) = -z\mathbf{j} + \mathbf{k}$ .
32. The surface  $S$  is parametrized by  $\mathbf{r}(u, v) = ve^u\mathbf{i} + v^3\mathbf{j} + u\mathbf{k}$ ,  $0 \leq u \leq 1$ ,  $-1 \leq v \leq 1$  and the vector field is  $\mathbf{F} = \mathbf{F}(x, y, z) = xy\mathbf{i} + 2z\mathbf{j}$ .
33. **Mass of a Lamina** Find the mass of a lamina in the shape of a cone  $z = \sqrt{x^2 + y^2}$ ,  $2 \leq z \leq 4$ , if the mass density of the lamina is  $\rho = \rho(x, y, z) = 8 - z$ .
34. **Mass of a Lamina** Find the mass of a lamina in the shape of a cone  $z = \sqrt{x^2 + y^2}$ ,  $2 \leq z \leq 4$ , if the mass density of the lamina is  $\rho = \rho(x, y, z) = \sqrt{x^2 + y^2}$ .
35. **Center of Mass of a Lamina** Find the center of mass of a lamina in the shape of the part of the plane  $2x + 3y + z = 4$  that lies inside  $x^2 + z^2 = 9$ , if the mass density of the lamina is  $\rho = \rho(x, y, z) = \sqrt{x^2 + z^2}$ .
36. **Center of Mass of a Lamina** Find the center of mass of a lamina in the shape of the unit sphere  $x^2 + y^2 + z^2 = 1$ , if the mass density of the lamina is  $\rho = \rho(x, y, z) = z + 1$ .

In Problems 37 and 38, find each surface integral.

37.  $\iint_S x^2 z \, dS$ ;  $S$ : the portion of the cylinder  $x^2 + y^2 = 9$  between  $z = 0$  and  $z = 5$
38.  $\iint_S (x + 2y) \, dS$ ;  $S$ :  $\mathbf{r}(u, v) = u \cos v \mathbf{i} + (u^2 + 1)\mathbf{j} + u \cos v \mathbf{k}$ ,  $0 \leq u \leq 1$  and  $0 \leq v \leq \pi/2$

39. **Flux Across a Surface** Find the mass of a fluid with constant mass density flowing across the paraboloid  $z = x^2 + y^2$ ,  $z \leq 5$ , in a unit of time in the direction of the outer unit normal, if the velocity of the fluid at any point on the paraboloid is  $\mathbf{F} = \mathbf{F}(x, y, z) = -x\mathbf{i} - y\mathbf{j} - z\mathbf{k}$ .

40. **Flux Across a Surface** Find the mass of a fluid with constant mass density flowing across the paraboloid  $z = 9 - x^2 - y^2$ ,  $z \geq 0$ , in a unit of time in the direction of the outer unit normal, if the velocity of the fluid at any point on the paraboloid is  $\mathbf{F} = \mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + 3\mathbf{k}$ .

41. If  $\mathbf{n}$  is the upward-pointing unit normal to a surface  $z = f(x, y)$  and  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j} + R\mathbf{k}$ , show that

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_D \left( -P \frac{\partial f}{\partial x} - Q \frac{\partial f}{\partial y} + R \right) dx \, dy$$

42. **Electric Flux** Find the electric flux across the part of the cylinder  $x^2 + y^2 = 9$ ,  $0 \leq z \leq 2$ , in the direction of the outer unit normal vectors when the electric field is  $\mathbf{E}(x, y, z) = x\mathbf{i} + 2y\mathbf{j} + 3z\mathbf{k}$ .

- CAS** 43. **Helicoid** Find  $\iint_S (x^2 + z^2) \, dS$ , where  $S$  is the helicoid  $\mathbf{r}(u, v) = u \cos(2v)\mathbf{i} + u \sin(2v)\mathbf{j} + v\mathbf{k}$ ,  $0 \leq u \leq 3$ ,  $0 \leq v \leq 2\pi$ .

### Challenge Problems

44. **Center of Mass** Find the center of mass of the upper half of the sphere  $x^2 + y^2 + z^2 = a^2$  covered by a thin material with mass density at each point proportional to the distance from the  $xy$ -plane.
45. Find  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $S$  is a level surface of a function  $w = f(x, y, z)$  with outer unit normal vector  $\mathbf{n}$ ,  $\mathbf{F} = \nabla f$ , and  $f$  satisfies the equation  $\left( \frac{\partial f}{\partial x} \right)^2 + \left( \frac{\partial f}{\partial y} \right)^2 + \left( \frac{\partial f}{\partial z} \right)^2 = 1$ . (Hint: The answer should depend on  $S$ .)

## 15.8 The Divergence Theorem

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the divergence of a vector field (p. 1038)
- 2 Use the Divergence Theorem (p. 1038)
- 3 Interpret the divergence of  $\mathbf{F}$  (p. 1042)

Green's Theorem expresses a relationship between a certain double integral over a plane region and a line integral taken around its boundary. There are two ways to generalize this result to space. One of these, known as the *Divergence Theorem*, is the subject of this section, and the other, known as *Stokes' Theorem*, is the subject of the next section.

The Divergence Theorem expresses a certain relationship between a triple integral involving the *divergence of a vector field* and a surface integral, the flux of a vector field. The theorem is used in applications involving fluid dynamics, electrostatics, and magnetism. We begin with the definition of *divergence of a vector field*.

**DEFINITION** Divergence of  $\mathbf{F}$ 

Let  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  be a vector field, where  $\frac{\partial P}{\partial x}$ ,  $\frac{\partial Q}{\partial y}$ , and  $\frac{\partial R}{\partial z}$  exist. The **divergence of  $\mathbf{F}$** , denoted by  $\operatorname{div} \mathbf{F}$ , is defined as the function\*

$$\operatorname{div} \mathbf{F} = \frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z}$$

**1 Find the Divergence of a Vector Field****EXAMPLE 1** Finding the Divergence of  $\mathbf{F}$ 

The divergence of the vector field

$$\mathbf{F}(x, y, z) = x^2yz^2\mathbf{i} + (2xz + y^3)\mathbf{j} + x^2y^3\mathbf{k}$$

is

$$\operatorname{div} \mathbf{F} = \frac{\partial}{\partial x}(x^2yz^2) + \frac{\partial}{\partial y}(2xz + y^3) + \frac{\partial}{\partial z}(x^2y^3z) = 2xyz^2 + 3y^2 + x^2y^3$$

**ORIGINS** Although Carl Friedrich Gauss (1777–1855) was neither the first to discover nor the first to prove the Divergence Theorem, the theorem is named in honor of him. The Divergence Theorem was proved by the Russian mathematician Mikhail Ostrogradsky (1801–1862), whose name is also associated with the theorem. Gauss is considered among the greatest mathematicians of all time. He was the mentor of many other notable mathematicians including Riemann, Bessel, Dedekind, and Möbius.

**NOW WORK** Problem 5.**2 Use the Divergence Theorem**

The Divergence Theorem (or Gauss' Theorem) states that if certain conditions are satisfied, a triple integral is equal to the flux of a fluid with constant mass density  $\rho = 1$  across a surface; that is, a triple integral can be expressed as a surface integral.

**THEOREM** Divergence Theorem

Let  $S$  be a positively oriented surface with outer unit normal  $\mathbf{n}$  that encloses a closed, bounded solid  $E$  in space. Let  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  be a vector field for which the functions  $P$ ,  $Q$ , and  $R$  have continuous first-order partial derivatives on an open set containing  $E$ . Then

$$\iiint_E \operatorname{div} \mathbf{F} dV = \iint_S \mathbf{F} \cdot \mathbf{n} dS$$

If  $\mathbf{n} = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$ , then

$$\iiint_E \left( \frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z} \right) dV = \iint_S (P \cos \alpha + Q \cos \beta + R \cos \gamma) dS$$

The proof of the Divergence Theorem for the general conditions on the solid  $E$  can be found in Advanced Calculus texts. The idea behind the proof is to verify each of the three equations

$$\iiint_E \frac{\partial P}{\partial x} dV = \iint_S P \cos \alpha dS \quad (1)$$

\*Some books define  $\operatorname{div} \mathbf{F}$  as the dot product  $\nabla \cdot \mathbf{F}$ , where  $\nabla$  is the partial differential operator

$\nabla = \frac{\partial}{\partial x}\mathbf{i} + \frac{\partial}{\partial y}\mathbf{j} + \frac{\partial}{\partial z}\mathbf{k}$  and  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j} + R\mathbf{k}$ .

$$\iiint_E \frac{\partial Q}{\partial y} dV = \iint_S Q \cos \beta dS \quad (2)$$

$$\iiint_E \frac{\partial R}{\partial z} dV = \iint_S R \cos \gamma dS \quad (3)$$

Figure 67

Once they are verified, the Divergence Theorem follows by adding the three equations.

We prove (3) for a special case of the solid  $E$  as described in Example 5 from Section 15.7. As Figure 67 shows, the surface  $S$  that encloses  $E$  is a positively oriented,  $xy$ -simple surface consisting of three surfaces,  $S_1$ ,  $S_2$ , and  $S_3$ , with the outer unit normals  $\mathbf{n}_1$ ,  $\mathbf{n}_2$ , and  $\mathbf{n}_3$ , respectively.

**Proof** We assume that surfaces  $S_1$  and  $S_2$  are defined by the equations

$$S_1: z = f_1(x, y) \quad \text{and} \quad S_2: z = f_2(x, y)$$

where  $f_1(x, y) < f_2(x, y)$  on  $D$ ,  $f_1$  and  $f_2$  are continuous on  $D$ , and  $f_1$  and  $f_2$  have continuous partial derivatives on  $D$ . The surface  $S_3$  is the portion of a cylindrical surface between  $S_1$  and  $S_2$  formed by lines parallel to the  $z$ -axis and along the boundary of the region  $D$  in the  $xy$ -plane. The solid  $E$  is enclosed on the bottom by  $S_1$ , on the top by  $S_2$ , and on the sides by the lateral surface  $S_3$ .

We now show that

$$\iiint_E \frac{\partial R}{\partial z} dV = \iint_S R \cos \gamma dS \quad (4)$$

We start with the right side of (4). Then using the fact that  $S$  consists of the three surfaces  $S_1$ ,  $S_2$ , and  $S_3$ , we have

$$\iint_S R \cos \gamma dS = \iint_{S_1} R \cos \gamma dS + \iint_{S_2} R \cos \gamma dS + \iint_{S_3} R \cos \gamma dS$$

For the bottom surface  $S_1: z = f_1(x, y)$ , the outer unit normal  $\mathbf{n}_1$  equals the downward-pointing unit normal vector  $-\mathbf{n}$  to  $S_1$ . So,  $\cos \gamma$  is given by

$$\cos \gamma = \mathbf{n}_1 \cdot \mathbf{k} = \frac{-1}{\sqrt{[(f_1)_x(x, y)]^2 + [(f_1)_y(x, y)]^2 + 1}} \quad \text{See Example 5 (page 1032).}$$

Then

$$\iint_{S_1} R \cos \gamma dS = \iint_{S_1} R(x, y, f_1(x, y)) \frac{-1}{\sqrt{[(f_1)_x(x, y)]^2 + [(f_1)_y(x, y)]^2 + 1}} dS$$

We can express the surface integral as a double integral

$$\begin{aligned} \iint_{S_1} R \cos \gamma dS &= - \iint_D R(x, y, f_1(x, y)) \frac{\sqrt{[(f_1)_x(x, y)]^2 + [(f_1)_y(x, y)]^2 + 1}}{\sqrt{[(f_1)_x(x, y)]^2 + [(f_1)_y(x, y)]^2 + 1}} dx dy \\ &= - \iint_D R(x, y, f_1(x, y)) dx dy \end{aligned} \quad (5)$$

For the top surface  $S_2: z = f_2(x, y)$ , the outer unit normal  $\mathbf{n}_2$  equals the upward-pointing unit normal vector  $\mathbf{n}$  to  $S_2$ . So,  $\cos \gamma$  is given by

$$\cos \gamma = \mathbf{n}_2 \cdot \mathbf{k} = \frac{1}{\sqrt{[(f_2)_x(x, y)]^2 + [(f_2)_y(x, y)]^2 + 1}} \quad \text{See Example 5 (page 1032).}$$

and

$$\iint_{S_2} R \cos \gamma \, dS = \iint_{S_2} R(x, y, f_2(x, y)) \frac{1}{\sqrt{[(f_2)_x(x, y)]^2 + [(f_2)_y(x, y)]^2 + 1}} \, dS$$

Again, we can express the surface integral as a double integral.

$$\begin{aligned} \iint_{S_2} R \cos \gamma \, dS &= \iint_D R(x, y, f_2(x, y)) \frac{\sqrt{[(f_2)_x(x, y)]^2 + [(f_2)_y(x, y)]^2 + 1}}{\sqrt{[(f_2)_x(x, y)]^2 + [(f_2)_y(x, y)]^2 + 1}} \, dx \, dy \\ &= \iint_D R(x, y, f_2(x, y)) \, dx \, dy \end{aligned} \quad (6)$$

On the lateral surface  $S_3$ , the angle between  $\mathbf{n}_3$  and  $\mathbf{k}$  is  $\gamma = \frac{\pi}{2}$ , so  $\cos \gamma = 0$ . Therefore,

$$\iint_{S_3} R \cos \gamma \, dS = 0 \quad (7)$$

We now obtain  $\iint_S R \cos \gamma \, dS$  by summing (5), (6), and (7):

$$\begin{aligned} \iint_S R \cos \gamma \, dS &= \iint_{S_1} R \cos \gamma \, dS + \iint_{S_2} R \cos \gamma \, dS + \iint_{S_3} R \cos \gamma \, dS \\ &= - \iint_D R(x, y, f_1(x, y)) \, dx \, dy + \iint_D R(x, y, f_2(x, y)) \, dx \, dy + 0 \\ &= \iint_D [R(x, y, f_2(x, y)) - R(x, y, f_1(x, y))] \, dx \, dy \\ &= \iint_D \left[ \int_{f_1(x, y)}^{f_2(x, y)} \frac{\partial R}{\partial z} \, dz \right] \, dx \, dy = \iiint_E \frac{\partial R}{\partial z} \, dV \end{aligned}$$

which proves (3). ■

### EXAMPLE 2 Using the Divergence Theorem to Find Flux

Find the mass of a fluid of constant mass density  $\rho$  flowing across the cube enclosed by the planes  $x = 0$ ,  $x = 1$ ,  $y = 0$ ,  $y = 1$ ,  $z = 0$ , and  $z = 1$  in a unit of time, in the direction of the outer unit normal vectors if the velocity of the fluid at any point on the cube is  $\mathbf{F} = \mathbf{F}(x, y, z) = 4xz\mathbf{i} - y^2\mathbf{j} + yz\mathbf{k}$ . (This is Example 8 on page 1035.)

**Solution** Suppose  $E$  is the solid cube and  $S$  is its surface. The mass of the fluid is  $\iint_S \rho \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $\mathbf{n}$  is the outer unit normal vector of  $S$ . Since the velocity of the fluid is  $\mathbf{F} = 4xz\mathbf{i} - y^2\mathbf{j} + yz\mathbf{k}$ , we have  $\operatorname{div} \mathbf{F} = 4z - 2y + y = 4z - y$ . Now we use the Divergence Theorem.

$$\begin{aligned} \iint_S \rho \mathbf{F} \cdot \mathbf{n} \, dS &= \rho \iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \rho \iiint_E \operatorname{div} \mathbf{F} \, dV = \rho \int_0^1 \int_0^1 \int_0^1 (4z - y) \, dz \, dy \, dx \\ &= \rho \int_0^1 \int_0^1 (2 - y) \, dy \, dx = \rho \int_0^1 \frac{3}{2} \, dx = \frac{3}{2} \rho \end{aligned}$$

which is the same as the result found in Example 8, Section 15.7. ■

### NOW WORK Problem 9.

**NEED TO REVIEW?** The Mean Value Theorem for integrals is discussed in Section 5.4, pp. 372–374.

### 3 Interpret the Divergence of $\mathbf{F}$

Recall that the Mean Value Theorem for single integrals states that if a function  $f$  of one variable is continuous on a closed interval  $[a, b]$ , then there is a real number  $u$ ,  $a \leq u \leq b$ , for which

$$\int_a^b f(x) dx = f(u)(b - a)$$

Similarly, there is a Mean Value Theorem for triple integrals asserting that if a function  $f$  of three variables is continuous in a simply connected, closed, bounded solid  $E$ , then there is a point  $(x^*, y^*, z^*)$  in  $E$  for which

$$\iiint_E f(x, y, z) dV = f(x^*, y^*, z^*)V \quad (8)$$

where  $V$  is the volume of  $E$ .

Let  $\mathbf{F} = \mathbf{F}(x, y, z)$  be a vector field defined and continuous on and within a spherical solid  $E_a$  of radius  $a$  with its center at  $(x_1, y_1, z_1)$ . Based on (8), there is a point  $(x^*, y^*, z^*)$  in  $E_a$  for which

$$\iiint_{E_a} \operatorname{div} \mathbf{F} dV_a = \operatorname{div} \mathbf{F}(x^*, y^*, z^*)V_a$$

where  $V_a$  is the volume of the sphere of radius  $a$ . Now we use the Divergence Theorem to obtain

$$\iiint_{E_a} \operatorname{div} \mathbf{F} dV_a = \iint_{S_a} \mathbf{F} \cdot \mathbf{n} dS_a$$

where  $S_a$  is the sphere of radius  $a$  with its center at  $(x_1, y_1, z_1)$ . Combining these last two equations, we get

$$\operatorname{div} \mathbf{F}(x^*, y^*, z^*) = \frac{\iint_{S_a} \mathbf{F} \cdot \mathbf{n} dS_a}{V_a}$$

The ratio on the right side is the flux of  $\mathbf{F}$  per unit volume across  $S_a$ . If we let the radius  $a \rightarrow 0$ , then  $(x^*, y^*, z^*) \rightarrow (x_1, y_1, z_1)$ , so that

$$\operatorname{div} \mathbf{F}(x_1, y_1, z_1) = \lim_{a \rightarrow 0} \left( \frac{\iint_{S_a} \mathbf{F} \cdot \mathbf{n} dS_a}{V_a} \right) \quad (9)$$

In other words,

$$\operatorname{div} \mathbf{F}(x_1, y_1, z_1) = \text{Limiting value of the flux of } \mathbf{F} \text{ per unit volume across } S_a$$

If  $\mathbf{F}$  is the velocity of a steady fluid flow and if  $\operatorname{div} \mathbf{F}(x_1, y_1, z_1) > 0$ , then the net flow is out of  $S_a$  and the point  $(x_1, y_1, z_1)$  is called a **source**. If  $\operatorname{div} \mathbf{F}(x_1, y_1, z_1) < 0$ , then the net flow is into  $S_a$  and the point  $(x_1, y_1, z_1)$  is called a **sink**. In terms of this vocabulary, the Divergence Theorem states that the net flow through  $S_a$  equals the sum of the sources and sinks across  $S_a$ .

If there are no sources or sinks across  $S$ , then  $\operatorname{div} \mathbf{F} = 0$ , and we call  $\mathbf{F}$  a **solenoidal** vector field. For such fields,

$$\operatorname{div} \mathbf{F} = \frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z} = 0$$

is referred to as the **equation of continuity**.

We close this section with an example of **Coulomb's law of electrostatic attraction**, an important law in the study of electrostatic fields,

### EXAMPLE 5 Applying the Divergence Theorem to an Electric Force Field

Let  $\mathbf{F} = \mathbf{F}(x, y, z)$  be an electric force field

$$\mathbf{F} = \mathbf{F}(x, y, z) = \frac{\varepsilon q Q}{x^2 + y^2 + z^2} \mathbf{u}$$

where  $\varepsilon$  is a constant that depends on the units used;  $q$  and  $Q$  are the charges of two objects, one located at the point  $(0, 0, 0)$  and the other at a point  $(x, y, z)$ ; and  $\mathbf{u}$  is the unit vector in the direction from  $(0, 0, 0)$  to  $(x, y, z)$ . Let  $S$  be a closed surface with positive orientation that encloses a solid  $E$  in space.

Show that the following statements are true under the assumptions of the Divergence Theorem:

- (a) If neither  $S$  nor its interior contains the point  $(0, 0, 0)$ , then  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 0$ . That is, the flux of  $\mathbf{F}$  across  $S$  equals 0.
- (b) If the interior of  $S$  contains the point  $(0, 0, 0)$ , then  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 4\pi\varepsilon q Q$ . That is, the flux of  $\mathbf{F}$  across  $S$  equals  $4\pi\varepsilon q Q$ .

**Solution** The unit vector  $\mathbf{u} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$ , so that

$$\mathbf{F} = \mathbf{F}(x, y, z) = \varepsilon q Q \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{3/2}}$$

The electric force field  $\mathbf{F}$  is continuous everywhere except at the point  $(0, 0, 0)$ .

(a) The surface  $S$  that forms the boundary of the solid  $E$  satisfies the assumptions of the Divergence Theorem. We find  $\operatorname{div} \mathbf{F}$ .

$$\begin{aligned} \operatorname{div} \mathbf{F} &= \varepsilon q Q \left\{ \frac{\partial}{\partial x} \left[ \frac{x}{(x^2 + y^2 + z^2)^{3/2}} \right] + \frac{\partial}{\partial y} \left[ \frac{y}{(x^2 + y^2 + z^2)^{3/2}} \right] + \frac{\partial}{\partial z} \left[ \frac{z}{(x^2 + y^2 + z^2)^{3/2}} \right] \right\} \\ &= \varepsilon q Q \left\{ \frac{(x^2 + y^2 + z^2)^{3/2} - 3x^2 \sqrt{x^2 + y^2 + z^2}}{(x^2 + y^2 + z^2)^3} + \frac{(x^2 + y^2 + z^2)^{3/2} - 3y^2 \sqrt{x^2 + y^2 + z^2}}{(x^2 + y^2 + z^2)^3} \right. \\ &\quad \left. + \frac{(x^2 + y^2 + z^2)^{3/2} - 3z^2 \sqrt{x^2 + y^2 + z^2}}{(x^2 + y^2 + z^2)^3} \right\} \\ &= \varepsilon q Q \frac{3(x^2 + y^2 + z^2)^{3/2} - 3\sqrt{x^2 + y^2 + z^2}(x^2 + y^2 + z^2)}{(x^2 + y^2 + z^2)^3} = 0 \end{aligned}$$

Therefore, by the Divergence Theorem,

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iiint_E \operatorname{div} \mathbf{F} \, dV = 0$$

(b) Since the interior of  $S$  contains the origin,  $\mathbf{F}$  is not continuous at the origin, so we cannot use the Divergence Theorem. We use the following argument to prove (b). Let  $E$  be the closed solid enclosed by two separate surfaces: the surface  $S$  and a sphere  $S_a$  of radius  $a$ , with its center at  $(0, 0, 0)$ , as shown in Figure 70. The outer surface is  $S$  and the inner surface is  $S_a$ . Now  $\mathbf{F}$  is continuous throughout  $E$ , so the Divergence Theorem can be used.

$$\iiint_E \operatorname{div} \mathbf{F} \, dV = \iint_S \mathbf{F} \cdot \mathbf{n} \, dS + \iint_{S_a} \mathbf{F} \cdot \mathbf{n} \, dS$$

Figure 70

From (a), we know that  $\iiint_E \operatorname{div} \mathbf{F} dV = 0$ . So,

$$\iint_S \mathbf{F} \cdot \mathbf{n} dS = - \iint_{S_a} \mathbf{F} \cdot \mathbf{n} dS$$

On the inner surface  $S_a$ , a sphere of radius  $a$ , the outer unit normal is

$$\mathbf{n} = -\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{a} = -\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$$

Then

$$\begin{aligned} \mathbf{F} \cdot \mathbf{n} &= \frac{\varepsilon q Q}{x^2 + y^2 + z^2} \mathbf{u} \cdot \left( -\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}} \right) \\ &= -\frac{\varepsilon q Q}{x^2 + y^2 + z^2} \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}} \cdot \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}} \\ &= -\varepsilon q Q \frac{x^2 + y^2 + z^2}{a^4} = -\frac{\varepsilon q Q}{a^2} \end{aligned}$$

So,

$$\iint_S \mathbf{F} \cdot \mathbf{n} dS = - \iint_{S_a} \left( -\frac{\varepsilon q Q}{a^2} \right) dS = \frac{\varepsilon q Q}{a^2} \iint_{S_a} dS = \frac{\varepsilon q Q}{a^2} (4\pi a^2) = 4\pi \varepsilon q Q$$

↑  
Surface area of the  
sphere  $S_a$  is  $4\pi a^2$

## 15.8 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The divergence of a vector field  $\mathbf{F}$  is a vector.
- If  $\mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  is a vector field, where  $\frac{\partial P}{\partial x}$ ,  $\frac{\partial Q}{\partial y}$ , and  $\frac{\partial R}{\partial z}$  each exist, then  $\operatorname{div} \mathbf{F} =$  \_\_\_\_\_.

### Skill Building

In Problems 3–8, find the divergence of  $\mathbf{F}$ .

- $\mathbf{F}(x, y, z) = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$
- $\mathbf{F}(x, y, z) = x\mathbf{i} + xy\mathbf{j} + xyz\mathbf{k}$
- $\mathbf{F}(x, y, z) = (x + \cos x)\mathbf{i} + (y + y \sin x)\mathbf{j} + 2z\mathbf{k}$
- $\mathbf{F}(x, y, z) = xye^z\mathbf{i} + x^2e^z\mathbf{j} + x^2ye^z\mathbf{k}$
- $\mathbf{F}(x, y, z) = \sqrt{x^2 + y^2}\mathbf{i} + \sqrt{x^2 + y^2}\mathbf{j} + z\mathbf{k}$
- $\mathbf{F}(x, y, z) = xy^2\mathbf{i} + x^2y\mathbf{j} + xyz\mathbf{k}$

In Problems 9–18, use the Divergence Theorem to find  $\iint_S \mathbf{F} \cdot \mathbf{n} dS$ , where  $\mathbf{n}$  is the outer unit normal vector to  $S$ .

- $\mathbf{F} = (2xy + 2z)\mathbf{i} + (y^2 + 1)\mathbf{j} - (x + y)\mathbf{k}$ ;  $S$  is the surface of the solid enclosed by  $x + y + z = 4$ ,  $x = 0$ ,  $y = 0$ , and  $z = 0$ .
- $\mathbf{F} = (2xy + z)\mathbf{i} + y^2\mathbf{j} - (x + 4y)\mathbf{k}$ ;  $S$  is the surface of the solid enclosed by  $2x + 2y + z = 6$ ,  $x = 0$ ,  $y = 0$ , and  $z = 0$ .

- $\mathbf{F} = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$ ;  $S$  is the surface of the solid enclosed by  $x = 0$ ,  $x = 1$ ,  $y = 0$ ,  $y = 1$ ,  $z = 0$ , and  $z = 1$ .
- $\mathbf{F} = (x - y)\mathbf{i} + (y - z)\mathbf{j} + (x - y)\mathbf{k}$ ;  $S$  is the surface of the solid cube with its center at the origin and faces in the planes  $x = \pm 1$ ,  $y = \pm 1$ , and  $z = \pm 1$ .
- $\mathbf{F} = x^2\mathbf{i} + 2y\mathbf{j} + 4z^2\mathbf{k}$ ;  $S$  is the surface of the solid cylinder  $x^2 + y^2 \leq 4$ ,  $0 \leq z \leq 2$ .
- $\mathbf{F} = x\mathbf{i} + 2y^2\mathbf{j} + 3z^2\mathbf{k}$ ;  $S$  is the surface of the solid cylinder  $x^2 + y^2 \leq 9$ ,  $0 \leq z \leq 1$ .
- $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ ;  $S$  is the sphere  $x^2 + y^2 + z^2 = 1$ .
- $\mathbf{F} = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$ ;  $S$  is the sphere  $x^2 + y^2 + z^2 = 2$ .
- $\mathbf{F} = (x + \cos x)\mathbf{i} + (y + y \sin x)\mathbf{j} + 2z\mathbf{k}$ ;  $S$  is the surface of the solid enclosed by the tetrahedron with vertices  $(0, 0, 0)$ ,  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$ .
- $\mathbf{F} = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$ ;  $S$  is the surface of the solid enclosed by the tetrahedron with vertices  $(0, 0, 0)$ ,  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$ .

### Applications and Extensions

- Volume** Let  $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ ; let  $S$  be the surface of a solid  $E$  satisfying the Divergence Theorem; and let  $\mathbf{n}$  be the outer unit normal vector to  $S$ . Show that the volume  $V$  of  $E$  is given by the formula  $V = \frac{1}{3} \iint_S \mathbf{F} \cdot \mathbf{n} dS$ .

**Volume** In Problems 20–22, use the formula given in Problem 19 to find each volume.

20. A rectangular parallelepiped with sides of length  $a$ ,  $b$ , and  $c$

21. A right circular cone with height  $h$  and base radius  $R$   
(Hint: The calculation is simplified with the cone oriented as shown in the figure.)

22. A sphere of radius  $R$

In Problems 23 and 24, find  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$  and  $\iiint_E \operatorname{div} \mathbf{F} \, dV$  separately and verify the Divergence Theorem.

23.  $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ ;  $S$  is the surface of the sphere  $x^2 + y^2 + z^2 = 100$ .

24.  $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ ;  $S$  is the closed cylindrical surface  $x^2 + y^2 = 1$  between  $z = 0$  and  $z = 2$ .

25. Show that if  $\mathbf{F}$  is a constant vector field and  $S$  is the surface of a solid  $E$  satisfying the assumptions of the Divergence Theorem, then  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = 0$ .

26. Let  $\mathbf{F} = 3x\mathbf{i} + 4y\mathbf{j} + (7z + 2x)\mathbf{k}$  and  $\mathbf{G} = 2x\mathbf{i} + 3y\mathbf{j} + (9z + 6y)\mathbf{k}$ . Let  $S$  be the surface of a solid  $E$  satisfying the assumptions of the Divergence Theorem. Show that  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \iint_S \mathbf{G} \cdot \mathbf{n} \, dS$ .

27. **Flux** Suppose the velocity of a fluid flow in space is constant.

(a) Show that the flux through any closed surface is 0.

(b) In your own words, give a physical interpretation of (a).

28. Let  $\mathbf{F}(x, y, z) = \frac{1}{\rho}(x\mathbf{i} + y\mathbf{j} + z\mathbf{k})$ , where  $\rho = \sqrt{x^2 + y^2 + z^2}$ .  
Show that  $\operatorname{div} \mathbf{F} = \frac{2}{\rho}$ .

29. (a) Use Problem 28 and the Divergence Theorem to find

$$\iiint_E \frac{dV}{\sqrt{x^2 + y^2 + z^2}}$$

where  $E$  is the solid inside the sphere  $x^2 + y^2 + z^2 = 1$ .

(b) Verify the solution to (a) by finding the triple integral directly.

30. Assume that the hypotheses of the Divergence Theorem hold for  $S$  and  $E$ . Show that if  $f$  satisfies the Laplace equation ( $f_{xx} + f_{yy} + f_{zz} = 0$ ) in a closed, bounded solid  $E$  with boundary  $S$  with outer unit normal  $\mathbf{n}$ , then  $\iint_S \nabla f \cdot \mathbf{n} \, dS = 0$ .

### Challenge Problems

31. Let  $\mathbf{F} = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$  and let  $\mathbf{n}$  be the outer unit normal to the surface  $S$ . Use the Divergence Theorem to show that

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, dS = \frac{8\pi q^4}{3}$$

if  $S$  is the surface  $x^2 + y^2 + z^2 = 2qz$ ,  $q > 0$ .

32. What is the value of the integral in Problem 31 if  $S$  is the surface of the cube  $x = 0$ ,  $x = q$ ,  $y = 0$ ,  $y = q$ ,  $z = 0$ , and  $z = q$ ,  $q > 0$ ?

33. Let  $f$  and  $g$  be two scalar functions and let  $S$  be the surface of a solid  $E$  satisfying the assumptions of the Divergence Theorem. Show that

$$\iint_S f(\nabla g) \cdot \mathbf{n} \, dS = \iiint_E [f(\nabla^2 g) + \nabla f \cdot \nabla g] \, dV$$

[Hint: Let  $\mathbf{F} = f(\nabla g)$  in the Divergence Theorem and use  $\nabla^2 g = \nabla \cdot \nabla g = g_{xx} + g_{yy} + g_{zz}$ .]

## 15.9 Stokes' Theorem

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Find the curl of  $\mathbf{F}$  (p. 1046)
- 2 Verify Stokes' Theorem (p. 1047)
- 3 Use Stokes' Theorem to find an integral (p. 1048)
- 4 Use Stokes' Theorem with conservative vector fields (p. 1049)
- 5 Interpret the curl of  $\mathbf{F}$  (p. 1050)

*Stokes' Theorem* is a second generalization of Green's Theorem to space. Stokes' Theorem expresses a certain relationship between a line integral of a vector field  $\mathbf{F}$  around a simple closed curve  $C$  in space to a surface integral for which  $C$  forms the boundary. The theorem is used in applications of electricity and magnetism, most notably in Ampere's Law and in the Maxwell–Faraday Law.

To get started, we need the definition of the *curl* of  $\mathbf{F}$ .

### DEFINITION Curl of $\mathbf{F}$

Let  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  be a vector field, where the functions  $P$ ,  $Q$ , and  $R$  have first-order partial derivatives. The **curl of  $\mathbf{F}$** , denoted by  $\text{curl } \mathbf{F}$ , is defined as\*

$$\text{curl } \mathbf{F} = \left( \frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \mathbf{i} - \left( \frac{\partial R}{\partial x} - \frac{\partial P}{\partial z} \right) \mathbf{j} + \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \mathbf{k}$$

**ORIGINS** Stokes' Theorem is named after the Irish mathematician George Gabriel Stokes (1819–1903). Stokes, along with Maxwell and Kelvin, contributed to the prominence of the Cambridge School of Mathematical Physics.

Rather than memorize this definition, you can write the curl in the form of the symbolic determinant:

$$\text{curl } \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix}$$

## 1 Find the Curl of $\mathbf{F}$

### EXAMPLE 1 Finding the Curl of $\mathbf{F}$

Find  $\text{curl } \mathbf{F}$  if  $\mathbf{F} = x^2y\mathbf{i} - 2xz\mathbf{j} + 2yz\mathbf{k}$ .

**Solution**

$$\begin{aligned} \text{curl } \mathbf{F} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ x^2y & -2xz & 2yz \end{vmatrix} \\ &= \left[ \frac{\partial}{\partial y}(2yz) - \frac{\partial}{\partial z}(-2xz) \right] \mathbf{i} - \left[ \frac{\partial}{\partial x}(2yz) - \frac{\partial}{\partial z}(x^2y) \right] \mathbf{j} + \left[ \frac{\partial}{\partial x}(-2xz) - \frac{\partial}{\partial y}(x^2y) \right] \mathbf{k} \\ &= (2z + 2x)\mathbf{i} - (0 - 0)\mathbf{j} + (-2z - x^2)\mathbf{k} = (2z + 2x)\mathbf{i} + (-2z - x^2)\mathbf{k} \end{aligned}$$

### NOW WORK Problem 11.

*Stokes' Theorem* can be stated in vector form as

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS \quad (1)$$

under certain conditions on the surface  $S$  and the curve  $C$ .

The conditions require the surface  $S$  to be:

- *Smooth.* That is, for any parametrization  $\mathbf{r} = \mathbf{r}(u, v)$  of  $S$ ,  $\mathbf{r}$  must have continuous first-order partial derivatives in the parameter domain  $R$  and  $\mathbf{r}_u \times \mathbf{r}_v \neq \mathbf{0}$ .
- *Simply connected.* That is, there can be no “holes” in  $S$ .
- *Orientable.* That is, it must be possible to choose a unit normal vector  $\mathbf{n}$  at each point of  $S$ , which we take as the positive direction of  $\mathbf{n}$ . The positively oriented

\*Some books define  $\text{curl } \mathbf{F}$  as the cross product  $\nabla \times \mathbf{F}$ , where  $\nabla$  is the partial differential operator

$\nabla = \frac{\partial}{\partial x}\mathbf{i} + \frac{\partial}{\partial y}\mathbf{j} + \frac{\partial}{\partial z}\mathbf{k}$  and  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j} + R\mathbf{k}$ .

Figure 71

vector  $\mathbf{n}$  must vary continuously, and as it moves around any closed curve on the surface,  $\mathbf{n}$  must return to its original direction.

- The curve  $C$  of the line integral in (1) is a piecewise-smooth, simple closed curve that forms the boundary of the surface  $S$ . The positively oriented surface  $S$  induces a *positive orientation* on  $C$  in the sense that if you walk around  $C$  in the positive direction with your head pointing in the same direction as the unit normal  $\mathbf{n}$  to  $S$ , then the surface will always be to your left, as shown in Figure 71.

### THEOREM Stokes' Theorem

Let  $S$  be a smooth, simply connected, orientable surface bounded by a piecewise-smooth, simple closed curve  $C$ . Let  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  be a vector field, where  $P$ ,  $Q$ , and  $R$  have continuous first-order partial derivatives throughout a solid  $E$  containing  $S$  and  $C$ . Let  $\mathbf{n}$  denote the positive unit normal to  $S$ , and let  $C$  be positively oriented, as described earlier. Then

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$$

In terms of the components of each vector, Stokes' Theorem takes the form

$$\oint_C (P \, dx + Q \, dy + R \, dz) = \iint_S \left[ \left( \frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) dy \, dz - \left( \frac{\partial R}{\partial x} - \frac{\partial P}{\partial z} \right) dz \, dx + \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx \, dy \right]$$

The proof of Stokes' Theorem is given in advanced calculus books.

## 2 Verify Stokes' Theorem

### EXAMPLE 2 Verifying Stokes' Theorem

Verify Stokes' Theorem for  $\mathbf{F} = y\mathbf{i} - x\mathbf{j}$ , where the surface  $S$  is the paraboloid  $z = x^2 + y^2$ , with  $x^2 + y^2 = 1$ ,  $z = 1$ , as its boundary  $C$ .

**Solution** Figure 72 shows the paraboloid and the circle  $C$  in the plane  $z = 1$ . Stokes' Theorem states the following:

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$$

Parametric equations for  $C$  are  $x = \cos t$ ,  $y = \sin t$ ,  $z = 1$ ,  $0 \leq t \leq 2\pi$ . We use the parametric equations to find the line integral  $\oint_C \mathbf{F} \cdot d\mathbf{r}$  for  $\mathbf{F} = y\mathbf{i} - x\mathbf{j}$ .

$$\begin{aligned} \oint_C \mathbf{F} \cdot d\mathbf{r} &= \oint_C (y \, dx - x \, dy) = \int_0^{2\pi} [\sin t (-\sin t \, dt) - \cos t \cos t \, dt] \\ &= - \int_0^{2\pi} [\sin^2 t + \cos^2 t] \, dt = - \int_0^{2\pi} dt = -2\pi \end{aligned}$$

To find the surface integral,  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$ , we find  $\text{curl } \mathbf{F}$  and  $\mathbf{n}$ :

$$\begin{aligned} \text{curl } \mathbf{F} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ y & -x & 0 \end{vmatrix} \\ &= \left[ \frac{\partial}{\partial y} 0 - \frac{\partial}{\partial z} (-x) \right] \mathbf{i} - \left[ \frac{\partial}{\partial x} 0 - \frac{\partial}{\partial z} y \right] \mathbf{j} + \left[ \frac{\partial}{\partial x} (-x) - \frac{\partial}{\partial y} y \right] \mathbf{k} \\ &= 0\mathbf{i} - 0\mathbf{j} - 2\mathbf{k} = -2\mathbf{k} \end{aligned}$$

 Figure 72  $C: x^2 + y^2 = 1; z = 1$

For  $z = f(x, y) = x^2 + y^2$ , we have

$$\mathbf{n} = \frac{-f_x(x, y)\mathbf{i} - f_y(x, y)\mathbf{j} + \mathbf{k}}{\sqrt{[f_x(x, y)]^2 + [f_y(x, y)]^2 + 1}} = \frac{-2x\mathbf{i} - 2y\mathbf{j} + \mathbf{k}}{\sqrt{4x^2 + 4y^2 + 1}}$$

$$\text{curl } \mathbf{F} \cdot \mathbf{n} = -2\mathbf{k} \cdot \frac{1}{\sqrt{4x^2 + 4y^2 + 1}} (-2x\mathbf{i} - 2y\mathbf{j} + \mathbf{k}) = \frac{-2}{\sqrt{4x^2 + 4y^2 + 1}}$$

So,

$$\begin{aligned} \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS &= \iint_S \frac{-2}{\sqrt{4x^2 + 4y^2 + 1}} \, dS = \iint_D \frac{-2}{\sqrt{4x^2 + 4y^2 + 1}} \sqrt{4x^2 + 4y^2 + 1} \, dx \, dy \\ &\quad \text{where } dS = \sqrt{4x^2 + 4y^2 + 1} \, dx \, dy \\ &= -2 \iint_D dx \, dy = -2\pi \end{aligned}$$

where  $D$  is the interior of the circle  $x^2 + y^2 = 1$ . ■

### NOW WORK Problem 19.

## 3 Use Stokes' Theorem to Find an Integral

### EXAMPLE 3 Using Stokes' Theorem to Find a Surface Integral

Find the surface integral  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $\mathbf{F} = \mathbf{F}(x, y, z) = y\mathbf{i} + x\mathbf{j} + z\mathbf{k}$  and  $S$  is the surface  $z = 5 - (x^2 + y^2)$ ,  $z \geq 1$ , using Stokes' Theorem.

**Solution** Figure 73 shows the surface  $S$ . The boundary curve  $C$  is the circle  $x^2 + y^2 = 4$  that lies in the plane  $z = 1$ . The vector form of  $C$  is  $\mathbf{r} = \mathbf{r}(t) = 2 \cos t \mathbf{i} + 2 \sin t \mathbf{j} + \mathbf{k}$ ,  $0 \leq t \leq 2\pi$ . Then

$$d\mathbf{r} = (-2 \sin t \mathbf{i} + 2 \cos t \mathbf{j}) \, dt$$

$$\mathbf{F} = y\mathbf{i} + x\mathbf{j} + z\mathbf{k} = 2 \sin t \mathbf{i} + 2 \cos t \mathbf{j} + \mathbf{k}$$

$$\mathbf{F} \cdot d\mathbf{r} = (-4 \sin^2 t + 4 \cos^2 t) \, dt = 4 \cos(2t) \, dt$$

Now we use Stokes' Theorem.

$$\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS = \oint_C \mathbf{F} \cdot d\mathbf{r} = \int_0^{2\pi} 4 \cos(2t) \, dt = 2 [\sin(2t)]_0^{2\pi} = 0$$

### NOW WORK Problem 25.

In Example 3, we found the surface integral  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$  using the line integral of  $\mathbf{F}$  on the boundary  $C$  of the surface  $S$ . This means that for any surface  $S_1$  with the same orientation and the same boundary curve as  $S$ , the surface integral  $\iint_{S_1} \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS_1$  will have the same value as  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$ .

We can use Stokes' Theorem to find a line integral, and avoid having to find a surface integral. However, it is more frequently used in the opposite direction. In cases where it is not easy to find the line integral  $\oint_C \mathbf{F} \cdot d\mathbf{r}$ , but the quantity  $\text{curl } \mathbf{F} \cdot \mathbf{n}$  is simple in form on an open surface with boundary  $C$ , then it can be easier to find  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS$ .

Figure 73

**EXAMPLE 4** Using Stokes' Theorem to Find a Line Integral

Find  $I = \oint_C [(e^{-x^2/2} - yz) dx + (e^{-y^2/2} + xz + 2x) dy + (e^{-z^2/2} + 5) dz]$ , where  $C$  is the circle  $x = \cos t$ ,  $y = \sin t$ ,  $z = 2$ ,  $0 \leq t \leq 2\pi$ .

**Solution** Let  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j} + R\mathbf{k}$ , with  $P = e^{-x^2/2} - yz$ ,  $Q = e^{-y^2/2} + xz + 2x$ , and  $R = e^{-z^2/2} + 5$ . It can be verified that

$$\text{curl } \mathbf{F} = -x\mathbf{i} - y\mathbf{j} + (2 + 2z)\mathbf{k}$$

To use Stokes' Theorem, take  $S$  to be a plane region enclosed by the circle  $C$  in the plane  $z = 2$  so that  $\mathbf{n} = \mathbf{k}$ . Then  $\text{curl } \mathbf{F} \cdot \mathbf{n} = 6$  on  $S$ , and

$$I = \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} dS = 6 \iint_S dx dy = 6\pi$$

**NOW WORK** Problem 27.**4 Apply Stokes' Theorem to Conservative Vector Fields**

A vector field  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  is conservative if  $\mathbf{F}$  is the gradient of some function  $w = f(x, y, z)$ . An extension of earlier proofs shows that  $\mathbf{F}$  is a conservative vector field if and only if  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is independent of the path, where  $C$  is a piecewise-smooth curve in space and  $\mathbf{F} = \mathbf{F}(x, y, z)$  is defined on some open, connected solid in space. In particular, if  $C$  is simple and closed, then  $\mathbf{F}$  is a conservative vector field if and only if  $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$  for every piecewise-smooth, simple closed curve  $C$ .

Stokes' Theorem provides an easy way to determine whether a vector field  $\mathbf{F}$  in space is a conservative vector field.

**THEOREM Conservative Vector Fields in Space**

Let  $\mathbf{F} = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  be a vector field whose components  $P$ ,  $Q$ , and  $R$  have continuous first-order partial derivatives throughout a solid  $E$  whose boundary is a surface  $S$  satisfying the conditions of Stokes' Theorem. Then  $\mathbf{F}$  is a conservative vector field if and only if  $\text{curl } \mathbf{F} = \mathbf{0}$  throughout  $S$ .

**Partial Proof** We provide only an outline of the proof. Suppose  $\text{curl } \mathbf{F} = \mathbf{0}$ . Then, by Stokes' Theorem,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} dS = 0$$

for any closed curve  $C$ . That is,  $\mathbf{F}$  is a conservative vector field.

Conversely, suppose  $\mathbf{F}$  is conservative. Then  $\mathbf{F} = \nabla f$  for some function  $f$ . Since  $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$ , and  $\nabla f(x, y, z) = \frac{\partial}{\partial x} f(x, y, z)\mathbf{i} + \frac{\partial}{\partial y} f(x, y, z)\mathbf{j} + \frac{\partial}{\partial z} f(x, y, z)\mathbf{k}$ , then

$$\begin{aligned} \text{curl } \mathbf{F} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{\partial}{\partial x} f(x, y, z) & \frac{\partial}{\partial y} f(x, y, z) & \frac{\partial}{\partial z} f(x, y, z) \end{vmatrix} \\ &= \left( \frac{\partial^2 f}{\partial y \partial z} - \frac{\partial^2 f}{\partial z \partial y} \right) \mathbf{i} - \left( \frac{\partial^2 f}{\partial x \partial z} - \frac{\partial^2 f}{\partial z \partial x} \right) \mathbf{j} + \left( \frac{\partial^2 f}{\partial x \partial y} - \frac{\partial^2 f}{\partial y \partial x} \right) \mathbf{k} \\ &= 0\mathbf{i} + 0\mathbf{j} + 0\mathbf{k} = \mathbf{0} \end{aligned}$$

**NEED TO REVIEW?** The Equality of Mixed Partials Theorem is discussed in Section 12.3, p 835.

The following statements are similar to those listed in the Summary at the end of Section 15.3 for a vector field in the plane.

## Summary

Suppose  $\mathbf{F} = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  is a vector field whose components  $P$ ,  $Q$ , and  $R$  have continuous first-order partial derivatives throughout a solid  $E$  whose boundary is a smooth, simply connected, oriented surface  $S$  bounded by a piecewise-smooth, simple closed curve  $C$ . Then the following are equivalent statements for a vector field  $\mathbf{F} = P\mathbf{i} + Q\mathbf{j} + R\mathbf{k}$  in space:

- $\mathbf{F}$  is a conservative vector field.
- $\mathbf{F}$  is the gradient of some function.
- The work done by  $\mathbf{F}$  in moving an object of mass  $m$  from a point  $A$  to a point  $B$  in  $S$  is independent of the path from  $A$  to  $B$ .
- The work done by  $\mathbf{F}$  in moving an object of mass  $m$  along any piecewise-smooth, closed curve  $C$  in  $S$  is 0.
- $\text{curl } \mathbf{F} = \mathbf{0}$

Of all these equivalent statements, the easiest to establish is  $\text{curl } \mathbf{F} = \mathbf{0}$ .

### EXAMPLE 5 Showing That $\mathbf{F}$ Is a Conservative Vector Field

Show that  $\mathbf{F} = \left(\frac{3}{5}y^5 + 2z^2\right)\mathbf{i} + 3xy^4\mathbf{j} + 4xz\mathbf{k}$  is a conservative vector field in space.

**Solution** We find  $\text{curl } \mathbf{F}$ .

$$\text{curl } \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \frac{3}{5}y^5 + 2z^2 & 3xy^4 & 4xz \end{vmatrix} = (0 - 0)\mathbf{i} - (4z - 4z)\mathbf{j} + (3y^4 - 3y^4)\mathbf{k} = \mathbf{0}$$

Since  $\text{curl } \mathbf{F} = \mathbf{0}$ ,  $\mathbf{F}$  is conservative. ■

### NOW WORK Problem 31.

## 5 Interpret the Curl of $\mathbf{F}$

Stokes' Theorem provides an interpretation for the curl of a vector.

Suppose  $Q = (x_1, y_1, z_1)$  is the center of a circular disk  $S_\rho$  of radius  $\rho$  and  $C_\rho$  is the boundary of  $S_\rho$ , as shown in Figure 74. There is a Mean Value Theorem for double integrals that, when combined with Stokes' Theorem, gives us

$$\oint_{C_\rho} \mathbf{F} \cdot d\mathbf{r} = \iint_{S_\rho} \text{curl } \mathbf{F} \cdot \mathbf{n} \, dS = (\text{curl } \mathbf{F} \cdot \mathbf{n})_{Q^*} (\pi\rho^2)$$

where  $(\text{curl } \mathbf{F} \cdot \mathbf{n})_{Q^*}$  is the value of  $\text{curl } \mathbf{F} \cdot \mathbf{n}$  evaluated at a suitably chosen point  $Q^* = (x^*, y^*, z^*)$  in  $S_\rho$ , and where  $\pi\rho^2$  is the area of  $S_\rho$ . Then

$$(\text{curl } \mathbf{F} \cdot \mathbf{n})_{Q^*} = \frac{1}{\pi\rho^2} \oint_{C_\rho} \mathbf{F} \cdot d\mathbf{r}$$

Now, if  $\rho$  is allowed to approach 0, then  $Q^* \rightarrow Q$ , and

$$(\text{curl } \mathbf{F} \cdot \mathbf{n})_Q = \lim_{\rho \rightarrow 0} \frac{1}{\pi\rho^2} \oint_{C_\rho} \mathbf{F} \cdot d\mathbf{r} \quad (2)$$

In the case where  $\mathbf{F}$  is the velocity of a fluid, the integral  $\oint_{C_\rho} \mathbf{F} \cdot d\mathbf{r}$  in (2) is referred to as the **circulation**, or **whirling tendency** of the fluid around  $C_\rho$ . It measures the extent to which the fluid rotates around the circle  $C_\rho$  in the direction of the orientation of  $C_\rho$ . Equation (2) therefore states that the component of  $\text{curl } \mathbf{F}$  at  $(x_1, y_1, z_1)$  in the direction of  $\mathbf{n}$  is the limiting ratio of circulation to area for a circle about  $(x_1, y_1, z_1)$  with  $\mathbf{n}$  as a normal, or

$$\text{Circulation per unit of area at } (x_1, y_1, z_1) = (\text{curl } \mathbf{F} \cdot \mathbf{n})_Q$$

The expression  $(\text{curl } \mathbf{F} \cdot \mathbf{n})_Q$  is a maximum at  $Q$  when  $\mathbf{n}$  has the same direction as  $\text{curl } \mathbf{F}$ .

Figure 74

DF Figure 75

**NEED TO REVIEW?** Angular velocity is discussed in Section 10.5, pp. 729–730.

**IN WORDS** If a fluid is rotating, the curl of the velocity vector is a constant vector that equals twice the angular velocity vector.

Suppose that a small paddle wheel of radius  $\rho$  is introduced into the fluid at  $Q$  with its axle directed along  $\mathbf{n}$ . The rate of spin of the paddle wheel is affected by the circulation of the fluid around  $C_\rho$ . The wheel will spin fastest when the circulation integral is maximized; that is, it will spin fastest when the axle of the paddle wheel is in the direction of  $\text{curl } \mathbf{F}$ . See Figure 75.

Another interpretation of the curl is based on motion.

### THEOREM Curl and Angular Velocity

Let  $\mathbf{F}$  be the velocity field of a fluid rotating about a fixed axis and let  $\boldsymbol{\omega}$  be the constant angular velocity. Then

$$\text{curl } \mathbf{F} = 2\boldsymbol{\omega}$$

**Proof** Since the motion of a fluid is simply a rotation about a given fixed axis in space, the angular velocity  $\boldsymbol{\omega}$  can be represented by a constant vector:

$$\boldsymbol{\omega} = \omega_1 \mathbf{i} + \omega_2 \mathbf{j} + \omega_3 \mathbf{k}$$

where the magnitude of  $\boldsymbol{\omega}$  is the angular speed and the direction of  $\boldsymbol{\omega}$  is along the direction of the axis of rotation, in accordance with the right-hand rule. If the origin of a rectangular coordinate system is on the fixed axis and  $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ , then the velocity vector  $\mathbf{F}$  is

$$\mathbf{F} = \boldsymbol{\omega} \times \mathbf{r}$$

and

$$\text{curl } \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ \omega_2 z - \omega_3 y & \omega_3 x - \omega_1 z & \omega_1 y - \omega_2 x \end{vmatrix}$$

Since  $\boldsymbol{\omega}$  is constant, then

$$\text{curl } \mathbf{F} = 2\omega_1 \mathbf{i} + 2\omega_2 \mathbf{j} + 2\omega_3 \mathbf{k} = 2\boldsymbol{\omega}$$

## Summary

We opened the chapter by stating that “vector calculus is the culmination of what we have learned throughout the course.” Now we end the chapter with a list of several of the formulas we have learned. The theorem formulas given below do not contain the important hypotheses necessary for the formulas to hold. Rather, this summary is meant to “pull everything together” and provide “the big picture of calculus.”

### Fundamental Theorem of Line Integrals

If  $\nabla f(x, y) = \mathbf{F}(x, y)$ , then

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C \nabla f \cdot d\mathbf{r} = \int_{(x_0, y_0)}^{(x_1, y_1)} \nabla f \cdot d\mathbf{r} = f(x_1, y_1) - f(x_0, y_0)$$

### Fundamental Theorem of Calculus

If  $F'(x) = f(x)$ , then

$$\int_a^b f(x) dx = \int_a^b F'(x) dx = F(b) - F(a)$$

### Green's Theorem

If  $\mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$ , then

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \oint_C (P dx + Q dy) = \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy$$

**Divergence Theorem**

If  $\mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$ , and  $\mathbf{n} = \cos \alpha \mathbf{i} + \cos \beta \mathbf{j} + \cos \gamma \mathbf{k}$ , then

$$\begin{aligned}\iiint_E \operatorname{div} \mathbf{F} \, dV &= \iint_S \mathbf{F} \cdot \mathbf{n} \, dS \\ \iiint_E \left( \frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z} \right) dV &= \iint_S (P \cos \alpha + Q \cos \beta + R \cos \gamma) \, dS\end{aligned}$$

**Stokes' Theorem**

If  $\mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$ , then

$$\begin{aligned}\oint_C \mathbf{F} \cdot d\mathbf{r} &= \iint_S \operatorname{curl} \mathbf{F} \cdot \mathbf{n} \, dS \\ \oint_C (P \, dx + Q \, dy + R \, dz) &= \iint_S \left[ \left( \frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) dy \, dz \right. \\ &\quad \left. - \left( \frac{\partial R}{\partial x} - \frac{\partial P}{\partial z} \right) dz \, dx + \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx \, dy \right]\end{aligned}$$

**15.9 Assess Your Understanding****Concepts and Vocabulary**

- True or False** The curl of a vector field  $\mathbf{F}$  is a scalar.
- If the vector field  $\mathbf{F} = (e^{-x^2/2} - yz)\mathbf{i} + (e^{-y^2/2} + xz + 2x)\mathbf{j} + (e^{-z^2/2} + 5)\mathbf{k}$ , then  $\operatorname{curl} \mathbf{F} =$  \_\_\_\_\_.
- Multiple Choice** A vector field  $\mathbf{F}$  is conservative if and only if  $\operatorname{curl} \mathbf{F} =$  [(a)  $\mathbf{F}$ , (b)  $\operatorname{div} \mathbf{F}$ , (c)  $\mathbf{0}$ , (d)  $\mathbf{n}$ ].
- True or False** An interpretation of the curl of  $\mathbf{F}$  is circulation per unit area of a fluid at a given point on a surface.
- Suppose  $\mathbf{F}$  is the velocity vector of a fluid rotating about a fixed axis and that  $\omega$  is a constant angular velocity. Then  $\operatorname{curl} \mathbf{F} =$  \_\_\_\_\_.
- True or False** If  $\mathbf{F}$  is a conservative vector field, then the work done by  $\mathbf{F}$  in moving an object of mass  $m$  from point  $A$  to point  $B$  depends on the path taken from  $A$  to  $B$ .

**Skill Building**

In Problems 7–18, find  $\operatorname{curl} \mathbf{F}$ .

- $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j}$
- $\mathbf{F}(x, y, z) = y\mathbf{i} + x\mathbf{j}$
- $\mathbf{F}(x, y, z) = xyz\mathbf{i} + xz\mathbf{j} + zk$
- $\mathbf{F}(x, y, z) = 4x\mathbf{i} - y\mathbf{j} - 2z\mathbf{k}$
- $\mathbf{F}(x, y, z) = 3xyz^2\mathbf{i} + y^2 \sin z\mathbf{j} + xe^{2z}\mathbf{k}$
- $\mathbf{F}(x, y, z) = yz\mathbf{i} + z^2x\mathbf{j} + yz\mathbf{k}$
- $\mathbf{F}(x, y, z) = \frac{x\mathbf{i}}{x^2 + y^2 + z^2} + \frac{y\mathbf{j}}{x^2 + y^2 + z^2} + \frac{z\mathbf{k}}{x^2 + y^2 + z^2}$

- $\mathbf{F}(x, y, z) = e^x\mathbf{i} + x^2y\mathbf{j} + e^z\mathbf{k}$
- $\mathbf{F}(x, y, z) = \cos x\mathbf{i} + \sin y\mathbf{j} + e^{xz}\mathbf{k}$
- $\mathbf{F}(x, y, z) = \sin(xy)\mathbf{i} + \cos(xy^2)\mathbf{j} + x\mathbf{k}$
- $\mathbf{F}(x, y, z) = (x + y)\mathbf{i} + (y + z)\mathbf{j} + (z + x)\mathbf{k}$
- $\mathbf{F}(x, y, z) = (y + z)\mathbf{i} + (z + x)\mathbf{j} + (z + y + x)\mathbf{k}$

In Problems 19–24, verify Stokes' Theorem for each vector field  $\mathbf{F}$  and surface  $S$ .

- $\mathbf{F} = (z - y)\mathbf{i} + (z + x)\mathbf{j} - (x + y)\mathbf{k}$ ;  $S$  is the portion of the paraboloid  $z = 1 - x^2 - y^2$ ,  $z \geq 0$ .
- $\mathbf{F} = y\mathbf{i} + z\mathbf{j} + x\mathbf{k}$ ;  $S$  is the portion of the paraboloid  $z = 1 - x^2 - y^2$ ,  $z \geq 0$ .
- $\mathbf{F} = y\mathbf{i} - x\mathbf{j}$ ;  $S$  is the hemisphere  $z = \sqrt{1 - x^2 - y^2}$ .
- $\mathbf{F} = z\mathbf{i} + x\mathbf{j} + y\mathbf{k}$ ;  $S$  is the hemisphere  $z = \sqrt{1 - x^2 - y^2}$ .
- $\mathbf{F} = y^2\mathbf{i} + x\mathbf{j} - xz\mathbf{k}$ ;  $S$  is the surface  $z = 1 - x^2 - y^2$ ,  $z \geq 0$ .
- $\mathbf{F}(x, y, z) = 4x\mathbf{i} - y\mathbf{j} + 2z\mathbf{k}$ ;  $S$  is the surface  $z = 1 + x^2 + y^2$ ,  $z \leq 5$ .
- Use Stokes' Theorem to find the surface integral  $\iint_S \operatorname{curl} \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $\mathbf{F} = \mathbf{F}(x, y, z) = y\mathbf{i} + x\mathbf{j} + x^2\mathbf{k}$  and  $S$  is the surface enclosed by the paraboloid  $z = 9 - x^2 - y^2$ ,  $z \geq 0$ .
- Use Stokes' Theorem to find the surface integral  $\iint_S \operatorname{curl} \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $\mathbf{F} = \mathbf{F}(x, y, z) = 4z\mathbf{i} + 3x\mathbf{j} + 3y\mathbf{k}$  and  $S$  is the surface enclosed by the paraboloid  $z = 10 - x^2 - y^2$ ,  $z \geq 4$ .

In Problems 27–30, use Stokes' Theorem to find each line integral. Verify your answer by a direct calculation of the line integral. Assume the orientation of  $C$  is counterclockwise.

27.  $\oint_C [(y+z)dx + (z+x)dy + (x+y)dz]$ ;  $C$  is the curve of intersection of  $x^2 + y^2 + z^2 = 1$ , and  $x + y + z = 0$ .
28.  $\oint_C [(y-z)dx + (z-x)dy + (x-y)dz]$ ;  $C$  is the curve of intersection of  $x^2 + y^2 = 1$ , and  $x + z = 1$ .
29.  $\oint_C [x dx + (x+y)dy + (x+y+z)dz]$ ;  $C$  is the curve  $x = 2 \cos t$ ,  $y = 2 \sin t$ ,  $z = 2$ ,  $0 \leq t \leq 2\pi$ .
30.  $\oint_C (y^2 dx + z^2 dy + x^2 dz)$ ;  $C$  is the triangle with vertices  $(1, 0, 0)$ ,  $(0, 1, 0)$ , and  $(0, 0, 1)$ .

In Problems 31–34, determine if the force  $\mathbf{F}$  is a conservative vector field.

31.  $\mathbf{F} = x\mathbf{i} + y\mathbf{j}$       32.  $\mathbf{F} = y\mathbf{i} + x\mathbf{j}$
33.  $\mathbf{F} = xy\mathbf{i} + yz\mathbf{j} + zx\mathbf{k}$       34.  $\mathbf{F} = yz\mathbf{i} + zx\mathbf{j} + xy\mathbf{k}$

### Applications and Extensions

35. Find the value of the constant  $c$  so that  $\mathbf{F} = xy\mathbf{i} + cx^2\mathbf{j}$  in space is a conservative vector field.
36. Find the value of the constant  $c$  so that  $\mathbf{F} = \frac{z}{y}\mathbf{i} + c\frac{xz}{y^2}\mathbf{j} + \frac{x}{y}\mathbf{k}$ ,  $y \neq 0$ , is a conservative vector field.
37. Show that  $\text{curl}(\mathbf{F} + \mathbf{G}) = \text{curl } \mathbf{F} + \text{curl } \mathbf{G}$ .
38. Show that  $\text{curl}(c\mathbf{F}) = c(\text{curl } \mathbf{F})$ , where  $c$  is a constant.
39. If  $\mathbf{F}(x, y, z) = z\mathbf{i} + x\mathbf{j} + y\mathbf{k}$ , find  $\iint_S \mathbf{F} \cdot \mathbf{n} dS$ , where  $S$  is the hemisphere  $z = \sqrt{1 - x^2 - y^2}$ .
40. Rework Problem 39, where  $S$  is the circular region  $x^2 + y^2 \leq 1$ ,  $z = 0$ .
41. Show that  $\mathbf{F} = y\mathbf{i} - x\mathbf{j} + z\mathbf{k}$  is not a conservative vector field. Nevertheless, there are certain paths  $C$  for which  $\oint_C \mathbf{F} \cdot d\mathbf{r} = 0$ . Find one.

42. Show that  $\text{div}(\text{curl } \mathbf{F}) = \mathbf{0}$ , where  $\mathbf{F} = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  and  $P$ ,  $Q$ , and  $R$  are twice differentiable and the partial derivatives are continuous.
43. Suppose  $\mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  is a vector field with continuous and differentiable components in a simply connected region of space.
- (a) Use Stokes' Theorem to show that  $\mathbf{F}$  is a gradient field if  $Q_x = P_y$ ,  $R_y = Q_z$ , and  $P_z = R_x$ .
- (b) Why does it follow that  $\int_C \mathbf{F} \cdot d\mathbf{r}$  is independent of the path when these conditions hold?
44. Use Problem 43 to show that  $\int_C [(yz - y - z)dx + (xz - x - z)dy + (xy - x - y)dz]$  is independent of the path.
45. **Work** An object is moved from the origin to the point  $(a, b, c)$  in the field of force  $\mathbf{F} = (x+y)\mathbf{i} + (x-z)\mathbf{j} + (z-y)\mathbf{k}$ . Show that the work done depends on only  $a$ ,  $b$ , and  $c$ , and find this value.
46. Show that no twice differentiable vector function exists whose curl is  $x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ .

### Challenge Problems

47. Let  $\mathbf{F}(x, y, z)$  be a vector field with continuous and differentiable components, and let  $S$  be a sphere with outer unit normal  $\mathbf{n}$ . Use Stokes' Theorem to show that  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} dS = 0$ .
48. Assume that the hypotheses of the Divergence Theorem hold for  $S$  and  $E$ . Show that for any vector field  $\mathbf{F}$  with continuous first-order partial derivatives in a closed, bounded solid  $E$  with orientable boundary  $S$  with outer unit normal  $\mathbf{n}$ ,  $\iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} dS = 0$ .
49. Let  $C$  be a smooth, simple, closed curve lying on an orientable surface  $S$ , and let  $f$  and  $g$  have continuous partial derivatives on  $S$ . Show that  $\int_C (f\nabla g) \cdot d\mathbf{r} = \iint_S (\nabla f \times \nabla g) \cdot \mathbf{n} dS$ . Assume that the portion of  $S$  bounded by  $C$  is smooth and simply connected.

## Chapter Review

### THINGS TO KNOW

#### 15.1 Vector Fields

- A vector field  $\mathbf{F}$  in the plane:  
 $\mathbf{F} = \mathbf{F}(x, y) = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$  (p. 974)
- A vector field  $\mathbf{F}$  in space:  
 $\mathbf{F} = \mathbf{F}(x, y, z) = P(x, y, z)\mathbf{i} + Q(x, y, z)\mathbf{j} + R(x, y, z)\mathbf{k}$  (p. 974)

#### 15.2 Line Integrals

- Line integral of  $f$  along a smooth curve  $C$ :  
$$\int_C f(x, y) ds = \int_a^b f(x(t), y(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt$$
 (p. 978)
- The line integral of  $P dx + Q dy$  along a smooth curve  $C$  in the plane:  
 $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$  (p. 983)

- The line integral of  $P dx + Q dy + R dz$  along a smooth curve  $C$  in space:  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy + R dz)$  (p. 986)
- A piecewise-smooth curve  $C$  consists of a finite number of smooth curves that are joined together end to end. (p. 984)

#### 15.3 Fundamental Theorem of Line Integrals

- $\mathbf{F}$  is a conservative vector field if  $\mathbf{F} = \nabla f$ ; the function  $f$  is called the potential function for  $\mathbf{F}$ . (p. 990)
- A vector field  $\mathbf{F}$  is conservative if and only if  $\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}$ . (p. 997)
- A piecewise-smooth curve  $C$  is closed if its initial point and terminal point coincide. The curve  $C$  is simple if it does not intersect itself. (p. 996)
- Simply connected region (p. 996)
- Fundamental Theorem of Line Integrals: If  $\mathbf{F}$  is a conservative field, then  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_{(x_0, y_0)}^{(x_1, y_1)} \mathbf{F} \cdot d\mathbf{r} = f(x_1, y_1) - f(x_0, y_0)$ . (p. 990)

- If  $\mathbf{F}$  is a conservative vector field on an open region  $R$  and  $C$  is a closed, piecewise-smooth curve in  $R$ , then  $\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy) = 0$ . (p. 992)

### 15.4 An Application of Line Integrals: Work

- Work:  $W = \int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (P dx + Q dy)$  (p. 1003)
- If  $\mathbf{F}$  is a conservative force field, the work  $W$  done by  $\mathbf{F}$  in moving an object along a closed path is 0. (p. 1004)
- Law of Conservation of Energy (p. 1006)

### 15.5 Green's Theorem

- Green's Theorem: 
$$\oint_C (P dx + Q dy) = \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy$$
 (p. 1008)
- Green's Theorem for Area:  $A = \frac{1}{2} \oint_C (-y dx + x dy)$  (p. 1010)

### 15.6 Parametric Surfaces

- Parametrization; parameter domain (p. 1016)
- Coordinate curves (p. 1017)
- Smooth parametrization; smooth surface (p. 1021)
- Surface area of a parametrized surface:

$$S = \iint_R dS = \iint_R \|\mathbf{r}_u \times \mathbf{r}_v\| du dv \quad (\text{p. 1024})$$

### 15.7 Surface and Flux Integrals

- A surface integral expressed as a double integral: 
$$\iint_S F(x, y, z) dS = \iint_R F(x(u, v), y(u, v), z(u, v)) \|\mathbf{r}_u \times \mathbf{r}_v\| du dv$$
 (p. 1027)
- Orientable surface (p. 1030)
- The flux of  $\mathbf{F}$  across  $S$ : 
$$\frac{\text{Mass of fluid}}{\text{Unit time}} = \iint_S \rho \mathbf{F} \cdot \mathbf{n} dS$$
, where  $\rho$  is the mass density of the fluid, the vector field  $\mathbf{F}$  is the velocity of the fluid, and  $\mathbf{n}$  is a unit normal vector of  $S$  (p. 1034)

### 15.8 The Divergence Theorem

- $\text{div } \mathbf{F} = \frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z}$  (p. 1038)
- Divergence Theorem: 
$$\iiint_E \text{div } \mathbf{F} dV = \iint_S \mathbf{F} \cdot \mathbf{n} dS$$
 (p. 1038)

### 15.9 Stokes' Theorem

- $\text{curl } \mathbf{F} = \left( \frac{\partial R}{\partial y} - \frac{\partial Q}{\partial z} \right) \mathbf{i} - \left( \frac{\partial R}{\partial x} - \frac{\partial P}{\partial z} \right) \mathbf{j} + \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \mathbf{k}$  (p. 1046)
- Stokes' Theorem: 
$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \text{curl } \mathbf{F} \cdot \mathbf{n} dS$$
 (p. 1047)
- $\mathbf{F}$  is a conservative vector field in space if and only if  $\text{curl } \mathbf{F} = 0$  (p. 1049)

## OBJECTIVES

| Section | You should be able to ...                                                                                           | Examples | Review Exercises         |
|---------|---------------------------------------------------------------------------------------------------------------------|----------|--------------------------|
| 15.1    | 1 Describe a vector field (p. 974)                                                                                  | 1–6      | 1, 2                     |
| 15.2    | 1 Define a line integral in the plane (p. 977)                                                                      |          |                          |
|         | 2 Find the value of a line integral along a smooth curve (p. 979)                                                   | 1–4      | 11, 15                   |
|         | 3 Find line integrals of the form $\int_C f(x, y) dx$ and $\int_C f(x, y) dy$ (p. 981)                              | 5–7      | 3, 4, 12(a), (c), 14, 23 |
|         | 4 Find line integrals along a piecewise-smooth curve (p. 984)                                                       | 8        | 12(b), 21                |
|         | 5 Find the value of a line integral in space (p. 985)                                                               | 9        | 7, 8                     |
| 15.3    | 1 Identify a conservative vector field and a potential function (p. 990)                                            | 1        | 9(a)                     |
|         | 2 Use the Fundamental Theorem of Line Integrals (p. 991)                                                            | 2, 3     | 6(b), 9(b), 10           |
|         | 3 Reconstruct a function from its gradient: Finding the potential function for a conservative vector field (p. 995) | 4        | 6(a)                     |
|         | 4 Determine whether a vector field is conservative (p. 996)                                                         | 5–8      | 5                        |
| 15.4    | 1 Compute work (p. 1003)                                                                                            | 1, 2     | 16–18                    |
| 15.5    | 1 Use Green's Theorem to find a line integral (p. 1009)                                                             | 1, 2     | 12(d), 20, 22, 24        |
|         | 2 Use Green's Theorem to find area (p. 1010)                                                                        | 3        | 19                       |
|         | 3 Use Green's Theorem with multiply-connected regions (p. 1011)                                                     | 4        | 25                       |
| 15.6    | 1 Describe surfaces defined parametrically (p. 1017)                                                                | 1, 2     | 26                       |
|         | 2 Find a parametric representation of a surface (p. 1018)                                                           | 3–5      | 27                       |
|         | 3 Find equations for a tangent plane and a normal line (p. 1022)                                                    | 6, 7     | 28                       |
|         | 4 Find the surface area of a parametrized surface (p. 1023)                                                         | 8        | 29                       |
| 15.7    | 1 Find a surface integral using a double integral (p. 1027)                                                         | 1–3      | 13, 30, 31, 33–35        |
|         | 2 Determine the orientation of a surface (p. 1030)                                                                  | 4–6      | 32                       |
|         | 3 Find the flux of a vector field across a surface (p. 1033)                                                        | 7, 8     | 36, 46(a)                |

## REVIEW EXERCISES

- Describe the vector field  $\mathbf{F}(x, y) = 3\mathbf{i} + \mathbf{j}$  by drawing some of its vectors.
- Describe the vector field  $\mathbf{F}(x, y) = \sin x \mathbf{i} + \mathbf{j}$  by drawing some of its vectors.
- Find  $\int_C \left( \frac{dx}{y} + \frac{dy}{x} \right)$ , where  $C$  is the arc of the parabola  $y = x^2$  from  $(1, 1)$  to  $(2, 4)$ .
- Find  $\int_C [y \cos(xy) dx + x \cos(xy) dy]$ , where  $C$  is the curve  $x = t^2, y = t^3, 0 \leq t \leq 1$ .
- (a) Confirm that the line integral  $\int_C [y \cos(xy) dx + x \cos(xy) dy]$  is independent of the path.  
 (b) Find  $\int_C [y \cos(xy) dx + x \cos(xy) dy]$  by following the right-angle path from  $(0, 0)$  to  $(1, 0)$  to  $(1, 1)$ .
- (a) Find a function  $f$  whose gradient is  $y \cos(xy) \mathbf{i} + x \cos(xy) \mathbf{j}$ .  
 (b) Explain why  $\int_C [y \cos(xy) dx + x \cos(xy) dy] = f(1, 1) - f(0, 0)$ , where  $C$  is a smooth curve joining  $(0, 0)$  to  $(1, 1)$ .
- Find  $\int_C [(yz - y - z) dx + (xz - x - z) dy + (xy - x - y) dz]$ , where  $C$  is the twisted cubic  $x = t, y = t^2, z = t^3, 0 \leq t \leq 1$ .
- Find  $\int_C \mathbf{F} \cdot d\mathbf{r}$  if  $\mathbf{F}(x, y, z) = xy \mathbf{i} + xz \mathbf{j} + (y - x) \mathbf{k}$  and  $C$  is the line segment from  $(0, 0, 0)$  to  $(1, -2, 3)$ .
- (a) Show that  $f(x, y) = 3x^2 + y - 2$  is a potential function of  $\mathbf{F}(x, y) = 6x\mathbf{i} + \mathbf{j}$ .  
 (b) Use the Fundamental Theorem of Line Integrals to find  $\int_C [6x dx + dy]$ , where  $C$  is any curve joining the two points  $(4, 1)$  to  $(6, 3)$ .
- Find  $\int_C [e^x \sin y dx + e^x \cos y dy]$ , where  $C$  is the arc of the parabola  $y = x^2$  from  $(0, 0)$  to  $(1, 1)$ .  
 (Hint:  $\nabla(e^x \sin y) = e^x \sin y \mathbf{i} + e^x \cos y \mathbf{j}$ .)
- Mass of a Wire** Find the mass of a thin piece of wire in the shape of a circular arc  $x = \cos t, y = \sin t, 0 \leq t \leq \frac{3\pi}{4}$ , if the variable mass density of the wire is  $\rho(x, y) = x + 1$ .
- Find the line integral  $\int_C (x^3 dx + y^3 dy)$ 
  - if  $C$  consists of the line segment from  $(1, 1)$  to  $(2, 4)$ .
  - if  $C$  consists of line segments from  $(1, 1)$  to  $(1, 5)$ , from  $(1, 5)$  to  $(2, 3)$  and from  $(2, 3)$  to  $(2, 4)$ .
  - if  $C$  is a part of the parabola  $x = t, y = t^2, 1 \leq t \leq 2$ .
  - by using Green's Theorem to find  $\oint_C (y^2 dx + xy dy)$  if  $C$  is the closed curve given by  $y = 3x - 2$  and  $y = x^2$ .
- Mass of a Lamina** A lamina is in the shape of the cone  $z = \sqrt{x^2 + y^2}, 1 \leq z \leq 4$ . If the mass density of the lamina is  $\rho(x, y, z) = x^2 + y^2$ , find the mass  $M$  of the lamina.
- Find  $\int_C [x^2 y^3 dx - xy^4 dy]$ , where  $C$  is the arc of the parabola  $y^2 = x$  from  $(0, 0)$  to  $(1, 1)$ .
- Find  $\int_C x^2 y^2 ds$ ;  $C: x = \cos t, y = \sin t; 0 \leq t \leq \pi$ .
- Work** If  $\mathbf{F}(x, y) = \frac{y}{(x^2 + y^2)^{3/2}} \mathbf{i} - \frac{x}{(x^2 + y^2)^{3/2}} \mathbf{j}$ , find the work done by going around the unit circle against  $\mathbf{F}$  from  $t = 0$  to  $t = 2\pi$ .
- Work** Find the work done by the force  $\mathbf{F} = y \sin x \mathbf{i} + \sin x \mathbf{j}$  in moving an object along the curve  $y = \sin x$  from  $x = 0$  to  $x = 2\pi$ .
- Work** Find the work done by the force  $\mathbf{F} = \frac{x}{x^2 + y^2} \mathbf{i} + \frac{y}{x^2 + y^2} \mathbf{j}$  in moving an object along the curve  $\mathbf{r}(t) = t \cos t \mathbf{i} + t \sin t \mathbf{j}$  from  $(-\pi, 0)$  to  $(2\pi, 0)$ .
- Area** Use Green's Theorem to find the area of the region enclosed by the curves  $C_1: x(t) = t, y(t) = t^2 + 3$  and  $C_2: x(t) = t, y(t) = 30 - 2t^2$ .
- Use Green's Theorem to find the line integral  $\int_C \left[ \ln(1 + y) dx + \frac{xy}{1 + y} dy \right]$  where  $C$  is the parallelogram with vertices  $(0, 0), (2, 1), (2, 6)$ , and  $(0, 5)$  traversed counterclockwise.
- Find  $\oint_C (y^2 dx - x^2 dy)$ , where  $C$  is the square with vertices  $(0, 0), (1, 0), (1, 1)$ , and  $(0, 1)$  traversed counterclockwise. Do not use Green's Theorem.
- Rework Problem 21 using Green's Theorem.
- Find  $\oint_C [(x - y) dx + (x + y) dy]$ , where  $C$  is the ellipse  $x = 2 \cos t, y = 3 \sin t, 0 \leq t \leq 2\pi$ , without using Green's Theorem.
- Rework Problem 23 using Green's Theorem.
- Area** Use Green's Theorem to find the area of the multiply connected region enclosed by the ellipse  $\frac{x^2}{4} + \frac{y^2}{16} = 1$  which has a small hole  $C_1$  given by  $x^2 + (y - 1)^2 = 1$  punched out of its interior.
- (a) Identify the coordinate curves of the surface parametrized by  $\mathbf{r}(u, v) = 3u \cos v \mathbf{i} + 2u \sin v \mathbf{j} + u^2 \mathbf{k}, 0 \leq u \leq 1, 0 \leq v \leq 2\pi$ .  
 (b) Find a rectangular equation for the surface.

27. Find a parametrization of the part of the cylinder  $4x^2 + 25y^2 = 100$  that lies above the plane  $z = 1$  and below the plane  $z = 6$ .
28. (a) Find an equation of the tangent plane to the surface  $\mathbf{r}(u, v) = u \sin v \mathbf{i} + u^2 \mathbf{j} + u \cos v \mathbf{k}$ , at the point  $(\sqrt{3}, 4, 1)$ .  
 (b) Find an equation of the normal line to the tangent plane at the point  $(\sqrt{3}, 4, 1)$ .
29. Find the surface area of the part of the paraboloid  $\mathbf{r}(u, v) = u \sin v \mathbf{i} + u^2 \mathbf{j} + u \cos v \mathbf{k}$ ,  $0 \leq u \leq 4$ ,  $0 \leq v \leq 2\pi$ .
30. Find  $\iint_S x \, dS$ , where  $S$  is the surface parametrized by  $\mathbf{r}(u, v) = \cos u \mathbf{i} + 3 \sin u \sin v \mathbf{j} + 3 \cos u \sin v \mathbf{k}$ ,  $0 \leq u \leq 2\pi$  and  $0 \leq v \leq \pi/2$ .
- CAS** 31. Find  $\iint_S z^2 \, dS$ , where  $S$  is the sphere  $x^2 + y^2 + z^2 = 4$ .
32. Find the outer unit normal vectors to the surface  $S$  that forms the boundary of the solid  $z = f(x, y) = \sqrt{25 - x^2 - y^2}$ ,  $0 \leq x^2 + y^2 \leq 25$ .
33. Find  $\iint_S x \, dS$ , where  $S$  is the surface  $x^2 + y^2 = 9$ ,  $-1 \leq z \leq 1$ .
34. Find  $\iint_S z \, dS$ , where  $S$  is the surface  $z = 9 - x - y$ ,  $x^2 + y^2 \leq 9$ .
35. Find  $\iint_S \cos x \, dS$ , where  $S$  is the portion of the plane  $x = y + z$ ,  $x \leq \pi$ ,  $y \geq 0$ ,  $z \geq 0$ .
36. A fluid has a constant mass density  $\rho$ . Find the mass of fluid flowing across the surface  $x^2 + y^2 = 1$ ,  $0 \leq z \leq 1$  in a unit of time, in the direction outward from the  $z$ -axis if the velocity of the fluid at any point on the surface is  $\mathbf{F} = x^2 \mathbf{i} + y \mathbf{j} - z \mathbf{k}$ .

In Problems 37–40, for each vector field  $\mathbf{F}$ , find

- (a)  $\operatorname{div} \mathbf{F}$   
 (b)  $\operatorname{curl} \mathbf{F}$   
 (c) Verify Stokes' Theorem where  $S$  is the paraboloid  $z = x^2 + y^2$ , with the circle  $x^2 + y^2 = 1$  and  $z = 1$  as its boundary.

37.  $\mathbf{F} = z \cos x \mathbf{i} + \sin y \mathbf{j} + e^x \mathbf{k}$

38.  $\mathbf{F} = x^2 \mathbf{i} - 3y \mathbf{j} + 4z^2 \mathbf{k}$
39.  $\mathbf{F} = x \mathbf{i} + y \mathbf{j} + z \mathbf{k}$
40.  $\mathbf{F} = xe^y \mathbf{i} - ye^z \mathbf{j} + ze^x \mathbf{k}$
41. Use the Divergence Theorem to find  $\iint_S \mathbf{F} \cdot \mathbf{n} \, dS$ , where  $S$  is the surface  $x^2 + y^2 = 1$ ,  $0 \leq z \leq 1$ , and  $\mathbf{F} = x^2 \mathbf{i} + y \mathbf{j} - z \mathbf{k}$ .
42. (a) Find a function  $f(x, y, z)$  whose gradient is  $(yz - y - z) \mathbf{i} + (xz - x - z) \mathbf{j} + (xy - x - y) \mathbf{k}$ .  
 (b) Use Stokes' Theorem to confirm the answer to  $\int_C [(yz - y - z) dx + (xz - x - z) dy + (xy - x - y) dz]$ , where  $C$  is the twisted cubic  $x = t$ ,  $y = t^2$ ,  $z = t^3$ ,  $0 \leq t \leq 1$ .
43. Find  $\iint_S (xz \cos \alpha + yz \cos \beta + x^2 \cos \gamma) \, dS$ , where  $S$  is the upper half of the unit sphere together with the plane  $z = 0$ , and  $\cos \alpha$ ,  $\cos \beta$ , and  $\cos \gamma$  are the direction cosines for the outer unit normal to  $S$ .
44. Find  $\iiint_E \operatorname{div} \mathbf{F} \, dV$ , where  $E$  is the unit ball,  $\|\mathbf{r}\| \leq 1$ , and  $\mathbf{F} = \|\mathbf{r}\|^2 \mathbf{r}$ .
45. Use Stokes' Theorem to find  $\int_C [(x - y) dx + (y - z) dy + (z - x) dz]$ , where  $C$  is the boundary of the portion of the plane  $x + y + z = 1$ ,  $x \geq 0$ ,  $y \geq 0$ ,  $z \geq 0$  (traversed counterclockwise when viewed from above).
46. Let  $\mathbf{F}(x, y, z) = x^3 \mathbf{i} + y^3 \mathbf{j} + z^3 \mathbf{k}$  be the velocity of a fluid flow in space, where the mass density of the fluid is 1.  
 (a) Find the flux across the sphere  $x^2 + y^2 + z^2 = 1$ .  
 (b) Find the circulation around the circle  $x^2 + y^2 = 1$  in the  $xy$ -plane.
47. Determine if  $\mathbf{F}(x, y, z) = yz \mathbf{i} + xy \mathbf{j} + xy \mathbf{k}$  is a conservative vector field.
48. Let  $\mathbf{F}(x, y, z) = 2xy^2z \mathbf{i} + 2x^2yz \mathbf{j} + (x^2y^2 - 2z) \mathbf{k}$ . Show that  $\mathbf{F}$  is a conservative vector field.

## CHAPTER 15 PROJECT

### Modeling a Tornado

A tornado is a three-dimensional wind field that can be modeled as a velocity field. In this project we look at a two-dimensional slice of a vortex and use an Oseen vortex velocity field to model a tornado.

In rectangular coordinates, an Oseen velocity field is given by

$$\mathbf{v} = \left( \frac{V_{\max} y}{\sqrt{x^2 + y^2}} \right) \mathbf{i} - \left( \frac{V_{\max} x}{\sqrt{x^2 + y^2}} \right) \mathbf{j}$$

We place the center of the tornado at origin, where  $\mathbf{v}$  is undefined. Then  $\mathbf{v}$  gives the velocity of the wind at any other location within the vortex.

1. Show that in the Oseen model, the speed (magnitude of the velocity) of the wind at any location is  $V_{\max}$ .

2. Suppose  $V_{\max} = 80$  m/s. Describe the velocity field at the following locations  
 (a)  $(0, -10)$ , (b)  $(-10, 0)$ , (c)  $(0, 10)$ , (d)  $(10, 0)$ , (e)  $(10, 10)$
3. Add a few more vectors in the velocity field. What can you conclude about the direction of the wind?

A fluid, like the air in a tornado, is considered to be **incompressible** if the divergence of its velocity field,  $\operatorname{div} \mathbf{v}$ , equals 0. When a fluid is incompressible, it is possible to find a function,  $\psi(x, y)$ , called a **stream function**. The level curves of a stream function are called **stream lines**. These are the curves along which particles of fluid would flow. (You may have seen examples of stream lines such as air moving around a car in a wind tunnel.) The stream function,  $\psi(x, y)$ , for a velocity field,  $\mathbf{v} = h(x, y) \mathbf{i} + g(x, y) \mathbf{j}$ , where  $h$  and  $g$  are functions of  $x$  and  $y$ , satisfies

$$\frac{\partial \psi}{\partial y} = h(x, y) \quad \text{and} \quad \frac{\partial \psi}{\partial x} = -g(x, y)$$

4. Show that in the Oseen model, the air in a tornado is incompressible.
5. Find a general form for the stream function of a stream line  $\psi(x, y) = C$  for an Oseen velocity field.
6. Suppose the speed  $V_{\max}$  of the wind in a tornado is 80 m/s and the value of the constant  $C$  is  $3200 \text{ m}^3/\text{s}$  (the units of  $C$  represent a volume flow rate).
  - (a) Find the stream function and graph the stream line  $\psi(x, y) = 3200$ .
  - (b) Graph the stream lines for  $C = 1000, 2000, 3000$ , and  $4000$ .

The air in the tornado is turning, and the twisting behavior of the velocity field can be quantified by a vector  $\mathbf{w}$ , called the *vorticity*.

The **vorticity** at a point in space is a vector that is normal to the plane of rotation, and describes the amount of rotation about that point. The vorticity of a vector field is given by the curl of the vector field,  $\text{curl } \mathbf{v}$ . That is,

$$\mathbf{w} = \text{curl } \mathbf{v}$$

7. Find the vorticity  $\mathbf{w}$  of the Oseen velocity field. Interpret the result.
8. In this project, we assumed the wind speed in the vortex was 80 m/s. Research the **Enhanced Fujita scale**, or **EF-scale**, that is used to classify tornados based on the damage they cause. Rework Problems 2, 3, 6, and 7 for a tornado with a wind speed of 110 m/s (an EF-5 tornado). Compare the results to a tornado with a wind speed of 80 m/s.

## The Melting Arctic Ice Cap

The Arctic ice cap is melting. “The average thickness of the Arctic ice cover is declining because it is rapidly losing its thick component, the *multi-year ice*. At the same time, the surface temperature of the Arctic is going up, which results in a shorter ice-forming season,” said senior research scientist Josefino Comiso.

Each year during the Arctic winter, new sea ice, called **seasonal ice**, forms. Most of the seasonal ice melts during the summer melt season, but some of it survives. Scientists use this pattern to differentiate among three types of Arctic ice: seasonal ice forms and melts each year, **perennial ice** is defined as ice that has remained through at least one summer melt season, and **multi-year ice** is perennial ice that has survived at least three summer melt seasons. In a recent study, NASA scientists have discovered that the thick, old multi-year ice of the Arctic Ocean is melting at a faster rate than that of the thin seasonal ice and the one- and two-year perennial ice.

**CHAPTER 16 PROJECT** The Chapter Project on page 1096 investigates the growth of sea ice.

This chapter continues our investigation into methods for finding solutions to differential equations and includes some important applications such as inhibited growth, learning curves, Newton’s Law of Heating, falling objects with air resistance, flow rates in mixtures, and sales growth. The analyses and solutions of differential equations are a very useful branch of mathematics, but differential equations are often difficult or impossible to solve algebraically. In practical applications, differential equations are often solved using numerical approximations.

## 16.1 Classification of Ordinary Differential Equations

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Classify ordinary differential equations (p. 1059)
- 2 Verify the solution of an ordinary differential equation (p. 1060)

### 1 Classify Ordinary Differential Equations

An **ordinary differential equation** is an equation involving an independent variable  $x$ , a dependent variable  $y$ , and derivatives of  $y$  with respect to  $x$ . Examples of ordinary differential equations are:

$$\begin{array}{lll} \text{(a)} \ y' + y + 5 = 0 & \text{(b)} \ \frac{x-y}{x+y} + \frac{y+x}{x-y} \frac{dy}{dx} = 0 & \text{(c)} \ 7y'' - 5y' + 4x^3y = 0 \\ \text{(d)} \ y' + y''' = 1 & \text{(e)} \ \left(\frac{dy}{dx}\right)^3 = 8\frac{d^2y}{dx^2} & \text{(f)} \ 5x^2 = 6y^3\left(\frac{dy}{dx}\right)^2 + 18 \end{array}$$

**NOTE** Other variables besides  $x$  and  $y$  are often used. If  $s = f(t)$ , then

$\frac{d^2s}{dt^2} + t = 0$  is a second-order differential equation.

The **order** of a differential equation is the order of the highest-order derivative of  $y$  appearing in the equation. For the equations above, (a), (b), and (f) are first-order, (c) and (e) are second-order, and (d) is a third-order differential equation. The exponent of the highest-order derivative in a differential equation is called the **degree** of the equation. For example, equations (a)–(e) above are of degree 1, and equation (f) is of degree 2. Being able to recognize the order and degree of a differential equation are important steps in finding its solution.

An important class of differential equations are *linear differential equations*. If  $P_0, P_1, \dots, P_n$  and  $Q$  are functions of the variable  $x$ , then an equation of the form

$$P_0(x) \frac{d^n y}{dx^n} + P_1(x) \frac{d^{n-1} y}{dx^{n-1}} + \cdots + P_{n-1}(x) \frac{dy}{dx} + P_n(x)y = Q(x)$$

is a **linear differential equation of order  $n$** . The term *linear* is used to describe these differential equations because each derivative including  $y$  (which we treat as a derivative of order zero) is of degree 1 and no term contains more than one derivative and no term contains a product of  $y$  and any derivative of  $y$  up to the  $n$ th derivative. For example,

$$x^2 \frac{d^2 y}{dx^2} + 8 \frac{dy}{dx} - 5x^3 y = x + 10$$

is a second-order linear differential equation.

#### EXAMPLE 1 Classifying a Differential Equation

What are the order and degree of the differential equation  $xe^x \frac{d^2 y}{dx^2} - 5e^x \frac{dy}{dx} + 4x^3 y = 0$ . Is it linear?

**Solution** This is a second-order differential equation of degree 1. Since  $P_0(x) = xe^x$ ,  $P_1(x) = -5e^x$ , and  $P_2(x) = 4x^3$  are all functions of  $x$  alone and no term contains more than one derivative, the differential equation is linear. ■

**NOW WORK** Problem 9.

## 2 Verify the Solution of an Ordinary Differential Equation

A function  $y = f(x)$  is called a **solution** to a differential equation on an interval  $I$  if, when  $y$  and its derivatives are substituted into the equation, the equation is satisfied for all  $x$  in the interval  $I$ .

The **general solution** of a differential equation represents all the solutions to the differential equation and is in the form of an equation with arbitrary constants. The number of arbitrary constants in the general solution agrees with the order of the differential equation.

As an example, consider the second-order differential equation

$$\frac{d^2y}{dx^2} + y = 0$$

It can be shown that the general solution has the form  $y = C_1 \sin x + C_2 \cos x$ , where  $C_1$  and  $C_2$  are constants.

Any solution of a differential equation obtained from the general solution by assigning values to the arbitrary constants is called a **particular solution**. So, for this example, choosing  $C_1 = 6$  and  $C_2 = 9$  yields the particular solution  $y = 6 \sin x + 9 \cos x$ .

### EXAMPLE 2 Verifying Solutions to a Differential Equation

- (a) Show that  $y = f(x) = x^4 - 5x + 1$  is a solution of the differential equation  $y'' - 12x^2 = 0$ .
- (b) Show that  $y = g(x) = x^4 + C_1x + C_2$ , where  $C_1$  and  $C_2$  are constants, is a solution\* of the differential equation  $y'' - 12x^2 = 0$ .
- (c) Show that  $x^2 - x^3y + 3y^4 = C$ , where  $C$  is a constant, is a solution\* of the differential equation  $\frac{dy}{dx} = \frac{3x^2y - 2x}{12y^3 - x^3}$ .

**Solution** (a) For  $y = f(x) = x^4 - 5x + 1$ , we have

$$y' = 4x^3 - 5 \quad y'' = 12x^2$$

The function  $f$  satisfies the differential equation  $y'' - 12x^2 = 0$  and so  $f$  is a solution.

(b) For  $y = g(x) = x^4 + C_1x + C_2$ , we have

$$y' = 4x^3 + C_1 \quad y'' = 12x^2$$

The function  $g$  satisfies the differential equation  $y'' - 12x^2 = 0$ , so  $g$  is a solution.

(c) Differentiate  $x^2 - x^3y + 3y^4 = C$  implicitly with respect to  $x$  to find  $\frac{dy}{dx}$ .

$$\begin{aligned} 2x - x^3 \frac{dy}{dx} - 3x^2y + 12y^3 \frac{dy}{dx} &= 0 \\ (12y^3 - x^3) \frac{dy}{dx} &= 3x^2y - 2x \\ \frac{dy}{dx} &= \frac{3x^2y - 2x}{12y^3 - x^3} \end{aligned}$$

The function  $y = f(x)$  defined by the equation  $x^2 - x^3y + 3y^4 = C$  satisfies the first-order differential equation and so is a solution. ■

### NOW WORK Problems 21 and 23.

**NEED TO REVIEW?** Implicit differentiation is discussed in Section 3.2, pp. 209–212.

\*It can be shown that this is the general solution of the differential equation.

## 16.1 Assess Your Understanding

### Concepts and Vocabulary

- The differential equation  $\frac{d^2y}{dx^2} + 5\left(\frac{dy}{dx}\right)^3 - y = 0$  is of order \_\_\_\_\_ and degree \_\_\_\_\_.
- True or False** The differential equation  $(x^2 + 2)\frac{dy}{dx} - \frac{1}{x}y = 0$  is linear.
- True or False**  $y = -4x^2 + 100$  is a solution of the differential equation  $\frac{dy}{dx} = -8x$ .
- True or False**  $y = 8e^{5x}$  is a solution of the differential equation  $\frac{dy}{dx} + 3 = 8e^{5x}$ .

### Skill Building

In Problems 5–14, state the order and degree of each equation. State whether the equation is linear or nonlinear.

- $\frac{dy}{dx} + x^2y = xe^x$
- $\frac{d^3y}{dx^3} + 4\frac{d^2y}{dx^2} - 5\frac{dy}{dx} + 3y = \sin x$
- $\frac{d^4y}{dx^4} + 3\frac{d^2y}{dx^2} + 5y = 0$
- $\frac{d^2y}{dx^2} + x \sin y = 0$
- $\left(\frac{dr}{ds}\right)^2 = \left(\frac{d^2r}{ds^2}\right)^3 + 1$
- $\frac{d^2y}{ds^2} + 3s\frac{dy}{ds} = y$
- $\frac{d^2y}{dx^2} + y \sin x = 0$
- $\frac{d^6x}{dt^6} + \frac{d^4x}{dt^4} + \frac{d^3x}{dt^3} + x = t$
- $x(y'')^3 + (y')^4 - y = 0$
- $\frac{dy}{dx} = 1 - xy + y^2$

In Problems 15–22, show that the function  $y$  is a solution of the differential equation.

- $y = e^x + 3e^{-x}$ ,  $\frac{d^2y}{dx^2} - y = 0$
- $y = 5 \sin x + 2 \cos x$ ,  $\frac{d^2y}{dx^2} + y = 0$
- $y = \sin(2x)$ ,  $\frac{d^2y}{dx^2} + 4y = 0$
- $y = \cos(2x)$ ,  $\frac{d^2y}{dx^2} + 4y = 0$
- $y = \frac{3}{1-x^3}$ ,  $\frac{dy}{dx} = x^2y^2$
- $y = 1 + Ce^{-x^2/2}$ ,  $\frac{dy}{dx} + xy = x$ ,  $C$  is a constant
- $y = e^{-2x}$ ,  $y'' + 3y' + 2y = 0$
- $y = e^x$ ,  $2y'' + y' - 3y = 0$

In Problems 23–30, use implicit differentiation to show that the given equation is a solution of the differential equation.  $C$  is a constant.

- $y^2 + 2xy - x^2 = C$ ,  $\frac{dy}{dx} = \frac{x-y}{x+y}$

- $x^2 - y^2 = Cx^2y^2$ ,  $\frac{dy}{dx} = \frac{y^3}{x^3}$  (Hint: Solve for  $C$  first.)
- $x^2 - y^2 = Cx$ ,  $\frac{dy}{dx} = \frac{x^2 + y^2}{2xy}$  (Hint: Solve for  $C$  first.)
- $x^2y + 12x^2 + 16y = 9$ ,  $\frac{dy}{dx} = -\frac{2xy + 24x}{x^2 + 16}$
- $2(x-1)e^x + y^2 = C$ ,  $\frac{dy}{dx} = -\frac{xe^x}{y}$
- $x^2 - y^2 + 2(e^{-x} - e^y) = C$ ,  $\frac{dy}{dx} = \frac{x - e^{-x}}{y + e^y}$
- $\tan^{-1} y = x + \frac{x^2}{2} + C$ ,  $\frac{dy}{dx} = xy^2 + y^2 + x + 1$
- $1 + 2y^2\sqrt{1+x^2} = Cy^2$ ,  $\frac{dy}{dx} = \frac{xy^3}{\sqrt{1+x^2}}$  (Hint: Solve for  $C$  first.)

### Applications and Extensions

In Problems 31–34, for each differential equation, show that  $y$  is a particular solution that satisfies the initial condition.

- $\frac{dy}{dx} = \frac{y}{x}$ ;  $y = 3x$  initial condition:  $y = 3$  when  $x = 1$
- $\frac{dy}{dx} = 3y$ ;  $y = 2e^{3x}$  initial condition:  $y = 2$  when  $x = 0$
- $\frac{dy}{dx} = y^2$ ;  $y = \frac{1}{1-x}$  initial condition:  $y = 1$  when  $x = 0$
- $x\frac{dy}{dx} + y = x^2$ ;  $y = \frac{x^2}{3} + \frac{3}{x}$  initial condition:  $y = 4$  when  $x = 3$

In Problems 35–38, show that  $y$  is a solution of the differential equation.

- $y = C_1e^{ax} + C_2e^{-ax}$ ,  $\frac{d^2y}{dx^2} - a^2y = 0$ ,  $C_1, C_2$  are constants
- $y = \sinh x$ ,  $\frac{d^2y}{dx^2} = y$
- $y = \frac{a^2kt}{1+akt}$ ,  $\frac{dy}{dt} = k(a-y)^2$ ,  $a > 0$ , and  $k$  are constants
- $y = \ln(C - e^{-x})$ ,  $\frac{dy}{dx} = e^{-(x+y)}$ ,  $C$  is a constant
- Find the values of  $n$  so that  $y = e^{nx}$  is a solution of  $y'' + y' - 6y = 0$

- Find a first-order differential equation that has  $y = e^x + e^{-x}$  as a solution.

- Schrödinger Equation** In quantum mechanics, the time-independent **Schrödinger equation** in one dimension can be written as  $-\frac{h^2}{2m} \frac{d^2Y(x)}{dx^2} + U(x)Y(x) = EY(x)$ . What are the degree and order of this differential equation?

## 16.2 Separation of Variables in First-Order Differential Equations

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Solve a separable first-order differential equation (p. 1062)
- 2 Identify a homogeneous function of degree  $k$  (p. 1063)
- 3 Use a change of variables to solve a homogeneous first-order differential equation (p. 1064)
- 4 Solve applied problems (p. 1066)

In this section, we solve first-order differential equations that are *separable*. Such differential equations are used to find orthogonal trajectories of families of curves and to analyze inhibited growth models, such as bacterial growth and sales forecasts of a company.

A first-order differential equation is usually written in the form

$$\frac{dy}{dx} = f(x, y)$$

where  $f$  is continuous on its domain. If we treat  $dy$  and  $dx$  as differentials, we can write

$\frac{dy}{dx} = f(x, y)$  in **differential form** as

$$M(x, y) dx + N(x, y) dy = 0$$

where  $M$  and  $N$  are each continuous on their domains.

### DEFINITION Separable Equation

A first-order differential equation is said to be **separable** if it can be written in the form

$$M(x) dx + N(y) dy = 0$$

where  $M$  is a function of  $x$  alone,  $N$  is a function of  $y$  alone, and both  $M$  and  $N$  are continuous on their domains.

### 1 Solve a Separable First-Order Differential Equation

The following steps are used to solve separable differential equations:

#### Steps for Solving a Separable Differential Equation

**Step 1** Express the given equation in the differential form

$$M(x) dx + N(y) dy = 0$$

**Step 2** Integrate to obtain the general solution

$$\int M(x) dx + \int N(y) dy = C$$

where  $C$  is the constant of integration.

**EXAMPLE 1** Solving a Separable First-Order Differential Equation

Solve  $\frac{dy}{dx} = \frac{2e^x}{y^2}$

**Solution** Use the steps on page 1062:**Step 1** Express  $\frac{dy}{dx} = \frac{2e^x}{y^2}$  in the differential form:

$$y^2 dy - 2e^x dx = 0 \quad \text{or equivalently, as} \quad y^2 dy = 2e^x dx$$

**Step 2** Integrate to obtain the general solution.

$$\int y^2 dy = \int 2e^x dx$$

$$\frac{y^3}{3} = 2e^x + C$$

where  $C$  is a constant. This solution is expressed implicitly. To obtain the explicit form, solve for  $y$ .

$$y^3 = 6e^x + 3C$$

$$y = \sqrt[3]{6e^x + 3C}$$

**NOW WORK** Problems 5 and 15.**2 Identify a Homogeneous Function of Degree  $k$** Some first-order differential equations are not separable, but can be made separable by a change of variable. This is true for differential equations of the form  $\frac{dy}{dx} = f(x, y)$ , where  $f$  is a *homogeneous function*.**DEFINITION** Homogeneous Function of Degree  $k$ A function  $f(x, y)$  is said to be a **homogeneous function of degree  $k$  in  $x$  and  $y$**  if, and only if, for  $t > 0$ ,

$$f(tx, ty) = t^k f(x, y)$$

for some real number  $k$ .**EXAMPLE 2** Identifying a Homogeneous Function of Degree  $k$ **(a)**  $f(x, y) = 3x^2 - xy + y^2$  is a homogeneous function of degree 2, since

$$\begin{aligned} f(tx, ty) &= 3(tx)^2 - (tx)(ty) + (ty)^2 = t^2 3x^2 - t^2 xy + t^2 y^2 \\ &= t^2 (3x^2 - xy + y^2) = t^2 f(x, y) \quad \text{for all } t > 0 \end{aligned}$$

**(b)**  $f(x, y) = \sqrt{x + 4y}$  is a homogeneous function of degree  $\frac{1}{2}$ , since

$$\begin{aligned} f(tx, ty) &= \sqrt{tx + 4(ty)} = \sqrt{t(x + 4y)} = \sqrt{t} \sqrt{x + 4y} \\ &= t^{1/2} f(x, y) \quad \text{for all } t > 0 \end{aligned}$$

**(c)**  $f(x, y) = \frac{x}{\sqrt{x^2 - y^2}}$  is a homogeneous function of degree 0, since

$$\begin{aligned} f(tx, ty) &= \frac{tx}{\sqrt{(tx)^2 - (ty)^2}} = \frac{tx}{\sqrt{t^2(x^2 - y^2)}} = \frac{tx}{t\sqrt{x^2 - y^2}} \\ &= t^0 f(x, y) \quad \text{for all } t > 0 \end{aligned}$$

(d)  $f(x, y) = x - y^2$  is not a homogeneous function, since

$$f(tx, ty) = tx - (ty)^2 = t(x - ty^2) \neq t^k(x - y^2)$$

for all  $t > 0$  and some  $k$

**NOW WORK** Problem 21.

**DEFINITION** Homogeneous First-Order Differential Equation

A first-order differential equation of the form

$$M(x, y) dx + N(x, y) dy = 0$$

is said to be **homogeneous** if  $M$  and  $N$  are homogeneous functions of the *same* degree.

**NOTE** The word “homogeneous” has been used in two different ways: to describe a property of a function and to identify a certain type of first-order differential equation. Context will make it clear which meaning applies.

### 3 Use a Change of Variables to Solve a Homogeneous First-Order Differential Equation

To solve first-order homogeneous differential equations, we use the following change of variables theorem.

**THEOREM** Change of Variables for Homogeneous First-Order Differential Equations

If  $M(x, y) dx + N(x, y) dy = 0$  is a homogeneous first-order differential equation, then it can be transformed into a first-order differential equation whose variables are separable by using the substitution

$$y = xv(x)$$

where  $v = v(x)$  is a differentiable function of  $x$ .

**NOTE** For simplicity of notation, we usually write  $v$  instead of  $v(x)$ .

**Proof** In the differential equation  $M(x, y) dx + N(x, y) dy = 0$ , we use the substitution  $y = xv$ , where  $v = v(x)$  is a differentiable function of  $x$ . Then  $dy = x dv + v dx$  and

$$M(x, y) dx + N(x, y) dy = M(x, xv) dx + N(x, xv)(x dv + v dx) = 0$$

Since  $M$  and  $N$  are each homogeneous functions of degree  $k$ , it follows that for some number  $k$

$$x^k M(1, v) dx + x^k N(1, v)(x dv + v dx) = 0 \quad \begin{array}{l} M(x, xv) = x^k M(1, v), \\ N(x, xv) = x^k N(1, v) \end{array}$$

$$x^k [M(1, v) dx + N(1, v)(x dv + v dx)] = 0$$

$$M(1, v) dx + N(1, v)x dv + N(1, v)v dx = 0 \quad \text{Divide out } x^k.$$

$$[M(1, v) + vN(1, v)] dx + N(1, v)x dv = 0$$

$$\frac{dx}{x} + \frac{N(1, v)}{M(1, v) + vN(1, v)} dv = 0$$

provided neither denominator is 0. This first-order differential equation is separable. ■

**Steps for Solving a Homogeneous First-Order Differential Equation**  $M(x, y) dx + N(x, y) dy = 0$

**Step 1** Confirm that the functions  $M$  and  $N$  are homogeneous of the same degree.

**Step 2** Let  $y = xv$ . Substitute for  $y$  and  $dy = x dv + v dx$ .

**Step 3** Express the new equation in differential form. The variables will be separable.

**Step 4** Integrate to obtain the general solution and replace  $v$  by  $\frac{y}{x}$ .

**EXAMPLE 3** Solving a Homogeneous First-Order Differential Equation

Solve the differential equation  $(x^2 - 3y^2) dx + 2xy dy = 0$ .

**Solution** Follow the steps for solving a homogeneous first-order differential equation.

**Step 1** Both  $x^2 - 3y^2$  and  $2xy$  are homogeneous of degree 2. Do you see why?

**Step 2** Let  $y = xv$ . Then  $dy = x dv + v dx$ . Substitute these into the differential equation:

$$\begin{aligned}(x^2 - 3y^2) dx + 2xy dy &= 0 \\ [x^2 - 3(xv)^2] dx + 2x(xv)(x dv + v dx) &= 0 & dy = x dv + v dx \\ (x^2 - x^2v^2) dx + 2x^3v dv &= 0 \\ x^2(1 - v^2) dx + 2x^3v dv &= 0\end{aligned}$$

**Step 3** Then for  $x \neq 0$  and  $v \neq \pm 1$ , we can separate the variables by dividing by  $x^3$  and  $1 - v^2$ .

$$\begin{aligned}x^2(1 - v^2) dx + 2x^3v dv &= 0 \\ \frac{x^2(1 - v^2) dx}{x^3(1 - v^2)} + \frac{2x^3v dv}{x^3(1 - v^2)} &= 0 \\ \frac{dx}{x} + \frac{2v dv}{1 - v^2} &= 0\end{aligned}$$

**Step 4** Integrate.

$$\begin{aligned}\int \frac{dx}{x} - \int \frac{2v dv}{v^2 - 1} &= 0 \\ \ln |x| - \ln |v^2 - 1| &= C_1 \\ \ln \left| \frac{x}{v^2 - 1} \right| &= C_1\end{aligned}$$

Since  $C_1$  is a constant, we can write  $C_1 = \ln C_2$ , where  $C_2$  is a constant. Then

$$\begin{aligned}\ln \left| \frac{x}{v^2 - 1} \right| &= \ln C_2 \\ \left| \frac{x}{v^2 - 1} \right| &= C_2 \\ \left| \frac{x}{\frac{y^2}{x^2} - 1} \right| &= C_2 & v = \frac{y}{x} \\ \left| \frac{x^3}{y^2 - x^2} \right| &= C_2 \\ x^3 &= \pm C_2(y^2 - x^2)\end{aligned}$$

Since  $\pm C_2$  may be either positive or negative, the general solution can be written as  $x^3 = C(y^2 - x^2)$ , where  $C \neq 0$  is a constant. ■

**NOW WORK** Problem 37.**EXAMPLE 4** Solving a Homogeneous First-Order Differential Equation

Solve the differential equation  $x dy + (2xe^{y/x} - y) dx = 0$  if  $y = 0$  when  $x = 1$ .

**Solution** Follow the steps for solving a homogeneous first-order differential equation:

**Step 1** Both  $x$  and  $2xe^{y/x} - y$  are homogeneous of degree 1.

**Step 2** Let  $y = xv$ . Then  $dy = x dv + v dx$ . Substitute these into the differential equation.

$$x dy + (2xe^{y/x} - y) dx = 0$$

$$x(x dv + v dx) + (2xe^v - xv) dx = 0$$

$$x^2 dv + xv dx + 2xe^v dx - xv dx = 0$$

$$x^2 dv + 2xe^v dx = 0$$

$$x dv + 2e^v dx = 0$$

**Step 3** To separate the variables, we divide by  $xe^v$ . Then for  $x \neq 0$ ,

$$\frac{2dx}{x} + \frac{dv}{e^v} = 0$$

**Step 4** Integrate.

$$\int \frac{2dx}{x} + \int \frac{dv}{e^v} = 0$$

$$2 \int \frac{dx}{x} + \int e^{-v} dv = 0$$

$$2 \ln |x| - e^{-v} = C$$

$$2 \ln |x| - e^{-y/x} = C \quad v = \frac{y}{x}$$

This is the general solution to the differential equation. To find the particular solution, we substitute  $x = 1$  and  $y = 0$  to find  $C$ .

$$2 \ln 1 - e^0 = C$$

$$C = -1$$

The particular solution is

$$2 \ln |x| - e^{-y/x} = -1$$

### NOW WORK Problem 41.

## 4 Solve Applied Problems

### Orthogonal Trajectories

Consider the one-parameter family of circles

$$(x - 1)^2 + (y - 2)^2 = C \quad C > 0$$

with center at the point  $(1, 2)$  and radius  $\sqrt{C}$ . Figure 1 shows some members of this family of circles. If the equation describing the circles is differentiated with respect to  $x$ , we obtain

$$2(x - 1) + 2(y - 2)y' = 0$$

$$y' = -\frac{x - 1}{y - 2} \quad (1)$$

which represents the differential equation of the family of circles.

For a specific point  $(x, y)$ ,  $y \neq 2$ , on any one of the circles, the differential equation  $y' = -\frac{x - 1}{y - 2}$  gives the slope of the tangent line at  $(x, y)$ .

Now let's consider another example. The family of nonvertical lines passing through the point  $(1, 2)$  satisfies the equation

$$y - 2 = m(x - 1)$$

**DF** Figure 1  $(x - 1)^2 + (y - 2)^2 = C$ ,  $C > 0$

 Figure 2  $y - 2 = m(x - 1)$ 

 Figure 3  $y^2 = Cx^3$ 

where  $m$  is the slope of a particular member of the family. The differential equation for this family of lines is

$$y' = m = \frac{y - 2}{x - 1} \quad (2)$$

Figure 2 shows some members of this family of lines.

If we compare the differential equations (1) and (2), we see that the right side of (1) is the negative reciprocal of the right side of (2). From this, we conclude that if  $(x, y)$  is a point of intersection of one of the circles and one of the lines from each family, then the line and the circle are perpendicular (orthogonal) to each other at the point of intersection. Each line in the family  $y - 2 = m(x - 1)$  is an *orthogonal trajectory* of the family of circles, and conversely, each circle in the family  $(x - 1)^2 + (y - 2)^2 = C$  is an orthogonal trajectory of the family of lines.

In general, if  $F(x, y, C) = 0$  and  $G(x, y, K) = 0$  are one-parameter families of curves, in which each member of one family intersects the members of the other family at a right angle, then the two families are said to be **orthogonal trajectories** of each other.

Orthogonal trajectories occur naturally. For example, iron filings sprinkled on a pane of glass over a bar magnet arrange themselves along a family of curved lines, indicating the direction of magnetic force. A family of orthogonal trajectories can be determined by locating all the points in the plane of the glass with the same potential energy.

To find a family  $G(x, y, K) = 0$  of orthogonal trajectories for a given family  $F(x, y, C) = 0$ , we use the steps below:

#### Steps for Finding a Family of Orthogonal Trajectories

**Step 1** Find the differential equation for the given family.

**Step 2** Replace  $y'$  in this differential equation by  $-\frac{1}{y'}$ ; the resulting equation is the differential equation for the family of orthogonal trajectories.

**Step 3** Find the solution of the differential equation obtained in Step 2.

#### EXAMPLE 5 Finding a Family of Orthogonal Trajectories

Find the family of orthogonal trajectories for the one-parameter family  $y^2 = Cx^3$ . See Figure 3 for several graphs in the family.

##### Solution

**Step 1** We differentiate  $y^2 = Cx^3$  with respect to  $x$ .

$$2yy' = 3Cx^2$$

Then we eliminate  $C$  using this equation and the equation  $y^2 = Cx^3$  of the family. Since  $C = \frac{y^2}{x^3}$ , we find

$$\begin{aligned} 2yy' &= 3\frac{y^2}{x^3}x^2 \\ y' &= \frac{3y}{2x} \end{aligned}$$

**Step 2** Now we replace  $y'$  with  $-\frac{1}{y'}$ , to obtain the differential equation for the family of orthogonal trajectories.

$$\begin{aligned} -\frac{1}{y'} &= \frac{3y}{2x} \\ y' &= -\frac{2x}{3y} \end{aligned}$$

**DF** Figure 4  $y^2 = Cx^3$ ;  $x^2 + \frac{3}{2}y^2 = K$

**Step 3** The differential equation  $\frac{dy}{dx} = -\frac{2x}{3y}$  is separable and can be written as

$$2x \, dx + 3y \, dy = 0$$

The general solution is

$$x^2 + \frac{3}{2}y^2 = K$$

The orthogonal trajectories for the family  $y^2 = Cx^3$  is a family of ellipses

$$x^2 + \frac{3}{2}y^2 = K, \text{ as shown in Figure 4.}$$

**NOW WORK** Problem 43.

### Inhibited Growth and Decay

Functions  $A = A(t)$ , whose rates of change are  $\frac{dA}{dt} = kA$ , are said to follow the **exponential law**, or the **law of uninhibited growth or decay**. These models, discussed in Chapter 5, are examples of first-order differentiable equations. There, we found that the particular solution of

$$\frac{dA}{dt} = kA \quad A(0) = A_0 > 0$$

is

$$A(t) = A_0 e^{kt}$$

Notice that

$$\text{if } k > 0, \quad \lim_{t \rightarrow \infty} A(t) = \lim_{t \rightarrow \infty} (A_0 e^{kt}) = \infty$$

which represents uninhibited growth, and

$$\text{if } k < 0, \quad \lim_{t \rightarrow \infty} A(t) = \lim_{t \rightarrow \infty} (A_0 e^{kt}) = 0$$

which represents uninhibited decay.

In contrast to uninhibited growth or decay, there are many situations in which the growth or decay is **inhibited**, that is, it is limited by some factor. For example, a new company entering a market in which the total sales in the market is \$ $M$  might expect its annual sales to grow, but the sales can never exceed \$ $M$ . A possible model for the company to use to predict the growth of its sales is to assume that the rate of growth is proportional to the difference between its sales at time  $t$  and the upper limit \$ $M$ . If  $y = y(t)$  denotes the sales at time  $t$ , then this situation is modeled by

$$\boxed{\frac{dy}{dt} = k(M - y)} \quad (3)$$

where  $k$  is a positive constant. Solving the separable differential equation, we have

$$\frac{dy}{M - y} = k \, dt$$

$$-\ln |M - y| = kt + C_1$$

$$M - y = e^{-(kt + C_1)} = e^{-C_1} e^{-kt} \quad y < M, \text{ so } M - y > 0$$

The general solution is

$$y = y(t) = M + C e^{-kt} \quad \text{where } C = -e^{-C_1}$$

If we assume that sales are initially \$ $R$ , then  $y(0) = R \geq 0$ . Using this initial condition,  $R = M + C e^0$  so  $C = R - M$ . A particular solution is

$$\boxed{y(t) = M + (R - M)e^{-kt} \quad k > 0}$$

**NEED TO REVIEW?** Differential equations of the form  $\frac{dA}{dt} = kA$  are discussed in Section 5.5, pp. 382–384.

Figure 5  $y(t) = M + (R - M)e^{-kt}$ ,  $k > 0$

Figure 5 shows the graph of  $y = y(t)$ .

The function  $y = y(t)$  is increasing [ $y'(t) = k(M - y) > 0$ ], its graph is concave downward [ $y''(t) = -ky'(t) < 0$ ], and  $\lim_{t \rightarrow \infty} y(t) = M$ . In the special case where  $R = 0$ , denoting that there are no sales when  $t = 0$ , then

$$y(t) = M(1 - e^{-kt}) \quad k > 0 \quad (4)$$

### EXAMPLE 6 Analyzing a Company's Sales Growth

The annual sales of a new company are expected to grow at a rate proportional to the difference between the sales at time  $t$  and an upper limit of \$5 million. Suppose the sales are \$0 initially and are \$2 million after 4 years of operation. Determine the annual sales at any time  $t$ . How long will it take for the annual sales to reach \$4 million?

**Solution** Since there are no sales initially ( $R = 0$ ), we use equation (4). Then since the upper limit of sales is \$5 million, the sales at time  $t$  are

$$y(t) = 5(1 - e^{-kt}) \quad M = 5$$

Since sales are \$2 million after 4 years, the boundary condition is  $y(4) = 2$ . We use the boundary condition to find the constant  $k$ :

$$\begin{aligned} 2 &= 5(1 - e^{-4k}) & y(4) = 2 \\ 5e^{-4k} &= 3 \\ e^{-4k} &= 0.6 \\ k &= \frac{\ln 0.6}{-4} = -0.25 \ln 0.6 \end{aligned}$$

So, the function

$$y(t) = 5(1 - e^{(0.25 \ln 0.6)t})$$

models the company's sales in year  $t$ .

To find out how long it will take for sales to reach \$4 million, we solve the equation  $y(t) = 4$ . Then

$$\begin{aligned} 4 &= 5(1 - e^{(0.25 \ln 0.6)t}) \\ 5e^{(0.25 \ln 0.6)t} &= 1 \\ (0.25 \ln 0.6)t &= \ln 0.2 \\ t &= \frac{\ln 0.2}{0.25 \ln 0.6} \approx 12.6 \text{ years} \end{aligned}$$

It will take approximately 12.6 years for annual sales to reach \$4 million. ■

The differential equation  $\frac{dy}{dt} = k(M - y)$ ,  $k > 0$ , also models Newton's Law of Heating, where  $y(t)$  denotes the temperature of an object at time  $t$  units after it is placed in a warmer surrounding medium that is at the constant temperature  $M$ .\* The temperature of the object will never exceed  $M$ .

### NOW WORK Problem 53.

The differential equation (3) is used to model productivity based on *learning theory*. **Learning theory** proposes that the time or effort needed to learn a specific repetitive skill decreases as the number of repetitions increases. In a paper published in the *Journal of Aeronautical Science* (February 1936), an aeronautical engineer Theodore P. Wright (1895–1970) applied learning theory to the repetitive work performed on an airplane

\*See Newton's Law of Cooling, which is discussed in Section 5.6, pp. 394–395.

assembly line. He developed a mathematical model, called a **learning curve**, to model employee productivity. This model is still used to obtain cost estimates.

For example, suppose a new employee is hired to assemble a component of an airplane wing. If she needs to be trained before starting the job, then her productivity will follow a learning curve. If  $y = y(t)$  denotes the number of components assembled at time  $t$ , then her rate of productivity is modeled by the differential equation

$$\frac{dy}{dt} = k(M - y)$$

where  $k$  is a positive constant and the number of components she assembles per unit of time is limited by outside constraints to  $M$  units. Then, solving the differential equation, the assembler's productivity at time  $t$  is given by

$$y(t) = M(1 - e^{-kt})$$

**NOW WORK** Problem 55.

## 16.2 Assess Your Understanding

### Concepts and Vocabulary

- The general solution of the differential equation  $\frac{dy}{dx} = xy$  is \_\_\_\_\_.
- True or False** If  $f(tx, ty) = t^k f(x, y)$ , for all  $t > 0$ , where  $k$  is a real number, then the function  $f$  is said to be homogeneous of degree  $k$  in  $x$  and  $y$ .
- If  $F(x, y, C) = 0$  and  $G(x, y, K) = 0$  are one-parameter families of curves in which each member of one family intersects the members of the other family orthogonally, then the two families are said to be orthogonal \_\_\_\_\_ of each other.
- If  $M(x, y) dx + N(x, y) dy = 0$  is a homogeneous differential equation, then it can be transformed into an equation whose variables are separable by using the substitution \_\_\_\_\_, where \_\_\_\_\_ is a differentiable function of  $x$ .

### Skill Building

In Problems 5–14, solve each differential equation.

- $\frac{dy}{dx} = x \sec y$
- $\cos y \frac{dy}{dx} = \frac{2}{x}$
- $\frac{dy}{dx} = e^{y-x}$
- $x \frac{dy}{dx} + 2y = 5$
- $\frac{dy}{dx} = \cos x \frac{dy}{dx} - y \sin x$
- $\frac{dy}{dx} = x + y \frac{dy}{dx}$
- $\frac{dy}{dx} + xy = x$
- $(3x + 1) dx + e^{x+y} dy = 0$
- $\ln x \frac{dx}{dy} = \frac{x}{y}$
- $\frac{dy}{dx} = \frac{x+2}{2-y}$

In Problems 15–20, obtain a particular solution of each differential equation. (Use the results obtained for Problems 5–10.)

- $\frac{dy}{dx} = x \sec y$ ,  $y = \frac{\pi}{4}$  when  $x = 1$
- $\cos y \frac{dy}{dx} = \frac{2}{x}$ ,  $y = \frac{\pi}{3}$ , when  $x = -1$
- $\frac{dy}{dx} = e^{y-x}$ ;  $y = 0$  when  $x = 0$
- $x \frac{dy}{dx} + 2y = 5$ ;  $y = 1$  when  $x = -1$

- $\frac{dy}{dx} = \cos x \frac{dy}{dx} - y \sin x$ ;  $y = \frac{1}{2}$  when  $x = \pi$
- $\frac{dy}{dx} = x + y \frac{dy}{dx}$ ,  $y = 1$  when  $x = 2$

In Problems 21–30, determine if each function is homogeneous. If it is, find its degree.

- $f(x, y) = 2x^2 - 3xy - y^2$
- $f(x, y) = x^3 - xy^2 + y^3$
- $f(x, y) = x^3 - xy + y^3$
- $f(x, y) = x^2 - xy^2 + y^2$
- $f(x, y) = 2x + \sqrt{x^2 + y^2}$
- $f(x, y) = \sqrt{x + y}$
- $f(x, y) = \tan\left(\frac{3x}{y}\right)$
- $f(x, y) = e^{x/y}$
- $f(x, y) = \ln \frac{x}{y}$
- $f(x, y) = x \ln x - x \ln y$

In Problems 31–42, solve each homogeneous differential equation. Follow the steps on p. 1064.

- $(x - y) dx + x dy = 0$
- $(x + y) dx + x dy = 0$
- $(x^2 + y^2) dx + (x^2 - xy) dy = 0$
- $xy dx + (x^2 + y^2) dy = 0$
- $\frac{dy}{dx} = \frac{y - x}{y + x}$
- $\frac{dy}{dx} = \frac{x + 2y}{2x + y}$
- $x \frac{dy}{dx} = x + y$
- $x(x^2 - y^2) \frac{dy}{dx} - y(x^2 + y^2) = 0$
- $\frac{dy}{dx} = \frac{2xy}{x^2 + y^2}$
- $\frac{dy}{dx} = \frac{x + 2y}{2x - y}$
- $x^2 \frac{dy}{dx} = x^2 + xy - 4y^2$ ;  $y = 1$  when  $x = -1$
- $x(x^2 - y^2) \frac{dy}{dx} - y(x^2 + y^2) = 0$ ;  $y = -2$  when  $x = -1$

In Problems 43–46, find the orthogonal trajectories of each family of curves. Graph the members of each family that contain the point  $(2, 1)$ .

- $xy = C$
- $y^2 = 2(C - x)$
- $y = Cx^2$
- $x^2 = Cy^3$

## Applications and Extensions

In Problems 47 and 48, solve each differential equation by letting  $x = u + h$  and  $y = v + k$ , where  $h$  and  $k$  are constants chosen so as to eliminate the constant terms on the right side.

47.  $\frac{dy}{dx} = \frac{y - x - 3}{y + x + 4}$     48.  $\frac{dy}{dx} = \frac{x + 2y - 3}{2x - y + 1}$ ;  $y = 4$  when  $x = 3$

49. **Orthogonal Families** Find the orthogonal trajectories of the family of parabolas  $y^2 = 4Cx$ .

50. **Orthogonal Trajectories** Find the orthogonal trajectories of all circles tangent to the  $x$ -axis at  $(3, 0)$ .

51. **Newton's Law of Heating** Newton's Law of Heating states that the rate of increase of the temperature  $u$  of an object immersed in a medium of constant temperature  $T$  is proportional to the difference  $T - u$ . The differential equation that models the temperature of the object at time  $t$  is

$$\frac{du}{dt} = k(T - u)$$

where  $k$  is a positive constant.

- Find a solution of this differential equation.
- Find the particular solution that satisfies the initial condition  $u(0) = u_0$ .
- A metal bar with initial temperature  $25^\circ\text{C}$  is dropped into a container of boiling water ( $100^\circ\text{C}$ ). After 5 seconds, the temperature of the bar is  $35^\circ\text{C}$ . What will the temperature of the bar be after 1 min?
-  Graph the particular solution to the differential equation found in (c).
- Use the graph to approximate how long will it take for the temperature of the bar to be within  $0.5^\circ\text{C}$  of the temperature of the boiling water.

52. **Newton's Law of Cooling** According to Newton's Law of Cooling, the rate at which a body cools is proportional to the difference between the temperature of the body and the temperature of the surrounding medium. A certain steel bar has a temperature of  $1230^\circ\text{C}$  and cools to  $1030^\circ\text{C}$  in 10 min when the surrounding temperature is  $30^\circ\text{C}$ .

- How long will it take for the bar to cool to  $80^\circ\text{C}$ ?

 (b) Graph the temperature of the steel bar over the interval  $t = 0$  to  $t = 240$  (i.e., for the first 4 h).

- Use the graph to approximate when the steel bar cools to  $50^\circ\text{C}$ .

53. **Sales Growth** The annual sales of a new company are expected to grow at a rate that is proportional to the difference between the sales and an upper limit of \$20 million. Sales are \$0 initially and are \$3 million for the second year.

- Determine the annual sales at any time  $t$ .
- According to the model, what will sales be during the eighth year of operations?
- How long will it take for sales to reach \$12 million?

 (d) Graph the annual sales of the company for its first 20 years of operation.

54. **Bacteria Growth** A culture of bacteria is growing in a medium that can support a maximum of 1,000,000 bacteria. The rate of growth of the population at time  $t$  is proportional to the difference between 1,000,000 and the number present at time  $t$ . The culture contains 1000 bacteria initially, and after 1 h there are 1500 bacteria.

- How many bacteria will there be after 5 h?
- When will the culture contain 9950 bacteria?

55. **Learning Curve** The number of words per minute  $W$  that a person can text increases with practice. Assume that the rate of change of  $W$  is proportional to the difference between an upper limit of 150 words per minute and  $W$ . That is, the rate of change is proportional to  $150 - W$ . Suppose a beginner cannot text at all, that is,  $W = 0$  when  $t = 0$ , and can text 30 words per minute after 10 h of practice.

- How many words per minute can he text after 25 h of practice?
- How many hours of practice will be required in order for him to text 100 words per minute?

(c) Graph the number of words per minute  $W$  a beginner can text as a function of hours of practice.

56. **Drug Concentration** A drug is injected into a patient's bloodstream at a constant rate of  $r$  mg/s. Simultaneously, the drug is removed from the bloodstream at a rate proportional to the amount  $y(t)$  present at time  $t$ .

- Find a differential equation that models this problem.
- Find a solution of the differential equation in (a).
- Find the particular solution that satisfies the initial condition  $y(0) = 0$ .

57. **Friction** The frictional force  $f$  on an object sliding over a surface depends on the speed  $v$  of the object and can be modeled by the function  $f = -Av$ , where  $A$  is a positive constant that depends on the two surfaces. *Note:* The force is negative because the direction of the friction is opposite to the direction of the velocity.

- Express the frictional force  $f$  as a differential equation by using Newton's Second Law,  $F = ma$ .
- Solve the differential equation found in (a) for  $v(t)$ . Assume the object slides over the surface with an initial speed  $v_0$ .
- Suppose that the frictional force on a 25-kg sled is 150 N when the speed of the sled is 10 m/s. Determine the value of the constant  $A$ .
- How long will it take the sled to slow down to 10% of its initial speed?
- How far will the sled travel while slowing down to 1.0 m/s? Assume an initial speed of 10 m/s.

58. **Friction** The frictional force  $f$  on an object sliding over a surface depends on the speed  $v$  of the object and can be modeled by the function  $f = -B\sqrt{v}$ , where  $B$  is a positive constant that depends on the two surfaces. *Note:* The force is negative because the direction of the friction is opposite to the direction of the velocity.

- Express the frictional force  $f$  as a differential equation by using Newton's Second Law,  $F = ma$ .

- (b) Solve the differential equation found in (a) for  $v(t)$ . Assume the object slides over the surface with an initial speed  $v_0$ .
- (c) Suppose that the frictional force on a 25-kg sled is 150 N when the speed of the sled is 10 m/s. Determine the value of the constant  $B$ .
- (d) How long will it take the sled to slow down to 10% of its initial speed?
- (e) How far will the sled travel while slowing down to 1.0 m/s? Assume an initial speed of 10 m/s.

**59. Electronics: Discharging a Capacitor** In a circuit, a capacitor  $C$  carries an initial charge  $q_0$  and discharges through a resistor  $R$ . Using Kirchhoff's rules with this circuit, we obtain the differential equation

$$\frac{dq}{dt} + \frac{q}{RC} = 0$$

where  $q$  is the charge, in Coulombs, on the capacitor at any time  $t$ , and  $R$  and  $C$  are constants.

- (a) Solve the differential equation for the charge  $q$  as a function of time  $t$ .
- (b) In a typical laboratory circuit,  $R = 150 \Omega$  (ohms) and  $C = 5.0 \mu\text{F}$  (microfarads). How long will it take the discharging capacitor to lose 99% of its initial charge? [Hint: The product  $(1 \Omega)(1 \text{ F}) = 1 \text{ second}$ .]
- 60. Air Resistance** At high speeds, air resistance (**drag**) can be modeled by  $F_{\text{drag}} = -Av^2$ , where  $A$  is a positive constant that depends on the shape of the object, its surface texture, and the conditions of the air. *Note:* The force is negative because the direction of the drag is opposite to the direction of the velocity. Suppose, in a test facility, a projectile of mass  $m$  is launched with initial horizontal speed  $v_0$  on a frictionless horizontal track. The only force opposing the motion of the projectile is the drag.
- (a) Express the drag  $F_{\text{drag}}$  as a differential equation by using Newton's Second Law,  $F = ma$ .
- (b) Solve the differential equation found in (a) for  $v(t)$ .
- (c) What happens to the speed of the projectile as  $t$  becomes arbitrarily large?

### Challenge Problems

**61. Orthogonal Families** Find the orthogonal trajectories of the family of hyperbolas  $\frac{x^2}{C^2} - \frac{y^2}{4 - C^2} = 1$ , where  $0 < C < 2$ .

**62. Orthogonal Trajectories** Find the orthogonal trajectories of the family of parabolas with a common vertex at  $(1, 2)$  having a vertical axis. Graph the member of each family that contains the point  $(2, 3)$ .

**63. Velocity of a Projectile** Near Earth's surface the attraction due to gravity is practically constant, but according to Newton's law, the force of attraction exerted by Earth on a given body is  $\frac{k}{x^2}$ , where  $x$  is the distance of the body from the center of Earth and  $g$  is the acceleration due to gravity.

- (a) Show that if a projectile is shot upward from Earth's surface with initial velocity  $v_0$ , and if air resistance is neglected, then

$$v^2 = v_0^2 - 2Rg + \frac{2R^2g}{x}$$

where  $R = 3960 \text{ mi}$  is the radius of Earth.

$$\text{Hint: } \frac{d^2x}{dt^2} = \frac{dv}{dt} = \frac{dv}{dx} \frac{dx}{dt} = v \frac{dv}{dx}$$

- (b) Find the smallest value of  $v_0$  necessary to keep the projectile going indefinitely (neglecting the attractive forces due to celestial bodies other than Earth). This is called the **escape velocity** for Earth.
- 64. Rate of Flow** From physics, it is known that the rate of flow of water from a tank through an orifice of area  $A$  square feet is approximately  $\frac{dV}{dt} = -kA\sqrt{2gh}$ , where  $k = 0.6$ ,  $g = 32 \text{ ft/s}^2$ , and  $h$  is the height of the water level, in feet, above the orifice. Suppose a cylindrical tank with height 6 ft and diameter 3 ft is filled with water. At time  $t = 0$ , a valve in the bottom of the tank is opened and the water begins draining through a circular hole of diameter 1 in.
- (a) Express the height of the water in the tank as a function of time  $t$ .
- (b) How much time is required to empty the tank?
- 65. Rate of Flow** If the water in a tank leaks out through a small hole in the bottom, then the rate of flow is proportional to the square root of the height of the water in the tank. Prove that if the tank is a cylinder with a vertical axis, then the time required for three-fourths of the water to leak out is equal to the time required for the remaining one-fourth of the water to leak out.
- 66. Water Level** A cylindrical tank has a leak in the bottom, and water flows out at a rate proportional to the pressure at the bottom. If the tank loses 2% of its water in 24 h, when will it be half empty?

## 16.3 Exact Differential Equations

**OBJECTIVE** When you finish this section, you should be able to:

- 1** Identify and solve an exact differential equation (p. 1074)

When a first-order differential equation is separable, that is, when it can be written as

$$M(x) dx + N(y) dy = 0$$

a solution can be found by integrating. Under certain conditions, this idea can be extended to differential equations of the form

$$M(x, y) dx + N(x, y) dy = 0$$

in which separation of variables is not possible.

### DEFINITION Exact Differential Equation

The differential equation

$$M(x, y) dx + N(x, y) dy = 0$$

is called an **exact differential equation** in a simply connected, open set  $R$  if there is a function  $z = f(x, y)$  of two variables with continuous partial derivatives on  $R$  for which

$$dz = M(x, y) dx + N(x, y) dy$$

for all  $(x, y)$  in  $R$ .

**NEED TO REVIEW?** The differential of  $z = f(x, y)$  is discussed in Section 12.4, p. 843.

If the differential equation  $M(x, y) dx + N(x, y) dy = 0$  is exact, then the differential of  $z = f(x, y)$  is given by

$$dz = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy = M(x, y) dx + N(x, y) dy$$

**NEED TO REVIEW?** Gradients are discussed in Section 13.1, pp. 866–871.

In other words,  $M(x, y) dx + N(x, y) dy = 0$  is an exact differential equation if there is a potential function  $z = f(x, y)$  whose gradient is  $\nabla f = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ . The condition for this is repeated below.

### THEOREM Test for Exactness

A differential equation of the form

$$M(x, y) dx + N(x, y) dy = 0$$

is an exact differential equation at every point  $(x, y)$  in a simply connected open set  $R$  if and only if

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

for all  $(x, y)$  in  $R$ .

So, if  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$ , then the differential equation  $M(x, y) dx + N(x, y) dy = 0$  is exact, and it can be written in the equivalent form  $\frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy = 0$ , where  $z = f(x, y)$  is a function of two variables with the property that  $\frac{\partial f}{\partial x} = M$  and  $\frac{\partial f}{\partial y} = N$ . But  $\frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy$  is the total differential of  $z = f(x, y)$ , and so  $f_x dx + f_y dy = 0$  is equivalent to  $dz = 0$ , whose solution is  $f(x, y) = C$ ,  $C$  a constant.

## 1 Identify and Solve an Exact Differential Equation

### EXAMPLE 1 Identifying and Solving an Exact Differential Equation

(a) Show that the differential equation

$$(2x + 3x^2y) dx + (x^3 + 2y - 3y^2) dy = 0 \quad (1)$$

is an exact differential equation.

(b) Find the general solution.

**Solution** (a) Let  $M = 2x + 3x^2y$  and  $N = x^3 + 2y - 3y^2$ . Then

$$\frac{\partial M}{\partial y} = 3x^2 \quad \text{and} \quad \frac{\partial N}{\partial x} = 3x^2$$

Since  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$  for all  $x$  and  $y$ , the differential equation (1) is exact over the  $xy$ -plane.

(b) Since the differential equation  $(2x + 3x^2y) dx + (x^3 + 2y - 3y^2) dy = 0$  is exact, there is a function  $z = f(x, y)$  so that

$$\frac{\partial f}{\partial x} = M = 2x + 3x^2y \quad \text{and} \quad \frac{\partial f}{\partial y} = N = x^3 + 2y - 3y^2$$

We find  $f$  by integrating  $\frac{\partial f}{\partial x} = M = 2x + 3x^2y$  partially with respect to  $x$  (holding  $y$  constant). Then

$$f(x, y) = \int (2x + 3x^2y) dx = x^2 + x^3y + B(y) \quad (2)$$

where the constant of integration is a function  $B$  of  $y$  alone, which is as yet unknown.

To determine  $B(y)$ , we use the fact that  $f$  must also satisfy  $\frac{\partial f}{\partial y} = N = x^3 + 2y - 3y^2$ . Then from (2),

$$\frac{\partial f}{\partial y} = \frac{\partial}{\partial y}[x^2 + x^3y + B(y)] = x^3 + \frac{\partial}{\partial y}B(y) \quad \text{and} \quad \frac{\partial f}{\partial y} = x^3 + 2y - 3y^2$$

Equating the two expressions, we have

$$x^3 + \frac{\partial}{\partial y}B(y) = x^3 + 2y - 3y^2$$

$$\frac{dB}{dy} = 2y - 3y^2 \quad \text{B is a function of y alone; } \frac{\partial B}{\partial y} = \frac{dB}{dy}.$$

Now we integrate  $\frac{dB}{dy} = 2y - 3y^2$  with respect to  $y$ .

$$B(y) = \int (2y - 3y^2) dy = y^2 - y^3 + C$$

Substituting for  $B(y)$  in (2), we obtain

$$f(x, y) = x^2 + x^3y + y^2 - y^3 + C$$

The general solution of the differential equation is

$$x^2 + x^3y + y^2 - y^3 + C = 0$$

where  $C$  is a constant. ■

**NEED TO REVIEW?** Finding a potential function  $f$  for a conservative vector field  $F$  is discussed in Section 15.3, pp. 995–996.

### NOW WORK Problem 9.

**EXAMPLE 2** Identifying and Solving an Exact Differential Equation

(a) Show that

$$(\cos y - \cos x) dx + (e^y - x \sin y) dy = 0$$

is an exact differential equation.

(b) Find the particular solution that satisfies the boundary condition  $y(\pi) = 0$ .**Solution** (a) Let  $M = \cos y - \cos x$  and  $N = e^y - x \sin y$ . Then

$$\frac{\partial M}{\partial y} = -\sin y \quad \text{and} \quad \frac{\partial N}{\partial x} = -\sin y$$

Since  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$  for all  $x$  and  $y$ , the differential equation is exact over the  $xy$ -plane.(b) Since the differential equation is exact, there is a function  $z = f(x, y)$  so that

$$\frac{\partial f}{\partial x} = M = \cos y - \cos x \quad \text{and} \quad \frac{\partial f}{\partial y} = N = e^y - x \sin y$$

We integrate  $\frac{\partial f}{\partial x} = M = \cos y - \cos x$  partially with respect to  $x$  (holding  $y$  constant). Then

$$f(x, y) = \int (\cos y - \cos x) dx = x \cos y - \sin x + B(y) \quad (3)$$

where  $B$ , which is yet unknown, is a function of  $y$  alone. To find  $B$ , we differentiate  $f$  with respect to  $y$ .

$$\frac{\partial f}{\partial y} = \frac{\partial}{\partial y} [x \cos y - \sin x + B(y)] = -x \sin y - 0 + \frac{\partial}{\partial y} B(y) = -x \sin y + \frac{dB}{dy}$$

Since  $\frac{\partial f}{\partial y} = N = e^y - x \sin y$ , we have

$$-x \sin y + \frac{dB}{dy} = e^y - x \sin y$$

$$\frac{dB}{dy} = e^y$$

$$B(y) = e^y + C$$

where  $C$  is a constant. Now we substitute  $B(y)$  into (3) to obtain the general solution

$$f(x, y) = x \cos y - \sin x + e^y + C = 0$$

To find the particular solution that satisfies the boundary condition  $y(\pi) = 0$ , we need to find  $C$  so that  $y = 0$  when  $x = \pi$ . Then

$$\pi \cos 0 - \sin \pi + e^0 + C = 0$$

$$\pi + 1 + C = 0$$

$$C = -(1 + \pi)$$

The particular solution is  $x \cos y - \sin x + e^y = \pi + 1$ . ■**NOW WORK** Problem 25.**Integrating Factors**There are differential equations that are not exact, but can be made exact by multiplying the equation by an appropriate expression called an *integrating factor*.

### EXAMPLE 3 Transforming a Differential Equation into an Exact Differential Equation

The equation

$$-y \, dx + x \, dy = 0$$

is not an exact differential equation because

$$\frac{\partial}{\partial y}(-y) = -1 \quad \text{and} \quad \frac{\partial}{\partial x}(x) = 1$$

are not equal. The differential equation, however, can be converted into an exact differential equation by multiplying by  $\frac{1}{x^2}$ . Then

$$-\frac{y}{x^2} \, dx + \frac{1}{x} \, dy = 0$$

is an exact differential equation because

$$\frac{\partial}{\partial y}\left(-\frac{y}{x^2}\right) = -\frac{1}{x^2} \quad \text{and} \quad \frac{\partial}{\partial x}\left(\frac{1}{x}\right) = -\frac{1}{x^2}$$

Multiplying the differential equation in Example 3 by  $\frac{1}{x^2}$  converted the original differential equation into an exact differential equation. An expression that makes a differential equation exact is called an **integrating factor**. Problems 27 and 28 discuss two situations for which an integrating factor can be found for a first-order differential equation.

## 16.3 Assess Your Understanding

### Concepts and Vocabulary

- True or False** The differential equation  $xy \, dx + \frac{x^2}{2} \, dy = 0$  is exact.
- True or False** The differential equation  $y \cos x \, dx - \sin x \, dy = 0$  is exact.
- True or False** If  $\frac{\partial M}{\partial x} = \frac{\partial N}{\partial y}$ , then  $M(x, y) \, dx + N(x, y) \, dy = 0$  is an exact differential equation.
- If the differential equation  $M(x, y) \, dx + N(x, y) \, dy = 0$  is not exact, but  $a(x, y)M(x, y) \, dx + a(x, y)N(x, y) \, dy = 0$  is an exact differential equation, then the expression  $a(x, y)$  is called a(n) \_\_\_\_\_.

### Skill Building

In Problems 5–22:

- Show that each equation is an exact differential equation.
- Find the general solution.

- $(4x - 2y + 5) \, dx + (2y - 2x) \, dy = 0$
- $(3x^2 + 3xy^2) \, dx + (3x^2y - 3y^2 + 2y) \, dy = 0$
- $(a^2 - 2xy - y^2) \, dx - (x + y)^2 \, dy = 0$ ,  $a$  is constant
- $(2ax + by + g) \, dx + (2e^y + bx + h) \, dy = 0$ ,  $a, b, g, h$  are constants
- $\frac{1}{y} \, dx - \frac{x}{y^2} \, dy = 0$
- $\frac{y \, dx - x \, dy}{x^2} = 0$

- $(x - 1)^{-1}y \, dx + [\ln(2x - 2) + y^{-1}] \, dy = 0$
- $2xy^{-1} \, dy + (2 \ln(5y) + x^{-1}) \, dx = 0$
- $(x + 3)^{-1} \cos y \, dx - [\sin y \ln(5x + 15) - y - 1] \, dy = 0$
- $p^2 \sec(2\theta) \tan(2\theta) \, d\theta + p[\sec(2\theta) + 2] \, dp = 0$
- $\cos(x + y^2) \, dx + 2y \cos(x + y^2) \, dy = 0$
- $[\sin(2\theta) - 2p \cos(2\theta)] \, dp + [2p \cos(2\theta) + 2p^2 \sin(2\theta)] \, d\theta = 0$
- $e^{2x}(y \, dy + 2y \, dx) = x^2 \, dx$
- $e^{x^2}(y \, dy + 2xy \, dx) = 3x^2 \, dx$
- $\left[\frac{1}{x+y} + y^2\right] \, dx + \left[\frac{1}{x+y} + 2xy\right] \, dy = 0$
- $\frac{y^2 - 2x^2}{xy^2 - x^3} \, dx + \frac{2y^2 - x^2}{y^3 - x^2y} \, dy = 0$
- $2y^3 \sin(2x) \, dx - 3y^2 \cos(2x) \, dy = 0$
- $\frac{3y^2}{x^2 + 3x} \, dx + \left(2y \ln \frac{5x}{x+3} + 3 \sin y\right) \, dy = 0$

In Problems 23–26, each differential equation is exact. Find the particular solution that satisfies the given boundary condition.

- $(1 + y^2 + xy^2) \, dx + (x^2y + y + 2xy) \, dy = 0$ ;  $y(1) = 1$
- $(3x^2y^{-1} + 2x) \, dx + (y^2 - x^3y^{-2}) \, dy = 0$ ;  $y(3) = 3$
- $(2xy - \sin x) \, dx = (2y - x^2) \, dy$ ;  $y(0) = 1$
- $y[y + \sin x] \, dx - \left[\cos x - 2xy + \frac{1}{1+y^2}\right] \, dy = 0$ ;  $y(0) = 1$

## Applications and Extensions

**27. Integrating Factors** Suppose the equation

$M(x, y) dx + N(x, y) dy = 0$  has the property that

$\frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{M}$  is a function of  $y$  only. If

$$u(y) = e^{\left[ \int \frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{M} dy \right]} = \exp \left[ \int \frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{M} dy \right]$$

show that  $u(y)[M(x, y) dx + N(x, y) dy] = 0$  is an exact differential equation.

**28. Integrating Factors** Suppose the equation

$M(x, y) dx + N(x, y) dy = 0$  has the property that

$\frac{\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}}{N}$  is a function of  $x$  only. If

$$u(x) = e^{\left[ \int \frac{\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}}{N} dx \right]} = \exp \left[ \int \frac{\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}}{N} dx \right]$$

show that  $u(x)[M(x, y) dx + N(x, y) dy] = 0$  is an exact differential equation.

In Problems 29–33,

- (a) Change each equation to an exact differential equation by using one of the integrating factors discussed in Problems 27 and 28.
- (b) Solve the resulting differential equation.
- (c) Verify that the solution also satisfies the original equation.

**29.**  $(4x^2 + y^2 + 1) dx + (x^2 - 2xy) dy = 0$

**30.**  $4x^2y dx + (x^3 + y) dy = 0$      **31.**  $y dx + (x^2y - x) dy = 0$

**32.**  $(\cos y + x) dx + x \sin y dy = 0$

**33.**  $(x^2 - x \sin y) dx + x^2 \cos y dy = 0$

## Challenge Problem

**34. Measuring the Effect of Pollution** A crash in the Gulf of Mexico resulted in an oil spill at the point  $A$  shown in the figure below. Several months after the spill, measurements are taken to determine whether the oil is still affecting the marine environment of the Gulf. The contour curves shown in the figure are curves of constant oil concentration. These curves are modeled by the differential equation

$$2 \frac{\beta - y}{100} - 2 \cos \frac{\beta - y}{100} \frac{\frac{\beta - y}{100}}{\frac{\alpha - x}{100} + 4 \cos \frac{\alpha - x}{100}} y'(x) = 1$$

where  $\alpha$  and  $\beta$  are specified constants.

- (a) Find the solution of the differential equation.
- (b) The solution from (b) can be interpreted as the oil concentration in pounds of oil per million gallons at a point  $(x, y)$ . Suppose the point  $A$  is at the origin and the point  $B$  is  $(162.14, 250.64)$ . Use the initial condition  $f(0, 0) = 74.1$  to find the oil concentration at  $B$ , given  $\alpha = 93.43$  and  $\beta = 59.12$ .

## 16.4 First-Order Linear Differential Equations; Bernoulli Differential Equations

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Solve a first-order linear differential equation (p. 1078)
- 2 Solve applied problems involving first-order linear differential equations (p. 1079)
- 3 Find the general solution of a Bernoulli equation (p. 1082)
- 4 Solve applied problems (p. 1083)

In this section, we solve first-order linear differential equations and Bernoulli differential equations. These differential equations occur in the study of free fall with air resistance, flow rates in mixtures, and logistic equations.

## 1 Solve a First-Order Linear Differential Equation

We use integrating factors to solve first-order linear differential equations. Recall that a first-order differential equation is linear if it can be written in the form

$$\frac{dy}{dx} + P(x)y = Q(x) \quad (1)$$

where the functions  $P$  and  $Q$  are continuous on their domains.

For example, the differential equation

$$\frac{dy}{dx} - \frac{3}{x}y = x^2$$

is a first-order linear differential equation.

In the differential equation (1), either  $Q(x) = 0$  or  $Q(x) \neq 0$ . If  $Q(x) = 0$ , then  $\frac{dy}{dx} + P(x)y = 0$ , and the differential equation is separable:

$$\frac{dy}{y} + P(x) dx = 0$$

The general solution of this differential equation is

$$\ln |y| + \int P(x) dx = C$$

### NOW WORK Problem 5.

If  $Q(x) \neq 0$ , we solve (1) by multiplying by the integrating factor

$$e^{\int P(x) dx} = \exp \left[ \int P(x) dx \right]$$

$$\frac{dy}{dx} + P(x)y = Q(x) \quad \text{Equation (1), } Q(x) \neq 0.$$

$$\frac{dy}{dx} e^{\int P(x) dx} + P(x)y e^{\int P(x) dx} = Q(x)e^{\int P(x) dx} \quad \text{Multiply (1) by } \exp \left[ \int P(x) dx \right].$$

The left side of this equation equals  $\frac{d}{dx} \left( y \cdot e^{\int P(x) dx} \right)$ , so

$$\frac{d}{dx} \left( y \cdot e^{\int P(x) dx} \right) = Q(x)e^{\int P(x) dx}$$

Now we integrate to obtain

$$y \cdot e^{\int P(x) dx} = \int Q(x)e^{\int P(x) dx} dx + C \quad (2)$$

The general solution of the differential equation  $\frac{dy}{dx} + P(x)y = Q(x)$ ,  $Q(x) \neq 0$ , is found by finding the integrals in (2) and solving for  $y$ .

### EXAMPLE 1 Solving a First-Order Linear Differential Equation

Find the general solution of the first-order linear differential equation

$$\frac{dy}{dx} + \frac{x}{x^2 + 1}y = \frac{x^3}{1 + x^2}$$

**Solution** Compare the differential equation to (1). Since  $P(x) = \frac{x}{x^2 + 1}$ , the integrating factor is

$$e^{\int P(x) dx} = \exp \left[ \int \frac{x}{x^2 + 1} dx \right] = \exp \left[ \frac{1}{2} \ln(x^2 + 1) \right] = \exp \left[ \ln(x^2 + 1)^{1/2} \right] = \sqrt{x^2 + 1}$$

Now we multiply the differential equation by  $\sqrt{x^2 + 1}$  and obtain

$$\sqrt{x^2 + 1} \frac{dy}{dx} + \frac{x}{\sqrt{x^2 + 1}} y = \frac{x^3}{\sqrt{x^2 + 1}}$$

The left side of the above equation is the derivative of  $\sqrt{x^2 + 1} y$ , so we can write

$$\frac{d}{dx}(\sqrt{x^2 + 1} y) = \frac{x^3}{\sqrt{x^2 + 1}}$$

Integrating both sides, we find

$$\begin{aligned} \sqrt{x^2 + 1} y &= \int \frac{x^3}{\sqrt{x^2 + 1}} dx = \frac{1}{2} \int \frac{(u - 1)}{\sqrt{u}} du = \frac{1}{2} \int (u^{1/2} - u^{-1/2}) du \\ &\quad \text{Let } u = x^2 + 1, \, du = 2x \, dx \\ &= \frac{1}{2} \left( \frac{u^{3/2}}{\frac{3}{2}} - \frac{u^{1/2}}{\frac{1}{2}} \right) + C = \frac{(x^2 + 1)^{3/2}}{3} - (x^2 + 1)^{1/2} + C \\ y &= \frac{x^2 + 1}{3} - 1 + \frac{C}{\sqrt{x^2 + 1}} \quad \text{Solve for } y. \end{aligned}$$

and we have the general solution to the differential equation. ■

### NOW WORK Problem 9.

## 2 Solve Applied Problems Involving First-Order Linear Differential Equations

### Free Fall with Air Resistance

In Chapter 4, we saw that if air resistance is ignored, then the position  $s = s(t)$  at time  $t$  of an object with mass  $m$  in free fall obeys the equation

$$ma = -mg$$

where  $a = \frac{d^2s}{dt^2}$  and  $g$  is the acceleration due to gravity.

A more realistic model of the motion of an object in free fall accounts for the effect of air resistance. A common assumption is that air resistance exerts a force proportional to the speed  $v$  of the object and opposite to the motion of the object. With this assumption, the motion of an object of mass  $m$  in free fall is described by the differential equation

$$m \frac{d^2s}{dt^2} = -mg - kv$$

where  $k > 0$  is the constant of proportionality and depends on the particular object and certain air properties. For example, a sheet of paper has a much larger constant of proportionality than a solid lead ball has. Since  $v = \frac{ds}{dt}$ , the second-order differential equation becomes

$$m \frac{dv}{dt} = -mg - kv$$

$$\frac{dv}{dt} + \frac{k}{m}v = -g$$

This is a first-order linear differential equation. To solve the differential equation, we multiply both sides by the integrating factor  $\exp\left[\int \frac{k}{m} dt\right] = \exp\left[\frac{k}{m}t\right] = e^{kt/m}$ .

$$e^{kt/m} \frac{dv}{dt} + e^{kt/m} \frac{k}{m} v = -g e^{kt/m}$$

$$\frac{d}{dt} [v e^{kt/m}] = -g e^{kt/m}$$

$$v e^{kt/m} = -g \int e^{kt/m} dt = -\frac{mg}{k} e^{kt/m} + C \quad \text{Integrate both sides.}$$

$$v = \frac{-\frac{mg}{k} e^{kt/m} + C}{e^{kt/m}} = -\frac{mg}{k} + C e^{-kt/m} \quad \text{Solve for } v.$$

The general solution is

$$v(t) = -\frac{mg}{k} + C e^{-kt/m}$$

If the object has initial velocity  $v_0$ , then

$$v_0 = v(0) = -\frac{mg}{k} + C, \quad \text{so} \quad C = v_0 + \frac{mg}{k}$$

Then

$$v(t) = -\frac{mg}{k} + \left(v_0 + \frac{mg}{k}\right) e^{-kt/m} \quad (3)$$

Notice that  $\lim_{t \rightarrow \infty} v(t) = -\frac{mg}{k}$ . That is, the limiting velocity of a freely falling object depends only on the mass of the body and the constant of proportionality  $k$ .

### EXAMPLE 2 Solving a Free Fall Problem

A parachuter and his parachute together weigh 192 lb. At the instant the parachute opens, he is falling at 150 feet per second (ft/s). Suppose the air resistance exerts a force of 200 lb when the parachuter's speed is 20 ft/s.

- How fast is he falling 3 seconds after the parachute opens?
- What is the parachuter's limiting velocity?

**Solution** (a) In the U.S. customary system of units, length is measured in feet, weight in pounds, time in seconds, and  $g \approx 32 \text{ ft/s}^2$ . The mass  $m$  of the parachuter and his parachute obeys  $mg = \text{weight} = 192 \text{ lb}$ .

Since the air resistance is 200 lb when the speed is 20 ft/s,

$$200 = k \cdot 20 \quad F = kv; \text{ force is proportional to speed.}$$

$$k = 10$$

From (3), the velocity of the parachuter at time  $t$  after the parachute opens is

$$v(t) = -\frac{mg}{k} + \left(v_0 + \frac{mg}{k}\right) e^{-kt/m}$$

$$v(t) = -\frac{192}{10} + \left(-150 + \frac{192}{10}\right) e^{-10t/6} \quad v_0 = -150; mg = 192; g = 32; k = 10.$$

$$v(t) = -19.2 - 130.8 e^{-5t/3}$$

**NOTE** Remember that with falling objects, the positive direction is up, so  $v_0 = v(0) = -150 \text{ ft/s}$ .

After 3 seconds, the parachuter's velocity is

$$v(3) = -19.2 - 130.8e^{-5} \approx -20.081 \text{ ft/s (13.692 mi/h)}$$

(b) The limiting velocity is  $\lim_{t \rightarrow \infty} v(t) = -\frac{mg}{k} = -19.2 \text{ ft/s (13.091 mi/h)}$ . ■

### NOW WORK Problem 47.

## Flow Rate in Mixtures

### EXAMPLE 3 Solving a Flow Rate Problem

A large tank contains 81 gal of brine in which 20 lb of salt are dissolved. Brine containing 3 lb of dissolved salt per gallon runs into the tank at the rate of 5 gal/min. The mixture, kept uniform by stirring, drains from the tank at the rate of 2 gal/min. How much salt is in the tank at the end of 37 min? See Figure 6.

DF Figure 6

**Solution** Let  $y(t)$  be the amount of salt in the tank at time  $t$ . The rate of change  $\frac{dy}{dt}$  of salt in the tank at time  $t$  is the rate at which salt enters the tank minus the rate at which salt leaves the tank. Salt enters the tank at the rate of  $(3 \text{ lb/gal})(5 \text{ gal/min}) = 15 \text{ lb/min}$ .

To find the rate at which the salt exits the tank, we first need to find the concentration of salt in pounds per gallon at time  $t$ .

$$\text{Concentration} = \frac{\text{amount of salt}}{\text{number of gallons}} = \frac{y(t)}{81 + (5 - 2)t} = \frac{y(t)}{81 + 3t} \text{ lb/gal}$$

Then the rate at which the salt exits the tank is

$$\left( \frac{y(t)}{81 + 3t} \text{ lb/gal} \right) (2 \text{ gal/min}) = \frac{2y(t)}{81 + 3t} \text{ lb/min}$$

The mixture problem is modeled by the differential equation

$$\begin{aligned} \frac{dy}{dt} &= \text{rate in} - \text{rate out} = 15 - \frac{2y(t)}{81 + 3t} \\ \frac{dy}{dt} + \frac{2}{3(27 + t)}y &= 15 \end{aligned}$$

This is a first-order linear differential equation. We use the integrating factor:

$$\begin{aligned} e^{\int P(t) dt} &= \exp \left[ \int \frac{2}{3(27 + t)} dt \right] = \exp \left[ \frac{2}{3} \ln(27 + t) \right] \\ &= \exp [\ln(27 + t)^{2/3}] = (27 + t)^{2/3} \end{aligned}$$

We multiply the differential equation by the integrating factor to obtain

$$\begin{aligned} (27 + t)^{2/3} \frac{dy}{dt} + \frac{2y}{3(27 + t)^{1/3}} &= 15(27 + t)^{2/3} \\ \frac{d}{dt} [y(t)(27 + t)^{2/3}] &= 15(27 + t)^{2/3} \end{aligned}$$

Now we integrate both sides with respect to  $t$ .

$$\begin{aligned} y(t)(27 + t)^{2/3} &= \int 15(27 + t)^{2/3} dt = 15 \int u^{2/3} du = 15 \frac{u^{5/3}}{5/3} + C \\ &\quad \text{Let } u = 27 + t, du = dt \\ &= 9(27 + t)^{5/3} + C \\ y(t) &= \frac{9(27 + t)^{5/3} + C}{(27 + t)^{2/3}} = 9(27 + t) + C(27 + t)^{-2/3} \end{aligned}$$

Next we use the initial condition that  $y(0) = 20$  lb. Then

$$\begin{aligned} y(0) &= 20 = 9(27) + C(27)^{-2/3} \\ -223 &= \frac{C}{9} \\ C &= -2007 \end{aligned}$$

The amount of salt  $y(t)$  in the brine at time  $t$  min is

$$y(t) = 9(27 + t) - 2007(27 + t)^{-2/3}$$

The amount of salt in the tank at the end of 37 min is

$$y(37) = 9(27 + 37) - 2007(27 + 37)^{-2/3} \approx 451 \text{ lb}$$

### NOW WORK Problem 49.

**ORIGINS** Jakob (or James) Bernoulli (1654–1705) was a Swiss mathematician. Jakob was one of eight family members, in three generations of Bernoullis, who made major contributions to mathematics and physics.

## 3 Find the General Solution of a Bernoulli Equation

The equation

$$\frac{dy}{dx} + P(x)y = Q(x)y^n \quad n \neq 0 \quad n \neq 1 \quad (4)$$

where  $P$  and  $Q$  are functions of  $x$  only, is called a **Bernoulli equation**, named for Jakob Bernoulli who studied it in 1695.

If we multiply both sides of (3) by  $y^{-n}$  and make a judicious substitution, we obtain a first-order linear differential equation. First, we multiply (3) by  $y^{-n}$ :

$$y^{-n} \frac{dy}{dx} + P(x)y^{-n+1} = Q(x) \quad (5)$$

Now we use the substitution  $v = v(x) = y^{-n+1}$ . Then  $\frac{dv}{dx} = (1 - n)y^{-n} \frac{dy}{dx}$ . Since  $n \neq 0$  and  $n \neq 1$ , we can write  $y^{-n} \frac{dy}{dx} = \frac{1}{1 - n} \frac{dv}{dx}$ . Then (4) becomes

$$\begin{aligned} \frac{1}{1 - n} \frac{dv}{dx} + P(x)v &= Q(x) \\ \frac{dv}{dx} + (1 - n)P(x)v &= (1 - n)Q(x) \quad \text{Multiply by } 1 - n. \end{aligned}$$

This is a first-order linear differential equation in  $v = v(x)$ .

We use the following steps to solve a Bernoulli equation:

### Steps for Solving a Bernoulli Equation

$$\frac{dy}{dx} + P(x)y = Q(x)y^n \quad n \neq 0 \quad n \neq 1$$

**Step 1** Multiply both sides of the equation by  $y^{-n}$ . [This isolates  $Q(x)$  on the right.]

**Step 2** Let  $v = v(x) = y^{-n+1}$ . Then  $\frac{dv}{dx} = (1 - n)y^{-n} \frac{dy}{dx}$ .

**Step 3** Substitute  $v$  and  $\frac{1}{1 - n} \frac{dv}{dx}$  into  $y^{-n} \frac{dy}{dx} + P(x)y^{-n+1} = Q(x)$ .

**Step 4** Find the general solution of the resulting first-order linear differential equation.

**Step 5** Rewrite the general solution in terms of the original variables  $x$  and  $y$ .

**EXAMPLE 4** Solving a Bernoulli Equation

Find the general solution of the differential equation

$$\frac{dy}{dx} = 4y + 2e^x y^{1/2}$$

**Solution** We begin by writing the equation in the form of (3):

$$\frac{dy}{dx} - 4y = 2e^x y^{1/2}$$

This is a Bernoulli differential equation with  $P(x) = -4$ ,  $Q(x) = 2e^x$ , and  $n = \frac{1}{2}$ . Then we follow the steps for solving a Bernoulli equation.

**Step 1** Multiply the differential equation by  $y^{-1/2}$  to obtain

$$y^{-1/2} \frac{dy}{dx} - 4y^{1/2} = 2e^x$$

**Step 2** Let  $v = v(x) = y^{1/2}$ . Then  $\frac{dv}{dx} = \frac{1}{2}y^{-1/2} \frac{dy}{dx}$ .

**Step 3** Substitute  $v$  and  $\frac{dv}{dx}$  into  $y^{-1/2} \frac{dy}{dx} - 4y^{1/2} = 2e^x$ .

$$2 \frac{dv}{dx} - 4v = 2e^x$$

$$\frac{dv}{dx} - 2v = e^x$$

This is a first-order linear differential equation in  $x$  and  $v$ .

**Step 4** Multiply the differential equation by the integrating factor  $e^{\int -2 dx} = e^{-2x}$ .

$$e^{-2x} \frac{dv}{dx} - 2e^{-2x} v = e^{-x}$$

$$\frac{d}{dx}(e^{-2x} v) = e^{-x}$$

$$e^{-2x} v = \int e^{-x} dx = -e^{-x} + C \quad C > 0$$

$$v = Ce^{2x} - e^x$$

**Step 5** Using  $v = y^{1/2}$ , we write the solution in terms of  $x$  and  $y$ .

$$y^{1/2} = Ce^{2x} - e^x$$

$$y = (Ce^{2x} - e^x)^2$$

**NOTE** Since  $e^{-2x}v + e^{-x} > 0$ , then  $C > 0$ .

**NOW WORK** Problem 25.**4 Solve Applied Problems****Logistic Growth**

In the mid-nineteenth century, the Belgian mathematical biologist Pierre F. Verhulst (1804–1849) used the differential equation

$$\frac{dy}{dt} = ky(M - y)$$

where  $k$  and  $M$  are positive constants, to predict the human population of various countries. Verhulst referred to the model as **logistic growth**. Because of this, the equation is known as the **logistic differential equation** and its solutions are called **logistic functions**.

Rewrite the differential equation as

$$\frac{dy}{dt} = kMy - ky^2$$

where the first term on the right side,  $kMy$ , is a **growth** term and the second term,  $-ky^2$ , is an “**inhibition**” or “**competition**” term that impedes growth.

The logistic differential equation  $\frac{dy}{dt} = kMy - ky^2$  is a Bernoulli differential equation:

$$\frac{dy}{dt} - kMy = -ky^2$$

where  $P(t) = -kM$ ,  $Q(t) = -k$ , and  $n = 2$ . To solve it, we follow the steps for solving a Bernoulli equation.

**Step 1** Multiply by  $y^{-n} = y^{-2}$ .

$$y^{-2} \frac{dy}{dt} + (-kM)y^{-1} = -k$$

**Step 2** Let  $v = y^{-1}$ . Then  $\frac{dv}{dt} = -y^{-2} \frac{dy}{dt}$ .

**Step 3** Substitute  $v$  and  $\frac{dv}{dt}$  into  $y^{-2} \frac{dy}{dt} - kMy^{-1} = -k$ .

$$\begin{aligned} -\frac{dv}{dt} - kMv &= -k \\ \frac{dv}{dt} + kMv &= k \end{aligned}$$

**Step 4** Multiply by the integrating factor  $e^{\int P(t) dt} = e^{\int kM dt} = e^{kMt}$ .

$$\begin{aligned} e^{kMt} \frac{dv}{dt} + e^{kMt} kMv &= ke^{kMt} \\ \frac{d}{dt}[e^{kMt} v] &= ke^{kMt} \\ e^{kMt} v &= k \int e^{kMt} dt = \frac{1}{M} e^{kMt} + C \end{aligned}$$

**Step 5** Using  $v = y^{-1}$ , we rewrite the solution in terms of  $y$ .

$$\begin{aligned} e^{kMt} \frac{1}{y} &= \frac{1}{M} e^{kMt} + C & v = y^{-1} = \frac{1}{y} \\ y(t) &= \frac{e^{kMt}}{\frac{1}{M} e^{kMt} + C} = \frac{Me^{kMt}}{e^{kMt} + MC} = \frac{M}{1 + MCe^{-kMt}} \end{aligned}$$

If we assume that the initial condition is  $y(0) = R$ ,  $0 \leq R < M$ , then  $R = \frac{M}{1 + MC}$  or  $C = \frac{M - R}{RM}$  and

$$y(t) = \frac{RM}{R + (M - R)e^{-kMt}} \quad (6)$$

Equation (5) is called a **logistic function**.

The graph of a logistic equation has a distinct “s” shape. See Figure 7. Since  $\lim_{t \rightarrow \infty} y(t) = M$ ,  $M$  is called the **carrying capacity** of the logistic function.

Logistic equations have various applications:

- They are used to predict the growth of certain bacteria in a closed system where the scarcity of space or nutrients limits growth.

**Figure 7**  $y(t) = \frac{RM}{R + (M - R)e^{-kMt}}$

**ORIGINS** Daniel Bernoulli (1700–1782) was the nephew of Jakob Bernoulli and son of mathematician Daniel Bernoulli. Daniel, the son, was a medical doctor and a mathematician who did much work with Leonhard Euler (1707–1783). In 1760 Daniel Bernoulli used what is now called the logistic equation to study the spread of smallpox.

- They provide a reasonable model for describing the spread of an epidemic caused by the introduction of an infected individual into a population. In this model, if  $M$  is the size of the population and  $y = y(t)$  is the number of infected individuals at time  $t$ , then the logistic equation states that the spread (rate of growth) of the disease is proportional to the product of the number of infected individuals and the number of individuals who have not been infected. At the start of the epidemic, the disease spreads with uninhibited growth, and is modeled by the differential

equation  $\frac{dy}{dt} = kMy$ . See Section 5.5 for examples of uninhibited growth. Then

since the number of individuals who are exposed is limited, at some point in time the rate of infection begins to decrease.

- In economics, the logistic equation is used to predict the growth of sales, the effects of advertising, and company growth. The logistic equation provides a reasonable model for describing the spread of a new technology. For example, after the introduction of the iPad®, the rate of sales increases rapidly for a time, until it reaches a maximum. Then although the sales continue to increase, the rate of sales begins to decrease.
- Social scientists use logistic equations to study cultural phenomena in a society. The 2011 Occupy Wall Street movement is one such example. On September 17, 2011, a small group of protestors gathered at Zuccotti Park in New York City to protest the high salaries of Wall Street executives. As the movement spread throughout the city and the United States, the number of protestors increased rapidly for a time, until reaching a maximum rate of increase. Then although more protestors joined the movement, the rate of increase began to decrease.

### EXAMPLE 5 Solving a Logistic Equation

An influenza epidemic is spreading throughout a population of 50,000 people at a rate that is proportional to the product of the number of infected people and the number of noninfected people. Suppose that 100 people were infected initially and 1000 were infected after 10 days.

- Find the number of infected people at any time  $t$ . How long will it take for half the population to be infected?
- Find the time  $t$  at which the rate of spread of infection stops increasing and begins to decrease.

**Solution** (a) If  $y = y(t)$  is the number of people infected at time  $t$ , then

$$\frac{dy}{dt} = ky(50,000 - y) \quad (7)$$

where  $k$  is the constant of proportionality. As given in equation (5), the solution is

$$\begin{aligned} y(t) &= \frac{100(50,000)}{100 + (50,000 - 100)e^{-50,000kt}} && R = 100, \quad M = 50,000 \\ &= \frac{100(50,000)}{100 + 49,900e^{-50,000kt}} = \frac{50,000}{1 + 499e^{-50,000kt}} \end{aligned}$$

We find  $k$  from the boundary condition  $y(10) = 1000$ . Then

$$\begin{aligned} 1000 &= \frac{50,000}{1 + 499e^{-500,000k}} \\ 499e^{-500,000k} &= 49 \\ -500,000k &= \ln\left(\frac{49}{499}\right) \\ k &\approx 0.00000464 = 4.64 \times 10^{-6} \end{aligned}$$

So,

$$y(t) = \frac{50,000}{1 + 499e^{-0.232t}}$$

Half the population is infected when  $y(t) = 25,000$ .

$$\begin{aligned} 25,000 &= \frac{50,000}{1 + 499e^{-0.232t}} \\ 1 + 499e^{-0.232t} &= 2 \\ e^{-0.232t} &= \frac{1}{499} \\ t &= \frac{\ln \frac{1}{499}}{-0.232} \approx 27 \text{ days} \end{aligned}$$

Half the population is infected in approximately 27 days.

(b) The time  $t$  we seek is the inflection point of  $y = y(t)$ . We need to find  $t$  so that  $y''(t) = 0$ .

$$\begin{aligned} y'(t) &= ky(50,000 - y) = k(50,000y - y^2) \\ y'' &= k(50,000y' - 2yy') = 0 \\ 2y &= 50,000 \\ y &= 25,000 \end{aligned} \quad (6)$$

From (a),  $y = 25,000$  when  $t = 27$ . That is, on Day 27, the rate of infection stops increasing and begins to decrease. ■

**NOW WORK** Problem 51.

## 16.4 Assess Your Understanding

### Concepts and Vocabulary

- True or False** First-order linear differential equations have the form  $\frac{dy}{dx} + P(x)y = Q(x)$ , where the functions  $P$  and  $Q$  are continuous on their domains.
- True or False** The first-order linear differential equation  $\frac{dy}{dx} + P(x)y = 0$  is separable.
- True or False** Multiplying a first-order linear differential equation  $\frac{dy}{dx} + P(x)y = Q(x)$ , where  $Q(x) \neq 0$ , by the integrating factor  $e^{\int Q(x) dx}$  results in a separable differential equation.
- True or False** To solve a Bernoulli equation,  $\frac{dy}{dx} + P(x)y = Q(x)y^n$ ,  $n \neq 0$ ,  $n \neq 1$ , the first step is to multiply by  $y^n$ .

### Skill Building

In Problems 5–20, find the general solution of each first-order linear differential equation.

- $\frac{dy}{dx} + 2xy = 0$
- $\frac{dy}{dx} + \frac{1}{x}y = 0$
- $\frac{dy}{dx} + \frac{1}{x}y = 3x$
- $\frac{dr}{d\theta} + \frac{4r}{\theta} = \theta$
- $\frac{dy}{dx} + \frac{y}{x} = x^2$
- $\frac{dy}{dx} - \frac{2y}{x+1} = 3(x+1)^2$
- $\frac{dy}{dx} - 2y = e^{-x}$
- $\frac{dy}{dx} - \frac{y}{x} = x^{3/2}$
- $\frac{dy}{dx} + \frac{2y}{x} = x^2 + 1$
- $\frac{dy}{dx} + e^x y = e^x$
- $\frac{dy}{dx} + y \tan x = \cos x$
- $\frac{dy}{dx} + 2xy = 2x$
- $\frac{dy}{dx} + e^{-x} y = e^{-x}$
- $\frac{dy}{dx} - y \csc x = \sin 2x$
- $\frac{dy}{dx} + y \cot x = \csc^2 x$
- $\frac{dy}{dx} + y \tan x = \cos^2 x$

In Problems 21–26, solve each Bernoulli equation.

21.  $\frac{dy}{dx} + x^{-1}y = 3x^2y^3$       22.  $\frac{dy}{dx} + x^{-1}y = \frac{2}{3}x^2y^4$   
 23.  $\frac{dy}{dx} + 2xy = xy^4$       24.  $\frac{dy}{dx} + \frac{1}{x}y = 3xy^3$   
 25.  $\frac{dy}{dx} + \frac{1}{x}y = 3xy^{1/3}$       26.  $\frac{dy}{dx} + \frac{4y}{x} = xy^{1/2}$

### Applications and Extensions

In Problems 27–38, find the general solution of each differential equation.

27.  $x \frac{dy}{dx} - y = x^2e^x$       28.  $\frac{dy}{dx} = \frac{y}{x - y^2}$   
 29.  $dx + (2x - y^2)dy = 0$       30.  $(2x + y)dx - xdy = 0$   
 31.  $\cos x \frac{dy}{dx} + y = \sec x$       32.  $(1 + x^2) \frac{dy}{dx} + xy = x^3$   
 33.  $dy + ydx = 2xy^2e^x dx$       34.  $dx + 2xy^{-1}dy = 2x^2y^2dy$   
 35.  $2 \frac{dy}{dx} - yx^{-1} = 5x^3y^3$       36.  $dx - 2xydy = 6x^3y^2e^{-2y^2}dy$   
 37.  $(x^2 + 2y^2) \frac{dx}{dy} + xy = 0$       38.  $(3x^2y^2 - e^y x^4y) \frac{dy}{dx} = 2xy^3$

In Problems 39–42, find a particular solution of each differential equation that satisfies the given boundary condition.

39.  $\frac{dy}{dx} + y = e^{-x}$ ;  $y = 5$  when  $x = 0$   
 40.  $\frac{dy}{dx} + \frac{2y}{x} = \frac{4}{x}$ ;  $y = 6$  when  $x = 1$   
 41.  $\frac{dy}{dx} + \frac{y}{x} = e^x$ ;  $y = e^{-1}$  when  $x = -1$   
 42.  $\frac{dy}{dx} + y \cot x = 2 \cos x$ ;  $y = 3$  when  $x = \frac{\pi}{2}$

In Problems 43 and 44,

- (a) Use a CAS to find the general solution of each differential equation.  
 (b) Find the particular solution that satisfies the given boundary condition.  
 (c) Graph the particular solution of each differential equation over the interval  $[\pi/2, 5\pi/2]$ .

43.  $\frac{dy}{dx} + \frac{3y}{x} = \sin x$ ;  $y(\pi) = 0$   
 44.  $x \frac{dy}{dx} + 2y = \frac{5 \sin x}{x}$ ;  $y(\pi) = 0$   
 45. **Free Fall** Using  $v(t) = -\frac{mg}{k} + \left(v_0 + \frac{mg}{k}\right)e^{-(k/m)t}$ , find the position  $s(t)$  of a freely falling object at any time  $t$ . Assume that its initial position is  $s(0) = s_0$ .

46. **Free Fall** An object of mass  $m = 2$  kg is dropped from rest from a height of 2000 m. As it falls, the air resistance is equal to  $\frac{1}{2}v$ , where  $v$  is the velocity measured in meters per second.

- (a) Find the velocity  $v$  and the distance  $s$  the object has fallen at time  $t$ .  
 (b) What is the limiting velocity of the object?  
 (c) With what velocity does the object strike Earth?

47. **Velocity of a Skydiver** A skydiver and her parachute together weigh 160 lb. She free falls from rest from a height of 10,000 ft for 5 seconds. Assume that there is no air resistance during the fall. After her parachute opens, the air resistance is four times her velocity  $v$ .

- (a) How fast will the skydiver be falling 4 seconds after the parachute opens?  
 (b) How long will it take for the skydiver to land on the ground?  
 (c) What is her velocity  $v$  when she lands?

(Hint: There are two distinct differential equations that govern the velocity and position of the skydiver: one for the free fall period and the other for the period after the parachute opens.)

48. **Spread of a Rumor** A rumor spreads through a population of 5000 people at a rate that is proportional to the product of the number of people who have heard the rumor and the number who have not heard it. Suppose that 100 people initiated the rumor and 500 have heard it after 3 days.

- (a) Write a differential equation that models the rate  $\frac{dy}{dt}$  at which the rumor spreads, where  $y = y(t)$ , is the number of people who have heard the rumor after  $t$  days.  
 (b) Solve the differential equation from (a).  
 (c) How many people will have heard the rumor after 8 days?  
 (d) How long will it take for half the people to hear the rumor?

49. **Mixtures** A tank initially contains 100 liters (L) of pure water. Starting at time  $t = 0$ , brine containing 3 kg of salt per liter flows into the tank at the rate of 8 L/min. The mixture is kept uniform by stirring, and the well-stirred mixture flows out of the tank at the same rate as it flows in. How much salt is in the tank after 5 min? How much salt is in the tank after a very long time?

50. **Flu Epidemic** A flu virus is spreading through a college campus of 10,000 students at a rate that is proportional to the product of the number of infected students and the number of noninfected students. Assume 10 students were infected initially and 200 students are infected after 10 days.

- (a) Write a differential equation that models the rate  $\frac{dy}{dt}$  of infection with respect to time, where  $y = y(t)$  is the number of students infected at time  $t$  in days.  
 (b) Solve the differential equation from (a).  
 (c) How many students will be infected after 5 days?  
 (d) How long will it take for 75% of the students to be infected?

- (e) Graph  $y = y(t)$  for the first 40 days of the flu epidemic.

51. **Urban Planning** The developers of a planned community assume that the population  $P(t)$  of the community will be governed by the logistic equation

$$\frac{dP}{dt} = P(10^{-2} - 10^{-6}P)$$

where  $t$  is measured in months.

- (a) Solve the differential equation if the initial population is estimated to be  $P(0) = 1500$ .

- (b) What is the limiting size of the population?
- (c) When will the population equal one-half of the limiting value?

 (d) Graph the predicted population for  $0 \leq t \leq 60$  (5 years).

- 52. Kirchhoff's Law** The basic equation governing the amount of current  $I$  (in amperes) in a simple  $RL$  circuit consisting of a resistance  $R$  (in ohms), an inductance  $L$  (in henrys), and an electromotive force  $E$  (in volts) is

$$\frac{dI}{dt} + \frac{R}{L}I = \frac{E}{L}$$

where  $t$  is the time in seconds. Solve the differential equation, assuming that  $E$ ,  $R$ , and  $L$  are constants and  $I = 0$  when  $t = 0$ .

- 53. Electrical Charge** The equation governing the amount of electrical charge  $q$  (in coulombs) of an  $RC$  circuit consisting of a resistance  $R$  (in ohms), a capacitance  $C$  (in farads), an electromotive force  $E$ , and no inductance is

$$\frac{dq}{dt} + \frac{1}{RC}q = \frac{E}{R}$$

where  $t$  is the time in seconds. Solve the differential equation, assuming  $E$ ,  $R$ , and  $C$  are constants and  $q = 0$  when  $t = 0$ .

- 54. Population Growth** Consider modeling the growth of a population of fish in a pond as a case of inhibited growth, where the rate of growth of the number of fish is given by the logistic equation  $\frac{dN}{dt} = kN(N_{\max} - N)$ , where  $t$  is the time in years,  $N$  is the number of fish at time  $t$ ,  $N_{\max}$  is the maximum number of fish the pond can support, and  $k$  is a positive constant.

- (a) Solve the differential equation.
- (b) If the population doubles after 5 years, the initial population is 20 fish, and  $N_{\max} = 400$  fish, express  $N$  as a function of  $t$ .
- (c) What will the population be after 43 years?
- (d) Show that the population is growing the fastest when
- $$N = \frac{N_{\max}}{2}.$$

 (e) Graph  $N = N(t)$ .

- 55. Population Growth** A second model for inhibited growth is called the **Gompertz equation**, given by the solution to the differential equation  $\frac{dN}{dt} = pN \ln \left( \frac{N_{\max}}{N} \right)$ , where  $N$  is the population at time  $t$  in years,  $N_{\max}$  is the maximum population the environment can support, and  $p$  is a positive constant. Suppose the population of fish in the pond from Problem 54 follows a Gompertz equation.

- (a) Solve the differential equation.
- (b) If the population doubles after 5 years, the initial population is 20 fish, and  $N_{\max} = 400$  fish, express  $N$  as a function of  $t$ .
- (c) What will the population be after 43 years?

- (d) Show that the population is growing the fastest when

$$N = \frac{N_{\max}}{e}.$$

 (e) Graph  $N = N(t)$ ,  $0 \leq t \leq 100$ .

- 56. Rate of Growth** If all members of a population are in contact with every other member, the rate of growth of a fad at any time  $t$  among the population is proportional to the product  $xy$ , where  $x$  is the number who have adopted the fad and  $y$  is the number who have not adopted the fad at time  $t$ . Suppose that on a certain day ( $t = 0$ ), two members from a club of 30 members begin wearing a new style of clothing. Each day thereafter, one more member adopts the clothing style.

- (a) Express the number of members  $x$  in the club who have adopted the style as a function of  $t$  days.
- (b) In approximately how many days will half of the club members have adopted the style?

- 57.** Consider the logistic differential equation

$$\frac{dy}{dt} = ky(M - y)$$

Show that  $\frac{dy}{dt}$  is increasing if  $y < \frac{M}{2}$  and is decreasing if  $y > \frac{M}{2}$ .

From this, it follows that the growth rate is a maximum

when  $y = \frac{M}{2}$ .

- 58.** Solve the logistic differential equation  $\frac{dy}{dt} = ky(M - y)$

by separating the variables and integrating the resulting rational function using partial fractions. Compare the answer obtained with the “Bernoulli solution.”

### Challenge Problems

- 59. Air Quality** A room 150 ft by 50 ft by 20 ft receives fresh air at the rate of 5000 ft<sup>3</sup>/min. If the fresh air contains 0.04% carbon dioxide and the air in the room initially contained 0.3% carbon dioxide, find the percentage of carbon dioxide after 1 h. What is the percentage after 2 h? Assume the mixed air leaves the room at the rate of 5000 ft<sup>3</sup>/min.

- 60. Renewing Currency** A nation's federal bank has \$3 billion of paper currency in circulation. Each day about \$10 million comes into the bank and the same amount is paid out. The federal reserve decides to issue new currency, and whenever the old-style currency comes into the bank, it is destroyed and replaced by the new currency. How long will it take for the currency in circulation to become 95% new?

- 61. Kirchhoff's Law** The equation governing the amount of current  $I$  (in amperes) in an  $RL$  circuit consisting of a resistance  $R$  (in ohms), an inductance  $L$  (in henrys), and an electromotive force  $E_0 \sin(\omega t)$  volts is given by Kirchhoff's Second Law:

$$L \frac{dI}{dt} + RI = E_0 \sin(\omega t) \quad \omega > 0$$

Find  $I$  as a function of  $t$  if  $I = I_0$  when  $t = 0$ . Here,  $R$ ,  $L$ ,  $E_0$  and  $\omega$  are constants.

## 16.5 Power Series Methods

**OBJECTIVES** When you finish this section, you should be able to:

**1** Use power series to solve a linear differential equation (p. 1089)

Up to now, we have concentrated on first-order differential equations for which exact solutions could be found. But many first-order differential equations lead to integrals that cannot be expressed in terms of elementary functions. Moreover, most higher-order differential equations cannot be solved exactly. For these reasons, considerable emphasis is placed on methods for approximating solutions of differential equations. One such method, *power series*, is introduced here.

### 1 Use Power Series to Solve a Linear Differential Equation

**Power series methods** assume that a solution  $y = y(x)$  of a given differential equation has a power series expansion of the form

**NEED TO REVIEW?** Power series are discussed in Section 8.8, pp. 600–609.

$$y = y(x) = \sum_{k=0}^{\infty} a_k x^k$$

A power series method consists of finding power series for the terms in the differential equation, as well as the power series for  $y$ ,  $y'$ ,  $y''$ , and so on. These power series expansions are substituted into the differential equation to obtain relationships among the coefficients.

We begin with a simple example to outline the basic idea.

#### EXAMPLE 1 Using Power Series to Solve a Linear Differential Equation

Use power series to solve the differential equation  $y' = y$ .

**Solution** We assume that the solution of the differential equation can be expressed as the power series

$$y(x) = \sum_{k=0}^{\infty} a_k x^k \quad (1)$$

Then

$$y'(x) = \sum_{k=1}^{\infty} k a_k x^{k-1}$$

Since  $y' = y$ , this leads to

$$\sum_{k=1}^{\infty} k a_k x^{k-1} = \sum_{k=0}^{\infty} a_k x^k$$

To obtain relationships among the coefficients, we write out the terms.

$$a_1 x^0 + 2a_2 x + 3a_3 x^2 + 4a_4 x^3 + \cdots = a_0 x^0 + a_1 x + a_2 x^2 + a_3 x^3 + \cdots$$

Because the coefficients of corresponding powers of  $x$  are equal, we have

$$a_1 = a_0 \quad 2a_2 = a_1 \quad 3a_3 = a_2 \quad 4a_4 = a_3 \quad \dots \quad na_n = a_{n-1} \dots$$

We can express these relationships recursively.

$$\begin{aligned} a_1 &= a_0 & a_2 &= \frac{1}{2}a_1 = \frac{1}{2!}a_0 & a_3 &= \frac{1}{3}a_2 = \frac{1}{3 \cdot 2}a_0 = \frac{1}{3!}a_0 \\ a_4 &= \frac{1}{4}a_3 = \frac{1}{4!}a_0 & \dots & a_n &= \frac{1}{n}a_{n-1} = \frac{1}{n!}a_0 & \dots \end{aligned}$$

The power series (1) takes the form

$$y(x) = \sum_{k=0}^{\infty} a_k x^k = \sum_{k=0}^{\infty} \frac{1}{k!} a_0 x^k = a_0 \sum_{k=0}^{\infty} \frac{x^k}{k!}$$

**RECALL** As we learned in Section 8.9,

$$e^x = \sum_{k=0}^{\infty} \frac{x^k}{k!}$$

which we recognize as  $y(x) = a_0 e^x$ . ■

**NOW WORK** Problem 1.

Although this example led to a power series solution we recognized, most solutions will not. The next examples will illustrate typical power series solutions.

**EXAMPLE 2** Using Power Series to Solve a Linear Differential Equation

Use power series to solve the differential equation  $y' - 2y = e^{-x}$ .

**Solution** Assume that a solution  $y = y(x)$  of the differential equation can be expressed as the power series  $y(x) = \sum_{k=0}^{\infty} a_k x^k$ . Then  $y'(x) = \sum_{k=1}^{\infty} k a_k x^{k-1}$ . Since  $e^{-x} = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k$ , the differential equation can be written as

$$\underbrace{\sum_{k=1}^{\infty} k a_k x^{k-1}}_{y'} - 2 \underbrace{\sum_{k=0}^{\infty} a_k x^k}_y = \underbrace{\sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k}_{e^{-x}} \quad (2)$$

To obtain relationships among the coefficients, we write out the terms of the power series.

$$\begin{aligned} (a_1 + 2a_2x + 3a_3x^2 + 4a_4x^3 + 5a_5x^4 + \cdots) - 2(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + \cdots) \\ = 1 - x + \frac{1}{2!}x^2 - \frac{1}{3!}x^3 + \frac{1}{4!}x^4 + \cdots \end{aligned}$$

Now we combine the coefficients of corresponding powers of  $x$  to get

$$\begin{aligned} (a_1 - 2a_0) + (2a_2 - 2a_1)x + (3a_3 - 2a_2)x^2 + (4a_4 - 2a_3)x^3 + \cdots \\ = 1 - x + \frac{1}{2!}x^2 - \frac{1}{3!}x^3 + \frac{1}{4!}x^4 - \cdots \end{aligned}$$

Since the coefficients of corresponding powers of  $x$  are equal, we have

$$\begin{aligned} a_1 - 2a_0 &= 1 && \text{or equivalently, } a_1 = 2a_0 + 1 \\ 2a_2 - 2a_1 &= -1 && \text{or equivalently, } a_2 = \frac{2a_1 - 1}{2} = \frac{2(2a_0 + 1) - 1}{2} = 2a_0 + \frac{1}{2} \\ 3a_3 - 2a_2 &= \frac{1}{2!} && \text{or equivalently, } a_3 = \frac{2a_2 + \frac{1}{2!}}{3} = \frac{2}{3} \left( 2a_0 + \frac{1}{2} \right) + \frac{1}{3 \cdot 2!} \\ &&& = \frac{4}{3}a_0 + \frac{3}{3!} \\ 4a_4 - 2a_3 &= -\frac{1}{3!} && \text{or equivalently, } a_4 = \frac{2a_3 - \frac{1}{3!}}{4} = \frac{1}{2}a_3 - \frac{1}{4!} \\ &&& = \frac{1}{2} \left( \frac{4}{3}a_0 + \frac{3}{3!} \right) - \frac{1}{4!} = \frac{2}{3}a_0 + \frac{5}{4!} \\ 5a_5 - 2a_4 &= \frac{1}{4!} && \text{or equivalently, } a_5 = \frac{2a_4 + \frac{1}{4!}}{5} = \frac{2}{5}a_4 + \frac{1}{5!} \\ &&& = \frac{2}{5} \left( \frac{2}{3}a_0 + \frac{5}{4!} \right) + \frac{1}{5!} = \frac{4}{15}a_0 + \frac{11}{5!} \end{aligned}$$

This recursive formula  $(n+1)a_{n+1} = 2a_n + (-1)^n \frac{1}{(n)!}$  can be used to find  $a_n$  in terms of  $a_0$ , as we did for  $a_1, a_2, a_3, a_4$ , and  $a_5$ . The power series representation of the general solution of the equation is

$$\begin{aligned} y(x) &= \sum_{k=0}^{\infty} a_k x^k = a_0 + (2a_0 + 1)x + \left(2a_0 + \frac{1}{2!}\right)x^2 + \left(\frac{4}{3}a_0 + \frac{3}{3!}\right)x^3 \\ &\quad + \left(\frac{2}{3}a_0 + \frac{5}{4!}\right)x^4 + \left(\frac{4}{15}a_0 + \frac{11}{5!}\right)x^5 + \cdots \\ &= a_0 \left(1 + 2x + 2x^2 + \frac{4}{3}x^3 + \frac{2}{3}x^4 + \frac{4}{15}x^5 + \cdots\right) \\ &\quad + x + \frac{1}{2!}x^2 + \frac{3}{3!}x^3 + \frac{5}{4!}x^4 + \frac{11}{5!}x^5 + \cdots \end{aligned}$$

where  $a_0$  is arbitrary. ■

There is a more direct method for obtaining the recursion formula in Example 2. If we change the index of summation from  $k$  to  $k+1$  in the first power series on the left side of (2) and distribute the  $-2$  inside the second power series, we have

$$\sum_{k=0}^{\infty} (k+1)a_{k+1}x^k + \sum_{k=0}^{\infty} (-2)a_k x^k = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k$$

Now add the two series on the left.

$$\sum_{k=0}^{\infty} [(k+1)a_{k+1} - 2a_k]x^k = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} x^k$$

Then  $(n+1)a_{n+1} - 2a_n = \frac{(-1)^n}{n!}$ , as before.

### EXAMPLE 3 Using Power Series to Solve a Linear Differential Equation

Use power series to find the general solution of the linear differential equation

$$y'' + xy' + 2y = 0$$

**Solution** If  $y(x) = \sum_{k=0}^{\infty} a_k x^k$  is a solution to the differential equation, then

$$y'(x) = \sum_{k=1}^{\infty} k a_k x^{k-1} \quad \text{and} \quad y''(x) = \sum_{k=2}^{\infty} k(k-1) a_k x^{k-2}$$

Now we substitute these power series into the differential equation.

$$\begin{aligned} \sum_{k=2}^{\infty} k(k-1) a_k x^{k-2} + x \sum_{k=1}^{\infty} k a_k x^{k-1} + 2 \sum_{k=0}^{\infty} a_k x^k &= 0 \quad y'' + xy' + 2y = 0 \\ \sum_{k=2}^{\infty} k(k-1) a_k x^{k-2} + \sum_{k=1}^{\infty} k a_k x^k + \sum_{k=0}^{\infty} 2a_k x^k &= 0 \quad \text{Move } x \text{ and } 2 \text{ into the summation.} \end{aligned}$$

Next we adjust the indexes of summation so that  $x^k$  appears in each series. Here, only the first series needs modification. If we replace  $k$  with  $k+2$  in the first series, we obtain

$$\underbrace{\sum_{k=0}^{\infty} (k+2)(k+1) a_{k+2} x^k}_{\text{Replace } k \text{ with } k+2} + \sum_{k=1}^{\infty} k a_k x^k + \sum_{k=0}^{\infty} 2a_k x^k = 0$$

The index in the first and third series begins at  $k = 0$ , and the index in the second series begins at  $k = 1$ . We write out the  $k = 0$  term of the first and third series separately. Then each summation starts at  $k = 1$ .

$$\begin{aligned} (2) \quad (1) \quad a_2 x^0 + 2a_0 x^0 + \sum_{k=1}^{\infty} (k+2)(k+1)a_{k+2}x^k + \sum_{k=1}^{\infty} k a_k x^k + \sum_{k=1}^{\infty} 2a_k x^k &= 0 \\ 2a_2 + 2a_0 + \sum_{k=1}^{\infty} [(k+2)(k+1)a_{k+2} + (k+2)a_k] x^k &= 0 \end{aligned}$$

Equating the coefficients of corresponding powers of  $x$  (the coefficients on the right side are all 0), we have

$$2a_2 + 2a_0 = 0 \quad (n+2)(n+1)a_{n+2} + (n+2)a_n = 0$$

$$a_2 = -a_0 \quad a_{n+2} = -\frac{a_n}{(n+1)} \quad n = 1, 2, 3, \dots$$

If  $n = 1$ , we find  $a_3 = -\frac{a_1}{2}$ . Then we use the recursion formula on the left to obtain all of the coefficients in terms of  $a_0$  and  $a_1$ . That is,

$$\begin{aligned} a_2 &= -a_0 & a_4 &= -\frac{a_2}{3} = \frac{a_0}{3} & a_6 &= -\frac{a_4}{5} = -\frac{a_0}{3 \cdot 5} & a_8 &= -\frac{a_6}{7} = \frac{a_0}{3 \cdot 5 \cdot 7} \\ a_3 &= -\frac{a_1}{2} & a_5 &= -\frac{a_3}{4} = \frac{a_1}{2 \cdot 4} & a_7 &= -\frac{a_5}{6} = -\frac{a_1}{2 \cdot 4 \cdot 6} \end{aligned}$$

and so on. Since  $a_0$  and  $a_1$  can be chosen arbitrarily, the power series representation for the general solution is

$$\begin{aligned} y(x) &= a_0 \left( 1 - x^2 + \frac{x^4}{3} - \frac{x^6}{3 \cdot 5} + \frac{x^8}{3 \cdot 5 \cdot 7} - \dots \right) \\ &\quad + a_1 \left( x - \frac{x^3}{2} + \frac{x^5}{2 \cdot 4} - \frac{x^7}{2 \cdot 4 \cdot 6} + \dots \right) \end{aligned}$$

### NOW WORK Problem 7.

A second type of series solution method involves a differential equation with initial conditions and makes use of a Maclaurin series.

**NEED TO REVIEW?** Maclaurin series are discussed in Section 8.9, pp. 611–614

### EXAMPLE 4 Using a Maclaurin Series to Solve a Linear Differential Equation

(a) Use a Maclaurin series to find the solution of

$$y'' = x^2 y + e^x y' \quad (3)$$

given the initial conditions  $y(0) = 1$  and  $y'(0) = 1$ .

(b) Use the first five terms of the series to approximate values of  $y = y(x)$  for  $0 \leq x \leq 1$ .

**CAS** (c) Use a numeric differential equation solver with 10,000 equally spaced numbers in the interval  $[0, 1]$  to solve the differential equation in (a). Then construct a table showing the values of  $y$  for  $x = 0, 0.1, 0.2, \dots, 0.9, 1$ .

**Solution** (a) We assume that the solution of the differential equation is given by the Maclaurin series

$$y(x) = \sum_{k=0}^{\infty} \frac{y^{(k)}(0)}{k!} x^k = y(0) + y'(0)x + \frac{y''(0)}{2!}x^2 + \frac{y'''(0)}{3!}x^3 + \dots$$

We substitute the initial conditions,  $y(0) = 1$  and  $y'(0) = 1$ , into (3). Then

$$y''(0) = 0^2 \cdot 1 + e^0 \cdot 1 = 1 \quad x = 0; y(0) = 1; y'(0) = 1; y''(x) = x^2y + e^xy'$$

Now we differentiate  $y'' = x^2y + e^xy'$  with respect to  $x$  to find  $y'''(0)$ .

$$y'''(x) = (x^2y' + 2xy) + (e^xy'' + e^xy')$$

$$y'''(0) = (0^2 \cdot 1 + 2 \cdot 0 \cdot 1) + (e^0 \cdot 1 + e^0 \cdot 1) = 2$$

We continue differentiating and evaluating the derivative at  $x = 0$ .

$$y^{(4)}(x) = x^2y'' + 4xy' + 2y + e^xy''' + 2e^xy'' + e^xy'$$

$$y^{(4)}(0) = 0^2 \cdot 1 + 4 \cdot 0 \cdot 1 + 2 \cdot 1 + e^0 \cdot 2 + 2 \cdot e^0 \cdot 1 + e^0 \cdot 1 = 7$$

and so on. The Maclaurin series then becomes

$$y(x) = 1 + x + \frac{1}{2!}x^2 + \frac{2}{3!}x^3 + \frac{7}{4!}x^4 + \cdots$$

(b) We construct Table 1 that uses the first five terms of the series to approximate select values of  $y$  in the interval  $0 \leq x \leq 1$ .

**TABLE 1** Maclaurin Series Approximation of  $y$  Using Five Terms of the Series

| $x$ | 0.0 | 0.1    | 0.2    | 0.3    | 0.4    | 0.5    | 0.6    | 0.7    | 0.8    | 0.9    | 1.0   |
|-----|-----|--------|--------|--------|--------|--------|--------|--------|--------|--------|-------|
| $y$ | 1.0 | 1.1054 | 1.2231 | 1.3564 | 1.5088 | 1.6849 | 1.8898 | 2.1294 | 2.4101 | 2.7394 | 3.125 |

 (c) Using every thousandth term from the numeric solution, we construct Table 2.

**TABLE 2** Select Values of  $y$  Using a Numeric Equation Solver

| $x$ | 0.0 | 0.1    | 0.2    | 0.3    | 0.4    | 0.5    | 0.6    | 0.7    | 0.8    | 0.9    | 1.0    |
|-----|-----|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| $y$ | 1.0 | 1.1054 | 1.2232 | 1.3569 | 1.5114 | 1.6933 | 1.9127 | 2.1836 | 2.5271 | 2.9747 | 3.5752 |

From the results of Tables 1 and 2, we can see how the five-term approximation to the series solution of the differential equation deteriorates as we move away from the center of convergence 0. ■

**NOW WORK** Problem 15.

## 16.5 Assess Your Understanding

### Skill Building

In Problems 1–12, use power series to solve each differential equation.

- $y' + 3xy = 0$
- $y'' + y = 0$
- $y'' + x^2y = 0$
- $y'' + x^2y' + xy = 0$
- $y''' + y = 0$
- $(1 + x^2)y'' - 4xy' + 6y = 0$
- $(x^2 + 2)y'' - 3xy' + 4y = 0$

- $y' - x + 3xy = 0$
- $y'' + xy = 0$
- $y'' - 2xy = 0$
- $y'' + 3xy' + 3y = 0$
- $y''' - xy = 0$

In Problems 13–22:

- Use a Maclaurin series to find the solution of each differential equation using the given initial conditions.
  - Use the first five nonzero terms of the series to approximate values of  $y$  for  $0 \leq x \leq 1$ . Use Table 1 as a guide.
- $y'' + xy' + y = 0; \quad y(0) = 1, \quad y'(0) = 0$
  - $y'' - 2xy' + y = 0; \quad y(0) = 2, \quad y'(0) = 1$
  - $y'' - (\sin x)y = 0; \quad y(0) = 0, \quad y'(0) = 1$
  - $y'' + (\cos x)y = 0; \quad y(0) = 0, \quad y'(0) = 1$
  - $y'' + y' + e^xy = 0; \quad y(0) = 2, \quad y'(0) = 1$

18.  $y'' + (3 + x)y = 0$ ;  $y(0) = 1$ ,  $y'(0) = 0$
19.  $y'' + x^2y = 0$ ;  $y(0) = 0$ ,  $y'(0) = 2$
20.  $y'' - 3x^2y' + 2xy = 0$ ;  $y(0) = 1$ ,  $y'(0) = 1$ ,
21.  $y^{(4)} - \ln(1 + x)y = 0$ ;  $y(0) = 1$ ,  $y'(0) = 1$ ,  $y''(0) = 0$ ,  $y'''(0) = 0$
22.  $y''' + 4y'' + 2y' - x^3y = 0$ ;  $y(0) = 1$ ,  $y'(0) = 1$ ,  $y''(0) = 0$

### Applications and Extensions

#### 23. Exact and Series Solutions

- (a) Use the first six terms of a Maclaurin series to approximate the solution of the differential equation  $y'' + 4y' + 4y = 0$  with the initial conditions  $y(0) = 1$  and  $y'(0) = 2$ .
- (b) Solve the differential equation from (a) using a CAS.
- (c) Graph both the series solution from (a) and the exact solution from (b) on the interval  $[-1, 2]$ .
- (d) Comment on the graphs.
- (e) Repeat (a) using the first eight terms of a Maclaurin series.
- (f) Add the solution from (e) to the graph in (c). What is happening?

#### 24. Exact and Series Solutions

- (a) Use the first six nonzero terms of a Maclaurin series to approximate the solution of the differential equation  $y' = xy(1 - y^2)$  with the initial condition  $y(0) = 2$ .

- (b) Solve the differential equation from (a) using a CAS.
- (c) Graph the exact solution from (b) and the series solutions using two, four, and six nonzero terms on the interval  $[-2, 2]$ .

### Challenge Problem

25. **Age of the Earth's Crust.** Uranium has a half-life of  $4.5 \times 10^9$  years. The decomposition sequence is very complicated, producing a very large number of intermediate radioactive products, but the final product is an isotope of lead with an atomic weight of 206, called uranium lead.
- (a) Assuming that the change from uranium to lead is direct, show that  $u = u_0 e^{-kt}$ ,  $l = u_0(1 - e^{-kt})$ , where  $u$  and  $l$  denote the number of uranium and uranium lead atoms, respectively, present at time  $t$ . That is, assume  $\frac{du}{dt} = -ku$ , where  $k > 0$  is a constant, and  $l = u_0 - u$ .
- We can measure the ratio  $r = \frac{l}{u}$  in a rock, and if it is assumed that all the uranium lead came from decomposition of the uranium originally present in the rock, we can obtain a lower bound for the age of Earth's crust. Currently,  $r \approx 0.054$ .
- (b) Show that this lower bound is given by

$$t = \frac{1}{k} \ln(1 + r) = \frac{1}{k} \left( r - \frac{r^2}{2} + \frac{r^3}{3} - \cdots \right) > \frac{r}{k}$$

- (c) What is this lower bound?

## Chapter Review

### THINGS TO KNOW

#### 16.1 Classification of Ordinary Differential Equations

- Ordinary differential equation (p. 1059)
- Order of a differential equation: the highest-order derivative of  $y$  in the equation (p. 1059)
- Degree of a differential equation: the exponent of the highest-order derivative in the equation (p. 1059)
- Linear differential equation of order  $n$  (p. 1059)

#### 16.2 Separation of Variables in First-Order Differential Equations

- Separable first-order differential equations (p. 1062)
- Steps for Solving a Separable Differential Equation (p. 1062)
- The function  $f(x, y)$  is a homogeneous function of degree  $k$  in  $x$  and  $y$  if and only if for all  $t > 0$ ,  $f(tx, ty) = t^k f(x, y)$ , where  $k$  is some real number. (p. 1063)
- A differential equation of the form  $M(x, y) dx + N(x, y) dy = 0$  is homogeneous if  $M$  and  $N$  are homogeneous functions of the same degree. (p. 1064)
- Steps for Solving a Homogeneous First-Order Differential Equation (p. 1064)

#### 16.3 Exact Differential Equations

- Exact differential equation (p. 1073)
- A differential equation of the form  $M(x, y) dx + N(x, y) dy = 0$  is an exact differential equation

at every point  $(x, y)$  in a simply connected open set  $R$

if and only if  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$  for all  $(x, y)$  in  $R$ . (p. 1073)

- Integrating factor (p. 1076)

#### 16.4 First-Order Linear Differential Equations; Bernoulli Differential Equations

- First-order linear differential equation:  $\frac{dy}{dx} + P(x)y = Q(x)$ , where  $P$  and  $Q$  are continuous on their domains (p. 1078)
- If  $Q(x) = 0$ , the first-order linear differential equation is separable. (p. 1078)
- If  $Q(x) \neq 0$ , use the integrating factor  $e^{\int P(x) dx}$ . (p. 1078)
- Bernoulli equation:  $\frac{dy}{dx} + P(x)y = Q(x)y^n$ ,  $n \neq 0$ ,  $n \neq 1$ , and  $P$  and  $Q$  are functions of  $x$ . (p. 1082)
- Steps for Solving a Bernoulli Equation (p. 1082)

#### 16.5 Power Series Methods (pp. 1089–1093)

- Assumes a solution  $y = y(x)$  of a differential equation has a power series expansion of the form  $y = y(x) = \sum_{k=0}^{\infty} a_k x^k$ . (p. 1089)

## OBJECTIVES

| Section | You should be able to ...                                                                      | Example | Review Exercises           |
|---------|------------------------------------------------------------------------------------------------|---------|----------------------------|
| 16.1    | 1 Classify ordinary differential equations (p. 1059)                                           | 1       | 1–4                        |
|         | 2 Verify the solution of an ordinary differential equation (p. 1060)                           | 2       | 5–8                        |
| 16.2    | 1 Solve a separable first-order differential equation (p. 1062)                                | 1       | 13, 19, 29, 30, 32, 34     |
|         | 2 Identify a homogeneous function of degree $k$ (p. 1063)                                      | 2       | 9–12                       |

| 16.5    | 1 Use power series to solve a linear differential equation (p. 1089)                           | 1–4     | 35–38                      |

## REVIEW EXERCISES

In Problems 1–4, state the order and degree of each differential equation. Determine whether the equation is linear or nonlinear.

- $\frac{dy}{dx} + x^2y = \sin x$
- $\frac{d^2y}{dx^2} - 5\frac{dy}{dx} + 3y = xe^x$
- $\frac{d^3y}{dx^3} + 4x\frac{d^2y}{dx^2} + (\sin^2 x)\frac{dy}{dx} + 3y = \sin x$
- $\left(\frac{dr}{ds}\right)^3 - r = 1$

In Problems 5–8, verify that the given function is a solution of the differential equation.

- $y = e^x$ ,  $\frac{d^2y}{dx^2} - y = 0$
- $y = \frac{\ln x}{x^2}$ ,  $\frac{d^2y}{dx^2} + \frac{5}{x}\frac{dy}{dx} + \frac{4}{x^2}y = 0$
- $y = e^{-3x}$ ,  $\frac{d^2y}{dx^2} + 2\frac{dy}{dx} - 3y = 0$
- $y = x^2 + 3x$ ,  $x\frac{dy}{dx} - y = x^2$

In Problems 9–12, determine if each function is homogeneous. If it is, state the degree.

- $f(x, y) = x^3 + 2x^2y + 2xy^2 + y^3$
- $f(x, y) = x^2 - x^2y^2 + y^2$
- $f(x, y) = xe^{y/x}$
- $f(x, y) = \ln \frac{y}{x}$

In Problems 13–24:

- (a) Identify each differential equation as separable, homogeneous, exact, linear, or Bernoulli.  
 (b) Solve each differential equation.

- $x(y^2 + 1)dx + y(x^2 - x)dy = 0$
- $(2y + e^{2x})dx + (2x + e^{2y})dy = 0$
- $x\frac{dy}{dx} + y = x^6$
- $\frac{dy}{dx} - 2y = e^{3x}$
- $(2xy^3 + y^2 \cos x - 2x)dx + (3x^2y^2 + 2y \sin x)dy = 0$

- $\frac{dy}{dx} + x^2y - y = x^2 - 1$
- $y \sin x dx - \cos x dy = 0$
- $(2x \sin y - \ln y)dx + \left(x^2 \cos y - \frac{x}{y} + 3y^2\right)dy = 0$
- $\left(x - y \tan \frac{y}{x}\right)dx + x \tan \frac{y}{x} dy = 0$
- $x\frac{dy}{dx} - 2y = x + 1$
- $\frac{dy}{dx} + \frac{2}{x}y = \frac{y^3}{x^2}$
- $\frac{dy}{dx} - 5y + 2y^2 = 0$

In Problems 25–34, find the particular solution of each differential equation.

- $x\frac{dy}{dx} + 2y = 6$ ,  $y(2) = 8$
- $xy dy = (y^2 + x\sqrt{x^2 + y^2})dx$ ,  $y(1) = 1$
- $\frac{dy}{dx} + \frac{y}{x} = 2$ ,  $y(1) = 0$
- $(x^2 + xy + y^2)dx - x^2dy = 0$ ,  $y(1) = 1$
- $\frac{dy}{dx} = \frac{y-1}{x+3}$ ,  $y(-1) = 0$
- $(1 - \cos x)\frac{dy}{dx} + y \sin x = 0$ ,  $y\left(\frac{\pi}{4}\right) = 1$
- $\frac{dy}{dx} - \frac{2y}{x} = x^2 \cos x$ ,  $y\left(\frac{\pi}{2}\right) = 3$
- $\left(\frac{2x-1}{y}\right)dx + x\left(\frac{1-x}{y^2}\right)dy = 0$ ,  $y(-1) = 3$
- $(x^2 + y^2)dx - xy dy = 0$ ,  $y(1) = 2$
- $y^2 \sin x dx + \left(\frac{1}{x} - \frac{y}{x}\right)dy = 0$ ,  $y(\pi) = 1$

In Problems 35 and 36, find a power series solution for each differential equation.

- $(x-2)y' + y = 0$
- $y'' + y' - 2y = 0$

In Problems 37 and 38, (a) Use a Maclaurin series to find a solution for each differential equation.

(b) Use the first five terms of the series to approximate values of  $y = y(x)$  for  $0 \leq x \leq 1$ .

37.  $y'' + (\sin x)y = 0, \quad y(0) = 1; \quad y'(0) = 1$

38.  $y'' + e^x y' + y = 0, \quad y(0) = 1; \quad y'(0) = 1$

39. **Population Growth** Suppose that the available food supply will support a maximum number  $M$  of bacteria, and that the rate of growth of the bacteria is proportional to the difference between the maximum number and the number present. Find an expression for the number of bacteria as a function of time.

40. **Flow in Mixtures** A large tank contains 1000 L of water in which 500 mg of chlorine are dissolved. Water containing 2 mg of dissolved chlorine per liter flows into the tank at the rate of

100 L/min. The mixture, kept uniform by stirring, runs out of the tank at the rate of 80 L/min. How much chlorine is in the tank after an hour?

41. **Orthogonal Trajectories** Find the orthogonal trajectories of the family of hyperbolas  $xy = c$ . Graph a member of each family that contains the point  $(2, 3)$ .

42. **Spread of Rumors** After a large chip manufacturer posts poor quarterly earnings, the rumor of widespread layoffs spreads among the employees. The rumor spreads throughout the 100,000 employees at a rate that is proportional to the product of the number of employees who have heard the rumor and those who have not. If 10 employees started the rumor, and it has spread to 100 employees after 1 h, how long will it take for 25% of the employees to have heard the rumor?

## CHAPTER 16 PROJECT

### The Melting Arctic Ice Cap

In this project we study the changes in the thickness of sea ice that forms in the Arctic. There are many factors that affect the behavior of sea ice: abiotic factors such as, temperature, both that of

the underlying water and air; wind, sea currents, and the motion of the Earth, and biotic factors such as plant and animal life. We examine only one factor: temperature.

We begin with a principle of thermodynamics: The direction of heat transfer is from a warmer to a cooler medium. **Fourier's Law of**

**Conduction** states that the rate of heat flow  $\frac{dQ}{dt}$  through a

homogeneous solid is directly proportional to the area  $A$  of the solid orthogonal to the direction of the heat flow, and to the change  $\Delta T$  in the temperature  $T$  and is inversely proportional to the thickness  $x$  of the solid. See Figure 8. The constant of proportionality  $k$  depends on the homogeneous solid and is called the **thermal conductivity** of the solid.

Figure 8 Fourier's Law of Conduction

1. Write Fourier's Law of Conduction as a differential equation.

A simple model depicting sea ice consists of a layer of air, a layer of sea ice, and a layer of sea water. A closer look at this model actually shows another layer directly below the ice. See Figure 9. It is this thin layer of super-cold, almost freezing water that is of interest in this project.

Figure 9 Model of sea ice

In this model heat flows from the warmer water beneath the ice, through the ice, to the colder air above the ice.

2. Using  $k = 2.1 \text{ W/m K}$ , (the thermal conductivity for sea ice),  $A = 1 \text{ m}^2$  as the surface area of the ice,  $x \text{ m}$  as the thickness of the ice,  $T_w = -1.8^\circ\text{C}$  as the near freezing temperature of the layer of sea water directly beneath the ice, and  $T_a = -20^\circ\text{C}$  as the (average winter) temperature of Arctic air, write Fourier's Law of Conduction.

Then as the thin layer of sea water directly below the ice loses heat  $Q$ , it begins to freeze. The amount of water that freezes satisfies the equation:

$$Q = 334m$$

where  $334 \text{ J/g}$  is the heat needed to freeze  $1 \text{ g}$  of water, and  $m$  is the mass of the thin layer of water that freezes.

3. Find an expression for the mass  $m$  of the layer of water directly below the ice that freezes. (The mass density  $\rho$  of freezing sea water is  $1.025 \text{ g/ml}$ .) Recall that the surface area of the ice is  $A = 1 \text{ m}^2$ .
4. Find the rate of change in heat  $Q$  with respect to the thickness  $x$  of the ice.
5. Combine the result from Problem 4 with Fourier's Law of Conductivity (Problem 2) to find the rate of change in thickness of the ice with respect to time.
6. Solve the differential equation found in Problem 5. Then use the initial condition that at time  $t = 0$ , the thickness of the ice is  $x = x_0$ .

7. Interpret the solution of the differential equation in Problem 6. Is the rate of change of the thickness of the ice increasing or decreasing over time?
8. Discuss whether this simple model offers a possible explanation for NASA's finding that the multi-year ice is melting faster than seasonal and other perennial ice.
9. Investigate some of the other factors that affect the behavior of sea ice and write a position paper on the impact of at least one these other factors on the depth of ice in the Arctic.

- A.1 Algebra Used in Calculus
- A.2 Geometry Used in Calculus
- A.3 Analytic Geometry Used in Calculus
- A.4 Trigonometry Used in Calculus
- A.5 Sequences; Summation Notation; the Binomial Theorem

The topics reviewed here are not exhaustive of the precalculus used in calculus. However, they do represent a large body of the material you will see in calculus. If you encounter difficulty with any of this material, consult a textbook in precalculus for more detail and explanation.

## A.1 Algebra Used in Calculus

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Factor and simplify algebraic expressions (p. A-1)
- 2 Complete the square (p. A-2)
- 3 Solve equations (p. A-3)
- 4 Solve inequalities (p. A-5)
- 5 Work with exponents (p. A-8)
- 6 Work with logarithms (p. A-10)

### 1 Factor and Simplify Algebraic Expressions

#### EXAMPLE 1 Factoring Algebraic Expressions

Factor each expression completely:

- (a)  $2(x + 3)(x - 2)^3 + (x + 3)^2(3)(x - 2)^2$
- (b)  $\frac{4}{3}x^{1/3}(2x + 1) + 2x^{4/3}$

**Solution (a)** In expression (a),  $(x + 3)$  and  $(x - 2)^2$  are **common factors**, factors found in each term. Factor them out.

$$\begin{aligned}
 &2(x + 3)(x - 2)^3 + (x + 3)^2(3)(x - 2)^2 \\
 &= (x + 3)(x - 2)^2[2(x - 2) + 3(x + 3)] && \text{Factor out } (x + 3)(x - 2)^2. \\
 &= (x + 3)(x - 2)^2(5x + 5) && \text{Simplify.} \\
 &= 5(x + 3)(x - 2)^2(x + 1) && \text{Factor out 5.}
 \end{aligned}$$

(b) We begin by writing the term  $2x^{4/3}$  as a fraction with a denominator of 3.

$$\begin{aligned}
 \frac{4}{3}x^{1/3}(2x + 1) + 2x^{4/3} &= \frac{4x^{1/3}(2x + 1)}{3} + \frac{6x^{4/3}}{3} \\
 &= \frac{4x^{1/3}(2x + 1) + 6x^{4/3}}{3} && \text{Add the two fractions.} \\
 &= \frac{2x^{1/3}[2(2x + 1) + 3x]}{3} && 2 \text{ and } x^{1/3} \text{ are common factors.} \\
 &= \frac{2x^{1/3}(7x + 2)}{3} && \text{Simplify.}
 \end{aligned}$$

**EXAMPLE 2** Simplifying Algebraic Expressions

- (a) Simplify  $\frac{(x^2 + 1)(3) - (3x + 4)(2x)}{(x^2 + 1)^2}$ .
- (b) Write the expression  $(x^2 + 1)^{1/2} + x \cdot \frac{1}{2}(x^2 + 1)^{-1/2} \cdot 2x$  as a single quotient in which only positive exponents appear.

**Solution**

$$\begin{aligned} \text{(a)} \quad \frac{(x^2 + 1)(3) - (3x + 4)(2x)}{(x^2 + 1)^2} &= \frac{3x^2 + 3 - (6x^2 + 8x)}{(x^2 + 1)^2} = \frac{3x^2 + 3 - 6x^2 - 8x}{(x^2 + 1)^2} \\ &= \frac{-3x^2 - 8x + 3}{(x^2 + 1)^2} = \frac{-(3x - 1)(x + 3)}{(x^2 + 1)^2} \end{aligned}$$

Factor

$$\begin{aligned} \text{(b)} \quad (x^2 + 1)^{1/2} + x \cdot \frac{1}{2}(x^2 + 1)^{-1/2} \cdot 2x &= (x^2 + 1)^{1/2} + \frac{x^2}{(x^2 + 1)^{1/2}} \\ &= \frac{(x^2 + 1)^{1/2}(x^2 + 1)^{1/2}}{(x^2 + 1)^{1/2}} + \frac{x^2}{(x^2 + 1)^{1/2}} \\ &= \frac{(x^2 + 1) + x^2}{(x^2 + 1)^{1/2}} = \frac{2x^2 + 1}{(x^2 + 1)^{1/2}} \end{aligned}$$

**2 Complete the Square**

We complete the square in one variable by modifying an expression of the form  $x^2 + bx$  to make it a perfect square. Perfect squares are trinomials of the form

$$x^2 + 2ax + a^2 = (x + a)^2 \quad \text{or} \quad x^2 - 2ax + a^2 = (x - a)^2$$

For example,  $x^2 + 6x + 9$  is a perfect square because  $x^2 + 6x + 9 = (x + 3)^2$ . And  $p^2 - 12p + 36$  is a perfect square because  $p^2 - 12p + 36 = (p - 6)^2$ .

To make  $x^2 + 6x$  a perfect square, we must add 9. The number to be added is chosen by dividing the coefficient of the first-degree term, which is 6, by 2 and squaring the

result  $\left[ \left( \frac{6}{2} \right)^2 = 9 \right]$ .

**EXAMPLE 3** Completing the Square

Determine the number that must be added to each expression to complete the square. Then factor.

| Start                     | Add                                                      | Result                                   | Factored Form                       |
|---------------------------|----------------------------------------------------------|------------------------------------------|-------------------------------------|
| $y^2 + 8y$                | $\left( \frac{1}{2} \cdot 8 \right)^2 = 16$              | $y^2 + 8y + 16$                          | $(y + 4)^2$                         |
| $a^2 - 20a$               | $\left( \frac{1}{2} \cdot (-20) \right)^2 = 100$         | $a^2 - 20a + 100$                        | $(a - 10)^2$                        |
| $p^2 - 5p$                | $\left( \frac{1}{2} \cdot (-5) \right)^2 = \frac{25}{4}$ | $p^2 - 5p + \frac{25}{4}$                | $\left( p - \frac{5}{2} \right)^2$  |
| $2x^2 + 6x = 2(x^2 + 3x)$ | $\left( \frac{1}{2} \cdot 3 \right)^2 = \frac{9}{4}$     | $2\left( x^2 + 3x + \frac{9}{4} \right)$ | $2\left( x + \frac{3}{2} \right)^2$ |

**CAUTION** The original expression  $x^2 + bx$  and the perfect square  $x^2 + bx + \left(\frac{b}{2}\right)^2$  are not equal. So when completing the square within an equation or an inequality, we must not only add  $\left(\frac{b}{2}\right)^2$ , we must also subtract it. That is,

$$x^2 + bx = x^2 + bx + \underbrace{\left(\frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2}_{=0} = \left(x + \frac{b}{2}\right)^2 - \left(\frac{b}{2}\right)^2$$

### 3 Solve Equations

To solve a **quadratic equation**  $ax^2 + bx + c = 0$ ,  $a \neq 0$ , the *quadratic formula* can be used.

#### THEOREM Quadratic Formula

Consider the quadratic equation

$$ax^2 + bx + c = 0 \quad a \neq 0$$

If  $b^2 - 4ac < 0$ , the equation has no real solution.

If  $b^2 - 4ac \geq 0$ , the real solution(s) of the equation is (are) given by the **quadratic formula**:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

The expression  $b^2 - 4ac$  is called the **discriminant** of the quadratic equation.

#### EXAMPLE 4 Solving Quadratic Equations

Solve the equations: (a)  $3x^2 - 5x + 1 = 0$  (b)  $x^2 + x = -1$

**Solution** (a) The discriminant:  $b^2 - 4ac = 25 - 12 = 13$ . We use the quadratic formula.

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} = \frac{5 \pm \sqrt{13}}{6}$$

The solutions are  $x = \frac{5 - \sqrt{13}}{6} \approx 0.232$  and  $x = \frac{5 + \sqrt{13}}{6} \approx 1.434$

(b) The equation in standard form is  $x^2 + x + 1 = 0$ . Its discriminant is  $b^2 - 4ac = 1 - 4 = -3$ . This equation has no real solution. ■

**NOTE** Remember to put a quadratic equation in standard form before attempting to solve it. That is, write the quadratic equation in the form  $ax^2 + bx + c = 0$ .

#### EXAMPLE 5 Solving Equations

Solve the equations:

(a)  $\frac{3}{x-2} = \frac{1}{x-1} + \frac{7}{(x-1)(x-2)}$  (b)  $x^3 - x^2 - 4x + 4 = 0$

(c)  $\sqrt{x-1} = x-7$  (d)  $|1-x| = 2$

**NOTE** The set of real numbers that a variable can assume is called the **domain of the variable**.

**Solution (a)** First, notice that the domain of the variable is  $\{x \mid x \neq 1, x \neq 2\}$ . Now clear the equation of rational expressions by multiplying both sides by  $(x - 1)(x - 2)$ .

$$\begin{aligned}\frac{3}{x-2} &= \frac{1}{x-1} + \frac{7}{(x-1)(x-2)} \\ (x-1)(x-2) \frac{3}{x-2} &= (x-1)(x-2) \left[ \frac{1}{x-1} + \frac{7}{(x-1)(x-2)} \right] && \text{Multiply both sides by } (x-1)(x-2). \\ 3x-3 &= (x-1)(x-2) \frac{1}{x-1} + (x-1)(x-2) \frac{7}{(x-1)(x-2)} && \text{Distribute on both sides.} \\ 3x-3 &= (x-2) + 7 && \text{Simplify.} \\ 3x-3 &= x+5 \\ 2x &= 8 \\ x &= 4\end{aligned}$$

Since 4 is in the domain of the variable, the solution is 4.

**(b)** We group the terms of  $x^3 - x^2 - 4x + 4 = 0$ , and factor by grouping.

$$\begin{aligned}x^3 - x^2 - 4x + 4 &= 0 \\ (x^3 - x^2) - (4x - 4) &= 0 && \text{Group the terms.} \\ x^2(x-1) - 4(x-1) &= 0 && \text{Factor out the common factor from each group.} \\ (x^2 - 4)(x-1) &= 0 && \text{Factor out the common factor } (x-1). \\ (x-2)(x+2)(x-1) &= 0 && x^2 - 4 = (x-2)(x+2) \\ x-2 = 0 \text{ or } x+2 = 0 \text{ or } x-1 = 0 &&& \text{Set each factor equal to 0.} \\ x = 2 \quad x = -2 \quad x = 1 &&& \text{Solve.}\end{aligned}$$

The solutions are  $-2$ ,  $1$ , and  $2$ .

**(c)** We square both sides of the equation since the index of a square root is 2.

$$\begin{aligned}\sqrt{x-1} &= x-7 \\ (\sqrt{x-1})^2 &= (x-7)^2 && \text{Square both sides.} \\ x-1 &= x^2 - 14x + 49 \\ x^2 - 15x + 50 &= 0 && \text{Put in standard form.} \\ (x-10)(x-5) &= 0 && \text{Factor.} \\ x = 10 \text{ or } x = 5 &&& \text{Set each factor equal to 0 and solve.}\end{aligned}$$

$$\text{Check: } x = 10: \sqrt{x-1} = \sqrt{10-1} = \sqrt{9} = 3 \text{ and } x-7 = 10-7 = 3$$

$$x = 5: \sqrt{x-1} = \sqrt{5-1} = \sqrt{4} = 2 \text{ and } x-7 = 5-7 = -2$$

The apparent solution 5 is extraneous; the only solution of the equation is 10.

**RECALL**  $|a| = a$  if  $a \geq 0$ ;  $|a| = -a$  if  $a < 0$ . If  $|x| = b$ ,  $b \geq 0$ , then  $x = b$  or  $x = -b$ .

$$\begin{aligned}\text{(d) } |1-x| &= 2 \\ 1-x = 2 \text{ or } 1-x = -2 &&& \text{The expression inside the absolute value bars equals 2 or } -2. \\ -x = 1 \quad -x = -3 &&& \text{Simplify.} \\ x = -1 \quad x = 3 &&& \text{Simplify.}\end{aligned}$$

The solutions are  $-1$  and  $3$ . ■

### 4 Solve Inequalities

In expressing the solution to an inequality, *interval notation* is often used.

**NOTE** Every interval of real numbers contains both rational numbers, numbers that can be expressed as the quotient of two integers, and irrational numbers, numbers that are not rational.

**DEFINITION**

Let  $a$  and  $b$  represent two real numbers with  $a < b$ .

A **closed interval**, denoted by  $[a, b]$ , consists of all real numbers  $x$  for which  $a \leq x \leq b$ .

An **open interval**, denoted by  $(a, b)$ , consists of all real numbers  $x$  for which  $a < x < b$ .

The **half-open**, or **half-closed, intervals** are:

- $(a, b]$ , consisting of all real numbers  $x$  for which  $a < x \leq b$ , and
- $[a, b)$ , consisting of all real numbers  $x$  for which  $a \leq x < b$ .

In each of these definitions,  $a$  is called the **left endpoint** and  $b$  the **right endpoint** of the interval.

The symbol  $\infty$  (read “infinity”) is *not* a real number, but a notational device used to indicate unboundedness in the positive direction. The symbol  $-\infty$  (read “negative infinity”) also is not a real number, but a notational device used to indicate unboundedness in the negative direction. Using the symbols  $\infty$  and  $-\infty$ , we define five other kinds of intervals:

- $[a, \infty)$ , consisting of all real numbers  $x$  for which  $x \geq a$
- $(a, \infty)$ , consisting of all real numbers  $x$  for which  $x > a$
- $(-\infty, a]$ , consisting of all real numbers  $x$  for which  $x \leq a$
- $(-\infty, a)$ , consisting of all real numbers  $x$  for which  $x < a$
- $(-\infty, \infty)$ , consisting of all real numbers  $x$

Notice that  $\infty$  and  $-\infty$  are never included as endpoints, since neither is a real number.

Table 1 summarizes interval notation, corresponding inequality notation, and their graphs.

**TABLE 1**

| Interval                        | Inequality           | Graph |
|---------------------------------|----------------------|-------|
| The open interval $(a, b)$      | $a < x < b$          |       |
| The closed interval $[a, b]$    | $a \leq x \leq b$    |       |
| The half-open interval $[a, b)$ | $a \leq x < b$       |       |
| The half-open interval $(a, b]$ | $a < x \leq b$       |       |
| The interval $[a, \infty)$      | $a \leq x < \infty$  |       |
| The interval $(a, \infty)$      | $a < x < \infty$     |       |
| The interval $(-\infty, a]$     | $-\infty < x \leq a$ |       |
| The interval $(-\infty, a)$     | $-\infty < x < a$    |       |

EXAMPLE 6 Solving Inequalities

Solve each inequality and graph the solution:

(a)  $4x + 7 \geq 2x - 3$    (b)  $x^2 - 4x + 3 > 0$    (c)  $x^2 + x + 1 < 0$    (d)  $\frac{1+x}{1-x} > 0$

**Solution (a)**

$$4x + 7 \geq 2x - 3$$
$$4x \geq 2x - 10$$
$$2x \geq -10$$
$$x \geq -5$$

Subtract 7 from both sides.

Subtract 2x from both sides.

Divide both sides by 2.

(The direction of the inequality symbol is unchanged.)

Figure 1  $x \geq -5$

**NOTE** The test number can be any real number in the interval, but it cannot be an endpoint.

The solution using interval notation is  $[-5, \infty)$ . See Figure 1 for the graph of the solution.

(b) This is a quadratic inequality. The related quadratic equation  $x^2 - 4x + 3 = (x - 1)(x - 3) = 0$  has two solutions, 1 and 3. We use these numbers to partition the number line into three intervals. Now select a test number in each interval, and determine the value of  $x^2 - 4x + 3$  at the test number. See Table 2.

TABLE 2

| Interval       | Test Number | Value of $x^2 - 4x + 3$ | Sign of $x^2 - 4x + 3$ |
|----------------|-------------|-------------------------|------------------------|
| $(-\infty, 1)$ | 0           | 3                       | Positive               |
| $(1, 3)$       | 2           | -1                      | Negative               |
| $(3, \infty)$  | 4           | 3                       | Positive               |

Figure 2  $x < 1$  or  $x > 3$

We conclude that  $x^2 - 4x + 3 > 0$  on the set  $(-\infty, 1) \cup (3, \infty)$ . See Figure 2 for the graph of the solution.

(c) The quadratic equation  $x^2 + x + 1 = 0$  has no real solution, since its discriminant is negative. [See Example 4(b)]. When this happens, the quadratic inequality is either positive for all real numbers or negative for all real numbers. To see which is true, evaluate  $x^2 + x + 1$  at some number, say, 0. At 0,  $x^2 + x + 1 = 1$ , which is positive. So,  $x^2 + x + 1 > 0$  for all real numbers  $x$ . The inequality  $x^2 + x + 1 < 0$  has no solution.

(d) The only solution of the rational equation  $\frac{1+x}{1-x} = 0$  is  $x = -1$ ; also, the expression  $\frac{1+x}{1-x}$  is not defined for  $x = 1$ . We use the solution  $-1$  and the value 1, at which the expression is undefined, to partition the real number line into three intervals. Now select a test number in each interval, and evaluate the rational expression  $\frac{1+x}{1-x}$  at each test number. See Table 3.

TABLE 3

| Interval        | Test Number | Value of $\frac{1+x}{1-x}$ | Sign of $\frac{1+x}{1-x}$ |
|-----------------|-------------|----------------------------|---------------------------|
| $(-\infty, -1)$ | -2          | $-\frac{1}{3}$             | Negative                  |
| $(-1, 1)$       | 0           | 1                          | Positive                  |
| $(1, \infty)$   | 2           | -3                         | Negative                  |

Figure 3  $-1 < x < 1$

We conclude that  $\frac{1+x}{1-x} > 0$  on the interval  $(-1, 1)$ . See Figure 3 for the graph of the solution. ■

**NOTE** If  $x > 0$  and  $y > 0$ , the Triangle Inequality is an algebraic statement for the fact that the length of any side of a triangle is less than the sum of the lengths of the other two sides.

Below we state an important relationship involving the absolute value of a sum.

### THEOREM Triangle Inequality

If  $x$  and  $y$  are real numbers, then

$$|x + y| \leq |x| + |y|$$

Use the following theorem as a guide to solving inequalities involving absolute values.

### THEOREM

If  $a$  is a positive number and if  $u$  is an algebraic expression, then

$$|u| < a \text{ is equivalent to } -a < u < a \quad (1)$$

$$|u| > a \text{ is equivalent to } u < -a \text{ or } u > a \quad (2)$$

Similar relationships hold for the nonstrict inequalities  $|u| \leq a$  and  $|u| \geq a$ .

### EXAMPLE 7 Solving Inequalities Involving Absolute Value

Solve each inequality and graph the solution:

(a)  $|3 - 4x| < 11$       (b)  $|2x + 4| - 1 \leq 9$       (c)  $\left| \frac{4x + 1}{2} - \frac{3}{5} \right| > 1$

**Solution** (a) The absolute value is less than the number 11, so statement (1) applies.

$$\begin{aligned} |3 - 4x| &< 11 && \text{Apply statement (1).} \\ -11 &< 3 - 4x < 11 && \text{Subtract 3 from each part.} \\ -14 &< -4x < 8 \\ \frac{-14}{-4} &> x > \frac{8}{-4} && \text{Divide each part by } -4, \text{ which reverses the inequality signs.} \\ -2 &< x < \frac{7}{2} && \text{Simplify and rearrange the ordering.} \end{aligned}$$

The solutions are all the numbers in the open interval  $\left(-2, \frac{7}{2}\right)$ . See Figure 4 for the graph of the solution.

(b) We begin by putting  $|2x + 4| - 1 \leq 9$  into the form  $|u| \leq a$ .

$$\begin{aligned} |2x + 4| - 1 &\leq 9 \\ |2x + 4| &\leq 10 && \text{Add 1 to each side.} \\ -10 &\leq 2x + 4 \leq 10 && \text{Apply statement (1), but use } \leq. \\ -14 &\leq 2x \leq 6 \\ -7 &\leq x \leq 3 \end{aligned}$$

The solutions are all the numbers in the closed interval  $[-7, 3]$ . See Figure 5 for the graph of the solution.

(c)  $\left| \frac{4x + 1}{2} - \frac{3}{5} \right| > 1$  is in the form of statement (2). We begin by simplifying the expression inside the absolute value.

$$\left| \frac{4x + 1}{2} - \frac{3}{5} \right| = \left| \frac{5(4x + 1)}{10} - \frac{2(3)}{10} \right| = \left| \frac{20x + 5 - 6}{10} \right| = \left| \frac{20x - 1}{10} \right|$$

**RECALL** Multiplying (or dividing) an inequality by a negative quantity reverses the direction of the inequality sign.

Figure 4  $-2 < x < \frac{7}{2}$

Figure 5  $-7 \leq x \leq 3$

The original inequality is equivalent to the inequality below.

$$\left| \frac{20x - 1}{10} \right| > 1$$

$$\begin{array}{ll} \frac{20x - 1}{10} < -1 & \text{or} \quad \frac{20x - 1}{10} > 1 \quad \text{Apply statement (2).} \\ 20x - 1 < -10 & \text{or} \quad 20x - 1 > 10 \\ 20x < -9 & \text{or} \quad 20x > 11 \\ x < -\frac{9}{20} & \text{or} \quad x > \frac{11}{20} \end{array}$$

Figure 6  $x < -\frac{9}{20}$  or  $x > \frac{11}{20}$

The solutions are all the numbers in the set  $\left(-\infty, -\frac{9}{20}\right) \cup \left(\frac{11}{20}, \infty\right)$ . See Figure 6 for the graph of the solution. ■

## 5 Work with Exponents

Integer exponents provide a shorthand notation for repeated multiplication. For example,

$$2^3 = 2 \cdot 2 \cdot 2 = 8 \quad \text{or} \quad \left(\frac{1}{3}\right)^4 = \frac{1}{3} \cdot \frac{1}{3} \cdot \frac{1}{3} \cdot \frac{1}{3} = \frac{1}{81}$$

### DEFINITION

If  $a$  is a real number and  $n$  is a positive integer, then the symbol  $a^n$  represents the product of  $n$  factors of  $a$ . That is,

$$a^n = \underbrace{a \cdot a \cdot \dots \cdot a}_{n \text{ factors}}$$

Here, it is understood that  $a^1 = a$ .

Then  $a^2 = a \cdot a$  and  $a^3 = a \cdot a \cdot a$ , and so on. In the expression  $a^n$ , the number  $a$  is called the **base** and the number  $n$  is called the **exponent** or **power**. We read  $a^n$  as “ $a$  raised to the power  $n$ ” or as “ $a$  to the  $n$ th power.” We usually read  $a^2$  as “ $a$  squared” and  $a^3$  as “ $a$  cubed.”

### DEFINITION

If  $a \neq 0$ , then

$$a^0 = 1$$

If  $n$  is a positive integer, then

$$a^{-n} = \frac{1}{a^n} \quad a \neq 0$$

The following properties, called the *Laws of Exponents*, can be proved using the preceding definitions.

### THEOREM Laws of Exponents

In each of these properties  $a$  and  $b$  are real numbers, and  $u$  and  $v$  are integers.

$$\begin{array}{lll} a^u a^v = a^{u+v} & (a^u)^v = a^{uv} & (ab)^u = a^u b^u \\ \frac{a^u}{a^v} = a^{u-v} = \frac{1}{a^{v-u}} \quad \text{if } a \neq 0 & & \left(\frac{a}{b}\right)^u = \frac{a^u}{b^u} \quad \text{if } b \neq 0 \end{array}$$

**IN WORDS** The symbol  $\sqrt[n]{a}$  means “the number that, when raised to the  $n$ th power, equals  $a$ .”

### DEFINITION

The **principal  $n$ th root of a real number  $a$** , where  $n \geq 2$  is an integer, symbolized by  $\sqrt[n]{a}$ , is defined as the solution of the equation  $b^n = a$ .

$$\sqrt[n]{a} = b \text{ is equivalent to } a = b^n$$

If  $n$  is even, then both  $a \geq 0$  and  $b \geq 0$ , and if  $n$  is odd, then  $a$  and  $b$  are any real numbers and both have the same sign.

If  $a$  is negative and  $n$  is even, then  $\sqrt[n]{a}$  is not defined. When  $\sqrt[n]{a}$  is defined, the principal  $n$ th root of a number is unique.

The symbol  $\sqrt[n]{a}$  for the principal  $n$ th root of  $a$  is called a **radical**; the integer  $n$  is called the **index**, and  $a$  is called the **radicand**. If the index of a radical is 2, we call  $\sqrt[2]{a}$  the **square root** of  $a$  and omit the index 2 by writing  $\sqrt{a}$ . If the index is 3, we call  $\sqrt[3]{a}$  the **cube root** of  $a$ .

Radicals are used to define rational exponents.

### DEFINITION

If  $a$  is a real number and  $n \geq 2$  is an integer, then

$$a^{1/n} = \sqrt[n]{a}$$

provided that  $a^{1/n} = \sqrt[n]{a}$  exists.

### DEFINITION

If  $a$  is a real number and  $m$  and  $n$  are integers with  $n \geq 2$ , then

$$a^{m/n} = (\sqrt[n]{a})^m$$

provided that  $\sqrt[n]{a}$  exists.

From the two definitions, we have

$$a^{m/n} = \sqrt[n]{a^m} = (\sqrt[n]{a})^m$$

In simplifying the rational expression  $a^{m/n}$ , either  $\sqrt[n]{a^m}$  or  $(\sqrt[n]{a})^m$  can be used. The choice depends on which is easier to simplify. Generally, taking the root first, as in  $(\sqrt[n]{a})^m$ , is easier.

But does  $a^x$  have meaning, where the base  $a$  is a positive real number and the exponent  $x$  is an irrational number? The answer is yes, and although a rigorous definition requires methods discussed in calculus, the basis for the definition is easy to follow: Select a rational number  $r$  that is formed by truncating (removing) all but a finite number of digits from the irrational number  $x$ . Then it is reasonable to expect that

$$a^x \approx a^r$$

For example, take the irrational number  $\pi = 3.14159 \dots$ . Then an approximation to  $a^\pi$  is

$$a^\pi \approx a^{3.14}$$

where the digits after the hundredths position have been truncated from the value for  $\pi$ . A better approximation would be

$$a^\pi \approx a^{3.14159}$$

where the digits after the hundred-thousandths position have been truncated. Continuing in this way, we can obtain approximations to  $a^\pi$  to any desired degree of accuracy.

It can be shown that the Laws of Exponents hold for real number exponents  $u$  and  $v$ .

## 6 Work with Logarithms

The definition of a *logarithm* is based on an exponential relationship.

### DEFINITION

Suppose  $y = a^x$ ,  $a > 0$ ,  $a \neq 1$ , and  $x$  is a real number. The **logarithm with base  $a$  of  $y$** , symbolized by  $\log_a y$ , is the exponent to which  $a$  must be raised to obtain  $y$ . That is,

$$\log_a y = x \text{ is equivalent to } y = a^x$$

As this definition states, a logarithm is a name for a certain exponent.

### EXAMPLE 8 Working with Logarithms

- (a) If  $x = \log_3 y$ , then  $y = 3^x$ . For example,  $4 = \log_3 81$  is equivalent to  $81 = 3^4$ .  
 (b) If  $x = \log_5 y$ , then  $y = 5^x$ . For example,

$$-1 = \log_5 \left( \frac{1}{5} \right) \text{ is equivalent to } \frac{1}{5} = 5^{-1}$$

### THEOREM Properties of Logarithms

In the properties given next,  $u$  and  $a$  are positive real numbers,  $a \neq 1$ , and  $r$  is any real number. The number  $\log_a u$  is the exponent to which  $a$  must be raised to obtain  $u$ . That is,

$$a^{\log_a u} = u$$

The logarithm with base  $a$  of  $a$  raised to a power equals that power. That is,

$$\log_a a^r = r$$

### EXAMPLE 9 Using Properties of Logarithms

$$(a) \ 2^{\log_2 \pi} = \pi \quad (b) \ \log_{0.2} 0.2^{(-\sqrt{2})} = -\sqrt{2} \quad (c) \ \log_{1/5} \left( \frac{1}{5} \right)^{kt} = kt$$

### THEOREM Properties of Logarithms

In the following properties,  $u$ ,  $v$ , and  $a$  are positive real numbers,  $a \neq 1$ , and  $r$  is any real number:

- The Log of a Product Equals the Sum of the Logs

$$\log_a (uv) = \log_a u + \log_a v \quad (3)$$

- The Log of a Quotient Equals the Difference of the Logs

$$\log_a \left( \frac{u}{v} \right) = \log_a u - \log_a v \quad (4)$$

- The Log of a Power Equals the Product of the Power and the Log

$$\log_a u^r = r \log_a u \quad (5)$$

### EXAMPLE 10 Using Properties (3), (4), and (5) of Logarithms

$$\begin{aligned} (a) \ \log_a (x\sqrt{x^2+1}) &= \log_a x + \log_a \sqrt{x^2+1} & \log_a (uv) &= \log_a u + \log_a v \\ &= \log_a x + \log_a (x^2+1)^{1/2} \\ &= \log_a x + \frac{1}{2} \log_a (x^2+1) & \log_a u^r &= r \log_a u \end{aligned}$$

$$(b) \log_a \frac{x^2}{(x-1)^3} = \log_a x^2 - \log_a (x-1)^3 = 2 \log_a x - 3 \log_a (x-1)$$

$$\log_a \left( \frac{u}{v} \right) = \log_a u - \log_a v \quad \log_a u^r = r \log_a u$$

$$(c) \log_a x + \log_a 9 + \log_a (x^2 + 1) - \log_a 5 = \log_a (9x) + \log_a (x^2 + 1) - \log_a 5$$

$$= \log_a [9x(x^2 + 1)] - \log_a 5$$

$$= \log_a \left[ \frac{9x(x^2 + 1)}{5} \right]$$

**CAUTION** In using properties (3) through (5), be careful about the values that the variable may assume. For example, the domain of the variable for  $\log_a x$  is  $x > 0$ , and for  $\log_a (x - 1)$  it is  $x > 1$ . That is, the equality  $\log_a x + \log_a (x - 1) = \log_a [x(x - 1)]$  is true only for  $x > 1$ .

**CAUTION** Common errors made by some students include:

- Expressing the logarithm of a sum as the sum of the logarithms.

$$\log_a (u + v) \text{ is not equal to } \log_a u + \log_a v$$

Correct statement:  $\log_a (uv) = \log_a u + \log_a v$  **Property (3)**

- Expressing the difference of logarithms as the quotient of logarithms.

$$\log_a u - \log_a v \text{ is not equal to } \frac{\log_a u}{\log_a v}$$

Correct statement:  $\log_a u - \log_a v = \log_a \left( \frac{u}{v} \right)$  **Property (4)**

- Expressing a logarithm raised to a power as the product of the power and the logarithm.

$$(\log_a u)^r \text{ is not equal to } r \log_a u$$

Correct statement:  $\log_a u^r = r \log_a u$  **Property (5)**

Since most calculators can calculate only logarithms with base 10, called **common logarithms** and abbreviated  $\log$ , and logarithms with base  $e \approx 2.718$ , called **natural logarithms** and abbreviated  $\ln$ , it is often useful to be able to change the bases of logarithms.

### THEOREM Change-of-Base Formula

If  $a \neq 1$ ,  $b \neq 1$ , and  $u$  are positive real numbers, then

$$\log_a u = \frac{\log_b u}{\log_b a}$$

For example, to approximate  $\log_2 15$ , we use the change-of-base formula. Then we use a calculator.

$$\log_2 15 = \frac{\log 15}{\log 2} \approx 3.907$$

Change-of-Base Formula

## A.2 Geometry Used in Calculus

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Use properties of triangles and the Pythagorean Theorem (p. A-11)
- 2 Work with congruent triangles and similar triangles (p. A-12)
- 3 Use geometry formulas (p. A-15)

Figure 7

### 1 Use Properties of Triangles and the Pythagorean Theorem

A **triangle** is a three-sided polygon. The lengths of the sides are labeled with lowercase letters, such as  $a$ ,  $b$ , and  $c$ , and the angles are labeled with uppercase letters, such as  $A$ ,  $B$ , and  $C$ , with angle  $A$  opposite side  $a$ , angle  $B$  opposite side  $b$ , and angle  $C$  opposite side  $c$ , as shown in Figure 7.

Figure 8

Refer to the triangle in Figure 7. The sum of the lengths of any two sides of a triangle is always greater than the length of the remaining side. The sum of the measures of the angles of a triangle, when measured in degrees, equals  $180^\circ$ . That is,

$$a + b > c \quad a + c > b \quad b + c > a \quad A + B + C = 180^\circ$$

An **isosceles triangle** is a triangle with two equal sides. In an isosceles triangle, the angles opposite the two equal sides are equal.

An **equilateral triangle** is a triangle with three equal sides. In an equilateral triangle, each angle measures  $60^\circ$ .

The *Pythagorean Theorem* is a statement about *right triangles*. A **right triangle** contains a **right angle**, that is, an angle measuring  $90^\circ$ . The side of the triangle opposite the  $90^\circ$  angle is called the **hypotenuse**; the remaining two sides are called **legs**. In Figure 8,  $c$  represents the length of the hypotenuse, and  $a$  and  $b$  represent the lengths of the legs.

### THEOREM Pythagorean Theorem

In a right triangle, the square of the length of the hypotenuse is equal to the sum of the squares of the lengths of the legs. That is, in the right triangle shown in Figure 8,

$$c^2 = a^2 + b^2$$

### EXAMPLE 1 Finding the Hypotenuse of a Right Triangle

In a right triangle, one leg has length 4 and the other has length 3. What is the length of the hypotenuse?

**Solution** Since the triangle is a right triangle, we use the Pythagorean Theorem, with  $a = 4$  and  $b = 3$  to find the length  $c$  of the hypotenuse.

$$\begin{aligned} c^2 &= a^2 + b^2 \\ c^2 &= 4^2 + 3^2 = 16 + 9 = 25 \\ c &= \sqrt{25} = 5 \end{aligned}$$

The converse of the Pythagorean Theorem is also true. ■

### THEOREM Converse of the Pythagorean Theorem

In a triangle, if the square of the length of one side equals the sum of the squares of the lengths of the other two sides, the triangle is a right triangle. The  $90^\circ$  angle is opposite the longest side.

### EXAMPLE 2 Using the Converse of the Pythagorean Theorem

Show that a triangle whose sides have lengths 5, 12, and 13 is a right triangle. Identify the hypotenuse.

**Solution** We square the lengths of the sides.

$$5^2 = 25 \quad 12^2 = 144 \quad 13^2 = 169$$

Notice that the sum of the first two squares (25 and 144) equals the third square (169). So, the triangle is a right triangle. The longest side, 13, is the hypotenuse. ■

See Figure 9.

Figure 9

## 2 Work with Congruent Triangles and Similar Triangles

The word *congruent* means “coinciding when superimposed.” For example, two angles are congruent if they have the same measure, and two line segments are congruent if they have the same length.

**IN WORDS** Two triangles are congruent if they are the same size and shape.

Figure 10 Congruent triangles.

### DEFINITION Congruent Triangles

Two triangles are **congruent** if in each triangle, the corresponding angles have the same measure and the corresponding sides have the same length.

In Figure 10, corresponding angles are equal and the lengths of the corresponding sides are equal. So, these triangles are congruent.

It is not necessary to verify that all three angles and all three sides have the same measure to determine whether two triangles are congruent.

### Determining Congruent Triangles

- **Angle-Side-Angle Case (ASA)** Two triangles are congruent if the measures of two angles from each triangle are equal and the lengths of the corresponding sides between the two equal angles are equal.

For example, in Figure 11, the two triangles are congruent because both triangles have an angle measuring  $40^\circ$ , an angle measuring  $80^\circ$ , and the sides between these angles are both 10 units in length.

- **Side-Side-Side Case (SSS)** Two triangles are congruent if the lengths of the sides of one triangle are equal to the lengths of the sides of the other triangle.

For example, in Figure 12, the two triangles are congruent because both triangles have sides with lengths 8, 15, and 20 units.

- **Side-Angle-Side Case (SAS)** Two triangles are congruent if the lengths of two corresponding sides of the triangles are equal and the angles between the two sides have the same measure.

For example, in Figure 13, the two triangles are congruent because both triangles have sides of length 7 units and 8 units, and the angle between the two congruent sides in each triangle measures  $40^\circ$ .

- **Angle-Angle-Side Case (AAS)** Two triangles are congruent if the measures of two angles and the length of a nonincluded side of one triangle are equal to the corresponding parts of the other triangle.

For example, in Figure 14, the two triangles are congruent because both triangles have angles measuring  $35^\circ$  and  $96^\circ$ , and the nonincluded side adjacent to the  $35^\circ$  angle has length 10 units.

**CAUTION** Knowing that two triangles have equal angles is not sufficient to conclude that the triangles are congruent. Similarly, knowing that the lengths of two corresponding sides and the measure of a nonincluded angle of the triangles are equal is not sufficient to conclude that the triangles are congruent.

Figure 11 ASA

Figure 12 SSS

Figure 13 SAS

Figure 14 AAS

We contrast congruent triangles with *similar* triangles.

### DEFINITION Similar Triangles

Two triangles are **similar** if in each triangle corresponding angles have the same measure and corresponding sides are proportional in length, that is, the ratio of the lengths of the corresponding sides of each triangle equals the same constant.

**IN WORDS** Two triangles are similar if they have the same shape, but (possibly) different sizes.

Figure 15

Figure 16 AA

Figure 17 SSS

Figure 18 SAS

For example, the triangles in Figure 15 are similar because each of the corresponding angles of the two triangles has the same measure. Also, the lengths of the corresponding sides are proportional: each side of the triangle on the right is twice as long as the corresponding side of the triangle on the left. That is, the ratio of the corresponding sides is a constant:  $\frac{d}{a} = \frac{e}{b} = \frac{f}{c} = 2$ .

It is not necessary to verify that all three angles are equal and all three sides are proportional to determine whether two triangles are similar.

### Determining Similar Triangles

- **Angle-Angle Case (AA)** Two triangles are similar if the measures of two angles from each triangle are equal.

For example, the two triangles in Figure 16 are similar because each triangle has an angle measuring  $35^\circ$  and an angle measuring  $80^\circ$ .

- **Side-Side-Side Case (SSS)** Two triangles are similar if the lengths of the sides of one triangle are proportional to the lengths of the sides of the second triangle.

For example, Figure 17 shows two triangles with sides of lengths 5, 6, 10 and 15, 18, 30. These two triangles are similar because

$$\frac{5}{15} = \frac{6}{18} = \frac{10}{30} = \frac{1}{3}$$

- **Side-Angle-Side Case (SAS)** Two triangles are similar if the lengths of two sides of one triangle are proportional to the lengths of two sides of the second triangle, and the angles between the corresponding two sides have equal measure.

For example, in Figure 18, the two triangles are similar because  $\frac{4}{6} = \frac{12}{18} = \frac{2}{3}$  and the angle between sides 4 and 12 and the angle between sides 6 and 18 each measures  $120^\circ$ .

### EXAMPLE 3 Using Similar Triangles

Given that the triangles in Figure 19 are similar, find the missing length  $x$  and angles  $A$ ,  $B$ , and  $C$ .

**Solution** Because the triangles are similar, corresponding angles have the same measure. So,  $A = 71^\circ$ ,  $B = 19^\circ$ , and  $C = 90^\circ$ . Also corresponding sides are proportional. That is,  $\frac{3}{5} = \frac{9}{x}$ . We solve this equation for  $x$ .

$$\frac{3}{5} = \frac{9}{x}$$

$$5x \cdot \frac{3}{5} = 5x \cdot \frac{9}{x} \quad \text{Multiply both sides by } 5x.$$

$$3x = 45 \quad \text{Simplify.}$$

$$x = 15 \quad \text{Divide both sides by 3.}$$

The missing length is 15 units. ■

Figure 19

### 3 Use Geometry Formulas

Certain formulas from geometry are useful in solving calculus problems. Some of these are listed here.

For a rectangle of length  $l$  and width  $w$ ,

$$\text{Area} = lw \quad \text{Perimeter} = 2l + 2w$$

For a triangle with base  $b$  and height  $h$ ,

$$\text{Area} = \frac{1}{2}bh$$

For a circle of radius  $r$  (diameter  $d = 2r$ ),

$$\text{Area} = \pi r^2 \quad \text{Circumference} = 2\pi r = \pi d$$

For a trapezoid with base  $b$  and parallel heights  $h_1$  and  $h_2$ ,

$$\text{Area} = \frac{1}{2}b(h_1 + h_2)$$

For a closed rectangular box of length  $l$ , width  $w$ , and height  $h$ ,

$$\text{Volume} = lwh \quad \text{Surface area} = 2lh + 2wh + 2lw$$

For a sphere of radius  $r$ ,

$$\text{Volume} = \frac{4}{3}\pi r^3 \quad \text{Surface area} = 4\pi r^2$$

For a closed, right circular cylinder of height  $h$  and radius  $r$ ,

$$\text{Volume} = \pi r^2 h \quad \text{Surface area} = 2\pi r^2 + 2\pi rh$$

If the cylinder has no top or bottom, the surface area is  $2\pi rh$ .

For a right circular cone of height  $h$ , radius  $r$ , and slant height  $l = \sqrt{h^2 + r^2}$  that is open on top,

$$\text{Volume} = \frac{1}{3}\pi r^2 h \quad \text{Lateral surface area} = \pi rl = \pi r\sqrt{h^2 + r^2}$$

If the cone is closed on top, the surface area is  $\pi r^2 + \pi rl$ .

## A.3 Analytic Geometry Used in Calculus

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Use the distance formula (p. A-16)
- 2 Graph equations, find intercepts, and test for symmetry (p. A-16)
- 3 Work with equations of a line (p. A-18)
- 4 Work with the equation of a circle (p. A-21)
- 5 Graph parabolas, ellipses, and hyperbolas (p. A-22)

Figure 20

**NOTE** If  $(x, y)$  are the coordinates of a point  $P$ , then  $x$  is called the  **$x$ -coordinate** of  $P$  and  $y$  is called the  **$y$ -coordinate** of  $P$ .

### 1 Use the Distance Formula

Any point  $P$  in the  $xy$ -plane can be located using an **ordered pair**  $(x, y)$  of real numbers. The ordered pair  $(x, y)$ , called the **coordinates** of  $P$ , gives enough information to locate the point  $P$  in the plane. For example, to locate the point with coordinates  $(-3, 1)$ , move 3 units along the  $x$ -axis to the left of  $O$ , and then move straight up 1 unit. Then **plot** the point by placing a dot at this location. See Figure 20 in which the points with coordinates  $(-3, 1)$ ,  $(-2, -3)$ ,  $(3, -2)$ , and  $(3, 2)$  are plotted.

#### THEOREM Distance Formula

The distance between two points  $P_1 = (x_1, y_1)$  and  $P_2 = (x_2, y_2)$ , denoted by  $d(P_1, P_2)$ , is

$$d(P_1, P_2) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

#### EXAMPLE 1 Using the Distance Formula

Find the distance  $d$  between the points  $(-3, 5)$  and  $(3, 2)$ .

**Solution** We use the distance formula with  $P_1 = (x_1, y_1) = (-3, 5)$  and  $P_2 = (x_2, y_2) = (3, 2)$ .

$$d = \sqrt{[3 - (-3)]^2 + (2 - 5)^2} = \sqrt{6^2 + (-3)^2} = \sqrt{36 + 9} = \sqrt{45} = 3\sqrt{5} \approx 6.708$$

### 2 Graph Equations, Find Intercepts, and Test for Symmetry

An **equation in two variables**, say,  $x$  and  $y$ , is a statement in which two expressions involving  $x$  and  $y$  are equal. The expressions are called the **sides** of the equation. Since an equation is a statement, it may be true or false, depending on the value of the variables. Any values of  $x$  and  $y$  that result in a true statement are said to **satisfy** the equation.

For example, the following are equations in two variables  $x$  and  $y$ :

$$x^2 + y^2 = 5 \quad 2x - y = 6 \quad y = 2x + 5 \quad x^2 = y$$

The equation,  $x^2 + y^2 = 5$  is satisfied for  $x = 1$  and  $y = 2$ , since  $1^2 + 2^2 = 1 + 4 = 5$ . Other choices of  $x$  and  $y$ , such as  $x = -1$  and  $y = -2$ , also satisfy this equation. It is not satisfied for  $x = 2$  and  $y = 3$ , since  $2^2 + 3^2 = 4 + 9 = 13 \neq 5$ .

The **graph of an equation in two variables**  $x$  and  $y$  consists of the set of points in the  $xy$ -plane whose coordinates  $(x, y)$  satisfy the equation.

#### EXAMPLE 2 Graphing an Equation by Plotting Points

Graph the equation  $y = x^2$ .

**Solution** Table 4 lists several points on the graph. In Figure 21(a) the points are plotted and then they are connected with a smooth curve to obtain the graph (a *parabola*). Figure 21(b) shows the graph using graphing technology.

TABLE 4

| $x$ | $y = x^2$ | $(x, y)$   |
|-----|-----------|------------|
| -4  | 16        | $(-4, 16)$ |
| -3  | 9         | $(-3, 9)$  |
| -2  | 4         | $(-2, 4)$  |
| -1  | 1         | $(-1, 1)$  |
| 0   | 0         | $(0, 0)$   |
| 1   | 1         | $(1, 1)$   |
| 2   | 4         | $(2, 4)$   |
| 3   | 9         | $(3, 9)$   |
| 4   | 16        | $(4, 16)$  |

Figure 22

Figure 21  $y = x^2$ 

The graphs in Figure 21 do not show all the points whose coordinates  $(x, y)$  satisfy the equation  $y = x^2$ . For example, the point  $(6, 36)$  satisfies the equation  $y = x^2$ , but it is not shown. It is important when graphing to present enough of the graph so that any viewer will “see” the rest of the graph as an obvious continuation of what is actually there.

The points, if any, at which a graph crosses or touches a coordinate axis are called the **intercepts** of the graph. See Figure 22. The  $x$ -coordinate of a point where a graph crosses or touches the  $x$ -axis is an  **$x$ -intercept**. At an  $x$ -intercept, the  $y$ -coordinate equals 0. The  $y$ -coordinate of a point where a graph crosses or touches the  $y$ -axis is a  **$y$ -intercept**. At a  $y$ -intercept, the  $x$ -coordinate equals 0. When graphing an equation, all its intercepts should be displayed or be easily inferred from the part of the graph that is displayed.

### EXAMPLE 3 Finding the Intercepts of a Graph

Find the  $x$ -intercept(s) and the  $y$ -intercept(s) of the graph of  $y = x^2 - 4$ .

**Solution** To find the  $x$ -intercept(s), we let  $y = 0$  and solve the equation

$$x^2 - 4 = 0$$

$$(x + 2)(x - 2) = 0 \quad \text{Factor.}$$

$$x = -2 \quad \text{or} \quad x = 2 \quad \text{Set each factor equal to 0 and solve.}$$

The equation has two solutions,  $-2$  and  $2$ . The  $x$ -intercepts are  $-2$  and  $2$ .

To find the  $y$ -intercept(s), we let  $x = 0$  in the equation.

$$y = 0^2 - 4 = -4$$

The  $y$ -intercept is  $-4$ . ■

### DEFINITION Symmetry

- A graph is **symmetric with respect to the  $x$ -axis** if, for every point  $(x, y)$  on the graph, the point  $(x, -y)$  is also on the graph. See Figure 23.
- A graph is **symmetric with respect to the  $y$ -axis** if, for every point  $(x, y)$  on the graph, the point  $(-x, y)$  is also on the graph. See Figure 24.
- A graph is **symmetric with respect to the origin** if, for every point  $(x, y)$  on the graph, the point  $(-x, -y)$  is also on the graph. See Figure 25.

Figure 23 Symmetry with respect to the  $x$ -axis.Figure 24 Symmetry with respect to the  $y$ -axis.

Figure 25 Symmetry with respect to the origin.

**EXAMPLE 4** Testing for Symmetry

Test the graph of  $y = \frac{4x^2}{x^2 + 1}$  for symmetry.

**Solution** *x*-axis: To test for symmetry with respect to the *x*-axis, we replace *y* with  $-y$ . Since  $-y = \frac{4x^2}{x^2 + 1}$  is not equivalent to  $y = \frac{4x^2}{x^2 + 1}$ , the graph of the equation is not symmetric with respect to the *x*-axis.

*y*-axis: To test for symmetry with respect to the *y*-axis, we replace *x* with  $-x$ . Since  $y = \frac{4(-x)^2}{(-x)^2 + 1} = \frac{4x^2}{x^2 + 1}$  is equivalent to  $y = \frac{4x^2}{x^2 + 1}$ , the graph of the equation is symmetric with respect to the *y*-axis.

Origin: To test for symmetry with respect to the origin, we replace *x* with  $-x$  and *y* with  $-y$ .

$$-y = \frac{4(-x)^2}{(-x)^2 + 1} \quad \text{Replace } x \text{ by } -x \text{ and } y \text{ by } -y.$$

$$-y = \frac{4x^2}{x^2 + 1} \quad \text{Simplify.}$$

$$y = -\frac{4x^2}{x^2 + 1} \quad \text{Multiply both sides by } -1.$$

Since the result is not equivalent to the original equation, the graph of the equation is not symmetric with respect to the origin. ■

Figure 26 shows the graph of  $y = \frac{4x^2}{x^2 + 1}$  and confirms the symmetry with respect to the *y*-axis.

Figure 26  $y = \frac{4x^2}{x^2 + 1}$

**3** Work with Equations of a Line**DEFINITION** Slope

Let  $P = (x_1, y_1)$  and  $Q = (x_2, y_2)$  be two distinct points. If  $x_1 \neq x_2$ , the **slope**  $m$  of the nonvertical line  $L$  containing  $P$  and  $Q$  is defined by the formula

$$m = \frac{y_2 - y_1}{x_2 - x_1} \quad x_1 \neq x_2$$

If  $x_1 = x_2$ , then  $L$  is a **vertical line** and the slope  $m$  of  $L$  is **undefined**.

Figure 27(a) provides an illustration of the slope of a nonvertical line; Figure 27(b) illustrates a vertical line.

(a) Slope of  $L$  is  $m = \frac{y_2 - y_1}{x_2 - x_1}$

(b)  $L$  is vertical, the slope is undefined.

Figure 27

From the definition of slope, we conclude:

- When the slope of a line is positive, the line slants upward from left to right.
- When the slope of a line is negative, the line slants downward from left to right.

- When the slope of a line is 0, the line is horizontal.
- When the slope of a line is undefined, the line is vertical.

**THEOREM Equation of a Vertical Line**

A vertical line is given by an equation of the form

$$\boxed{x = a}$$

where  $a$  is the  $x$ -intercept.

**THEOREM Point-Slope Form of an Equation of a Line**

An equation of a nonvertical line with slope  $m$  that contains the point  $(x_1, y_1)$  is

$$\boxed{y - y_1 = m(x - x_1)}$$

Figure 28  $y = 4x - 2$

**EXAMPLE 5 Using the Point-Slope Form of a Line**

An equation of the line with slope 4 and containing the point  $(1, 2)$  can be found by using the point-slope form with  $m = 4$ ,  $x_1 = 1$ , and  $y_1 = 2$ .

$$y - y_1 = m(x - x_1) \quad \text{Point-slope form of a line}$$

$$y - 2 = 4(x - 1) \quad m = 4, x_1 = 1, y_1 = 2$$

$$y = 4x - 2 \quad \text{Solve for } y.$$

See Figure 28 for the graph of  $y$ . ■

Another useful equation of a line is obtained when the slope  $m$  and the  $y$ -intercept  $b$  are known. The point-slope form is used to obtain the following equation of a line with slope  $m$ , containing the point  $(0, b)$ :

$$y - b = m(x - 0) \quad \text{or equivalently} \quad y = mx + b$$

**THEOREM Slope-Intercept Form of an Equation of a Line**

An equation of a line with slope  $m$  and  $y$ -intercept  $b$  is

$$\boxed{y = mx + b}$$

For a horizontal line, the slope  $m$  is 0.

**THEOREM Equation of a Horizontal Line**

A horizontal line is given by an equation of the form

$$\boxed{y = b}$$

where  $b$  is the  $y$ -intercept.

**EXAMPLE 6 Finding the Slope and  $y$ -intercept from an Equation of a Line**

Find the slope  $m$  and the  $y$ -intercept of the equation  $2x + 4y = 8$ . Graph the equation.

**Solution** To obtain the slope and  $y$ -intercept, we write the equation in slope-intercept form by solving for  $y$ .

$$2x + 4y = 8$$

$$4y = -2x + 8$$

$$y = -\frac{1}{2}x + 2 \quad y = mx + b$$

Figure 29  $2x + 4y = 8$ 

The coefficient of  $x$  is the slope. The slope is  $-\frac{1}{2}$ . The constant 2 is the  $y$ -intercept, so the point  $(0, 2)$  is on the graph. Now use the slope  $-\frac{1}{2}$ . Starting at the point  $(0, 2)$ , we move 2 units to the right and then 1 unit down to the point  $(2, 1)$ . We plot this point and draw a line through the two points. See Figure 29. ■

When two lines in the plane do not intersect, they are **parallel**.

### THEOREM Criterion for Parallel Lines

Two nonvertical lines are parallel if and only if their slopes are equal and they have different  $y$ -intercepts.

### EXAMPLE 7 Finding an Equation of a Line that Is Parallel to a Given Line

Find an equation of the line that contains the point  $(1, 2)$  and is parallel to the line  $y = 5x$ .

**Solution** Since the two lines are parallel, the slope of the line we seek equals the slope of the line  $y = 5x$ , which is 5. Since the line we seek also contains the point  $(1, 2)$ , we use the point-slope form to obtain the equation.

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - 2 &= 5(x - 1) \\ y - 2 &= 5x - 5 \\ y &= 5x - 3 \end{aligned}$$

Figure 30 Parallel lines

The line  $y = 5x - 3$  contains the point  $(1, 2)$  and is parallel to the line  $y = 5x$ . See Figure 30. ■

When two lines intersect at a right angle ( $90^\circ$ ), they are **perpendicular**. See Figure 31.

### THEOREM Criterion for Perpendicular Lines

Two nonvertical lines are perpendicular if and only if the product of their slopes is  $-1$ .

### EXAMPLE 8 Finding an Equation of a Line that Is Perpendicular to a Given Line

Find an equation of the line that contains the point  $(-1, 3)$  and is perpendicular to the line  $4x + y = -1$ .

**Solution** We begin by writing the equation of the given line in slope-intercept form to find its slope.

$$\begin{aligned} 4x + y &= -1 \\ y &= -4x - 1 \end{aligned}$$

This line has a slope of  $-4$ . Any line perpendicular to this line will have slope  $\frac{1}{4}$ . Because the point  $(-1, 3)$  is on this line, we use the point-slope form of a line.

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - 3 &= \frac{1}{4}[x - (-1)] \\ y - 3 &= \frac{1}{4}x + \frac{1}{4} \\ y &= \frac{1}{4}x + \frac{13}{4} \end{aligned}$$

Figure 31 Perpendicular lines

Figure 32

Figure 32 shows the graphs of  $4x + y = -1$  and  $y = \frac{1}{4}x + \frac{13}{4}$ . ■

## 4 Work with the Equation of a Circle

An advantage of a coordinate system is that it enables a geometric statement to be translated into an algebraic statement, and vice versa. Consider, for example, the following geometric statement that defines a circle.

### DEFINITION Circle

A **circle** is the set of points in the  $xy$ -plane that is a fixed distance  $r$  from a fixed point  $(h, k)$ . The fixed distance  $r$  is called the **radius**, and the fixed point  $(h, k)$  is called the **center** of the circle.

Figure 33  $(x - h)^2 + (y - k)^2 = r^2$

Figure 34 The unit circle:  $x^2 + y^2 = 1$

Figure 35  $(x + 3)^2 + (y - 2)^2 = 16$

Figure 33 shows the graph of a circle. To find an equation that describes a circle, let  $(x, y)$  represent the coordinates of any point on the circle with radius  $r$  and center  $(h, k)$ . Then the distance between the point  $(x, y)$  and  $(h, k)$  equals  $r$ . That is, by the distance formula,

$$\sqrt{(x - h)^2 + (y - k)^2} = r$$

Now we square both sides to obtain

$$(x - h)^2 + (y - k)^2 = r^2$$

This form of the equation of a circle is called the **standard form**.

### THEOREM

The standard form of a circle with radius  $r$  and center at the origin  $(0, 0)$  is

$$x^2 + y^2 = r^2$$

### DEFINITION Unit Circle

The circle with radius  $r = 1$  and center at the origin is called the **unit circle** and has the equation

$$x^2 + y^2 = 1$$

See Figure 34.

### EXAMPLE 9 Graphing a Circle

Graph the equation  $(x + 3)^2 + (y - 2)^2 = 16$ .

**Solution** This is the standard form of an equation of a circle. To graph the circle, we first identify the center and the radius of the circle.

$$\begin{aligned} (x + 3)^2 + (y - 2)^2 &= 16 \\ (x - (-3))^2 + (y - 2)^2 &= 4^2 \\ \uparrow \quad \quad \quad \uparrow \quad \quad \uparrow \\ h \quad \quad \quad k \quad \quad r^2 \end{aligned}$$

The circle has its center at the point  $(-3, 2)$ ; its radius is 4 units. To graph the circle, we plot the center  $(-3, 2)$ . Then we locate the four points on the circle that are 4 units to the left, to the right, above, and below the center. These four points are used as guides to obtain the graph. See Figure 35. ■

### DEFINITION General Form of the Equation of a Circle

The equation

$$x^2 + y^2 + ax + bx + c = 0$$

is called the **general form of the equation of a circle**.

**NEED TO REVIEW?** Completing the square is discussed in Section A.1, p. A-2.

If the equation of a circle is given in the general form, we use the method of completing the square to put the equation in standard form in order to identify the center and radius.

### EXAMPLE 10 Graphing a Circle Whose Equation Is in General Form

Graph the equation

$$x^2 + y^2 + 4x - 6y + 12 = 0$$

**Solution** We complete the square in both  $x$  and  $y$  to put the equation in standard form. First, we group the terms involving  $x$ , group the terms involving  $y$ , and put the constant on the right side of the equation. The result is

$$(x^2 + 4x) + (y^2 - 6y) = -12$$

Next, we complete the square of each expression in parentheses. Remember that any number added to the left side of an equation must be added to the right side.

$$(x^2 + 4x + 4) + (y^2 - 6y + 9) = -12 + 4 + 9 = 1$$

$$\text{Add } \left(\frac{4}{2}\right)^2 = 4 \quad \text{Add } \left(\frac{-6}{2}\right)^2 = 9$$

$$(x + 2)^2 + (y - 3)^2 = 1 \quad \text{Factor.}$$

This is the standard form of the equation of a circle with radius 1 and center at the point  $(-2, 3)$ . To graph the circle, we plot the center  $(-2, 3)$  and points 1 unit to the right, to the left, above and below the point  $(-2, 3)$ , as shown in Figure 36. ■

Figure 36  $x^2 + y^2 + 4x - 6y + 12 = 0$

## 5 Graph Parabolas, Ellipses, and Hyperbolas

The graph of the equation  $y = x^2$  is an example of a *parabola*. See Figure 21 on page A-26. In fact, every parabola has a shape like the graph of  $y = x^2$ .

A **parabola** is the graph of an equation in one of the four forms:

$$y^2 = 4ax \quad y^2 = -4ax \quad x^2 = 4ay \quad x^2 = -4ay$$

where  $a > 0$ .

In each of the parabolas in Figure 37, the **vertex**  $V$  is at the origin  $(0, 0)$ . When the equation is of the form  $y^2 = 4ax$ , the point  $(a, 0)$  is called the **focus**, and the parabola is symmetric with respect to the  $x$ -axis. When the equation is of the form  $x^2 = 4ay$ , the point  $(0, a)$  is the focus, and the parabola is symmetric with respect to the  $y$ -axis.

Figure 37

**EXAMPLE 11** Graphing a Parabola with Vertex at the OriginGraph the equation  $x^2 = 16y$ .**Solution** The graph of  $x^2 = 16y$  is a parabola of the form

$$x^2 = 4ay$$

where  $a = 4$ . Look at Figure 37(c). The graph will open up, with focus at  $(0, 4)$ . The vertex is at  $(0, 0)$ . To graph the parabola, we let  $y = a$ ; that is, let  $y = 4$ . (Any other positive number will also work.)

$$x^2 = 16y = 16(4) = 64$$

$$y = a = 4$$

$$x = -8 \quad \text{or} \quad x = 8$$

The points  $(-8, 4)$  and  $(8, 4)$  are on the parabola and establish its opening. See Figure 38. ■

**Figure 38**  $x^2 = 16y$ 

An **ellipse** is the graph of an equation in one of the two forms:

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \quad \frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$$

where  $a \geq b > 0$ .

An ellipse is oval-shaped. The line segment dividing the ellipse in half the long way is the **major axis**; its length is  $2a$ . The two points of intersection of the ellipse and the major axis are the **vertices** of the ellipse. The midpoint of the vertices is the **center** of the ellipse. The line segment through the center of the ellipse and perpendicular to the major axis is the **minor axis**. Along the major axis  $c$  units from the center of the ellipse, where  $c^2 = a^2 - b^2$ ,  $c > 0$ , are two points, called **foci**, that determine the shape of the ellipse. See Figure 39.

- (a)  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ,  $a \geq b > 0$   
 Major axis: along the  $x$ -axis  
 Center:  $(0, 0)$   
 Vertices:  $(-a, 0)$ ,  $(a, 0)$   
 Foci:  $(-c, 0)$ ,  $(c, 0)$ , where  $c^2 = a^2 - b^2$ ,  $c > 0$   
 Symmetry:  $x$ -axis,  $y$ -axis, origin

- (b)  $\frac{x^2}{b^2} + \frac{y^2}{a^2} = 1$ ,  $a \geq b > 0$   
 Major axis: along the  $y$ -axis  
 Center:  $(0, 0)$   
 Vertices:  $(0, -a)$ ,  $(0, a)$   
 Foci:  $(0, -c)$ ,  $(0, c)$ , where  $c^2 = a^2 - b^2$ ,  $c > 0$   
 Symmetry:  $x$ -axis,  $y$ -axis, origin

**Figure 39****EXAMPLE 12** Graphing an Ellipse with Center at the OriginGraph the equation:  $9x^2 + 4y^2 = 36$ **Solution** To put the equation in standard form, we divide each side by 36.

$$\frac{x^2}{4} + \frac{y^2}{9} = 1$$

The graph of this equation is an ellipse. Since the larger number is under  $y^2$ , the major axis is along the  $y$ -axis. The center is at the origin  $(0, 0)$ . It is easiest to graph an ellipse

**NOTE** If  $a = b$ , then  $\frac{x^2}{a^2} + \frac{y^2}{a^2} = 1$  is the equation of a circle of radius  $a$ .

Figure 40  $9x^2 + 4y^2 = 36$ 

by finding its intercepts:

$x$ -intercepts: Let  $y = 0$

$$\frac{x^2}{4} + \frac{0^2}{9} = 1$$

$$x^2 = 4$$

$$x = -2 \text{ and } x = 2$$

$y$ -intercepts: Let  $x = 0$

$$0^2 + \frac{y^2}{9} = 1$$

$$y^2 = 9$$

$$y = -3 \text{ and } y = 3$$

The points  $(-2, 0)$ ,  $(2, 0)$ ,  $(0, -3)$ ,  $(0, 3)$  are the intercepts of the ellipse. See Figure 40. ■

A **hyperbola** is the graph of an equation in one of the two forms:

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \quad \frac{y^2}{b^2} - \frac{x^2}{a^2} = 1$$

where  $a > 0$  and  $b > 0$ .

Two points, called **foci**, determine the shape of the hyperbola. The midpoint of the line segment containing the foci is called the **center** of the hyperbola. The foci are located  $c$  units from the center, where  $c^2 = a^2 + b^2$ ,  $c > 0$ . The line containing the foci is called the **transverse axis**. The **vertices** of a hyperbola are its intercepts.

See Figure 41. The graph of a hyperbola consists of two branches. For the hyperbola

$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ , the branches of the graph open left and right; for the hyperbola

$\frac{y^2}{b^2} - \frac{x^2}{a^2} = 1$ , the branches of the graph open up and down.

Figure 41

### EXAMPLE 13 Graphing a Hyperbola With Center at the Origin

Graph the equation  $\frac{y^2}{4} - \frac{x^2}{5} = 1$ .

**Solution** The graph of  $\frac{y^2}{4} - \frac{x^2}{5} = 1$  is a hyperbola. The hyperbola consists of two branches, one opening up, the other opening down, like the graph in Figure 41(b). The hyperbola has no  $x$ -intercepts. To find the  $y$ -intercepts, we let  $x = 0$  and solve for  $y$ .

$$\frac{y^2}{4} = 1$$

$$y^2 = 4$$

$$y = -2 \quad \text{or} \quad y = 2$$

The  $y$ -intercepts are  $-2$  and  $2$ , so the vertices are  $(0, -2)$  and  $(0, 2)$ . The transverse axis is the vertical line  $x = 0$ . To graph the hyperbola, let  $y = \pm 3$  (or any numbers  $\geq 2$  or  $\leq -2$ ).

Then

$$\begin{aligned}\frac{y^2}{4} - \frac{x^2}{5} &= 1 \\ \frac{9}{4} - \frac{x^2}{5} &= 1 && y = \pm 3 \\ \frac{x^2}{5} &= \frac{5}{4} \\ x^2 &= \frac{25}{4} \\ x &= -\frac{5}{2} \text{ or } x = \frac{5}{2}\end{aligned}$$

Figure 42  $\frac{y^2}{4} - \frac{x^2}{5} = 1$

The points  $\left(-\frac{5}{2}, 3\right)$ ,  $\left(-\frac{5}{2}, -3\right)$ ,  $\left(\frac{5}{2}, 3\right)$ , and  $\left(\frac{5}{2}, -3\right)$  are on the hyperbola. See Figure 42 for the graph. ■

## A.4 Trigonometry Used in Calculus

**OBJECTIVES** When you finish this section, you should be able to:

- 1 Work with angles, arc length of a circle, and circular motion (p. A-25)
- 2 Define and evaluate trigonometric functions (p. A-27)
- 3 Determine the domain and the range of the trigonometric functions (p. A-31)
- 4 Use basic trigonometry identities (p. A-32)
- 5 Use sum and difference, double-angle and half-angle, and sum-to-product and product-to-sum formulas (p. A-34)
- 6 Solve triangles using the Law of Sines and the Law of Cosines (p. A-35)

### 1 Work with Angles, Arc Length of a Circle, and Circular Motion

Figure 43

A **ray**, or **half-line**, is the portion of a line that starts at a point  $V$  on the line and extends indefinitely in one direction. The point  $V$  of a ray is called its **vertex**. See Figure 43.

If two rays are drawn with a common vertex, they form an **angle**. We call one ray of an angle the **initial side** and the other ray the **terminal side**. The angle formed is identified by showing the direction and amount of rotation from the initial side to the terminal side. If the rotation is in the counterclockwise direction, the angle is **positive**; if the rotation is clockwise, the angle is **negative**. See Figure 44.

Figure 44

An angle  $\theta$  is in **standard position** if its vertex is at the origin of a rectangular coordinate system and its initial side is on the positive  $x$ -axis. See Figure 45 on page A-26.

Figure 45

Suppose an angle  $\theta$  is in standard position. If its terminal side coincides with a coordinate axis, we say that  $\theta$  is a **quadrantal angle**. If its terminal side does not coincide with a coordinate axis, we say that  $\theta$  **lies in a quadrant**. See Figure 46.

Figure 46

**Figure 47** 1 revolution counterclockwise is  $360^\circ$ .

**Figure 48** 1 Radian

**Figure 49**  $s = r\theta$

**Figure 50** 1 revolution =  $2\pi$  radians

Angles are measured by determining the amount of rotation needed for the initial side to coincide with the terminal side. The two commonly used measures for angles are *degrees* and *radians*.

The angle formed by rotating the initial side exactly once in the counterclockwise direction until it coincides with itself (one revolution) measures  $360^\circ$ , abbreviated  $360^\circ$ . See Figure 47.

A **central angle** is a positive angle whose vertex is at the center of a circle. The rays of a central angle subtend (intersect) an arc on the circle. If the radius of the circle is  $r$  and the arc subtended by the central angle is also of length  $r$ , then the measure of the angle is **1 radian**. See Figure 48.

### THEOREM Arc Length

For a circle of radius  $r$ , a central angle of  $\theta$  radians subtends an arc whose length  $s$  is

$$s = r\theta$$

See Figure 49.

Consider a circle of radius  $r$ . A central angle of one revolution will subtend an arc equal to the circumference of the circle, as shown in Figure 50. Because the circumference of a circle equals  $2\pi r$ , we use  $s = 2\pi r$  in the formula for arc length to find the radian measure of an angle of one revolution.

$$s = r\theta$$

$$2\pi r = r\theta$$

$$\theta = 2\pi \text{ radians}$$

$$\text{For one revolution: } s = 2\pi r$$

$$\text{Solve for } \theta.$$

Since one revolution is equivalent to  $360^\circ$ , we have  $360^\circ = 2\pi$  radians so that

$$180^\circ = \pi \text{ radians}$$

In calculus, radians are generally used to measure angles, unless degrees are specifically mentioned. Table 5 lists the radian and degree measures for some common angles.

**NOTE** If the measure of an angle is given as a number, it is understood to mean radians. If the measure of an angle is given in degrees, then it will be marked either with the symbol  $^\circ$  or the word “degrees.”

Figure 51  $A = \frac{1}{2}r^2\theta$

Figure 52  $v = \frac{s}{t}$ ;  $\omega = \frac{\theta}{t}$

**RECALL** In the formula  $s = r\theta$  for the arc length of a circle, the angle  $\theta$  must be measured in radians.

TABLE 5

| Radians | 0         | $\frac{\pi}{6}$ | $\frac{\pi}{4}$ | $\frac{\pi}{3}$ | $\frac{\pi}{2}$ | $\frac{2\pi}{3}$ | $\frac{3\pi}{4}$ | $\frac{5\pi}{6}$ | $\pi$       | $\frac{3\pi}{2}$ | $2\pi$      |
|---------|-----------|-----------------|-----------------|-----------------|-----------------|------------------|------------------|------------------|-------------|------------------|-------------|
| Degrees | $0^\circ$ | $30^\circ$      | $45^\circ$      | $60^\circ$      | $90^\circ$      | $120^\circ$      | $135^\circ$      | $150^\circ$      | $180^\circ$ | $270^\circ$      | $360^\circ$ |

### THEOREM Area of a Sector

The area  $A$  of the sector of a circle of radius  $r$  formed by a central angle of  $\theta$  radians is

$$A = \frac{1}{2}r^2\theta$$

See Figure 51.

### DEFINITION Linear Speed, Angular Speed

Suppose an object moves around a circle of radius  $r$  at a constant speed. If  $s$  is the distance around the circle traveled in time  $t$ , then the **linear speed**  $v$  of the object is

$$v = \frac{s}{t}$$

The **angular speed**  $\omega$  (the Greek letter omega) of an object moving at a constant speed around a circle of radius  $r$  is

$$\omega = \frac{\theta}{t}$$

where  $\theta$  is the angle (measured in radians) swept out in time  $t$ .

See Figure 52.

Angular speed is used to describe the turning rate of an engine. For example, an engine idling at 900 rpm (revolutions per minute) rotates at an angular speed of

$$900 \frac{\text{revolutions}}{\text{minute}} = 900 \frac{\text{revolutions}}{\text{minute}} \cdot 2\pi \frac{\text{radians}}{\text{revolution}} = 1800\pi \frac{\text{radians}}{\text{minute}}$$

There is an important relationship between linear speed and angular speed:

$$\text{linear speed} = v = \frac{s}{t} = \frac{r\theta}{t} = r \left( \frac{\theta}{t} \right) = r\omega$$

$\uparrow$   $s = r\theta$   $\uparrow$   $\omega = \frac{\theta}{t}$

So,

$$v = r\omega$$

where  $\omega$  is measured in radians per unit time.

When using the equation  $v = r\omega$ , remember that  $v = \frac{s}{t}$  has the dimensions of length per unit of time (such as meters per second or miles per hour),  $r$  has the same length dimension as  $s$ , and  $\omega$  has the dimensions of radians per unit of time. If the angular speed is given in terms of *revolutions* per unit of time (as is often the case), be sure to convert it to *radians* per unit of time, using the fact that one revolution =  $2\pi$  radians, before using the formula  $v = r\omega$ .

## 2 Define and Evaluate Trigonometric Functions

There are two common approaches to trigonometry: One uses right triangles and the other uses the unit circle. We suggest you first review the approach you are most familiar with and then read the other approach. The two approaches are given side-by-side on pages A-28 and A-29.

Right Triangle Approach

Suppose  $\theta$  is an **acute angle**; that is,  $0 < \theta < \frac{\pi}{2}$ , as shown in Figure 53(a). Using the angle  $\theta$ , we form a right triangle, like the one illustrated in Figure 53(b), with hypotenuse of length  $c$  and legs of lengths  $a$  and  $b$ . The three sides of the right triangle can be used to form exactly six ratios:

$\frac{b}{c}, \frac{a}{c}, \frac{b}{a}, \frac{c}{b}, \frac{c}{a}, \frac{a}{b}$

Figure 53

Because the ratios depend only on the angle  $\theta$  and not on the triangle itself, each ratio is given a name that involves  $\theta$ . See Figure 54.

Figure 54

**DEFINITION Trigonometric Functions**  
The six ratios of a right triangle are called the **trigonometric functions of an acute angle  $\theta$**  and are defined as follows:

| Function name         | Abbreviation  | Value         | Relation using words                        |
|-----------------------|---------------|---------------|---------------------------------------------|
| sine of $\theta$      | $\sin \theta$ | $\frac{b}{c}$ | $\frac{\text{opposite}}{\text{hypotenuse}}$ |
| cosine of $\theta$    | $\cos \theta$ | $\frac{a}{c}$ | $\frac{\text{adjacent}}{\text{hypotenuse}}$ |
| tangent of $\theta$   | $\tan \theta$ | $\frac{b}{a}$ | $\frac{\text{opposite}}{\text{adjacent}}$   |
| cosecant of $\theta$  | $\csc \theta$ | $\frac{c}{b}$ | $\frac{\text{hypotenuse}}{\text{opposite}}$ |
| secant of $\theta$    | $\sec \theta$ | $\frac{c}{a}$ | $\frac{\text{hypotenuse}}{\text{adjacent}}$ |
| cotangent of $\theta$ | $\cot \theta$ | $\frac{a}{b}$ | $\frac{\text{adjacent}}{\text{opposite}}$   |

To extend the definition of the trigonometric functions to include angles that are not acute, the angle is placed in standard position in a rectangular coordinate system, as shown in Figure 55.

Unit Circle Approach

Let  $t$  be any real number. We position a  $t$ -axis perpendicular to the  $x$ -axis so that  $t = 0$  coincides with the point  $(1, 0)$  of the  $xy$ -plane, and positive values of  $t$  are above the  $x$ -axis. See Figure 56(a).

Figure 56

Now look at the unit circle in Figure 56(b). If  $t > 0$ , we begin at the point  $(1, 0)$  on the unit circle and travel  $s = t$  units in the counterclockwise direction along the circle to arrive at the point  $P = (x, y)$ . In this sense, the length  $s = t$  units on the  $t$ -axis is being **wrapped** around the unit circle.

If  $t < 0$ , we begin at the point  $(1, 0)$  on the unit circle and travel  $s = |t|$  units in the clockwise direction along the circle to the point  $P = (x, y)$ , as shown in Figure 56(c).

If  $t > 2\pi$  or if  $t < -2\pi$ , it will be necessary to travel around the circle more than once before arriving at the point  $P$ .

This discussion tells us that, for any real number  $t$ , there is a unique point  $P = (x, y)$  on the unit circle, called **the point on the unit circle that corresponds to  $t$** . The coordinates of the point  $P = (x, y)$  are used to define the **six trigonometric functions of  $t$** .

**DEFINITION Trigonometric Functions of a Number  $t$**   
Let  $t$  be a real number and let  $P = (x, y)$  be the point on the unit circle that corresponds to  $t$ .

- The **sine function** is defined as

$\sin t = y$

- The **cosine function** is defined as

$\cos t = x$

- If  $x \neq 0$ , the **tangent function** is defined as

$\tan t = \frac{y}{x} \quad x \neq 0$

- If  $y \neq 0$ , the **cosecant function** is defined as

$\csc t = \frac{1}{y} \quad y \neq 0$

- If  $x \neq 0$ , the **secant function** is defined as

$\sec t = \frac{1}{x} \quad x \neq 0$

- If  $y \neq 0$ , the **cotangent function** is defined as

$\cot t = \frac{x}{y} \quad y \neq 0$

Figure 55

**DEFINITION** Trigonometric Functions of  $\theta$ 

Let  $\theta$  be any angle in standard position and let  $P = (a, b)$  be any point, except the origin, on the terminal side of  $\theta$ . If  $r = \sqrt{a^2 + b^2}$  denotes the distance of the point  $P$  from the origin, then the **six trigonometric functions of  $\theta$**  are defined as the ratios

$$\begin{array}{lll} \sin \theta = \frac{b}{r} & \cos \theta = \frac{a}{r} & \tan \theta = \frac{b}{a} \\ \csc \theta = \frac{r}{b} & \sec \theta = \frac{r}{a} & \cot \theta = \frac{a}{b} \end{array}$$

provided no denominator equals 0. If a denominator equals 0, that trigonometric function of the angle  $\theta$  is not defined.

Notice in these definitions that, if  $x = 0$ , that is, if the point  $P$  is on the  $y$ -axis, then the tangent function and the secant function are not defined. Also, if  $y = 0$ , that is, if the point  $P$  is on the  $x$ -axis, then the cosecant function and the cotangent function are not defined.

Because the unit circle is used in these definitions, the trigonometric functions are sometimes called **circular functions**.

Suppose  $\theta$  is an angle in standard position, whose terminal side is the ray from the origin through point  $P$ . Since the unit circle has radius  $r = 1$  unit, then, using the formula for arc length, we find that

$$s = r\theta = \theta$$

So, if  $s = |t|$  units, then  $\theta = t$  radians and the trigonometric functions of the angle  $\theta$  are defined as

$$\begin{array}{lll} \sin \theta = \sin t & \cos \theta = \cos t & \tan \theta = \tan t \\ \csc \theta = \csc t & \sec \theta = \sec t & \cot \theta = \cot t \end{array}$$

**Evaluating Trigonometric Functions**

Using properties of right triangles, we can find the values of the six trigonometric functions of  $\frac{\pi}{6} = 30^\circ$ ,  $\frac{\pi}{4} = 45^\circ$ , and  $\frac{\pi}{3} = 60^\circ$  given in Table 6.

**TABLE 6**

| $\theta$ (Radians) | $\theta$ (Degrees) | $\sin \theta$        | $\cos \theta$        | $\tan \theta$        | $\csc \theta$         | $\sec \theta$         | $\cot \theta$        |
|--------------------|--------------------|----------------------|----------------------|----------------------|-----------------------|-----------------------|----------------------|
| $\frac{\pi}{6}$    | $30^\circ$         | $\frac{1}{2}$        | $\frac{\sqrt{3}}{2}$ | $\frac{\sqrt{3}}{3}$ | 2                     | $\frac{2\sqrt{3}}{3}$ | $\sqrt{3}$           |
| $\frac{\pi}{4}$    | $45^\circ$         | $\frac{\sqrt{2}}{2}$ | $\frac{\sqrt{2}}{2}$ | 1                    | $\sqrt{2}$            | $\sqrt{2}$            | 1                    |
| $\frac{\pi}{3}$    | $60^\circ$         | $\frac{\sqrt{3}}{2}$ | $\frac{1}{2}$        | $\sqrt{3}$           | $\frac{2\sqrt{3}}{3}$ | 2                     | $\frac{\sqrt{3}}{3}$ |

The values of the trigonometric functions at the quadrantal angles,  $\left(0 = 0^\circ, \frac{\pi}{2} = 90^\circ, \frac{3\pi}{2} = 270^\circ, \text{ and } 2\pi = 360^\circ\right)$  are given in Table 7.

**TABLE 7**

| Radians          | Degrees     | $\sin \theta$ | $\cos \theta$ | $\tan \theta$ | $\csc \theta$ | $\sec \theta$ | $\cot \theta$ |
|------------------|-------------|---------------|---------------|---------------|---------------|---------------|---------------|
| 0                | $0^\circ$   | 0             | 1             | 0             | Not defined   | 1             | Not defined   |
| $\frac{\pi}{2}$  | $90^\circ$  | 1             | 0             | Not defined   | 1             | Not defined   | 0             |
| $\pi$            | $180^\circ$ | 0             | -1            | 0             | Not defined   | -1            | Not defined   |
| $\frac{3\pi}{2}$ | $270^\circ$ | -1            | 0             | Not defined   | -1            | Not defined   | 0             |
| $2\pi$           | $360^\circ$ | 0             | 1             | 0             | Not defined   | 1             | Not defined   |

Table 8 lists the signs of the six trigonometric functions for each quadrant.

TABLE 8

| Quadrant | $\sin \theta, \csc \theta$ | $\cos \theta, \sec \theta$ | $\tan \theta, \cot \theta$ | Conclusion                                                |
|----------|----------------------------|----------------------------|----------------------------|-----------------------------------------------------------|
| I        | Positive                   | Positive                   | Positive                   | All trigonometric functions are positive.                 |
| II       | Positive                   | Negative                   | Negative                   | Only sine and its reciprocal, cosecant, are positive.     |
| III      | Negative                   | Negative                   | Positive                   | Only tangent and its reciprocal, cotangent, are positive. |
| IV       | Negative                   | Positive                   | Negative                   | Only cosine and its reciprocal, secant, are positive.     |

For nonacute angles  $\theta$  that lie in a quadrant, the acute angle formed by the terminal side of  $\theta$  and the  $x$ -axis, called a **reference angle**, is often used.

Figure 57 illustrates the reference angle for some general angles  $\theta$ . Note that a reference angle is always an acute angle.

Figure 57

Although there are formulas for calculating reference angles, usually it is easier to find the reference angle for a given angle by making a quick sketch of the angle. The advantage of using reference angles is that, except for the correct sign, the values of the trigonometric functions of a general angle  $\theta$  equal the values of the trigonometric functions of its reference angle.

**THEOREM** Reference Angles

If  $\theta$  is an angle that lies in a quadrant and if  $A$  is its reference angle, then

|                            |                            |                            |
|----------------------------|----------------------------|----------------------------|
| $\sin \theta = \pm \sin A$ | $\cos \theta = \pm \cos A$ | $\tan \theta = \pm \tan A$ |
| $\csc \theta = \pm \csc A$ | $\sec \theta = \pm \sec A$ | $\cot \theta = \pm \cot A$ |

where the  $+$  or  $-$  sign depends on the quadrant in which  $\theta$  lies.

**EXAMPLE 1** Using Reference Angles

Find the exact value of: (a)  $\cos \frac{17\pi}{6}$  (b)  $\tan \left(-\frac{\pi}{3}\right)$

**Solution** (a) Refer to Figure 58(a) on page A-31. The angle  $\frac{17\pi}{6}$  is in quadrant II, where the cosine function is negative. The reference angle for  $\frac{17\pi}{6}$  is  $\frac{\pi}{6}$ . Since  $\cos \frac{\pi}{6} = \frac{\sqrt{3}}{2}$ ,

$$\cos \frac{17\pi}{6} = -\cos \frac{\pi}{6} = -\frac{\sqrt{3}}{2}$$

(b) Refer to Figure 58(b). The angle  $-\frac{\pi}{3}$  is in quadrant IV, where the tangent function is negative. The reference angle for  $-\frac{\pi}{3}$  is  $\frac{\pi}{3}$ . Since  $\tan \frac{\pi}{3} = \sqrt{3}$ ,

$$\tan \left(-\frac{\pi}{3}\right) = -\tan \frac{\pi}{3} = -\sqrt{3}$$

Figure 58

The use of symmetry provides information about integer multiples of the angles  $\frac{\pi}{4} = 45^\circ$ ,  $\frac{\pi}{6} = 30^\circ$ , and  $\frac{\pi}{3} = 60^\circ$ . See the unit circles in Figure 59(a)–(c).

Figure 59

### EXAMPLE 2 Finding the Exact Values of a Trigonometry Function

Use reference angles or the symmetry shown in Figure 59 to obtain:

$$\begin{aligned}
 \text{(a)} \quad \sin \frac{7\pi}{4} &= -\frac{\sqrt{2}}{2} & \text{(b)} \quad \cos \frac{7\pi}{6} &= -\frac{\sqrt{3}}{2} & \text{(c)} \quad \tan \frac{2\pi}{3} &= \frac{\sqrt{3}}{\frac{1}{2}} = -\sqrt{3} \\
 \text{(d)} \quad \cos \left(-\frac{3\pi}{4}\right) &= -\frac{\sqrt{2}}{2} & \text{(e)} \quad \sin \left(-\frac{\pi}{6}\right) &= -\frac{1}{2} & \text{(f)} \quad \sin \frac{7\pi}{3} &= \frac{\sqrt{3}}{2}
 \end{aligned}$$

### 3 Determine the Domain and the Range of the Trigonometric Functions

Suppose  $\theta$  is an angle in standard position and  $P = (x, y)$  is the point on the unit circle corresponding to  $\theta$ . Then the six trigonometric functions are

|                             |                             |                             |
|-----------------------------|-----------------------------|-----------------------------|
| $\sin \theta = y$           | $\cos \theta = x$           | $\tan \theta = \frac{y}{x}$ |
| $\csc \theta = \frac{1}{y}$ | $\sec \theta = \frac{1}{x}$ | $\cot \theta = \frac{x}{y}$ |

For  $\sin \theta$  and  $\cos \theta$ , there is no concern about dividing by 0, so  $\theta$  can be any angle. It follows that the domain of the sine and cosine functions is all real numbers.

- The domain of the sine function is all real numbers.
- The domain of the cosine function is all real numbers.

For the tangent and secant functions,  $x$  cannot be 0 since this results in division by 0. On the unit circle, there are two such points,  $(0, 1)$  and  $(0, -1)$ . These two points correspond to  $\frac{\pi}{2} = 90^\circ$  and  $\frac{3\pi}{2} = 270^\circ$  or, more generally, to any angle that is an odd integer multiple of  $\frac{\pi}{2}$ , such as  $\pm \frac{\pi}{2} = \pm 90^\circ$ ,  $\pm \frac{3\pi}{2} = \pm 270^\circ$ ,  $\pm \frac{5\pi}{2} = \pm 450^\circ$ , and

so on. These angles must be excluded from the domain of the tangent function and the domain of the secant function.

- The domain of the tangent function is all real numbers, except odd integer multiples of  $\frac{\pi}{2} = 90^\circ$ .
- The domain of the secant function is all real numbers, except odd integer multiples of  $\frac{\pi}{2} = 90^\circ$ .

For the cotangent and cosecant functions,  $y$  cannot be 0 since this results in division by 0. On the unit circle, there are two such points,  $(1, 0)$  and  $(-1, 0)$ . These two points correspond to  $0 = 0^\circ$  and  $\pi = 180^\circ$  or, more generally, to any angle that is an integer multiple of  $\pi$ , such as  $0 = 0^\circ$ ,  $\pm\pi = \pm 180^\circ$ ,  $\pm 2\pi = \pm 360^\circ$ ,  $\pm 3\pi = \pm 540^\circ$ , and so on. These angles must be excluded from the domain of the cotangent function and the domain of the cosecant function.

- The domain of the cotangent function is all real numbers, except integer multiples of  $\pi = 180^\circ$ .
- The domain of the cosecant function is all real numbers, except integer multiples of  $\pi = 180^\circ$ .

Now we investigate the range of the six trigonometric functions. If  $P = (x, y)$  is the point on the unit circle corresponding to the angle  $\theta$ , then it follows that  $-1 \leq x \leq 1$  and  $-1 \leq y \leq 1$ . Since  $\sin \theta = y$  and  $\cos \theta = x$ , we have

$$-1 \leq \sin \theta \leq 1 \quad \text{and} \quad -1 \leq \cos \theta \leq 1$$

The range of both the sine function and the cosine function is the closed interval  $[-1, 1]$ . Using absolute value notation, we have  $|\sin \theta| \leq 1$  and  $|\cos \theta| \leq 1$ .

If  $\theta$  is not an integer multiple of  $\pi = 180^\circ$ , then  $\csc \theta = \frac{1}{y}$ . Since  $y = \sin \theta$  and  $|y| = |\sin \theta| \leq 1$ , it follows that  $|\csc \theta| = \frac{1}{|\sin \theta|} = \frac{1}{|y|} \geq 1$ . That is,  $\frac{1}{y} \leq -1$  or  $\frac{1}{y} \geq 1$ . Since  $\csc \theta = \frac{1}{y}$ , the range of the cosecant functions consists of all real numbers in the set  $(-\infty, -1] \cup [1, \infty)$ . That is,

$$\csc \theta \leq -1 \quad \text{or} \quad \csc \theta \geq 1$$

If  $\theta$  is not an odd integer multiple of  $\frac{\pi}{2} = 90^\circ$ , then  $\sec \theta = \frac{1}{x}$ . Since  $x = \cos \theta$  and  $|x| = |\cos \theta| \leq 1$ , it follows that  $|\sec \theta| = \frac{1}{|\cos \theta|} = \frac{1}{|x|} \geq 1$ . That is,  $\frac{1}{x} \leq -1$  or  $\frac{1}{x} \geq 1$ . Since  $\sec \theta = \frac{1}{x}$ , the range of the secant function consists of all real numbers in the set  $(-\infty, -1] \cup [1, \infty)$ . That is,

$$\sec \theta \leq -1 \quad \text{or} \quad \sec \theta \geq 1$$

The range of both the tangent function and the cotangent function is all real numbers:

$$-\infty < \tan \theta < \infty \quad \text{and} \quad -\infty < \cot \theta < \infty$$

## 4 Use Basic Trigonometry Identities

### DEFINITION Identity

Two expressions  $a$  and  $b$  involving a variable  $x$  are **identically equal** if

$$a = b$$

for every value of  $x$  for which both expressions are defined. Such an equation is referred to as an **identity**. An equation that is not an identity is called a **conditional equation**.

For example, the equation  $2x + 3 = x$  is a conditional equation because it is true only for  $x = -3$ . However, the equation  $x^2 + 2x = (x + 1)^2 - 1$  is true for any value of  $x$ , so it is an identity.

The basic trigonometry identities listed below are consequences of the definition of the six trigonometric functions.

### Basic Trigonometry Identities

- Quotient Identities**

$$\tan \theta = \frac{\sin \theta}{\cos \theta} \quad \cot \theta = \frac{\cos \theta}{\sin \theta}$$

- Reciprocal Identities**

$$\csc \theta = \frac{1}{\sin \theta} \quad \sec \theta = \frac{1}{\cos \theta} \quad \cot \theta = \frac{1}{\tan \theta}$$

- Pythagorean Identities**

$$\sin^2 \theta + \cos^2 \theta = 1 \quad \tan^2 \theta + 1 = \sec^2 \theta \quad \cot^2 \theta + 1 = \csc^2 \theta$$

- Even/Odd Identities**

$$\cos(-\theta) = \cos \theta \quad \sin(-\theta) = -\sin \theta \quad \tan(-\theta) = -\tan \theta$$

#### EXAMPLE 3 Using Basic Trigonometry Identities

$$(a) \quad \tan \frac{\pi}{9} - \frac{\sin \frac{\pi}{9}}{\cos \frac{\pi}{9}} = \tan \frac{\pi}{9} - \tan \frac{\pi}{9} = 0$$

$\uparrow$   
 $\frac{\sin \theta}{\cos \theta} = \tan \theta$

$$(b) \quad \sin^2 \frac{\pi}{12} + \frac{1}{\sec^2 \frac{\pi}{12}} = \sin^2 \frac{\pi}{12} + \cos^2 \frac{\pi}{12} = 1$$

$\uparrow$                        $\uparrow$   
 $\cos \theta = \frac{1}{\sec \theta}$                        $\sin^2 \theta + \cos^2 \theta = 1$

#### EXAMPLE 4 Using Basic Trigonometry Identities

Given that  $\sin \theta = \frac{1}{3}$  and  $\cos \theta < 0$ , find the exact value of each of the remaining five trigonometric functions.

**Solution** We begin by solving the identity  $\sin^2 \theta + \cos^2 \theta = 1$  for  $\cos \theta$ .

$$\begin{aligned} \sin^2 \theta + \cos^2 \theta &= 1 \\ \cos^2 \theta &= 1 - \sin^2 \theta \\ \cos \theta &= \pm \sqrt{1 - \sin^2 \theta} \end{aligned}$$

Because  $\cos \theta < 0$ , we choose the negative value of the radical, and use the fact that  $\sin \theta = \frac{1}{3}$ .

$$\cos \theta = -\sqrt{1 - \sin^2 \theta} = -\sqrt{1 - \frac{1}{9}} = -\sqrt{\frac{8}{9}} = -\frac{2\sqrt{2}}{3}$$

$\uparrow$   
 $\sin \theta = \frac{1}{3}$

The values of  $\sin \theta$  and  $\cos \theta$  are now known, so we use the quotient and reciprocal identities to obtain

$$\begin{aligned}\tan \theta &= \frac{\sin \theta}{\cos \theta} = \frac{\frac{1}{3}}{\frac{-2\sqrt{2}}{3}} = -\frac{1}{2\sqrt{2}} = -\frac{\sqrt{2}}{4} & \cot \theta &= \frac{1}{\tan \theta} = -2\sqrt{2} \\ \sec \theta &= \frac{1}{\cos \theta} = \frac{1}{\frac{-2\sqrt{2}}{3}} = -\frac{3}{2\sqrt{2}} = -\frac{3\sqrt{2}}{4} & \csc \theta &= \frac{1}{\sin \theta} = \frac{1}{\frac{1}{3}} = 3\end{aligned}$$

## 5 Use Sum and Difference, Double-Angle and Half-Angle, and Sum-to-Product and Product-to-Sum Formulas

### THEOREM Sum and Difference Formulas for Sine, Cosine, and Tangent

- $\sin(A + B) = \sin A \cos B + \cos A \sin B$
- $\sin(A - B) = \sin A \cos B - \cos A \sin B$
- $\cos(A + B) = \cos A \cos B - \sin A \sin B$
- $\cos(A - B) = \cos A \cos B + \sin A \sin B$
- $\tan(A + B) = \frac{\tan A + \tan B}{1 - \tan A \tan B}$
- $\tan(A - B) = \frac{\tan A - \tan B}{1 + \tan A \tan B}$

### EXAMPLE 5 Using Trigonometry Identities

If  $\sin A = \frac{4}{5}$ ,  $\frac{\pi}{2} < A < \pi$ , and  $\sin B = -\frac{2}{\sqrt{5}} = -\frac{2\sqrt{5}}{5}$ ,  $\pi < B < \frac{3\pi}{2}$ , find the exact value of:

- (a)  $\cos A$       (b)  $\cos B$       (c)  $\cos(A + B)$       (d)  $\sin(A + B)$

**Solution** (a) We use a Pythagorean identity to find  $\cos A$ .

$$\cos A = -\sqrt{1 - \sin^2 A} = -\sqrt{1 - \left(\frac{4}{5}\right)^2} = -\sqrt{1 - \frac{16}{25}} = -\sqrt{\frac{9}{25}} = -\frac{3}{5}$$

$\uparrow$   
 A is in quadrant II  
 $\cos A < 0$

(b) We also find  $\cos B$  using a Pythagorean identity.

$$\cos B = -\sqrt{1 - \sin^2 B} = -\sqrt{1 - \frac{4}{5}} = -\sqrt{\frac{1}{5}} = -\frac{\sqrt{5}}{5}$$

(c) We use the results from (a) and (b) and a sum formula to find  $\cos(A + B)$ .

$$\begin{aligned}\cos(A + B) &= \cos A \cos B - \sin A \sin B \\ &= \left(-\frac{3}{5}\right) \left(-\frac{\sqrt{5}}{5}\right) - \left(\frac{4}{5}\right) \left(-\frac{2\sqrt{5}}{5}\right) = \frac{11\sqrt{5}}{25}\end{aligned}$$

(d) We use a sum formula to find  $\sin(A + B)$ .

$$\sin(A + B) = \sin A \cos B + \cos A \sin B = \left(\frac{4}{5}\right) \left(-\frac{\sqrt{5}}{5}\right) + \left(-\frac{3}{5}\right) \left(-\frac{2\sqrt{5}}{5}\right) = \frac{2\sqrt{5}}{25}$$

**THEOREM Double-Angle Formulas**

$$\begin{aligned}
 &\bullet \sin(2\theta) = 2 \sin \theta \cos \theta & \bullet \cos(2\theta) = \cos^2 \theta - \sin^2 \theta & \bullet \tan(2\theta) = \frac{2 \tan \theta}{1 - \tan^2 \theta} \\
 &\bullet \cos(2\theta) = 1 - 2 \sin^2 \theta & \bullet \cos(2\theta) = 2 \cos^2 \theta - 1
 \end{aligned}$$

The double-angle formulas in the first row are derived directly from the sum formulas by letting  $\theta = A = B$ . A Pythagorean identity is used to obtain those in the second row.

By rearranging the double-angle formulas, other identities can be obtained that are used in calculus.

$$\bullet \sin^2 \theta = \frac{1 - \cos(2\theta)}{2} \quad \bullet \cos^2 \theta = \frac{1 + \cos(2\theta)}{2}$$

If, in the double-angle formulas, we replace  $\theta$  with  $\frac{1}{2}\theta$ , we obtain these identities.

$$\bullet \sin^2 \frac{\theta}{2} = \frac{1 - \cos \theta}{2} \quad \bullet \cos^2 \frac{\theta}{2} = \frac{1 + \cos \theta}{2} \quad \bullet \tan^2 \frac{\theta}{2} = \frac{1 - \cos \theta}{1 + \cos \theta}$$

Taking the square root produces the **half-angle formulas**.

$$\bullet \sin \frac{\theta}{2} = \pm \sqrt{\frac{1 - \cos \theta}{2}} \quad \bullet \cos \frac{\theta}{2} = \pm \sqrt{\frac{1 + \cos \theta}{2}} \quad \bullet \tan \frac{\theta}{2} = \pm \sqrt{\frac{1 - \cos \theta}{1 + \cos \theta}}$$

where the  $+$  or  $-$  sign is determined by the quadrant of the angle  $\frac{\theta}{2}$ .

The **product-to-sum and sum-to-product identities** are also used in calculus. They are a result of combining the sum and difference formulas.

$$\bullet \sin A \cos B = \frac{1}{2}[\sin(A + B) + \sin(A - B)]$$

$$\bullet \cos A \cos B = \frac{1}{2}[\cos(A + B) + \cos(A - B)]$$

$$\bullet \sin B \sin A = \frac{1}{2}[\cos(A - B) - \cos(A + B)]$$

## 6 Solve Triangles Using the Law of Sines and the Law of Cosines

If no angle of a triangle is a right angle, the triangle is called **oblique**. An oblique triangle either has three acute angles or two acute angles and one obtuse angle (an angle between  $\frac{\pi}{2}$  and  $\pi$ ). See Figure 60.

**Figure 60** Two oblique triangles.

Figure 61

**NOTE** To solve an oblique triangle, you must know the length of at least one side. Knowing only angles results in a family of similar triangles.

In the discussion that follows, we label an oblique triangle so that side  $a$  is opposite angle  $A$ , side  $b$  is opposite angle  $B$ , and side  $c$  is opposite angle  $C$ , as shown in Figure 61.

To **solve an oblique triangle** means to find the lengths of its sides and the measures of its angles. To do this, we need to know the length of one side along with (i) two angles; (ii) one angle and one other side; or (iii) the other two sides. There are four possibilities to consider:

*Case 1:* One side and two angles are known (ASA or SAA).

*Case 2:* Two sides and the angle opposite one of them are known (SSA).

*Case 3:* Two sides and the included angle are known (SAS).

*Case 4:* Three sides are known (SSS).

Figure 62 illustrates the four cases.

Figure 62

The *Law of Sines* is used to solve triangles for which Case 1 or 2 holds.

### THEOREM Law of Sines

For a triangle with sides  $a, b, c$  and opposite angles  $A, B, C$ , respectively,

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c} \quad (1)$$

The Law of Sines actually consists of three equalities:

$$\frac{\sin A}{a} = \frac{\sin B}{b} \quad \frac{\sin A}{a} = \frac{\sin C}{c} \quad \frac{\sin B}{b} = \frac{\sin C}{c}$$

Formula (1) is a compact way to write these three equations.

For Case 1 (ASA or SAA), two angles are given. The third angle can be found using the fact that the sum of the angles in a triangle measures  $180^\circ$ . Then use the Law of Sines (twice) to find the two missing sides.

Case 2 (SSA), which applies to triangles for which two sides and the angle opposite one of them are known, is referred to as the **ambiguous case**, because the information can result in one triangle, two triangles, or no triangle at all.

### EXAMPLE 6 Using the Law of the Sines to Solve a Triangle

Solve the triangle with side  $a = 6$ , side  $b = 8$ , and angle  $A = 35^\circ$ , which is opposite side  $a$ .

**Solution** Because two sides and an opposite angle are known (SSA), we use the Law of Sines to find angle  $B$ .

$$\frac{\sin A}{a} = \frac{\sin B}{b}$$

Since  $a = 6$ ,  $b = 8$ , and  $A = 35^\circ$ , we have

$$\frac{\sin 35^\circ}{6} = \frac{\sin B}{8}$$

$$\sin B = \frac{8 \sin 35^\circ}{6} \approx 0.765$$

$$B_1 \approx 49.9^\circ \quad \text{or} \quad B_2 \approx 180^\circ - 49.9^\circ = 130.1^\circ$$

For both choices of  $B$ , we have  $A + B < 180^\circ$ . So, there are two triangles, one containing the angle  $B_1 \approx 49.9^\circ$  and the other containing the angle  $B_2 \approx 130.1^\circ$ . The third angle  $C$  is either

$$C_1 = 180^\circ - A - B_1 \approx 95.1^\circ \quad \text{or} \quad C_2 = 180^\circ - A - B_2 \approx 14.9^\circ$$

$\begin{array}{c} \uparrow \\ A = 35^\circ \\ B_1 = 49.9^\circ \end{array} \quad \begin{array}{c} \uparrow \\ A = 35^\circ \\ B_2 = 130.1^\circ \end{array}$

**Figure 63**

The third side  $c$  satisfies the Law of Sines, so

$$\begin{aligned} \frac{\sin A}{a} &= \frac{\sin C_1}{c_1} & \frac{\sin A}{a} &= \frac{\sin C_2}{c_2} \\ \frac{\sin 35^\circ}{6} &= \frac{\sin 95.1^\circ}{c_1} & \frac{\sin 35^\circ}{6} &= \frac{\sin 14.9^\circ}{c_2} \\ c_1 &= \frac{6 \sin 95.1^\circ}{\sin 35^\circ} \approx 10.42 & c_2 &= \frac{6 \sin 14.9^\circ}{\sin 35^\circ} \approx 2.69 \end{aligned}$$

The two solved triangles are illustrated in Figure 63. ■

Cases 3 and 4 are solved using the *Law of Cosines*.

#### **THEOREM** Law of Cosines

For a triangle with sides  $a, b, c$  and opposite angles  $A, B, C$ , respectively,

$$\begin{aligned} &\bullet c^2 = a^2 + b^2 - 2ab \cos C \\ &\bullet b^2 = a^2 + c^2 - 2ac \cos B \\ &\bullet a^2 = b^2 + c^2 - 2bc \cos A \end{aligned}$$

**NOTE** If the triangle is a right triangle, the Law of Cosines reduces to the Pythagorean Theorem.

**Figure 64**

#### **EXAMPLE 7** Using the Law of Cosines to Solve a Triangle

Solve the triangle:  $a = 2, b = 3, C = 60^\circ$  shown in Figure 64.

**Solution** Because two sides  $a$  and  $b$  and the included angle  $C = 60^\circ$  (SAS) are known, we use the Law of Cosines to find the third side  $c$ .

$$\begin{aligned} c^2 &= a^2 + b^2 - 2ab \cos C = 2^2 + 3^2 - 2 \cdot 2 \cdot 3 \cdot \cos 60^\circ = 13 - \left(12 \cdot \frac{1}{2}\right) = 7 \\ c &= \sqrt{7} \end{aligned}$$

Side  $c$  is of length  $\sqrt{7}$ . To find either the angle  $A$  or  $B$ , use the Law of Cosines. For  $A$ ,

$$\begin{aligned} a^2 &= b^2 + c^2 - 2bc \cos A \\ 2bc \cos A &= b^2 + c^2 - a^2 \\ \cos A &= \frac{b^2 + c^2 - a^2}{2bc} = \frac{9 + 7 - 4}{2 \cdot 3 \cdot \sqrt{7}} = \frac{12}{6\sqrt{7}} = \frac{2\sqrt{7}}{7} \\ A &\approx 40.9^\circ \end{aligned}$$

Then to find the third angle, use the fact that the sum of the angles of a triangle, when measured in degrees, equals  $180^\circ$ . That is,

$$\begin{aligned} 40.9^\circ + B + 60^\circ &= 180^\circ \\ B &= 79.1^\circ \end{aligned}$$

■

## A.5 Sequences; Summation Notation; the Binomial Theorem

**OBJECTIVES** When you finish this section you should be able to:

- 1 Write the first several terms of a sequence (p. A-38)
- 2 Write the terms of a recursively defined sequence (p. A-39)
- 3 Use summation notation (p. A-40)
- 4 Find the sum of the first  $n$  terms of a sequence (p. A-41)
- 5 Use the Binomial Theorem (p. A-42)

### 1 Write the First Several Terms of a Sequence

#### DEFINITION Sequence

A **sequence** is a rule that assigns a real number to each positive integer.

A sequence is often represented by listing its values in order. For example, the sequence whose rule is to assign to each positive integer its reciprocal may be represented as

$$s_1 = 1, \quad s_2 = \frac{1}{2}, \quad s_3 = \frac{1}{3}, \quad s_4 = \frac{1}{4}, \dots, \quad s_n = \frac{1}{n}, \dots$$

or merely as the list

$$1, \quad \frac{1}{2}, \quad \frac{1}{3}, \quad \frac{1}{4}, \quad \dots, \quad \frac{1}{n}, \quad \dots$$

The list never ends, as the dots (**ellipsis**) indicate. The real numbers in this ordered list are called the **terms** of the sequence.

Notice that when we use subscripted letters to represent the terms of a sequence,  $s_1$  is the 1st term,  $s_2$  is the 2nd term,  $\dots$ ,  $s_n$  is the  $n$ th term, and so on. If we have a rule for the  $n$ th term, as in the sequence above, it is used to identify the sequence. We

represent such a sequence by enclosing the  $n$ th term in braces. The notation  $\{s_n\} = \left\{\frac{1}{n}\right\}$

or  $\{s_n\}_{n=1}^{\infty} = \left\{\frac{1}{n}\right\}_{n=1}^{\infty}$  both represent the sequence  $1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \dots$

For simplicity, we use the notation  $\{s_n\}$  to represent a sequence that has a rule for the  $n$ th term. For example, the sequence whose  $n$ th term is  $b_n = \left(\frac{1}{2}\right)^n$  can be represented either as

$$b_1 = \frac{1}{2}, \quad b_2 = \frac{1}{4}, \quad b_3 = \frac{1}{8}, \dots, \quad b_n = \frac{1}{2^n}, \dots,$$

or as

$$\{b_n\} = \left\{\left(\frac{1}{2}\right)^n\right\}$$

#### EXAMPLE 1 Writing the Terms of a Sequence

Write the first six terms of the sequence:  $\{b_n\} = \left\{(-1)^{n-1} \frac{2}{n}\right\}$

**Solution**  $b_1 = (-1)^0 \frac{2}{1} = 2$        $b_2 = (-1)^1 \frac{2}{2} = -1$        $b_3 = (-1)^2 \frac{2}{3} = \frac{2}{3}$   
 $b_4 = -\frac{1}{2}$        $b_5 = \frac{2}{5}$        $b_6 = -\frac{1}{3}$

The first six terms of the sequence are  $2, -1, \frac{2}{3}, -\frac{1}{2}, \frac{2}{5}, -\frac{1}{3}$ . ■

**EXAMPLE 2** Determining a Sequence from a Pattern

The pattern on the left suggests the  $n$ th term of the sequence on the right.

| Pattern                                                          | $n$ th term                                   | Sequence                                                           |
|------------------------------------------------------------------|-----------------------------------------------|--------------------------------------------------------------------|
| $e, \frac{e^2}{2}, \frac{e^3}{3}, \frac{e^4}{4}, \dots$          | $a_n = \frac{e^n}{n}$                         | $\{a_n\} = \left\{ \frac{e^n}{n} \right\}$                         |
| $1, \frac{1}{3}, \frac{1}{9}, \frac{1}{27}, \dots$               | $b_n = \frac{1}{3^{n-1}}$                     | $\{b_n\} = \left\{ \frac{1}{3^{n-1}} \right\}$                     |
| $1, 3, 5, 7, \dots$                                              | $c_n = 2n - 1$                                | $\{c_n\} = \{2n - 1\}$                                             |
| $1, 4, 9, 16, 25, \dots$                                         | $d_n = n^2$                                   | $\{d_n\} = \{n^2\}$                                                |
| $1, -\frac{1}{2}, \frac{1}{3}, -\frac{1}{4}, \frac{1}{5}, \dots$ | $e_n = (-1)^{n+1} \left( \frac{1}{n} \right)$ | $\{e_n\} = \left\{ (-1)^{n+1} \left( \frac{1}{n} \right) \right\}$ |

**2 Write the Terms of a Recursively Defined Sequence**

A second way of defining a sequence is to assign a value to the first (or the first few) term(s) and specify the  $n$ th term by a formula or an equation that involves one or more of the terms preceding it. Such a sequence is defined **recursively**, and the rule or formula is called a **recursive formula**.

**EXAMPLE 3** Writing the Terms of a Recursively Defined Sequence

Write the first five terms of the recursively defined sequence.

$$s_1 = 1 \quad s_n = 4s_{n-1} \quad n \geq 2$$

**Solution** The first term is given as  $s_1 = 1$ . To get the second term, we use  $n = 2$  in the formula to obtain  $s_2 = 4s_1 = 4 \cdot 1 = 4$ . To obtain the third term, we use  $n = 3$  in the formula, getting  $s_3 = 4s_2 = 4 \cdot 4 = 16$ . Each new term requires that we know the value of the preceding term. The first five terms are

$$\begin{aligned} s_1 &= 1 \\ s_2 &= 4s_{2-1} = 4s_1 = 4 \cdot 1 = 4 \\ s_3 &= 4s_{3-1} = 4s_2 = 4 \cdot 4 = 16 \\ s_4 &= 4s_{4-1} = 4s_3 = 4 \cdot 16 = 64 \\ s_5 &= 4s_{5-1} = 4s_4 = 4 \cdot 64 = 256 \end{aligned}$$

**EXAMPLE 4** Writing the Terms of a Recursively Defined Sequence

Write the first five terms of the recursively defined sequence.

$$u_1 = 1 \quad u_2 = 1 \quad u_n = u_{n-2} + u_{n-1} \quad n \geq 3$$

**Solution** We are given the first two terms. To obtain the third term requires that we know each of the previous two terms.

$$\begin{aligned} u_1 &= 1 \\ u_2 &= 1 \\ u_3 &= u_1 + u_2 = 1 + 1 = 2 \\ u_4 &= u_2 + u_3 = 1 + 2 = 3 \\ u_5 &= u_3 + u_4 = 2 + 3 = 5 \end{aligned}$$

The sequence defined in Example 4 is called a **Fibonacci sequence**; its terms are called **Fibonacci numbers**. These numbers appear in a wide variety of applications.

### 3 Use Summation Notation

**NOTE** Summation notation is called **sigma notation** in some books.

It is often important to be able to find the sum of the first  $n$  terms of a sequence  $\{a_n\}$ , namely,

$$a_1 + a_2 + a_3 + \cdots + a_n$$

Rather than write down all these terms, we introduce **summation notation**. Using summation notation, the sum is written

$$a_1 + a_2 + a_3 + \cdots + a_n = \sum_{k=1}^n a_k$$

The symbol  $\sum$  (the uppercase Greek letter sigma, which is an  $S$  in our alphabet) is simply an instruction to sum, or add up, the terms. The integer  $k$  is called the **index of summation**; it tells us where to start the sum ( $k = 1$ ) and where to end it ( $k = n$ ). The expression  $\sum_{k=1}^n a_k$  is read, “The sum of the terms  $a_k$  from  $k = 1$  to  $k = n$ .”

#### EXAMPLE 5 Expanding Summation Notation

Write out each sum:

$$(a) \sum_{k=1}^n \frac{1}{k} \qquad (b) \sum_{k=1}^n k!$$

**NOTE** If  $n \geq 0$  is an integer, the **factorial symbol**  $n!$  means  $0! = 1$ ,  $1! = 1$ , and  $n! = 1 \cdot 2 \cdot 3 \cdot \cdots \cdot (n-1) \cdot n$ , where  $n > 1$ .

**Solution** (a)  $\sum_{k=1}^n \frac{1}{k} = 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}$  (b)  $\sum_{k=1}^n k! = 1! + 2! + \cdots + n!$  ■

#### EXAMPLE 6 Writing a Sum in Summation Notation

Express each sum using summation notation:

$$(a) 1^2 + 2^2 + 3^2 + \cdots + 9^2 \qquad (b) 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^{n-1}}$$

**Solution** (a) The sum  $1^2 + 2^2 + 3^2 + \cdots + 9^2$  has 9 terms, each of the form  $k^2$ ; it starts at  $k = 1$  and ends at  $k = 9$ :

$$1^2 + 2^2 + 3^2 + \cdots + 9^2 = \sum_{k=1}^9 k^2$$

(b) The sum

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^{n-1}}$$

has  $n$  terms, each of the form  $\frac{1}{2^{k-1}}$ . It starts at  $k = 1$  and ends at  $k = n$ .

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^{n-1}} = \sum_{k=1}^n \frac{1}{2^{k-1}} \quad \blacksquare$$

The index of summation does not need to begin at 1 or end at  $n$ . For example, the sum in Example 6(b) could be expressed as

$$\sum_{k=0}^{n-1} \frac{1}{2^k} = 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots + \frac{1}{2^{n-1}}$$

Letters other than  $k$  can be used as the index. For example,

$$\sum_{j=1}^n j! \qquad \text{and} \qquad \sum_{i=1}^n i!$$

each represent the same sum as Example 5(b).

## 4 Find the Sum of the First $n$ Terms of a Sequence

When working with summation notation, the following properties are useful for finding the sum of the first  $n$  terms of a sequence.

### THEOREM Properties Involving Summation Notation

If  $\{a_n\}$  and  $\{b_n\}$  are two sequences and  $c$  is a real number, then:

$$\bullet \sum_{k=1}^n (ca_k) = c \sum_{k=1}^n a_k \quad (1)$$

$$\bullet \sum_{k=1}^n (a_k + b_k) = \sum_{k=1}^n a_k + \sum_{k=1}^n b_k \quad (2)$$

$$\bullet \sum_{k=1}^n (a_k - b_k) = \sum_{k=1}^n a_k - \sum_{k=1}^n b_k \quad (3)$$

$$\bullet \sum_{k=j+1}^n a_k = \sum_{k=1}^n a_k - \sum_{k=1}^j a_k, \quad \text{where } 0 < j < n \quad (4)$$

The proof of property (1) follows from the distributive property of real numbers. The proofs of properties (2) and (3) are based on the commutative and associative properties of real numbers. Property (4) states that the sum from  $j + 1$  to  $n$  equals the sum from 1 to  $n$  minus the sum from 1 to  $j$ . It can be helpful to use this property when the index of summation begins at a number larger than 1.

### THEOREM Formulas for Sums of the First $n$ Terms of a Sequence

$$\bullet \sum_{k=1}^n 1 = \underbrace{1 + 1 + 1 + \cdots + 1}_{n \text{ terms}} = n \quad (5)$$

$$\bullet \sum_{k=1}^n k = 1 + 2 + 3 + \cdots + n = \frac{n(n+1)}{2} \quad (6)$$

$$\bullet \sum_{k=1}^n k^2 = 1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6} \quad (7)$$

$$\bullet \sum_{k=1}^n k^3 = 1^3 + 2^3 + 3^3 + \cdots + n^3 = \left[ \frac{n(n+1)}{2} \right]^2 \quad (8)$$

Notice the difference between formulas (5) and (6). In formula (5), the constant 1 is being summed from 1 to  $n$ , while in (6) the index of summation  $k$  is being summed from 1 to  $n$ .

### EXAMPLE 7 Finding Sums

Find each sum:

$$\text{(a)} \sum_{k=1}^{100} \frac{1}{2} \quad \text{(b)} \sum_{k=1}^5 (3k) \quad \text{(c)} \sum_{k=1}^{10} (k^3 + 1) \quad \text{(d)} \sum_{k=6}^{20} (4k^2)$$

**Solution** (a)  $\sum_{k=1}^{100} \frac{1}{2} = \frac{1}{2} \sum_{k=1}^{100} 1 = \frac{1}{2} \cdot 100 = 50$

$\uparrow$   
(1)
 $\uparrow$   
(5)

$$(b) \sum_{k=1}^5 (3k) = 3 \sum_{k=1}^5 k = 3 \left( \frac{5(5+1)}{2} \right) = 3(15) = 45$$

$\uparrow$   
(1)
 $\uparrow$   
(6)

$$(c) \sum_{k=1}^{10} (k^3 + 1) = \sum_{k=1}^{10} k^3 + \sum_{k=1}^{10} 1 = \left[ \frac{10(10+1)}{2} \right]^2 + 10 = 3025 + 10 = 3035$$

$\uparrow$   
(2)
 $\uparrow$   
(8) and (5)

(d) Notice that the index of summation starts at 6.

$$\begin{aligned} \sum_{k=6}^{20} (4k^2) &= 4 \sum_{k=6}^{20} k^2 = 4 \left[ \sum_{k=1}^{20} k^2 - \sum_{k=1}^5 k^2 \right] \\ &= 4 \left[ \frac{20(21)(41)}{6} - \frac{5(6)(11)}{6} \right] = 4[2870 - 55] = 11,260 \end{aligned}$$

$\uparrow$   
(1)
 $\uparrow$   
(4)
 $\uparrow$   
(7)

## 5 Use the Binomial Theorem

You already know formulas for expanding  $(x + a)^n$  for  $n = 2$  and  $n = 3$ . The *Binomial Theorem* is a formula for the expansion of  $(x + a)^n$  for any positive integer  $n$ . If  $n = 1, 2, 3$ , and  $4$ , the expansion of  $(x + a)^n$  is straightforward.

- $(x + a)^1 = x + a$  Two terms, beginning with  $x^1$  and ending with  $a^1$
- $(x + a)^2 = x^2 + 2ax + a^2$  Three terms, beginning with  $x^2$  and ending with  $a^2$
- $(x + a)^3 = x^3 + 3ax^2 + 3a^2x + a^3$  Four terms, beginning with  $x^3$  and ending with  $a^3$
- $(x + a)^4 = x^4 + 4ax^3 + 6a^2x^2 + 4a^3x + a^4$  Five terms, beginning with  $x^4$  and ending with  $a^4$

Notice that each expansion of  $(x + a)^n$  begins with  $x^n$ , ends with  $a^n$ , and has  $n + 1$  terms. As you look at the terms from left to right, the powers of  $x$  are decreasing by one, while the powers of  $a$  are increasing by one. As a result, we might conjecture that the expansion of  $(x + a)^n$  would look like this:

$$(x + a)^n = x^n + \text{---} ax^{n-1} + \text{---} a^2x^{n-2} + \cdots + \text{---} a^{n-1}x + a^n$$

where the blanks are numbers to be found. This, in fact, is the case.

Before filling in the blanks, we introduce the symbol  $\binom{n}{j}$ .

### DEFINITION

If  $j$  and  $n$  are integers with  $0 \leq j \leq n$ , the symbol  $\binom{n}{j}$  is defined as

$$\binom{n}{j} = \frac{n!}{j!(n-j)!}$$

### EXAMPLE 8 Evaluating $\binom{n}{j}$

$$(a) \quad \binom{3}{1} = \frac{3!}{1!(3-1)!} = \frac{3!}{1!2!} = \frac{3 \cdot 2 \cdot 1}{1(2 \cdot 1)} = \frac{6}{2} = 3$$

$$(b) \quad \binom{4}{2} = \frac{4!}{2!(4-2)!} = \frac{4!}{2!2!} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{(2 \cdot 1)(2 \cdot 1)} = \frac{24}{4} = 6$$

$$(c) \quad \binom{8}{7} = \frac{8!}{7!(8-7)!} = \frac{8!}{7!1!} = \frac{8 \cdot 7!}{7! \cdot 1!} = \frac{8}{1} = 8$$

$8! = 8 \cdot 7!$

$$(d) \quad \binom{n}{0} = \frac{n!}{0!(n-0)!} = \frac{n!}{0!n!} = \frac{n!}{1 \cdot n!} = 1$$

$$(e) \quad \binom{n}{n} = \frac{n!}{n!(n-n)!} = \frac{n!}{n!0!} = \frac{n!}{n! \cdot 1} = 1$$

**RECALL**  $0! = 1$

### THEOREM Binomial Theorem

Let  $x$  and  $a$  be real numbers. For any positive integer  $n$ ,

$$\begin{aligned} (x+a)^n &= \binom{n}{0}x^n + \binom{n}{1}ax^{n-1} + \binom{n}{2}a^2x^{n-2} + \cdots + \binom{n}{j}a^jx^{n-j} \\ &\quad + \cdots + \binom{n}{n}a^n = \sum_{j=0}^n \binom{n}{j}a^jx^{n-j} \end{aligned}$$

Because of its appearance in the Binomial Theorem, the symbol  $\binom{n}{j}$  is called a **binomial coefficient**.

### EXAMPLE 9 Expanding a Binomial

Use the Binomial Theorem to expand  $(x+2)^5$ .

**Solution** We use the Binomial Theorem with  $a = 2$  and  $n = 5$ . Then

$$\begin{aligned} (x+2)^5 &= \binom{5}{0}x^5 + \binom{5}{1}2x^4 + \binom{5}{2}2^2x^3 + \binom{5}{3}2^3x^2 + \binom{5}{4}2^4x + \binom{5}{5}2^5 \\ &= 1 \cdot x^5 + 5 \cdot 2x^4 + 10 \cdot 4x^3 + 10 \cdot 8x^2 + 5 \cdot 16x + 1 \cdot 32 \\ &= x^5 + 10x^4 + 40x^3 + 80x^2 + 80x + 32 \end{aligned}$$

## B.1 Limit Theorems and Proofs

### Uniqueness of a Limit

The limit of a function  $f$ , if it exists, is unique; that is, a function can only have one limit.

#### THEOREM A Limit Is Unique

If a function  $f$  is defined on an open interval containing the number  $c$ , except possibly at  $c$  itself, and if  $\lim_{x \rightarrow c} f(x) = L_1$  and  $\lim_{x \rightarrow c} f(x) = L_2$ , then  $L_1 = L_2$ .

**RECALL** An indirect proof (a proof by contradiction) begins by assuming the conclusion is false. Then we show that this assumption leads to a contradiction.

**RECALL** The Triangle Inequality: If  $x$  and  $y$  are real numbers, then  $|x + y| \leq |x| + |y|$ . See Appendix A.1, p. A-7.

**Proof** Assume that  $L_1 \neq L_2$ . We will show that this assumption leads to a contradiction. By the definition of the limit of a function  $f$ ,  $\lim_{x \rightarrow c} f(x) = L_1$  if, for any given number  $\varepsilon > 0$ , there is a number  $\delta_1 > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta_1 \quad \text{then } |f(x) - L_1| < \varepsilon \quad (1)$$

Similarly,  $\lim_{x \rightarrow c} f(x) = L_2$  if, for any given number  $\varepsilon > 0$ , there is a number  $\delta_2 > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta_2 \quad \text{then } |f(x) - L_2| < \varepsilon \quad (2)$$

Now

$$L_1 - L_2 = L_1 - f(x) + f(x) - L_2$$

so, by applying the Triangle Inequality, we get

$$|L_1 - L_2| = |L_1 - f(x) + f(x) - L_2| \leq |L_1 - f(x)| + |f(x) - L_2| \quad (3)$$

For any given number  $\varepsilon > 0$ , let  $\delta$  be the smaller of  $\delta_1$  and  $\delta_2$ . Then from (1)–(3), we can conclude that whenever  $0 < |x - c| < \delta \leq \delta_1$  and  $0 < |x - c| < \delta \leq \delta_2$ , we have

$$|L_1 - L_2| < \varepsilon + \varepsilon = 2\varepsilon \quad (4)$$

In particular, (4) is true for  $\varepsilon = \frac{1}{2}|L_1 - L_2| > 0$ . (Remember  $L_1 \neq L_2$ .) Then from (4),

$$|L_1 - L_2| < 2\varepsilon = |L_1 - L_2|$$

which is a contradiction. Therefore,  $L_1 = L_2$ , and the limit, if it exists, is unique. ■

### Algebra of Limits

#### THEOREM Limit of a Sum

If  $f$  and  $g$  are functions for which  $\lim_{x \rightarrow c} f(x)$  and  $\lim_{x \rightarrow c} g(x)$  both exist, then  $\lim_{x \rightarrow c} [f(x) + g(x)]$  exists and

$$\lim_{x \rightarrow c} [f(x) + g(x)] = \lim_{x \rightarrow c} f(x) + \lim_{x \rightarrow c} g(x)$$

**Proof** Suppose  $\lim_{x \rightarrow c} f(x) = L$  and  $\lim_{x \rightarrow c} g(x) = M$ . We need to show that for any number  $\varepsilon > 0$ , there is a number  $\delta > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta \quad \text{then } |[f(x) + g(x)] - [L + M]| < \varepsilon$$

Since  $\lim_{x \rightarrow c} f(x) = L$ , by the definition of a limit, given the number  $\frac{\varepsilon}{2} > 0$ , there is a number  $\delta_1 > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta_1 \quad \text{then } |f(x) - L| < \frac{\varepsilon}{2}$$

Since  $\lim_{x \rightarrow c} g(x) = M$ , for this same number  $\frac{\varepsilon}{2}$ , there is a number  $\delta_2 > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta_2 \quad \text{then } |g(x) - M| < \frac{\varepsilon}{2}$$

Let  $\delta$  be the smaller of  $\delta_1$  and  $\delta_2$ . Then  $\delta \leq \delta_1$  and  $\delta \leq \delta_2$ . Using this  $\delta$ ,

$$\text{whenever } 0 < |x - c| < \delta \quad \text{then } |f(x) - L| < \frac{\varepsilon}{2}$$

$$\text{whenever } 0 < |x - c| < \delta \quad \text{then } |g(x) - M| < \frac{\varepsilon}{2}$$

That is, whenever  $0 < |x - c| < \delta$ ,

$$\begin{aligned} |[f(x) + g(x)] - [L + M]| &= |[f(x) - L] + [g(x) - M]| \\ &\leq |f(x) - L| + |g(x) - M| \quad \text{Use the Triangle Inequality.} \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon \end{aligned}$$

So,  $\lim_{x \rightarrow c} [f(x) + g(x)] = L + M$ . ■

### THEOREM Limit of a Product

If  $f$  and  $g$  are functions for which  $\lim_{x \rightarrow c} f(x)$  and  $\lim_{x \rightarrow c} g(x)$  both exist, then  $\lim_{x \rightarrow c} [f(x) \cdot g(x)]$  exists and

$$\lim_{x \rightarrow c} [f(x) \cdot g(x)] = \lim_{x \rightarrow c} f(x) \cdot \lim_{x \rightarrow c} g(x)$$

**Proof** Suppose  $\lim_{x \rightarrow c} f(x) = L$  and  $\lim_{x \rightarrow c} g(x) = M$ . We need to show that for any number  $\varepsilon > 0$ , there is a number  $\delta > 0$ , so that

$$\text{whenever } 0 < |x - c| < \delta \quad \text{then } |f(x) \cdot g(x) - L \cdot M| < \varepsilon$$

Subtracting and adding  $f(x) \cdot M$  in the expression  $f(x) \cdot g(x) - L \cdot M$  result in terms involving  $g(x) - M$  and  $f(x) - L$ :

$$\begin{aligned} |f(x) \cdot g(x) - L \cdot M| &= |f(x) \cdot g(x) - f(x) \cdot M + f(x) \cdot M - L \cdot M| \\ &= |f(x) \cdot [g(x) - M] + [f(x) - L] \cdot M| \\ &\leq |f(x)| \cdot |g(x) - M| + |f(x) - L| \cdot |M| \end{aligned} \tag{5}$$

↑  
Use the Triangle Inequality.

Since  $\lim_{x \rightarrow c} f(x) = L$  and  $\lim_{x \rightarrow c} g(x) = M$ , then there is a number  $\delta_1 > 0$ , so that whenever  $0 < |x - c| < \delta_1$ , then

$$|f(x) - L| < 1, \quad \text{from which} \quad |f(x)| < 1 + |L| \tag{6}$$

Also given a number  $\varepsilon > 0$ , there is a number  $\delta_2$ , so that whenever  $0 < |x - c| < \delta_2$ , then

$$|g(x) - M| < \frac{\varepsilon}{1 + |L| + |M|} \tag{7}$$

Given a number  $\varepsilon > 0$ , there is a number  $\delta_3$ , so that whenever  $0 < |x - c| < \delta_3$ , then

$$|f(x) - L| < \frac{\varepsilon}{1 + |L| + |M|} \quad (8)$$

Choose  $\delta$  to be the minimum of  $\delta_1$ ,  $\delta_2$ , and  $\delta_3$  and combine (5)–(8). Then for any given  $\varepsilon > 0$ , there is a  $\delta > 0$ , so that whenever  $0 < |x - c| < \delta$ , we have

$$\begin{aligned} |f(x) \cdot g(x) - L \cdot M| &< [1 + |L|] \frac{\varepsilon}{1 + |L| + |M|} + |M| \frac{\varepsilon}{1 + |L| + |M|} \\ &< [1 + |L| + |M|] \frac{\varepsilon}{1 + |L| + |M|} = \varepsilon \end{aligned}$$

That is,  $\lim_{x \rightarrow c} [f(x) \cdot g(x)] = \lim_{x \rightarrow c} f(x) \cdot \lim_{x \rightarrow c} g(x)$ . ■

### THEOREM Squeeze Theorem

If the functions  $f$ ,  $g$ , and  $h$  have the property that for all  $x$  in an open interval containing  $c$ , except possibly at  $c$  itself,

$$f(x) \leq g(x) \leq h(x)$$

and if

$$\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$$

then

$$\lim_{x \rightarrow c} g(x) = L$$

**Proof** Since  $\lim_{x \rightarrow c} f(x) = \lim_{x \rightarrow c} h(x) = L$ , then for any number  $\varepsilon > 0$ , there are positive numbers  $\delta_1$  and  $\delta_2$ , so that

$$\text{whenever } 0 < |x - c| < \delta_1 \quad \text{then } |f(x) - L| < \varepsilon$$

$$\text{whenever } 0 < |x - c| < \delta_2 \quad \text{then } |h(x) - L| < \varepsilon$$

Choose  $\delta$  to be the smaller of the numbers  $\delta_1$  and  $\delta_2$ . Then  $0 < |x - c| < \delta$  implies that both  $|f(x) - L| < \varepsilon$  and  $|h(x) - L| < \varepsilon$ . In other words,  $0 < |x - c| < \delta$  implies that both

$$L - \varepsilon < f(x) < L + \varepsilon \quad \text{and} \quad L - \varepsilon < h(x) < L + \varepsilon$$

Since  $f(x) \leq g(x) \leq h(x)$  for all  $x \neq c$  in the open interval, it follows that whenever  $0 < |x - c| < \delta$  and  $x$  is in the open interval, we have

$$L - \varepsilon < f(x) \leq g(x) \leq h(x) < L + \varepsilon$$

Then for any given number  $\varepsilon > 0$ , there is a positive number  $\delta$ , so that whenever  $0 < |x - c| < \delta$ , then  $L - \varepsilon < g(x) < L + \varepsilon$ , or equivalently,  $|g(x) - L| < \varepsilon$ . That is,  $\lim_{x \rightarrow c} g(x) = L$ . ■

## B.2 Theorems and Proofs Involving Inverse Functions

### THEOREM Continuity of the Inverse Function

If  $f$  is a one-to-one function that is continuous on its domain, then its inverse function  $f^{-1}$  is also continuous on its domain.

**Proof** Let  $(a, b)$  be the largest open interval included in the domain of  $f$ . If  $f$  is continuous on its domain, then it is continuous on  $(a, b)$ . Since  $f$  is one-to-one, then  $f$  is either increasing on  $(a, b)$  or decreasing on  $(a, b)$ .

Suppose  $f$  is increasing on  $(a, b)$ . Then  $f^{-1}$  is also increasing. Let  $y_0 = f(x_0)$ . We need to show that  $f^{-1}$  is continuous at  $y_0$ , given that  $f$  is continuous at  $x_0$ . The number  $f^{-1}(y_0) = x_0$  is in the open interval  $(a, b)$ . Choose  $\varepsilon > 0$  sufficiently small, so that  $f^{-1}(y_0) - \varepsilon$  and  $f^{-1}(y_0) + \varepsilon$  are also in  $(a, b)$ . Then choose  $\delta$ , so that

$$f[f^{-1}(y_0) - \varepsilon] < y_0 - \delta \quad \text{and} \quad y_0 + \delta < f[f^{-1}(y_0) + \varepsilon]$$

Then whenever  $y_0 - \delta < y < y_0 + \delta$ , we have

$$f[f^{-1}(y_0) - \varepsilon] < y < f[f^{-1}(y_0) + \varepsilon]$$

This means whenever  $0 < |y - y_0| < \delta$ , then

$$f^{-1}(y_0) - \varepsilon < f^{-1}(y) < f^{-1}(y_0) + \varepsilon \quad \text{or equivalently,} \quad |f^{-1}(y) - f^{-1}(y_0)| < \varepsilon$$

That is,  $\lim_{y \rightarrow y_0} f^{-1}(y) = f^{-1}(y_0)$ , so  $f^{-1}$  is continuous at  $y_0$ .

The case where  $f$  is decreasing on  $(a, b)$  is proved in a similar way. ■

### THEOREM Derivative of the Inverse Function

Let  $y = f(x)$  and  $x = g(y)$  be inverse functions. If  $f$  is differentiable on an open interval containing  $x_0$  and if  $f'(x_0) \neq 0$ , then  $g$  is differentiable at  $y_0 = f(x_0)$  and

$$\frac{d}{dy}g(y_0) = \frac{1}{f'(x_0)}$$

where the notation  $f'(x_0)$  means the value of  $f'(x)$  at  $x_0$  and the notation  $\frac{d}{dy}g(y_0)$  means the value of  $\frac{d}{dy}g(y)$  at  $y_0$ .

**Proof** Since  $f$  and  $g$  are inverses of one another, then  $f(x) = y$  if and only if  $x = g(y)$ . So, we have the following identity, where  $g(y_0) = x_0$ :

$$\frac{g(y) - g(y_0)}{y - y_0} = \frac{x - x_0}{f(x) - f(x_0)} = \frac{1}{\frac{f(x) - f(x_0)}{x - x_0}}$$

By the continuity of an inverse function, the continuity of  $f$  at  $x_0$  implies the continuity of  $g$  at  $y_0$ , and  $y \rightarrow y_0$  as  $x \rightarrow x_0$ .

Now take the limits of both sides of the above identity. Since  $f'(x_0) \neq 0$ , we have

$$g'(y_0) = \lim_{y \rightarrow y_0} \frac{g(y) - g(y_0)}{y - y_0} = \frac{1}{\lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0}} = \frac{1}{f'(x_0)} \quad \blacksquare$$

## B.3 Derivative Theorems and Proofs

A proof of the Chain Rule when  $\Delta u$  is never 0 appears in Chapter 3. Here, we consider the case when  $\Delta u$  may be 0.

### THEOREM Chain Rule

If a function  $g$  is differentiable at  $x_0$ , and a function  $f$  is differentiable at  $g(x_0)$ , then the composite function  $f \circ g$  is differentiable at  $x_0$  and

$$(f \circ g)'(x_0) = f'(g(x_0)) \cdot g'(x_0).$$

Using Leibniz notation, if  $y = f(u)$  and  $u = g(x)$ , then

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx},$$

where  $\frac{dy}{du}$  is evaluated at  $u_0 = g(x_0)$  and  $\frac{du}{dx}$  is evaluated at  $x_0$ .

**Proof** For the fixed number  $x_0$ , let  $\Delta u = g(x_0 + \Delta x) - g(x_0)$ . Since the function  $u = g(x)$  is differentiable at  $x_0$ , it is also continuous at  $x_0$ , and therefore  $\Delta u \rightarrow 0$  as  $\Delta x \rightarrow 0$ .

For the fixed number  $u_0 = g(x_0)$ , let  $\Delta y = f(u_0 + \Delta u) - f(u_0)$ . Since the function  $y = f(u)$  is differentiable at the number  $u_0$ , we can write  $\lim_{\Delta u \rightarrow 0} \frac{\Delta y}{\Delta u} = \frac{dy}{du}(u_0)$ . This implies that for any  $\Delta u \neq 0$ :

$$\frac{\Delta y}{\Delta u} = \frac{dy}{du}(u_0) + \alpha, \quad (1)$$

where  $\alpha = \alpha(\Delta u)$  is a function of  $\Delta u$  such that  $\alpha \rightarrow 0$  as  $\Delta u \rightarrow 0$ . Now we define  $\alpha = 0$  when  $\Delta u = 0$ , so that  $\alpha = \alpha(\Delta u)$  is continuous at 0. Multiplying (1) by  $\Delta u \neq 0$ , we obtain

$$\Delta y = \frac{dy}{du}(u_0) \cdot \Delta u + \alpha(\Delta u) \cdot \Delta u. \quad (2)$$

Notice that the equation (2) is true for all  $\Delta u$ :

- If  $\Delta u$  is not equal to 0, then (2) is a consequence of (1).
- If  $\Delta u$  equals 0, then the left hand side of (2) is

$$\Delta y = f(u_0 + \Delta u) - f(u_0) = f(u_0) - f(u_0) = 0$$

and the right-hand side of 2 is also 0.

Now divide (2) by  $\Delta x \neq 0$ :

$$\frac{\Delta y}{\Delta x} = \frac{dy}{du}(u_0) \cdot \frac{\Delta u}{\Delta x} + \alpha(\Delta u) \cdot \frac{\Delta u}{\Delta x}. \quad (3)$$

Since the function  $u = g(x)$  is differentiable at  $x_0$ ,  $\lim_{\Delta x \rightarrow 0} \frac{\Delta u}{\Delta x} = \frac{du}{dx}(x_0)$ . Also, since  $\Delta u \rightarrow 0$  when  $\Delta x \rightarrow 0$  and  $\alpha(\Delta u)$  is continuous at  $\Delta u = 0$ , we conclude that  $\alpha(\Delta u) \rightarrow 0$  as  $\Delta x \rightarrow 0$ . So we can take the limit of (3) as  $\Delta x \rightarrow 0$ , which proves that the derivative  $\frac{dy}{dx}(x_0)$  exists and is equal to

$$\begin{aligned} \frac{dy}{dx}(x_0) &= \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \rightarrow 0} \left[ \frac{dy}{du}(u_0) \cdot \frac{\Delta u}{\Delta x} + \alpha(\Delta u) \cdot \frac{\Delta u}{\Delta x} \right] \\ &= \frac{dy}{du}(u_0) \cdot \left[ \lim_{\Delta x \rightarrow 0} \frac{\Delta u}{\Delta x} \right] + \left[ \lim_{\Delta x \rightarrow 0} \alpha(\Delta u) \right] \cdot \left[ \lim_{\Delta x \rightarrow 0} \frac{\Delta u}{\Delta x} \right] \\ &= \frac{dy}{du}(u_0) \cdot \frac{du}{dx}(x_0) + 0 \cdot \frac{du}{dx}(x_0) = \frac{dy}{du}(u_0) \cdot \frac{du}{dx}(x_0). \quad \blacksquare \end{aligned}$$

### Partial Proof of L'Hôpital's Rule

To prove L'Hôpital's Rule requires an extension of the Mean Value Theorem, called *Cauchy's Mean Value Theorem*.

#### THEOREM Cauchy's Mean Value Theorem

If the functions  $f$  and  $g$  are continuous on the closed interval  $[a, b]$  and differentiable on the open interval  $(a, b)$ , and if  $g'(x) \neq 0$  on  $(a, b)$ , then there is a number  $c$  in  $(a, b)$  for which

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$$

**ORIGINS** The theorem was named after the French mathematician Augustin Cauchy (1789–1857).

Notice that under the conditions of Cauchy's Mean Value Theorem,  $g(b) \neq g(a)$ , because otherwise, by Rolle's Theorem,  $g'(c) = 0$  for some  $c$  in the interval  $(a, b)$ .

**Proof** Define the function  $h$  as

$$h(x) = [g(b) - g(a)][f(x) - f(a)] - [g(x) - g(a)][f(b) - f(a)] \quad a \leq x \leq b$$

Then  $h$  is continuous on  $[a, b]$  and differentiable on  $(a, b)$  and  $h(a) = h(b) = 0$ . So by Rolle's Theorem, there is a number  $c$  in the interval  $(a, b)$  for which  $h'(c) = 0$ . That is,

$$h'(c) = [g(b) - g(a)]f'(c) - g'(c)[f(b) - f(a)] = 0$$

$$[g(b) - g(a)]f'(c) = g'(c)[f(b) - f(a)]$$

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$$

**NOTE** A special case of Cauchy's Mean Value Theorem is the Mean Value Theorem. To get the Mean Value Theorem, let  $g(x) = x$ . Then  $g'(x) = 1$ ,  $g(b) = b$ , and  $g(a) = a$ , giving the Mean Value Theorem. ■

### THEOREM L'Hôpital's Rule

Suppose the functions  $f$  and  $g$  are differentiable on an open interval  $I$  containing the number  $c$ , except possibly at  $c$ , and  $g'(x) \neq 0$  for all  $x \neq c$  in  $I$ . Let  $L$  denote either a real number or  $\pm\infty$ , and suppose  $\frac{f(x)}{g(x)}$  is an indeterminate form at  $c$  of the type  $\frac{0}{0}$

or  $\frac{\infty}{\infty}$ . If  $\lim_{x \rightarrow c} \frac{f'(x)}{g'(x)} = L$ , then  $\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = L$ .

**Partial Proof** Suppose  $\frac{f(x)}{g(x)}$  is an indeterminate form at  $c$  of the type  $\frac{0}{0}$ , and suppose

$\lim_{x \rightarrow c} \frac{f'(x)}{g'(x)} = L$ , where  $L$  is a real number. We need to prove  $\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = L$ . First define the functions  $F$  and  $G$  as follows:

$$F(x) = \begin{cases} f(x) & \text{if } x \neq c \\ 0 & \text{if } x = c \end{cases}, \quad G(x) = \begin{cases} g(x) & \text{if } x \neq c \\ 0 & \text{if } x = c \end{cases}$$

Both  $F$  and  $G$  are continuous at  $c$ , since  $\lim_{x \rightarrow c} F(x) = \lim_{x \rightarrow c} f(x) = 0 = F(c)$  and  $\lim_{x \rightarrow c} G(x) = \lim_{x \rightarrow c} g(x) = 0 = G(c)$ . Also,

$$F'(x) = f'(x) \quad \text{and} \quad G'(x) = g'(x)$$

for all  $x$  in the interval  $I$ , except possibly at  $c$ . Since the conditions for Cauchy's Mean Value Theorem are met by  $F$  and  $G$  in either  $[x, c]$  or  $[c, x]$ , there is a number  $u$  between  $c$  and  $x$  for which

$$\frac{F(x) - F(c)}{G(x) - G(c)} = \frac{F'(u)}{G'(u)} = \frac{f'(u)}{g'(u)}$$

Since  $F(c) = 0$  and  $G(c) = 0$ , this simplifies to  $\frac{f(x)}{g(x)} = \frac{f'(u)}{g'(u)}$ .

Since  $u$  is between  $c$  and  $x$ , it follows that

$$\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = \lim_{u \rightarrow c} \frac{f'(u)}{g'(u)} = L$$

A similar argument is used if  $L$  is infinite. The proof when  $\frac{f(x)}{g(x)}$  is an indeterminate form at  $\infty$  of the type  $\frac{\infty}{\infty}$  is omitted here, but it may be found in books on advanced calculus. ■

The use of L'Hôpital's Rule when  $c = \infty$  for an indeterminate form of the type  $\frac{0}{0}$  is justified by the following argument. In  $\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)}$ , let  $x = \frac{1}{u}$ . Then

as  $x \rightarrow \infty$ ,  $u \rightarrow 0^+$ , and

$$\lim_{x \rightarrow \infty} \frac{f(x)}{g(x)} = \lim_{u \rightarrow 0^+} \frac{f\left(\frac{1}{u}\right)}{g\left(\frac{1}{u}\right)} = \lim_{u \rightarrow 0^+} \frac{\frac{d}{du} f\left(\frac{1}{u}\right)}{\frac{d}{du} g\left(\frac{1}{u}\right)} = \lim_{u \rightarrow 0^+} \frac{-\frac{1}{u^2} f'\left(\frac{1}{u}\right)}{-\frac{1}{u^2} g'\left(\frac{1}{u}\right)} = \lim_{x \rightarrow \infty} \frac{f'(x)}{g'(x)} = L$$

Chain Rule

$x = \frac{1}{u}$

### Proof That Continuous Partial Derivatives Are Sufficient for Differentiability

#### THEOREM

Let  $z = f(x, y)$  be a function of two variables whose domain is  $D$ . Let  $(x_0, y_0)$  be an interior point of  $D$ . If the partial derivatives  $f_x$  and  $f_y$  exist at each point of some disk centered at  $(x_0, y_0)$ , and if  $f_x$  and  $f_y$  are each continuous at  $(x_0, y_0)$ , then  $f$  is differentiable at  $(x_0, y_0)$ .

**Proof** The proof depends on the Mean Value Theorem for derivatives. Let  $\Delta x$  and  $\Delta y$  be changes, not both 0, in  $x$  and in  $y$ , respectively, so that the point  $(x_0 + \Delta x, y_0 + \Delta y)$  lies in some disk centered at  $(x_0, y_0)$ . The change in  $z$  is

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$$

Adding and subtracting  $f(x_0, y_0 + \Delta y)$  on the right-hand side, we obtain

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0 + \Delta y) + f(x_0, y_0 + \Delta y) - f(x_0, y_0) \quad (4)$$

The expression  $f(x, y_0 + \Delta y)$  is a function of  $x$  alone, and its partial derivative  $f_x(x, y_0 + \Delta y)$  exists in the disk centered at  $(x_0, y_0)$ . Then by the Mean Value Theorem, there is a real number  $u$  between  $x_0$  and  $x_0 + \Delta x$  for which

$$f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0 + \Delta y) = f_x(u, y_0 + \Delta y)\Delta x \quad (5)$$

Similarly, the expression  $f(x_0, y)$  is a function of  $y$  alone, and the partial derivative  $f_y(x_0, y)$  exists in the disk centered at  $(x_0, y_0)$ . Again, by the Mean Value Theorem, there is a real number  $v$  between  $y_0$  and  $y_0 + \Delta y$  for which

$$f(x_0, y_0 + \Delta y) - f(x_0, y_0) = f_y(x_0, v)\Delta y \quad (6)$$

Substitute (5) and (6) back into equation (4) for  $\Delta z$  to obtain

$$\Delta z = f_x(u, y_0 + \Delta y)\Delta x + f_y(x_0, v)\Delta y$$

Now introduce the functions  $\eta_1$  and  $\eta_2$  defined by

$$\eta_1 = f_x(u, y_0 + \Delta y) - f_x(x_0, y_0) \quad \text{and} \quad \eta_2 = f_y(x_0, v) - f_y(x_0, y_0)$$

As  $(\Delta x, \Delta y) \rightarrow (0, 0)$ , then  $u \rightarrow x_0$  and  $v \rightarrow y_0$ . Since  $f_x$  and  $f_y$  are continuous at  $(x_0, y_0)$ ,  $\eta_1$  and  $\eta_2$  have the desired property that

$$\begin{aligned} \lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_1 &= \lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} [f_x(u, y_0 + \Delta y) - f_x(x_0, y_0)] \\ &= f_x(x_0, y_0) - f_x(x_0, y_0) = 0 \end{aligned}$$

and

$$\begin{aligned} \lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} \eta_2 &= \lim_{(\Delta x, \Delta y) \rightarrow (0, 0)} [f_y(x_0, v) - f_y(x_0, y_0)] \\ &= f_y(x_0, y_0) - f_y(x_0, y_0) = 0 \end{aligned}$$

As a result,  $\Delta z$  can be written as

$$\begin{aligned}\Delta z &= f_x(u, y_0 + \Delta y)\Delta x + f_y(x_0, v)\Delta y \\ &= [\eta_1 + f_x(x_0, y_0)]\Delta x + [\eta_2 + f_y(x_0, y_0)]\Delta y \\ &= f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \eta_1\Delta x + \eta_2\Delta y\end{aligned}$$

proving that  $f$  is differentiable at  $(x_0, y_0)$ . ■

## B.4 Integral Theorems and Proofs

### THEOREM

If a function  $f$  is continuous on an interval containing the numbers  $a$ ,  $b$ , and  $c$ , then

$$\int_a^b f(x) dx = \int_a^c f(x) dx + \int_c^b f(x) dx$$

**Proof** Since  $f$  is continuous on an interval containing  $a$ ,  $b$ , and  $c$ , the three integrals above exist.

**Part 1** Assume  $a < b < c$ . Since  $f$  is continuous on  $[a, b]$  and on  $[b, c]$ , given any  $\varepsilon > 0$ , there is a number  $\delta_1 > 0$ , so that

$$\left| \sum_{i=1}^k f(u_i)\Delta x_i - \int_a^b f(x) dx \right| < \frac{\varepsilon}{2} \quad (1)$$

for every Riemann sum  $\sum_{i=1}^k f(u_i)\Delta x_i$  for  $f$  on  $[a, b]$ , where  $x_{i-1} \leq u_i \leq x_i$ ,  $i = 1, 2, \dots, k$ , and whose partition  $P_1$  of  $[a, b]$  has norm  $\|P_1\| < \delta_1$ . There is also a number  $\delta_2 > 0$  for which

$$\left| \sum_{i=k+1}^n f(u_i)\Delta x_i - \int_b^c f(x) dx \right| < \frac{\varepsilon}{2} \quad (2)$$

for every Riemann sum  $\sum_{i=k+1}^n f(u_i)\Delta x_i$  for  $f$  on  $[b, c]$ , where  $x_{i-1} \leq u_i \leq x_i$ ,  $i = k+1, k+2, \dots, n$ , and whose partition  $P_2$  of  $[b, c]$  has norm  $\|P_2\| < \delta_2$ .

Let  $\delta$  be the smaller of  $\delta_1$  and  $\delta_2$ . Then (1) and (2) hold, with  $\delta$  replacing  $\delta_1$  and  $\delta_2$ . If (1) and (2) are added and if  $\|P_1\| < \delta$  and  $\|P_2\| < \delta$ , then

$$\left| \sum_{i=1}^k f(u_i)\Delta x_i - \int_a^b f(x) dx \right| + \left| \sum_{i=k+1}^n f(u_i)\Delta x_i - \int_b^c f(x) dx \right| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$$

Using the Triangle Inequality, this result implies that for  $\|P_1\| < \delta$  and  $\|P_2\| < \delta$ ,

$$\left| \sum_{i=1}^k f(u_i)\Delta x_i - \int_a^b f(x) dx + \sum_{i=k+1}^n f(u_i)\Delta x_i - \int_b^c f(x) dx \right| < \varepsilon \quad (3)$$

Denote  $P_1 \cup P_2$  by  $P^*$ . Then  $P^*$  is a partition of  $[a, c]$  having the number  $b = x_k$  as an endpoint of the  $k$ th subinterval. So,

$$\sum_{i=1}^k f(u_i)\Delta x_i + \sum_{i=k+1}^n f(u_i)\Delta x_i = \sum_{i=1}^n f(u_i)\Delta x_i$$

are Riemann sums for  $f$  on  $P^*$ . Since  $\|P^*\| < \delta$  implies that  $\|P_1\| < \delta$  and  $\|P_2\| < \delta$ , it follows from (3) that

$$\left| \sum_{i=1}^n f(u_i)\Delta x_i - \left[ \int_a^b f(x) dx + \int_b^c f(x) dx \right] \right| < \varepsilon$$

**NOTE** The partition  $P_1$  is  $x_0 = a, \dots, x_k = b$ . The partition  $P_2$  is  $x_k = b, \dots, x_n = c$ .

for every Riemann sum  $\sum_{i=1}^n f(u_i) \Delta x_i$  for  $f$  on  $[a, c]$  whose partition  $P^*$  of  $[a, c]$  has  $b$  as an endpoint of a subinterval of the partition and has norm  $\|P^*\| < \delta$ . Therefore,

$$\int_a^c f(x) dx = \int_a^b f(x) dx + \int_b^c f(x) dx$$

**Part 2** There are six possible orderings (permutations) of the numbers  $a$ ,  $b$ , and  $c$ :

$$a < b < c \quad a < c < b \quad b < a < c \quad b < c < a \quad c < a < b \quad c < b < a$$

In Part 1, we showed that the theorem is true for the order  $a < b < c$ . Now consider any other order, say,  $b < c < a$ . From Part 1,

$$\int_b^c f(x) dx + \int_c^a f(x) dx = \int_b^a f(x) dx \quad (4)$$

But,

$$\int_c^a f(x) dx = -\int_a^c f(x) dx \quad \text{and} \quad \int_b^a f(x) dx = -\int_a^b f(x) dx$$

Now we substitute this into (4).

$$\begin{aligned} \int_b^c f(x) dx - \int_a^c f(x) dx &= -\int_a^b f(x) dx \\ \int_a^b f(x) dx + \int_b^c f(x) dx &= \int_a^c f(x) dx \end{aligned}$$

proving the theorem for  $b < c < a$ .

The proofs for the remaining four permutations of  $a$ ,  $b$ , and  $c$  are similar. ■

### THEOREM Fundamental Theorem of Calculus, Part 1

Let  $f$  be a function that is continuous on a closed interval  $[a, b]$ . The function  $I$  defined by

$$I(x) = \int_a^x f(t) dt$$

has the property that it is continuous on  $[a, b]$  and differentiable on  $(a, b)$ . Moreover,

$$I'(x) = \frac{d}{dx} \left[ \int_a^x f(t) dt \right] = f(x)$$

for all  $x$  in  $(a, b)$ .

**Proof** Let  $x$  and  $x + h$ ,  $h \neq 0$ , be in the interval  $(a, b)$ . Then

$$I(x) = \int_a^x f(t) dt \quad I(x + h) = \int_a^{x+h} f(t) dt$$

and

$$\begin{aligned} I(x + h) - I(x) &= \int_a^{x+h} f(t) dt + \int_x^a f(t) dt \quad \int_x^a f(t) dt = -\int_a^x f(t) dt \\ &= \int_x^a f(t) dt + \int_a^{x+h} f(t) dt = \int_x^{x+h} f(t) dt \end{aligned}$$

Dividing both sides by  $h \neq 0$ , we get

$$\frac{I(x + h) - I(x)}{h} = \frac{1}{h} \int_x^{x+h} f(t) dt \quad (5)$$

**NEED TO REVIEW?** The Mean Value Theorem for Integrals is discussed in Section 5.4, p. 372.

Now we use the Mean Value Theorem for Integrals in the integral on the right. There are two possibilities: either  $h > 0$  or  $h < 0$ .

If  $h > 0$ , there is a number  $u$ , where  $x \leq u \leq x + h$ , for which

$$\begin{aligned}\int_x^{x+h} f(t) dt &= f(u)h \\ \frac{1}{h} \int_x^{x+h} f(t) dt &= f(u) \\ \frac{I(x+h) - I(x)}{h} &= f(u) \quad \text{From (5)}\end{aligned}$$

Since  $x \leq u \leq x + h$ , as  $h \rightarrow 0^+$ ,  $u$  approaches  $x^+$ , so

$$\lim_{h \rightarrow 0^+} \frac{I(x+h) - I(x)}{h} = \lim_{h \rightarrow 0^+} f(u) = \lim_{u \rightarrow x^+} f(u) = f(x)$$

$\uparrow$   
 $f$  is continuous

Using a similar argument for  $h < 0$ , we obtain

$$\lim_{h \rightarrow 0^-} \frac{I(x+h) - I(x)}{h} = f(x)$$

Since the two one-sided limits are equal,

$$\lim_{h \rightarrow 0} \frac{I(x+h) - I(x)}{h} = f(x)$$

The limit is the derivative of the function  $I$ , meaning  $I'(x) = f(x)$  for all  $x$  in  $(a, b)$ . ■

### THEOREM Bounds on an Integral

If a function  $f$  is continuous on a closed interval  $[a, b]$  and if  $m$  and  $M$  denote the absolute minimum and absolute maximum values of  $f$  on  $[a, b]$ , respectively, then

$$m(b-a) \leq \int_a^b f(x) dx \leq M(b-a)$$

The bounds on an integral theorem is proved by contradiction.

**Proof Part 1**  $m(b-a) \leq \int_a^b f(x) dx$

Assume

$$m(b-a) > \int_a^b f(x) dx \quad (6)$$

Since  $f$  is continuous on  $[a, b]$ ,

$$\lim_{\|P\| \rightarrow 0} \sum_{i=1}^n f(u_i) \Delta x_i = \int_a^b f(x) dx$$

By (6),  $m(b-a) - \int_a^b f(x) dx > 0$ . We choose  $\varepsilon$ , so that

$$\varepsilon = m(b-a) - \int_a^b f(x) dx > 0 \quad (7)$$

Then there is a number  $\delta > 0$ , so that for all partitions  $P$  of  $[a, b]$  with norm  $\|P\| < \delta$ , we have

$$\left| \sum_{i=1}^n f(u_i) \Delta x_i - \int_a^b f(x) dx \right| < \varepsilon$$

which is equivalent to

$$\int_a^b f(x) dx - \varepsilon < \sum_{i=1}^n f(u_i) \Delta x_i < \int_a^b f(x) dx + \varepsilon$$

By (7), the right inequality can be expressed as

$$\begin{aligned} \sum_{i=1}^n f(u_i) \Delta x_i &< \int_a^b f(x) dx + \varepsilon = \int_a^b f(x) dx + \left[ m(b-a) - \int_a^b f(x) dx \right] \\ &= m(b-a) \end{aligned}$$

Consequently,

$$\sum_{i=1}^n f(u_i) \Delta x_i < m(b-a) = \sum_{i=1}^n m \Delta x_i$$

implying that for every partition  $P$  of  $[a, b]$  with  $\|P\| < \delta$ ,

$$f(u_i) < m$$

for some  $u_i$  in  $[a, b]$ . But this is impossible because  $m$  is the absolute minimum of  $f$  on  $[a, b]$ . Therefore, the assumption  $m(b-a) > \int_a^b f(x) dx$  is false. That is,

$$m(b-a) \leq \int_a^b f(x) dx$$

**Part 2** To prove  $\int_a^b f(x) dx \leq M(b-a)$ , use a similar argument. ■

## B.5 A Bounded Monotonic Sequence Converges

### THEOREM

An increasing (or nondecreasing) sequence  $\{s_n\}$  that is bounded from above converges. A decreasing (or nonincreasing) sequence  $\{s_n\}$  that is bounded from below converges.

To prove this theorem, we need the following property of real numbers. The set of real numbers is defined by a collection of axioms. One of these axioms is the Completeness Axiom.

### Completeness Axiom of Real Numbers

If  $S$  is a nonempty set of real numbers that has an upper bound, then it has a least upper bound. Similarly, if  $S$  has a lower bound, then it has a greatest lower bound.

As an example, consider the set  $S: \{x \mid x^2 < 2, x > 0\}$ . The set of upper bounds to  $S$  is the set  $\{x \mid x^2 \geq 2, x > 0\}$ .

- (a) If our universe is the set of rational numbers, the set of upper bounds has no minimum (since  $\sqrt{2}$  is not rational).
- (b) If our universe is the set of real numbers, then by the Completeness Axiom, the set of upper bounds has a minimum ( $\sqrt{2}$ ). That is, this axiom completes the set of real numbers by incorporating the set of irrational numbers with the set of rational numbers to form the set of real numbers.

We prove the theorem for a nondecreasing sequence  $\{s_n\}$ . The proofs for the other three cases are similar.

**Proof** Suppose  $\{s_n\}$  is a nondecreasing sequence that is bounded from above. Since  $\{s_n\}$  is bounded from above, there is a positive number  $K$  (an upper bound), so that  $s_n \leq K$  for every  $n$ . From the Completeness Axiom, the set  $\{s_n\}$  has a least upper bound  $L$ . That is,  $s_n \leq L$  for every  $n$ .

Then for any  $\varepsilon > 0$ ,  $L - \varepsilon$  is not an upper bound of  $\{s_n\}$ . That is,  $L - \varepsilon < s_N$  for some integer  $N$ . Since  $\{s_n\}$  is nondecreasing,  $s_N \leq s_n$  for all  $n > N$ . Then for all  $n > N$ ,

$$L - \varepsilon < s_n \leq L < L + \varepsilon$$

That is,  $|s_n - L| < \varepsilon$  for all  $n > N$ , so the sequence  $\{s_n\}$  converges to  $L$ . ■

## B.6 Taylor's Formula with Remainder

### THEOREM Taylor's Formula with Remainder

Let  $f$  be a function whose first  $n + 1$  derivatives are continuous on an interval  $I$  containing the number  $c$ . Then for every  $x$  in the interval, there is a number  $u$  between  $x$  and  $c$  for which

$$f(x) = f(c) + f'(c)(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + R_n(x)$$

where

$$R_n(x) = \frac{f^{(n+1)}(u)}{(n+1)!}(x - c)^{n+1}$$

**Proof** For a fixed number  $x \neq c$  in the interval  $I$ , there is a number  $L$  (depending on  $x$ ) for which

$$f(x) = f(c) + \frac{f'(c)}{1!}(x - c) + \frac{f''(c)}{2!}(x - c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x - c)^n + \frac{L}{(n+1)!}(x - c)^{n+1} \quad (1)$$

Define the function  $F$  to be

$$F(t) = f(x) - f(t) - \frac{f'(t)}{1!}(x - t) - \frac{f''(t)}{2!}(x - t)^2 - \cdots - \frac{f^{(n)}(t)}{n!}(x - t)^n - \frac{L}{(n+1)!}(x - t)^{n+1} \quad (2)$$

The domain of  $F$  is  $c \leq t \leq x$  if  $x > c$  and  $x \leq t \leq c$  if  $x < c$ . Since  $f(t)$ ,  $f'(t)$ ,  $f''(t)$ ,  $\dots$ ,  $f^{(n)}(t)$  are each continuous, then  $F$  is continuous on its domain. Furthermore,  $F$  is differentiable and

$$\begin{aligned} \frac{dF}{dt} = F'(t) &= -f'(t) + \left[ f'(t) - \frac{f''(t)}{1!}(x - t) \right] + \left[ \frac{f''(t)}{1!}(x - t) - \frac{f'''(t)}{2!}(x - t)^2 \right] \\ &\quad + \cdots + \left[ \frac{f^{(n)}(t)}{(n-1)!}(x - t)^{n-1} - \frac{f^{(n+1)}(t)}{n!}(x - t)^n \right] + \frac{L}{n!}(x - t)^n \\ &= -\frac{f^{(n+1)}(t)}{n!}(x - t)^n + \frac{L}{n!}(x - t)^n \end{aligned}$$

for all  $t$  between  $x$  and  $c$ . From (1) and (2), we have

$$F(c) = f(x) - f(c) - \frac{f'(c)}{1!}(x - c) - \frac{f''(c)}{2!}(x - c)^2 - \cdots - \frac{f^{(n)}(c)}{n!}(x - c)^n - \frac{L}{(n+1)!}(x - c)^{n+1} = 0$$

Then

$$F(x) = f(x) - f(x) - \frac{f'(x)}{1!}(x - x) - \cdots - \frac{f^{(n)}(x)}{n!}(x - x)^n - \frac{L}{(n+1)!}(x - x)^{n+1} = 0$$

Now apply Rolle's Theorem to  $F$ . Then there is a number  $u$  between  $c$  and  $x$  for which

$$F'(u) = -\frac{f^{(n+1)}(u)}{n!}(x-u)^n + \frac{L}{n!}(x-u)^n = 0$$

Solving for  $L$ , we find  $L = f^{(n+1)}(u)$ . Now let  $t = c$  and  $L = f^{(n+1)}(u)$  in (2) and solve for  $f(x)$ . Then

$$f(x) = f(c) + f'(c)(x-c) + \frac{f''(c)}{2!}(x-c)^2 + \cdots + \frac{f^{(n)}(c)}{n!}(x-c)^n + R_n(x)$$

where

$$R_n(x) = \frac{f^{(n+1)}(u)}{(n+1)!}(x-c)^{n+1}$$

## Section 1.3

1. True 2. False 3.  $f(c)$  is defined,  $\lim_{x \rightarrow c} f(x)$  exists,  $\lim_{x \rightarrow c} f(x) = f(c)$  4. True 5. False 6. False 7. False 8. True 9. The function is discontinuous. 10. The function is continuous. 11. True 12. False 13. (a) The function is not continuous at  $c = -3$ . (b)  $\lim_{x \rightarrow -3} f(x) \neq f(-3)$  (c) The discontinuity is removable. (d)  $f(-3) = -2$  15. (a) The function is not continuous at  $c = 2$ . (b)  $\lim_{x \rightarrow 2^-} f(x) \neq f(2)$ . (c) The discontinuity is removable. 17. (a) The function is continuous at  $c = 4$ . 19. The function is continuous at  $c = -1$ . 21. The function is continuous at  $c = -2$ . 23. The function is continuous at  $c = 2$ . 25. The function is not continuous at  $c = 1$ . 27. The function is not continuous at  $c = 1$ . 29. The function is continuous at  $c = 0$ . 31. The function is not continuous at  $c = 0$ . 33.  $f(2) = 4$  35.  $f(1) = 2$  37. The function is continuous on the given interval. 39. The function is not continuous on the given interval. The function is continuous on the set  $\{x|x < 3\} \cup \{x|x > 3\}$ . 41. The function is continuous on  $\{x|x \neq 0\}$ . 43. The function is continuous on the set of all real numbers. 45. The function is continuous of  $\{x|x \geq 0, x \neq 9\}$ . 47. The function is continuous on the set  $\{x|x < 2\}$ . 49. The function is continuous on the set of all real numbers. 51.  $f$  is continuous at 0 because  $\lim_{x \rightarrow 0} f(x) = f(0)$ . 53.  $f$  is not continuous at 3 because  $\lim_{x \rightarrow 3} f(x)$  does not exist. 55.  $f$  is continuous at 1 because  $\lim_{x \rightarrow 1} f(x) = f(1)$ .

57. (a)

(b) Based on the graph, it appears that the function is continuous for all real numbers.

(c)  $f$  is actually continuous at all real numbers except  $x = 2$ .

(d) You should not use graphing technology alone to determine continuity.

59. Yes. A zero will exist on the given interval. 61. The IVT gives no information. 63. The IVT gives no information. 65. 1.154 67. 0.211 69. 3.134 71. 1.157 73. (a) Since  $f$  is continuous on  $[0, 1]$ ,  $f(0) < 0$  and  $f(1) > 0$ , the IVT guarantees that  $f$  must have a zero on the interval  $(0, 1)$ . (b) 0.828 75. The function is not continuous at  $c = 1$ . 77. The function is continuous on the set of all real numbers.

79. (a)  $C(w) = \begin{cases} 0.46, & 0 < w \leq 1 \\ 0.66, & 1 < w \leq 2 \\ 0.86, & 2 < w \leq 3 \\ 1.06, & 3 < w \leq 3.5 \end{cases}$  (b)  $\{w|0 < w \leq 3.5\}$  (c) The function is continuous on the intervals  $(0, 1]$ ,  $(1, 2]$ ,  $(2, 3]$ , and  $(3, 3.5]$ .

(d) At  $w = 1$ ,  $w = 2$ , and  $w = 3$ , the function has a jump discontinuity. (e) See student solution manual.

81. (a)  $C(x) = \begin{cases} 22.13 + 0.62273x, & 0 < x \leq 50 \\ 29.207 + 0.48116x, & x > 50 \end{cases}$  (b)  $\{x|x > 0\}$  (c)  $C(x)$  is continuous on its domain. (d) No such points.

(e) There is no jump in cost for usage over 50 therms. 83. (a)  $\frac{Gm}{R^2}$  (b) 1.3 m/s<sup>2</sup> (c) The gravity on Europa is less than the gravity on Earth.85.  $A = 5$ ,  $B = 7$ 87. (a)  $\{x|x < 2\} \cup \{x|x > 2, x \neq 8\}$  (b)  $f$  is discontinuous at  $x = 8$ . (c) The discontinuity at  $x = 8$  is removable.89. (a) Since  $f$  is continuous on  $[0, 2]$ ,  $f(0) < 0$  and  $f(2) > 0$ , the IVT guarantees that  $f$  must have a zero on the interval  $(0, 2)$ . (b)  $x = 0.443$ 91. This does not contradict the IVT.  $f(-1)$  and  $f(2)$  are both positive, so there is no guarantee that the function has a zero in the interval  $(-1, 2)$ .93. This does not contradict the IVT. The IVT guarantees that  $f$  must have at least one zero on the interval  $(-5, 0)$ .95. (a) This does not contradict the IVT.  $f(-2)$  and  $f(2)$  are both positive, so there is no guarantee that the function has a zero in the interval  $(-2, 2)$ .(b) The graph below indicates that  $f$  does not have a zero in the interval  $(-2, 2)$ .

97. See student solution manual. 99. (a)  $x = -2, x = 2, x = 3$  (b)  $p = 5$  (c)  $h(x)$  is an even function. 101. Answers will vary.  
 103. (1.125, 1.25) 105. (0.125, 0.25) 107. (3.125, 3.25) 109. (1.125, 1.25) 111. Since  $f$  is continuous on  $[0, 1]$ ,  $f(0) < 0$  and  $f(1) > 0$ , the IVT guarantees that  $f$  must have a zero on the interval  $(0, 1)$ . To the nearest tenth, the zero is  $x = 0.8$  113. See student solution manual.  
 115. See student solution manual. 117. See student solution manual. 119. See student solution manual.

## Chapter 9

## Section 9.1

1. Plane curve; parameter 2. (c) 3. (d) 4. Cycloid 5. False 6. True

7. (a)  $x = 2y - 3$

(b)

9. (a)  $x = 2y - 3, x \in [1, 5]$

(b)

11. (a)  $x = e^y$

(b)

13. (a)  $x^2 + y^2 = 1$

(b)

15. (a)  $\frac{x^2}{4} + \frac{y^2}{9} = 1$

(b)

17. (a)  $\frac{(x+3)^2}{4} + \frac{(y-1)^2}{4} = 1$

(b)

19. (a)  $x = 3$

(b)

21. (a)  $x = 2$

(b)

(c)  $x = 2, y > 4$

(d)

23. (a)  $x = y^2 + 5$

(b)

(c)  $x \geq 5, y \geq 0$

(d)

25. (a)  $y = (x-1)^3$

(b)

(c)  $x \geq 2, y \geq 1$

(d)

27. (a)  $x = \sec \arctan y$

(b)

(c)  $x \geq 1$

(d)

29. (a)  $x = y^2$

(b)

(c)  $x \geq 0, y \geq 0$

(d)

31. (a)  $x = \left(\frac{y+1}{2}\right)^2$

(b)

(c)  $x \geq 0$

(d)

33. (a)  $x = \left(\frac{y+1}{2}\right)^2$

(b)

(c)  $x > 0$

(d)

35. (a)  $\frac{x+2}{3} + \frac{y^2}{4} = 1$

(b)

(c)  $-2 \leq x \leq 1, -2 \leq y \leq 2$

(d)

37.  $y = \frac{2x}{1+x}, x \geq 0, 0 \leq y \leq 2$  39.  $x = \frac{4}{\sqrt{4 - \left(\frac{y}{x}\right)^2}}, x \geq 2, y \geq 0$  41.  $(x+2)^2 + \left(\left(\frac{4-y}{2}\right)^2\right) = 1, -3 \leq x \leq -1, 2 \leq y \leq 6$

43.  $x = t, y = 4t - 2$ ; or  $x = \frac{t+2}{4}, y = t$  45.  $x = t, y = -2t^2 + 1$ ; or  $x = t^3, y = -2x^6 + 1$

47.  $x = \sqrt[3]{t}, y = 4t$ ; or  $x = \frac{t}{\sqrt[3]{4}}, y = t^3$  49.  $x = \frac{1}{3}\sqrt{t} - 3, y = t$ ; or  $x = t^2 - 3, y = 9t^4$  51.  $x = t + 2, y = t, 0 \leq t \leq 5$

53.  $x = 3 \cos t, y = 2 \sin t, -\pi \leq t \leq \frac{\pi}{2}$  55.  $x = 3 \cos \frac{2\pi}{3}t, y = 2 \sin \frac{2\pi}{3}t$  57.  $x = 3 \sin \pi t, y = 2 \cos \pi t$

(b)

(c)

(d)

 61.  $I \rightarrow (d)$  counterclockwise  $II \rightarrow (a)$  counterclockwise  $III \rightarrow (b)$  counterclockwise  $IV \rightarrow (c)$  counterclockwise

 63.  $I \rightarrow (c)$  from  $(1, 0)$  to  $(-1, 0)$   $II \rightarrow (b)$  from  $(-1, 0)$  to  $(1, 0)$   $III \rightarrow (a)$  clockwise  $IV \rightarrow (d)$  from  $\left(-\frac{\sqrt{2}}{2}, 1\right)$  to  $(1, 0)$ 

65. (a)

(b)  $x \approx 8.66, y \approx 10.5$

67.  $x = a \sin t, y = b \cos t$  or  $x = a \cos t, y = b \sin t$  69. (a)  $x \approx 95.8t$  ft,  $y \approx -16t^2 + 80.3t + 3$  ft (b)  $y \approx 99.6$  ft (c)  $x \approx 191.6$  ft (d)  $t \approx 3.13$  s (e)  $y \approx 97.6$  ft (f)  $t \approx 5.1$  s (g)  $x \approx 488.6$  ft 71. (a)  $x \approx 65.5t$  ft,  $y \approx -16t^2 + 45.9t + 6$  ft (b)  $y \approx 35.9$  ft (c)  $x \approx 65.5$  ft (d)  $t \approx 1.8$  s (e)  $y \approx 36.8$  ft 73. The first curve is counterclockwise from  $(2, 0)$ ; the second is clockwise from  $(0, 2)$ .

75.  $x = \frac{m^2}{2R} - R, y = \pm \frac{m}{2R} \sqrt{4R^2 - m^2}, 0 \leq m \leq 2R$  77. See Student Solutions Manual.

79.  $x = (a+b) \cos t - b \cos \left(\frac{a+b}{b}t\right), y = (a+b) \sin t - b \sin \left(\frac{a+b}{b}t\right)$

$a = 4, b = 1$

Section 9.2

## Review Exercises

1. (a)

(b)  $x = -4y + 2$

(c) No restrictions

3. (a)

(b)  $y = \frac{1}{x}$

(c)  $x \geq 0, y \geq 0$

5. (a)

(b)  $x = \sec^2 \arctan \sqrt{y}$

(c)  $1 \leq x \leq 2, 0 \leq y \leq 1$

7. (a)  $y = \frac{1}{2}x + \frac{5}{2}$

(b)

9. (a)  $y = -\frac{81}{2\sqrt{10}}x + \frac{9}{2\sqrt{10}} + \sqrt{10}$

(b)

11.  $x = t,$   
 $y = -2t + 4$  or  
 $x = t^3,$   
 $y = -2t^3 + 4$

13.  $\frac{x^2}{4} + y = 1$

15.  $(1, \sqrt{3})$

17.  $(-2\sqrt{2}, 2\sqrt{2})$

19.  $(5, 0.295\pi), (-5, 1.295\pi)$  21.  $\left(3\sqrt{2}, \frac{3\pi}{4}\right), \left(-3\sqrt{2}, \frac{7\pi}{4}\right)$  23.  $x^2 + y^2 - e^{\tan^{-1}(y/x)} = 0$  25.  $\frac{(y - x^2 - y^2)\sqrt{x^2 - y^2}}{x^2 - y^2} - a = 0$

27.  $x^2 + y^2 - \left(\tan^{-1} \frac{y}{x}\right)^2 = 0$  29.  $\cos^2 \theta - \sin^2 \theta = 0$  31.  $r = \frac{6\sqrt{9\cos^2 \theta + 4\sin^2 \theta}}{9\cos^2 \theta + 4\sin^2 \theta}$

33.

35.

37. (a)

(b)  $x = 4 \cos \theta \cos(2\theta), y = 4 \sin \theta \cos(2\theta)$

39. (a)

(b)  $x = \frac{4 \cos \theta}{1 - 2 \cos \theta}, y = \frac{4 \sin \theta}{1 - 2 \cos \theta}$

41. (a)

(b)  $x = \cos \theta (2 - 2 \cos \theta),$   
 $y = \sin \theta (2 - 2 \cos \theta)$

43. (a)

(b)  $x = e^{0.5\theta} \cos \theta,$   
 $y = e^{0.5\theta} \sin \theta$

45. (a)

(b)  $x = \cos \theta \sqrt{1 + \sin^2 \theta},$   
 $y = \sin \theta \sqrt{1 + \sin^2 \theta}$

47. (a)  (b)  $35 \left( x - \frac{6}{35} \right)^2 + 36y^2 = \frac{1296}{35}$  (c)  $x = \frac{6 \cos \theta}{6 - \cos \theta}, y = \frac{6 \sin \theta}{6 - \cos \theta}$

49.  $x = 4 \sin \left( \frac{2\pi t}{5} \right), y = 3 \cos \left( \frac{2\pi t}{5} \right), 0 < t < 5$  51. Vertical: (0, 2), (2, 2); horizontal: (1, 5), (1, -1) 53. 1.10202 55. 1.6732868  
57.  $\sqrt{2}(1 - e^{-2\pi}) \approx 1.41157$  59.  $2(4 - 2\sqrt{2}) \approx 2.34315$  61.  $2\sqrt{3} - \frac{2\pi}{3} \approx 1.36971$  63.  $\frac{\pi^2}{2} \approx 4.9348$   
65.  $\frac{\pi}{32}(196\sqrt{17} + 15 \arcsin 4) \approx 82.4226$  67.  $16\pi \approx 50.2655$

## Chapter 10

### Section 10.1

1. True 2. False 3. True 4. True 5. Sphere 6. (0, 0, 0)

## Chapter Review

1. (a) 0 (b)  $e^{x+\Delta x} \ln y$  (c)  $e^x \ln(y + \Delta y)$  3. (a)  $\frac{3\pi}{2}$  (b)  $\frac{e\pi}{6}$  (c) 0 5.  $\{(x, y) \mid x^2 + 4y^2 \leq 9\}$

7.  $\{(x, y) \mid y \neq -\frac{1}{2}x\}$

9.  $\{(x, y, z) \mid z > 0\}$

11.

13.

15.

17. The level surfaces associated with the function  $w = 4x^2 + y^2 + z^2$  are all ellipsoids in space. 19.  $\frac{2}{\pi}$

21. (a) See Student Solutions Manual. (b)  $\frac{3}{2}$  (c) This limit does not exist. 23. The function is continuous at all points  $(x, y)$  in the plane.

25. (a) This function is continuous at all points  $(x, y)$  in the plane except the origin,  $(0, 0)$ . (b)  $\frac{\pi}{4}$  27.  $f_x(x, y) = \frac{1}{y}$ ;  $f_y(x, y) = \frac{-x}{y^2}$

29.  $\frac{\partial z}{\partial x} = e^x \ln(5x + 2y) + \frac{5e^x}{5x + 2y}$ ;  $\frac{\partial z}{\partial y} = \frac{2e^x}{5x + 2y}$  31.  $F_x(0, \pi/6) = \frac{1}{2}$ ;  $F_y(0, \pi/6) = \frac{\sqrt{3}}{2}$  33. (a)  $y = 2$ ,  $\frac{z-7}{1} = \frac{x-1}{1/8}$

(b)  $x = 1$ ,  $\frac{z-7}{1} = \frac{y+2}{1/4}$  35.  $f_{xx}(x, y) = 6e^{3x} + 9(x + y^2)e^{3x}$ ;  $f_{xy}(x, y) = 6ye^{3x}$ ;  $f_{yx}(x, y) = 6ye^{3x}$ ;  $f_{yy}(x, y) = 2e^{3x}$

37.  $f_x = yze^{xyz}$ ;  $f_y = xze^{xyz}$ ;  $f_z = xye^{xyz}$  39.  $f_x = e^x \sin y$ ;  $f_y = e^x \cos y + e^y \sin z$ ;  $f_z = e^y \cos z$  41. See Student Solutions Manual.

43. (a)  $\Delta z = (y)\Delta x + (x - 10y)\Delta y + (\Delta y)\Delta x + (-5\Delta y)\Delta y$  (b)  $\eta_1 = \Delta y$ ;  $\eta_2 = -5\Delta y$  (c) See Student Solutions Manual.

45.  $dz = \left( \frac{1}{\sqrt{y^2 - x^2}} \right) dx + \left( \frac{-x}{y\sqrt{y^2 - x^2}} \right) dy$  47.  $dw = \frac{1}{x}dx + \frac{1}{y}dy + \frac{1}{z}dz$  49.  $dz \approx 0.1$

51. The approximate maximum percentage error is 3%.

53.  $\frac{dw}{dt} = \left( \frac{1}{y} - \frac{z}{x^2} \right) \left( \frac{-1}{t^2} \right) + \left( \frac{1}{z} - \frac{x}{y^2} \right) \left( \frac{-2}{t^3} \right) + \left( \frac{1}{x} - \frac{y}{x^2} \right) \left( \frac{-3}{t^4} \right)$   
 $= 2 - \frac{2}{t^3}$

55.  $\frac{\partial u}{\partial r} = \frac{x}{\sqrt{x^2 + y^2 + z^2}} (\cos s) + \frac{y}{\sqrt{x^2 + y^2 + z^2}} (\sin s) + \frac{z}{\sqrt{x^2 + y^2 + z^2}} \left( \frac{r}{\sqrt{r^2 + s^2}} \right) = \frac{2r}{\sqrt{2r^2 + s^2}}$   
 $\frac{\partial u}{\partial s} = \frac{x}{\sqrt{x^2 + y^2 + z^2}} (-r \sin s) + \frac{y}{\sqrt{x^2 + y^2 + z^2}} (r \cos s) + \frac{z}{\sqrt{x^2 + y^2 + z^2}} \left( \frac{s}{\sqrt{r^2 + s^2}} \right) = \frac{s}{\sqrt{2r^2 + s^2}}$

57.  $\frac{\partial z}{\partial x} = \frac{-\sin y - y \cos x - yz}{xy}$   
 $\frac{\partial z}{\partial y} = \frac{-x \cos y - \sin x - xz}{xy}$

## Chapter 13

### Section 13.1

1. True 2. True 3. False 4. True 5. False 6.  $\frac{1}{\|\nabla f(x_0, y_0)\|} \nabla f(x_0, y_0)$  7.  $\nabla f(x_0, y_0)$  8.  $\|\nabla f(x_0, y_0)\|$
9. (a)  $D_{\mathbf{u}}f(-1, 2) = 1 - 2\sqrt{3} \approx -2.46$  (b) Starting at the point  $(-1, 2)$  and moving in the direction  $\mathbf{u} = \frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j}$ , the function is changing at a rate of approximately  $-2.46$  units per unit length. (c) The slope of the tangent line to the curve  $C$  that is the intersection of the surface  $f(x, y) = xy^2 + x^2$ , and the plane perpendicular to the  $xy$ -plane that contains the line through point  $(-1, 2, -3)$  in the direction  $\mathbf{u} = \frac{1}{2}\mathbf{i} + \frac{\sqrt{3}}{2}\mathbf{j}$ , is approximately  $-2.46$ .
11. (a)  $D_{\mathbf{u}}f(-1, 3) = -3 - 4\sqrt{3} \approx -9.93$  (b) Starting at the point  $(-1, 3)$  and moving in the direction  $\theta = \frac{2\pi}{3}$ , the function is changing at a rate of approximately  $-9.93$  units per unit length. (c) The slope of the tangent line to the curve  $C$  that is the intersection of the surface  $f(x, y) = 2xy - y^2$ , and the plane perpendicular to the  $xy$ -plane that contains the line through point  $(-1, 3, -15)$  in the direction  $\theta = \frac{2\pi}{3}$ , is approximately  $-9.93$ .
13. (a)  $D_{\mathbf{u}}f(0, 0) = \frac{1 + \sqrt{3}}{2} \approx 1.37$  (b) Starting at the point  $(0, 0)$  and moving in the direction  $\theta = \frac{\pi}{6}$ , the function is changing at a rate of approximately  $1.37$  units per unit length. (c) The slope of the tangent line to the curve  $C$  that is the intersection of the surface  $f(x, y) = xe^y + ye^x$ , and the plane perpendicular to the  $xy$ -plane that contains the line through point  $(0, 0, 0)$  in the direction  $\theta = \frac{\pi}{6}$ , is approximately  $1.37$ .
15. (a)  $D_{\mathbf{u}}f(1, 1) = -\frac{7}{10} = -0.7$  (b) Starting at the point  $(1, 1)$  and moving in the direction  $\mathbf{a} = 3\mathbf{i} - 4\mathbf{j}$ , the function is changing at a rate of  $-0.7$  units per unit length. (c) The slope of the tangent line to the curve  $C$  that is the intersection of the surface  $f(x, y) = \tan^{-1} \frac{y}{x}$ , and the plane perpendicular to the  $xy$ -plane that contains the line through point  $(1, 1, \frac{\pi}{4})$  in the direction  $\mathbf{a} = 3\mathbf{i} - 4\mathbf{j}$ , is  $-0.7$ .
17. (a)  $\nabla f(1, 2) = 6\mathbf{i} + 4\mathbf{j}$  (b)  $D_{\mathbf{u}}f(1, 2) = \frac{14\sqrt{5}}{5}$  19. (a)  $\nabla f(0, 3) = 6\mathbf{i}$  (b)  $D_{\mathbf{u}}f(0, 3) = \frac{12\sqrt{5}}{5}$
21. (a)  $\nabla f(0, 1) = 2\mathbf{i}$  (b)  $D_{\mathbf{u}}f(0, 1) = \frac{2\pi}{\sqrt{\pi^2 + 1}}$  23. (a)  $\nabla f(1, 0) = \mathbf{j}$  (b)  $D_{\mathbf{u}}f(1, 0) = \frac{\pi}{\sqrt{\pi^2 + 9}}$
25. (a)  $\nabla f(2, 0) = 4\mathbf{i} + 4\mathbf{j}$  (b)  $D_{\mathbf{u}}f(2, 0) = 4$  27. (a)  $\nabla f(0, 1, 2) = -4\mathbf{i}$  (b)  $D_{\mathbf{u}}f(0, 1, 2) = -\frac{4\sqrt{11}}{11}$
29. (a)  $\nabla f(1, 1, 3) = -\frac{3}{2}\mathbf{i} + \frac{3}{2}\mathbf{j} + \frac{\pi}{4}\mathbf{k}$  (b)  $D_{\mathbf{u}}f(1, 1, 3) = -\frac{(12 + 5\pi)\sqrt{3}}{36}$
31. (a)  $\nabla f(3, 4, 0) = \frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{j}$  (b)  $D_{\mathbf{u}}f(3, 4, 0) = -\frac{13\sqrt{30}}{75}$
33. (a)  $\mathbf{u} = \frac{1}{\sqrt{5}}\mathbf{i} - \frac{2}{\sqrt{5}}\mathbf{j}$  (b)  $\|\nabla f(-1, 2)\| = 2\sqrt{5}$
35. (a)  $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$  (b)  $\|\nabla f(0, 0)\| = \sqrt{2}$
37. (a)  $\mathbf{u} = \frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}$  (b)  $\|\nabla f(1, 2)\| = \frac{1}{5}$
39. (a)  $\mathbf{u} = -\frac{6}{\sqrt{\pi^2 + 72}}\mathbf{i} + \frac{6}{\sqrt{\pi^2 + 72}}\mathbf{j} + \frac{\pi}{\sqrt{\pi^2 + 72}}\mathbf{k}$  (b)  $\|\nabla f(1, 1, 3)\| = \sqrt{\frac{9}{2} + \frac{\pi^2}{16}}$
41. 
43. 
45. 
47. (a) The rate of change of temperature is  $-\frac{1}{5}^\circ\text{C}$  per unit length in the direction  $3\mathbf{i} - 4\mathbf{j}$ . (b) The temperature is increasing most rapidly in the direction  $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$ . (c) The temperature is decreasing most rapidly in the direction  $\mathbf{u} = -\frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}$ . (d) The rate of change of temperature is 0 in the directions  $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}$  and  $\mathbf{u} = -\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$ .
49. Water will flow in the direction  $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$ .
51. The rate of change of temperature is  $\frac{\sqrt{3}}{2}^\circ\text{C}$  per unit of distance in the  $\mathbf{u}$ -direction.

53. (a) The direction is  $\mathbf{u} = \frac{8}{\sqrt{145}}\mathbf{i} + \frac{9}{\sqrt{145}}\mathbf{j}$ . (b) See Student Solutions Manual. (c) The maximum rate of change is  $2\sqrt{145}$ .

55. Vector  $\mathbf{u} = -\frac{4}{\sqrt{17}}\mathbf{i} + \frac{1}{\sqrt{17}}\mathbf{j}$  is normal to the level curve of  $f$  at  $P$ .

57. (a) The level curves are circles of the form

$$x^2 + y^2 = \left(\frac{250}{T}\right)^2.$$

(c) The level curve is  $x^2 + y^2 = 25$ .

(e) An isothermal curve is a curve at which the temperature is the same for all points on the curve.

59. The charge moves in the direction  $\mathbf{u} = \frac{2}{3}\mathbf{i} - \frac{2}{3}\mathbf{j} + \frac{1}{3}\mathbf{k}$ . The electrical potential changes at a rate of  $-3e^{-2}$  volts per unit change in the

$\mathbf{u}$ -direction. 61.  $-\frac{x}{\sqrt{4-x^2}}$  63. See Student Solutions Manual. 65. See Student Solutions Manual. 67. See Student Solutions Manual.

69. See Student Solutions Manual. 71. Function  $f$  is not necessarily differentiable. See Student Solutions Manual.

73. See Student Solutions Manual. 75. See Student Solutions Manual. 77. See Student Solutions Manual.

## Section 13.2

1. True 2. True 3.  $4y + z = 14$  5.  $8x + 18y - z = 13$  7. (a)  $x - 2y + 3z = 14$  (b)  $\frac{x-1}{1} = \frac{y+2}{-2} = \frac{z-3}{3}$

9. (a)  $4x + y + 2z = 3$  (b)  $\frac{x-1}{4} = \frac{y-1}{1} = \frac{z+1}{2}$  11. (a)  $4x - 2y + z = -5$  (b)  $\frac{x+2}{-4} = \frac{y-1}{2} = \frac{z-5}{-1}$

13. (a)  $4x - z = 2$  (b)  $\frac{x-1}{4} = \frac{z-2}{-1}; y = 0$  15. (a)  $3x - 3y - 4z = 2$  (b)  $\frac{x-3}{3} = \frac{y-1}{-3} = \frac{z-1}{-4}$

17. (a)  $x\sqrt{\frac{\pi}{2}} + y\sqrt{\frac{\pi}{2}} - z = \frac{\pi}{2} - \ln\sqrt{2}$  (b)  $\frac{x - \sqrt{\frac{\pi}{8}}}{\sqrt{\frac{\pi}{2}}} = \frac{y - \sqrt{\frac{\pi}{8}}}{\sqrt{\frac{\pi}{2}}} = \frac{z - \ln\sqrt{2}}{-1}$

19. (a)  $y + z = \frac{\pi}{2}$  (b)  $\frac{y - \frac{\pi}{2}}{-1} = \frac{z}{-1}; x = 0$  (c)

21. (a)  $2x + y - z = 18$  (b)  $\frac{x-1}{2} = \frac{y-8}{1} = \frac{z+8}{-1}$  (c)

23. See Student Solutions Manual. 25. The tangent plane is parallel to the  $xy$ -plane at  $(x, y, z) = (3, -1, 11)$ . 27. The tangent plane is parallel to the  $xy$ -plane for all  $(x, y, z)$  such that  $y = -x$  and  $z = 0$ . 29. The tangent plane is parallel to the  $xy$ -plane at  $(x, y, z) = (0, -1, 1)$ ,  $\left(\frac{1}{2}, -1, \frac{7}{8}\right)$ , and  $\left(-\frac{1}{2}, -1, \frac{7}{8}\right)$ . 31. The engineer should drill in the direction  $\mathbf{u} = -\frac{2}{3}\mathbf{i} - \frac{2}{3}\mathbf{j} - \frac{1}{3}\mathbf{k}$ .

33. (a) See Student Solutions Manual.

35. See Student Solutions Manual. 37. The equation of the tangent plane is  $y + z = \pi$ . The symmetric equations for the normal line

are  $\frac{y - \frac{\pi}{2}}{-1} = \frac{z - \frac{\pi}{2}}{-1}, x = 0$ . 39. See Student Solutions Manual. 41. See Student Solutions Manual.

43. The equation of the tangent plane is  $(\ln 2)x + 2y + (1 + \ln 2)z = 4(1 + \ln 2)$ . The symmetric equations of the normal line

are  $\frac{x - 2}{\ln 2} = \frac{y - 1}{2} = \frac{z - 2}{1 + \ln 2}$ .

### Section 13.3

1. (a) 2.  $f_x(x, y) = f_y(x, y) = 0$ . 4. (c) 3. False 5. True 6. boundary 7. The critical points are  $(0, 0)$ ,  $(1, 0)$ , and  $(-1, 0)$ .

9. The critical points are  $(0, 0)$ ,  $(1, 1)$ , and  $(-1, -1)$ . 11. There are no critical points.

13. There is a local minimum at  $(1, -2)$ ; the local minimum value is  $z = -3$ .

15. There is a local minimum at  $(2, -1)$ ; the local minimum value is  $z = -9$ .

17. The point  $(0, 0, 0)$  is a saddle point of  $z$ . There is a local minimum at  $(2, 2)$ ; the local minimum value is  $z = -8$ .

19. The point  $(0, 2, 4)$  is a saddle point of  $z$ .

21. The point  $(0, 0, 0)$  is a saddle point of  $z$ . There is a local maximum at  $(-1, -1)$ ; the local maximum value is  $z = 1$ .

23. The points  $(3, -4.5, 6.75)$  and  $(0, 0, 0)$  are saddle points of  $z$ . 25. There are no critical points.

27. The function has critical points at  $(x, y) = (m\pi, n\pi)$  for integers  $m$  and  $n$ . For odd values of  $m$  and  $n$ , the function has a local minimum; the local minimum value is  $z = -2$ . For even values of  $m$  and  $n$ , the function has a local maximum; the local maximum value is  $z = 2$ . For odd  $m$  and even  $n$  OR even  $m$  and odd  $n$ ,  $(m\pi, n\pi, 0)$  is a saddle point of  $z$ .

29. For integer  $n$ , the function has a local minimum at  $(2\pi n, 3)$  and  $(\pi + 2\pi n, -3)$ ; the local minimum value is  $-3$ . For integer  $n$ , the points  $\left(\frac{\pi}{2} + 2\pi n, 0, 6\right)$  and  $\left(-\frac{\pi}{2} + 2\pi n, 0, 6\right)$  are saddle points of  $z$ .

31. The point  $(0, 0, 1)$  is a saddle point of  $z$ . 33. The absolute maximum value of  $f$  is 4; the absolute minimum value of  $f$  is 0.

35. The absolute maximum value of  $f$  is  $4 + 4\sqrt{2}$ ; the absolute minimum value of  $f$  is  $-2$ .

37. The absolute maximum value of  $f$  is 33; the absolute minimum value of  $f$  is  $-7$ .

39. For integers  $m$  and  $n$ , there are local minima at  $\left(-\frac{\pi}{2} + 2\pi m, \frac{\pi}{2} + 2\pi n\right)$  and  $\left(\frac{\pi}{2} + 2\pi m, -\frac{\pi}{2} + 2\pi n\right)$ ; the local minimum value is  $-1$ . For integers  $m$  and  $n$ , there are local maxima at  $\left(-\frac{\pi}{2} + 2\pi m, -\frac{\pi}{2} + 2\pi n\right)$  and  $\left(\frac{\pi}{2} + 2\pi m, \frac{\pi}{2} + 2\pi n\right)$ ; the local maximum value is 1. For integers  $m$  and  $n$ ,  $(x, y, z) = (\pi m, \pi n, 0)$  are saddle points of  $z$ . 41. At its highest peak, the mountain is 14 km above sea level.

43. The volume is a maximum when the length and width are  $\sqrt{\frac{S}{3}}$  and the depth is  $\frac{1}{2}\sqrt{\frac{S}{3}}$ .

45. The dimensions of the closed box of volume  $V = 500 \text{ cm}^3$  that uses the least amount of material occur when the length, width, and depth are all  $\sqrt[3]{500} \text{ cm}$ .

47. (a) The rectangular box with maximum volume has a cross section of dimensions  $\frac{65}{3}$  inches by  $\frac{65}{3}$  inches and a length of  $\frac{130}{3}$  inches.

(b) The cylindrical box with maximum volume has a radius of  $\frac{130}{3\pi}$  inches and a length of  $\frac{130}{3}$  inches.

49. (a) For a fixed amount  $x$  of Drug A,  $y = \frac{2b}{3}$  units of Drug B produces the maximum reaction. (b) For a fixed amount  $y$  of Drug B,  $x = \frac{2a}{3}$  units of Drug A produces the maximum reaction. (c) Reaction is a maximum when  $x = \frac{2a}{3}$  units of Drug A and  $y = \frac{2b}{3}$  units of Drug B are used. 51. The location  $\left(\frac{1}{3}, \frac{1}{2}\right)$  will minimize the cost of connecting the plants to  $D$ .

53. The location with the highest reading is  $(x, y) = \left(\frac{1}{2}, \frac{1}{8}\right)$ .

55. Production is maximized when  $x = \frac{20}{7} \approx 2.857$  thousand units are sold at a price of  $p = \frac{64}{7} \approx 9.143$  thousand dollars and  $y = \frac{2}{7} \approx 0.286$  thousand units are sold at a price of  $q = \frac{54}{7} \approx 7.714$  thousand dollars. The maximum profit is \$18,286.

57. See Student Solutions Manual.

59. (a) See Student Solutions Manual. (b) The equation of the least squares estimate is  $y = 0.7x + 1.2$ .

## Section 13.4

1. (c) 2. True 4. False 3. False 5. The maximum value of  $f$  is  $4\sqrt{6}$ . The minimum value of  $f$  is  $-4\sqrt{6}$ .
7. The maximum value of  $f$  is  $4 + \frac{1}{2}\sqrt{37}$ . The minimum value of  $f$  is  $4 - \frac{1}{2}\sqrt{37}$ .
9. The maximum value of  $f$  is 1. The minimum value of  $f$  is  $-\frac{17}{8}$ . 11. The maximum value of  $f$  is 2. The minimum value of  $f$  is  $-2$ .
13. The maximum value of  $f$  is 20. The minimum value of  $f$  is 0. 15. The minimum value of  $f$  is  $-\frac{75}{4}$ .
17. The absolute minimum value of  $f$  is  $-2$ . The absolute maximum value of  $f$  is 6.
19. The absolute minimum value of  $f$  is  $6 - 4\sqrt{2}$ . There is no absolute maximum value.
21. The point  $\left(\frac{3}{5}, -\frac{9}{5}\right)$  is closest to the origin. 23. The maximum product is  $\frac{441}{8}$ .
25. (a) The points  $(0, 3, \sqrt{7})$  and  $(0, 3, -\sqrt{7})$  are farthest from the origin.  
(b) The points  $\left(\frac{\sqrt{7}}{2}, 3, 0\right)$  and  $\left(-\frac{\sqrt{7}}{2}, 3, 0\right)$  are closest to the origin.
27. The product is a maximum at  $\left(1, \frac{\sqrt{2}}{2}\right)$  and  $\left(-1, -\frac{\sqrt{2}}{2}\right)$ . 29. The optimal dimensions are obtained when  $r = \sqrt[3]{\frac{V}{2\pi}}$  and  $h = 2r = 2 \cdot \sqrt[3]{\frac{V}{2\pi}}$ .
31. An open-topped box with a square base of  $2\sqrt[3]{3}$  m by  $2\sqrt[3]{3}$  m and a height of  $\sqrt[3]{3}$  m will minimize the cost.
33. A cubical suitcase with each side measuring 15 inches will maximize the volume.
35. (a) Width  $x$  must be no less than 20 m and no more than 50 m. (b) The greatest number of square meters that can be enclosed by the two fields is  $5100 \text{ m}^2$ . 37. Production levels of  $x = 1800$  thousand units and  $y = 3600$  thousand units will minimize production cost.
39. (a) Invest 250 units of capital and 1050 units of labor to maximize production. (b) The maximum production is 740.8 units.
41. The minimum value of  $w$  is 9. 43. See Student Solutions Manual.
45. On the union of the two curves,  $f$  attains a maximum value at  $(\pm 1, 0)$  and  $(0, \pm 1)$  and a minimum value at  $\left(\pm \frac{\sqrt{2}}{2}, \pm \frac{\sqrt{2}}{2}\right)$ .
47.  $\frac{D^4}{(A^{4/3} + B^{4/3} + C^{4/3})^3}$  49.  $\left(\frac{1}{2}, \frac{1}{2}, \frac{3}{2}\right)$

51.

## Chapter Review

1.  $\nabla f\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}\right) = \sqrt{\frac{\pi}{2}}\mathbf{i} + \sqrt{\frac{\pi}{2}}\mathbf{j}$ ;  $\mathbf{D}_{\mathbf{u}}f\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}\right) = \sqrt{\pi}$  3.  $\nabla f(0, 1) = \mathbf{i}$   $\mathbf{D}_{\mathbf{u}}f(0, 1) = \frac{3\sqrt{10}}{10}$
5.  $\nabla f(0, 0, 0) = \mathbf{j}$ ;  $\mathbf{D}_{\mathbf{u}}f(0, 0, 0) = \frac{1}{3}$
7. (a)  $\mathbf{u} = \frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j}$  (b)  $\left\|\nabla f\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}\right)\right\| = \sqrt{2\pi}$  is the maximum value;  $-\left\|\nabla f\left(\sqrt{\frac{\pi}{8}}, \sqrt{\frac{\pi}{8}}\right)\right\| = -\sqrt{2\pi}$  is the minimum value.
9. (a)  $\mathbf{u} = \mathbf{i}$  (b)  $\|\nabla f(0, 1)\| = 1$  is the maximum value;  $-\|\nabla f(0, 1)\| = -1$  is the minimum value.
11. (a)  $4x - z = 2$  (b)  $\frac{x-1}{4} = \frac{z-2}{-1}$ ;  $y = 0$  13. The critical point is  $(-4, 2)$ . 15. The critical point is  $(0, 0)$ .
17. For integers  $m$  and  $n$ , there is a local maximum value at  $\left(\frac{\pi}{2} + 2\pi m, \frac{\pi}{2} + 2\pi n\right)$ ; the local maximum value is  $z = 2$ . For integers  $m$  and  $n$ , there is a local minimum value at  $\left(-\frac{\pi}{2} + 2\pi m, -\frac{\pi}{2} + 2\pi n\right)$ ; the local minimum value is  $z = -2$ . For integers  $m$  and  $n$ ,  $\left(-\frac{\pi}{2} + 2\pi m, \frac{\pi}{2} + 2\pi n, 0\right)$  and  $\left(\frac{\pi}{2} + 2\pi m, -\frac{\pi}{2} + 2\pi n, 0\right)$  are saddle points of  $z$ . 19. The absolute maximum value is 9; the absolute minimum value is  $-7$ .
21. There is a minimum value at  $\left(\frac{130}{19}, -\frac{120}{19}\right)$ ; the minimum value is  $z = \frac{5900}{19}$ .
23. There is a minimum value at  $\left(\frac{8}{5}, \frac{4}{5}\right)$ ; the minimum value is  $z = \frac{16}{5}$ .
25. (a)  $\frac{7}{5}$  (b) The temperature is increasing most rapidly in the direction  $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$ . (c) The temperature is decreasing most rapidly in the direction  $\mathbf{u} = -\frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}$ . (d) The rate of change of temperature is 0 in the directions  $\mathbf{u} = \frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}$  and  $\mathbf{u} = -\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}$ .
27. (a) Invest 306 units of capital and 357 units of labor to maximize production. (b) The maximum production is 3408.7 units.
29. The points  $(1, 1, 1)$ ,  $(-1, 1, -1)$ ,  $(-1, -1, 1)$ , and  $(1, -1, -1)$  are all closest to the origin.
31. A box with a square base with each side measuring  $\sqrt[3]{\frac{V}{3}}$  and a height of  $3\sqrt[3]{\frac{V}{3}}$  will minimize the total cost of the box.

## Chapter 16

### Section 16.1

1. 2; 1  $2.$  True  $3.$  True  $4.$  False  $5.$  This is a first-order differential equation of degree 1. The differential equation is linear.

$7.$  This is a fourth-order differential equation of degree 1. The differential equation is linear.

$9.$  This is a second-order differential equation of degree 1. The differential equation is nonlinear.

$11.$  This is a second-order differential equation of degree 3. The differential equation is nonlinear.

$13.$  This is a second-order differential equation of degree 1. The differential equation is linear.  $15.$  See Student Solutions Manual.

$17.$  See Student Solutions Manual.  $19.$  See Student Solutions Manual.  $21.$  See Student Solutions Manual.  $23.$  See Student Solutions Manual.

25. See Student Solutions Manual. 27. See Student Solutions Manual. 29. See Student Solutions Manual. 31. See Student Solutions Manual.  
 33. See Student Solutions Manual. 35. See Student Solutions Manual. 37. See Student Solutions Manual. 39.  $n = -3, 2$   
 41. The Schrödinger equation is a second-order differential equation of degree 1.

## Section 16.2

1.  $y = Ce^{0.5x^2}$  2. True 3. Trajectories 4.  $y = xv(x); v = v(x)$  5.  $y = \sin^{-1}\left(\frac{1}{2}x^2 + C\right)$  7.  $y = -\ln(e^{-x} + C)$   
 9.  $y = \frac{C}{1 - \cos x}$  11.  $y = 1 - Ce^{-0.5x^2}$  13.  $y = C(\sqrt{x})^{\ln x}$  15.  $y = \sin^{-1}\left(\frac{1}{2}x^2 + \frac{\sqrt{2}-1}{2}\right)$  17.  $y = x$  19.  $y = \frac{1}{1 - \cos x}$   
 21. Function  $f$  is a homogeneous function of degree 2. 23. Function  $f$  is not a homogeneous function.  
 25. Function  $f$  is a homogeneous function of degree 1. 27. Function  $f$  is a homogeneous function of degree 0.  
 29. Function  $f$  is a homogeneous function of degree 0. 31.  $y = Cx - x \ln x$  33.  $\frac{y}{x} - 2 \ln|x + y| + \ln|x| + C = 0$   
 35.  $\frac{1}{2} \ln(x^2 + y^2) + \tan^{-1}\left(\frac{y}{x}\right) = C$  37.  $y = x(C + \ln|x|)$  39.  $\frac{y^2 - x^2}{y} = C$  41.  $\ln(x^4) - \ln\left|\frac{x + 2y}{x - 2y}\right| = \ln(3)$

43. The orthogonal trajectories for the family  $xy = C$  is the family  $y^2 = x^2 + K$ . The graph of  $xy = 2$  and  $y^2 = x^2 - 3$  is shown.

45. The orthogonal trajectories for the family  $y = Cx^2$  is the family  $x^2 + 2y^2 = K$ . The graph of  $y = \frac{1}{4}x^2$  and  $x^2 + 2y^2 = 6$  is shown.

47.  $\frac{1}{2} \ln((2y + 1)^2 + (2x + 7)^2) + \tan^{-1}\left(\frac{2y + 1}{2x + 7}\right) = C$  49.  $2x^2 + y^2 = K$

51. (a)  $u = T - C \cdot e^{-kt}$  (b)  $u = T - (T - u_0)e^{-kt}$   
 (c) After 1 minute, the temperature of the bar is  $86.53^\circ\text{C}$ .  
 (d) The graph of the particular solution to the differential equation is shown.

- (e) The temperature of the bar will be within  $0.5^\circ\text{C}$  of the temperature of the boiling water after approximately 175.1 seconds.

53. (a)  $S = 20 \left(1 - \left(\frac{17}{20}\right)^{0.5t}\right)$

- (b) During the eighth year of operation, the sales will be approximately 9.56 million dollars.  
 (c) Sales will reach \$12 million dollars in approximately 11.28 years.  
 (d) The graph of the annual sales of the company for its first 20 years of operation is shown.

55. (a) After 25 hours of practice, the person can text approximately 64.1 words per minute.  
 (b) The person will need approximately 49.2 hours of practice in order to text 100 words per minute.  
 (c) The graph of texting speed as a function of hours of practice is shown.

57. (a)  $\frac{dv}{dt} = \frac{-A}{m}v$  (b)  $v = v_0 e^{\frac{-A}{m}t}$  (c)  $A = 15 \text{ kg/s}$  (d) The sled will slow down to 10% of its initial speed in approximately 3.84 seconds. (e) While slowing down to 1.0 m/s, the sled will travel 15 meters.  
 59. (a)  $q = q_0 \cdot e^{\frac{-1}{RC}t}$  (b) The discharging capacitor will lose 99% of its initial charge in approximately 0.00345 seconds.  
 61.  $y = Kx^{-\frac{c^2}{4-c^2}}$  63. (a) See Student Solutions Manual. (b)  $v_0 = \sqrt{2Rg}$  65. See Student Solutions Manual.

### Section 16.3

1. True 2. False 3. True 4. Integrating factor 5. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = -2$  (b)  $2x^2 - 2xy + y^2 + 5x + C = 0$   
 7. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = -2x - 2y$  (b)  $a^2x - x^2y - xy^2 - \frac{1}{3}y^3 + C = 0$  9. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = \frac{-1}{y^2}$  (b)  $\frac{x}{y} + C = 0$   
 11. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = \frac{1}{x-1}$  (b)  $y \ln(x-1) + y \ln(2) + \ln(y) + C = 0$   
 13. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = \frac{-1}{x+3} \sin y$  (b)  $\ln(x+3) \cos y + \ln(5) \cos y + \frac{1}{2}y^2 + y + C = 0$   
 15. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = -2y \sin(x+y^2)$  (b)  $\sin(x+y^2) + C = 0$  17. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = 2e^{2x}$  (b)  $ye^{2x} - \frac{1}{3}x^3 + C = 0$   
 19. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = 2y - \frac{1}{(x+y)^2}$  (b)  $\ln|x+y| + xy^2 + C = 0$  21. (a)  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} = 6y^2 \sin(2x)$  (b)  $-y^3 \cos(2x) + C = 0$   
 23.  $x + xy^2 + \frac{1}{2}x^2y^2 + \frac{1}{2}y^2 - 3 = 0$  25.  $x^2y + \cos x - y^2 = 0$  27. See Student Solutions Manual.  
 29. (a)  $u(x) = \frac{1}{x^2}$  (b)  $4x - \frac{y^2}{x} - \frac{1}{x} + y + C = 0$  (c) See Student Solutions Manual.  
 31. (a)  $u(x) = \frac{1}{x^2}$  (b)  $-\frac{y}{x} + \frac{1}{2}y^2 + C = 0$  (c) See Student Solutions Manual.  
 33. (a)  $u(x) = \frac{1}{x^3}$  (b)  $\ln x + \frac{\sin y}{x} + C = 0$  (c) See Student Solutions Manual.

### Section 16.4

1. True 2. True 3. False 4. False 5.  $y = Ce^{-x^2}$  7.  $y = x^2 + \frac{C}{x}$  9.  $y = \frac{1}{4}x^3 + \frac{C}{x}$  11.  $y = \left(\frac{-1}{3}e^{-x} + Ce^{2x}\right)$   
 13.  $y = \frac{1}{5}x^3 + \frac{1}{3}x + \frac{C}{x^2}$  15.  $y = 1 + Ce^{-e^x}$  17.  $y = x \cos x + C \cos x$  19.  $y = \frac{\ln|\csc(x) - \cot(x)| + C}{\sin(x)}$   
 21.  $y = \frac{\pm 1}{x\sqrt{C-6x}}$  23.  $y = \sqrt[3]{\frac{2}{1+Ce^{3x^2}}}$  25.  $y^{\frac{2}{3}} - \frac{3}{4}x^2 - \frac{C}{x^{\frac{2}{3}}} = 0$  27.  $y = x(e^x + C)$  29.  $x - \frac{1}{4} + \frac{1}{2}y - \frac{1}{2}y^2 - Ce^{-2y} = 0$   
 31.  $y = \frac{\sec x \tan x + \tan^2 x + \ln|\sec x + \tan x| + C}{2(\sec x + \tan x)}$  33.  $y = \frac{1}{e^x(C-x^2)}$  35.  $y = \pm \sqrt{\frac{x}{C-x^5}}$   
 37.  $x^6 + 3x^4y^2 + C = 0$  39.  $y = \frac{x+5}{e^x}$  41.  $y = e^x - \frac{e^x}{x} + \frac{1}{e^x}$   
 43. (a)  $y = \frac{-x^3 \cos x + 3x^2 \sin x - 6 \sin x + 6x \cos x + C}{x^3}$   
 (b)  $y = \frac{-x^3 \cos x + 3x^2 \sin x - 6 \sin x + 6x \cos x + 6\pi - \pi^3}{x^3}$

(c) The graph of the particular solution over the interval  $[0, 10]$  is shown below.

$$45. s(t) = s_0 + \left( \frac{m^2 g}{k^2} + \frac{v_0 m}{k} \right) \left( 1 - e^{-\frac{k}{m} t} \right) - \frac{mg}{k} t$$

47. (a) The skydiver will be falling at a velocity of 44.89 ft/s. (b) The skydiver will land on the ground in approximately 242.75 seconds.  
 (c) The skydiver will land with a velocity of 40 ft/s.

49. After 5 minutes, there are approximately 98.9 kg of salt in the tank. After a long time, there will be 300 kg of salt in the tank.

51. (a) The solution of the differential equation is  $P(t) = \frac{30,000}{3 + 17e^{-0.01t}}$

(b) The limiting size of the population is 10,000.

(c) The population will be equal to 5000 (i.e. one-half of the limiting value) in 173.46 months.

(d) The graph of the predicted population for  $0 \leq t \leq 600$  months is shown.

53.  $q(t) = EC \left( 1 - e^{-\frac{t}{RC}} \right)$

55. (a)  $N(t) = N_{\max} \exp(-e^{-p(t+C)})$  (b)  $N(t) = 400 \exp(-e^{-0.0526(t-20.847)})$

(c) After 43 years, there will be approximately 293 fish. (d) See Student Solutions Manual.

(e) The graph of  $N = N(t)$  is shown.

57. See Student Solutions Manual. 59. After 1 hour, the percentage of carbon dioxide is approximately 0.0752%. After 2 hours, the percentage of carbon dioxide is approximately 0.0448%. 61.  $I(t) = \frac{E_0}{L} \left( \frac{k \sin(\omega t) - \omega \cos(\omega t) + \omega e^{-kt}}{k^2 + \omega^2} \right) + I_0 \cdot e^{-kt}, k = \frac{R}{L}$

## Section 16.5

1.  $y(x) = a_0 \sum_{k=0}^{\infty} \left( -\frac{3}{2} \right)^k \frac{x^{2k}}{k!}$  3.  $y(x) = a_0 \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k}}{(2k)!} + a_1 \sum_{k=0}^{\infty} (-1)^k \frac{x^{2k+1}}{(2k+1)!}$

5.  $y(x) = a_0 \left( 1 - \frac{x^4}{3 \cdot 4} + \frac{x^8}{3 \cdot 4 \cdot 7 \cdot 8} - \frac{x^{12}}{3 \cdot 4 \cdot 7 \cdot 8 \cdot 11 \cdot 12} + \frac{x^{16}}{3 \cdot 4 \cdot 7 \cdot 8 \cdot 11 \cdot 12 \cdot 15 \cdot 16} - \dots \right)$   
 $+ a_1 \left( x - \frac{x^5}{4 \cdot 5} + \frac{x^9}{4 \cdot 5 \cdot 8 \cdot 9} - \frac{x^{13}}{4 \cdot 5 \cdot 8 \cdot 9 \cdot 12 \cdot 13} + \frac{x^{17}}{4 \cdot 5 \cdot 8 \cdot 9 \cdot 12 \cdot 13 \cdot 16 \cdot 17} - \dots \right)$

(c and f) The graphs are shown. See Student Solutions Manual for explanation.

25. (a) See Student Solutions Manual. (b) See Student Solutions Manual. (c) The lower bound is  $6.19 \times 10^8$ .

## Review Exercises

1. This is a first-order differential equation of degree 1. The differential equation is linear. 3. This is a third-order differential equation of degree 1. The differential equation is linear. 5. See Student Solutions Manual. 7. See Student Solutions Manual. 9. Function  $f$  is a homogeneous function of degree 3. 11. Function  $f$  is a homogeneous function of degree 1.

13. (a) The differential equation is separable. (b)  $y = \pm \sqrt{\frac{C}{(1-x)^2} - 1}$  15. (a) The differential equation is exact. (b)  $y = \frac{1}{7}x^6 + \frac{C}{x}$

17. (a) The differential equation is exact. (b)  $x^2y^3 + y^2 \sin x - x^2 + C = 0$

19. (a) The differential equation is separable and exact. (b)  $y = \frac{C}{\cos x}$

21. (a) The differential equation is homogeneous of degree 1. (b)  $y = x \cos^{-1}(Cx)$

23. (a) The differential equation is Bernoulli. (b)  $y = \pm \sqrt{\frac{5x}{2 + Cx^5}}$

25.  $y = 3 + \frac{20}{x^2}$  27.  $y = x - \frac{1}{x}$  29.  $y = \frac{-1}{2} - \frac{1}{2}x$  31.  $y = x^2 \sin x + \left(\frac{12}{\pi^2} - 1\right)x^2$  33.  $y = x\sqrt{4 + 2 \ln x}$  35.  $y(x) = a_0 \sum_{k=0}^{\infty} \left(\frac{x}{2}\right)^k$

**37. (a)**  $y(x) = 1 + x - \frac{1}{6}x^3 - \frac{1}{12}x^4 + \frac{1}{120}x^5 + \dots$

**(b)**

| $x$    | 0       | 0.1     | 0.2     | 0.3     | 0.4     | 0.5     | 0.6     | 0.7     | 0.8     | 0.9     | 1.0     |
|--------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| $y(x)$ | 1.00000 | 1.09983 | 1.19854 | 1.29485 | 1.38729 | 1.47422 | 1.55385 | 1.62423 | 1.68326 | 1.72875 | 1.75833 |

**39.**  $y = M - Ce^{-kt}$

**41.** The orthogonal trajectories for the family  $xy = c$  is the family  $y^2 - x^2 = K$ .  
The graph of  $xy = 6$  and  $y^2 - x^2 = 5$  is shown.

 tangent, **878**  
 xy-simple, **1032–1033**  
 Symbols. *See also* Notation  
 binomial coefficients, 620, **A-43**  
 delta, 11  
 ellipsis, **A-38**  
 factorial, **178, A-40**  
 infinity, 117, **A-5**  
 integral, **355**  
 integral, closed path, 1008  
 operator, **866**  
 summation, **A-40**  
 Symmetric equations for lines, 734–736, **735, 877**  
 Symmetry  
 axes of, **18**  
 and centroids, 463  
 of graphs, **A-17–A-18**  
 and integration, 407  
 of inverse functions, 35  
 Symmetry principle, **463**

**T**

Tables of integrals, **520–521**  
 Tangent functions, **55, A-28**  
 derivatives of, 188  
 graphs of, 55  
 hyperbolic, 244  
 inverse, 59–**60**, 217–218  
 sum and difference formulas for, **A-34**  
 Tangent lines, 69–**70**, 147–149, **148**. *See also* Derivatives  
 finding equations for, 200, 211–212, 226, 831–832  
 horizontal, 187–188, **648**  
 and tangent vectors, **768**  
 vertical, **648**  
 Tangent planes, **875–876**  
 finding equations for, 1022–1023  
 Tangent problem, **69**  
 and smooth parametrization, 1021  
 Tangent surfaces, **878**  
 Tangent vectors, 767–**768**  
 and smooth parametrization, 1021  
 unit, **768–769**  
 Tangential components of acceleration, 788–792, **789**  
 Target parameters, **196**  
 Tautochrone properties, **643**  
 Taylor, Brook, 240, 240  
 Taylor expansions, **613**  
 Taylor polynomials, **240–241**  
 Taylor series, 611–**613**  
 convergence of, 614–616, **B-12–B-13**  
 finding, 616–619  
 functions expressed as, 613–614  
 Technology, graphing, 64–67  
 Telescoping sums, **556**  
 Terminal points, **699**  
 Terminal sides, of rays, **A-25**  
 Terminal speed, **129**

Terms  
 of sequences, **538–540, A-38**  
 of series, **554**  
 Test points, **892**  
 Tests  
 alternating series, 582–584, 598*t*  
 comparison, 529, 575–577, 597*t*  
 for concavity, 288  
 for convergence of sequences, 540–543, 541  
 for convergence of series, 596–597, 597*t*–598*t*  
 for divergence of sequences, 541, 545–547, 547  
 for divergence of series, 566–569  
 for exactness, 1073  
 first-derivative, 284–286  
 horizontal-line, 33, 408  
 for increasing or decreasing functions, 279–282  
 integral, 569–570, 572–573, 597*t*  
 Leibniz, 582  
 limit comparison, 577–579, 598*t*  
 ratio, for convergence, 591–593  
 root, for convergence, 593–595  
 second-derivative, 291–294  
 second-partial-derivative, 882–883  
 vertical-line, 6  
 Theorems. *See also* Laws; Rules

 and optimization, 323  
 Triple integrals, **941–947**  
 and Jacobians, 965–966  
 Mean Value Theorem for, 1042  
 using cylindrical coordinates, 950–954  
 using spherical coordinates, 956–960  
 Triple scalar products, **732**  
 Triple vector products, **732**, 803

## U

Undefined quantities, **A-18**  
 Unique values, **2**  
 Unit circles, **A-21**  
 Unit tangent vectors, **768–769**  
 Unit vectors, **708–709**  
 principle normal, **769–770**  
 tangent, **768–769**  
 Upper limits of integration, **355**  
 Upper sums, **348**  
 finding area using, 348–349  
 Upward-pointing normal vectors, **1030–1031**  
 UVW axes, 792

## V

Values  
 average, 373–**374**, 482  
 expectation, **532**  
 extreme, 263–267, **264**  
 of functions, **3**  
 unique, **2**  
 van der Waals equation, **220**  
 Variable forces, **1002**  
 Variable vector forces, **1003**  
 Variables  
 dummy, 362  
 independent vs. dependent, **3, 810**  
 separation of, **382**  
 Variance, **532**  
 Vector differential equations, 796–797  
 Vector equations, **733–734**  
 Vector fields, **974–976**  
 conservative, 989–991, **990**, 996–1000  
 solenoidal, **1042**  
 Vector functions, **3, 758**  
 arc lengths for, 770–772, 775–776  
 continuity of, 761–762  
 derivatives of, 762–764, 767–768  
 domains of, 758  
 graphs of, 758–760

Vector functions (*continued*)integrals of, **796–797**limits of, **761**Vector products. *See also* Cross productstriple, **732**, **803**Vectors, **699**algebraic representation of,  
**703–705**angles between, **716–718**arithmetic operations on, **705–707**binormal, **784**components of, **703**, **712**finding, **709–712**geometric representation of,  
**699–701**magnitude of, **699**, **707–708**in  $n$  dimensions, **711–712**orthogonal, **717–718**parallel, **706–707**, **729**position, **703–705**principle unit normal, **769–770**projections of, **719–720**properties of, **700–702**, **706**secant, **767**standard basis, **708–709**, **710**tangent, **767–768**unit, **708–709**unit tangent, **768–769**zero, **699**Velocity, **785–786**angular, **729–730**average, **145**instantaneous, **145–147**, **146**limiting, **1080**Velocity fields, **975**Oseen, **1056–1057**Vertical asymptotes, **119–120**Vertical-line tests, **6**Vertical lines, **A-18**Vertical motion, **179–181**Vertical tangent lines, **648**

## Vertices

of cones, **684**, **745**of ellipses, **A-23**of parabolas, **745**, **A-22**of rays, **A-25**Voltage, Hall, **756**

## Volumes

maximizing, **319–320**of solids, slicing method, **433–437**of solids of revolution, disk method,  
**414–417**

of solids of revolution, Pappus

Theorem, **464**

of solids of revolution, shell method,

**424–431**, **425**

of solids of revolution, washer method,

**417–422**, **418**, **426**, **427–428**under surfaces, **908**, **913**using double integrals, **909**, **919**using double integrals in polar coordinates,  
**925–927**using triple integrals in cylindrical coordinates,  
**953**using triple integrals in spherical coordinates,  
**959**

## W

Wallis's formula, **479**, **923**Washer method for finding volumes, **417–422**,  
**418**, **426**, **427–428**Washers, **418**Wave equations, one-dimensional, **857**Weierstrass substitutions, **507**Weight density, **449**Whirling tendency, **1050–1051**Wireframe plots, **1017**Wolfram, Stephen, **65**Work, **444–445**, **720**, **1002–1003**done by a gravitational force, **450**done by a spring force, **446–448**done by a variable force, **445–446**done to pump a liquid, **448–450**and dot products, **720–721**and kinetic energy, **1004–1005**and line integrals, **1002–1006**and potential energy, **1005–1006**Wright, Theodore P., **1069–1070**

## X

 $x$ -axes, **695**moments about, **459**partitions of, **405–408**reflections about, **30**symmetry with respect to, **A-17** $x$ -coordinate curves, **1017** $x$ -coordinates, **A-16** $x$ -intercepts, **A-17** $x$ -simple regions, **913–914** $xy$ -planes, **695** $xy$ -simple solids, **942–943** $xy$ -simple surfaces, **1032–1033** $xz$ -planes, **695** $xz$ -simple solids, **946–947**

## Y

 $y$ -axes, **695**moments about, **459**partitions of, **408–411**reflections about, **30**symmetry with respect to, **A-17** $y$ -coordinate curves, **1017** $y$ -coordinates, **A-16** $y$ -intercepts, **A-17** $y$ -simple regions, **915–916** $yz$ -planes, **696** $yz$ -simple solids, **947**

## Z

 $z$ -axes, **695**Zeno, **564**Zeno's paradox, **564**Zero vectors, **699**and dot products, **716**Zeros, **8**approximating, using Newton's Method,  
**234–237**approximating, using the Intermediate Value  
Theorem, **101–102**multiple, **18**of multiplicity, **18**repeated, **18**Zeta function, Riemann's, **565**, **575**
